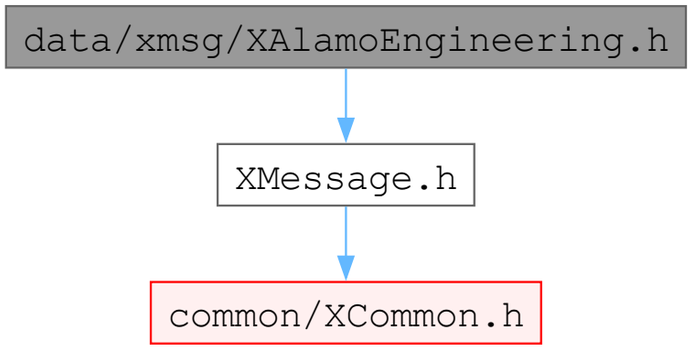
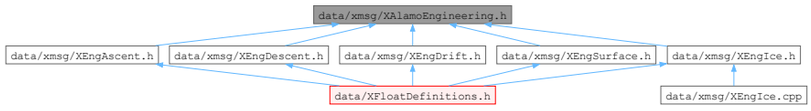
11.70 data/xmsg/XAlamoEngineering.h File Reference

The util::xmsg::XAlamoEngineering class header file.

`#include "XMessage.h"`
Include dependency graph for XAlamoEngineering.h:



This graph shows which files directly or indirectly include this file:



Classes

- class util::xmsg::XAlamoEngineering
  Abstract class representing a version controlled engineering message for ALAMO-type instruments.

Namespaces

- namespace util
  The utility namespace.
- namespace util::xmsg
  The X-Message utility namespace.

11.70.1 Detailed Description

The util::xmsg::XAlamoEngineering class header file.

Version

0.6

Date

Aug 5, 2014 1:32:39 PM

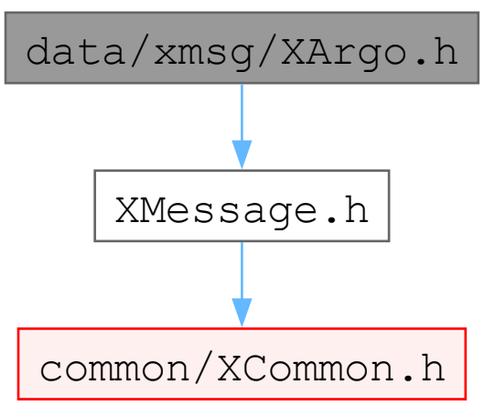
11.74 data/xmsg/XArgo.h File Reference

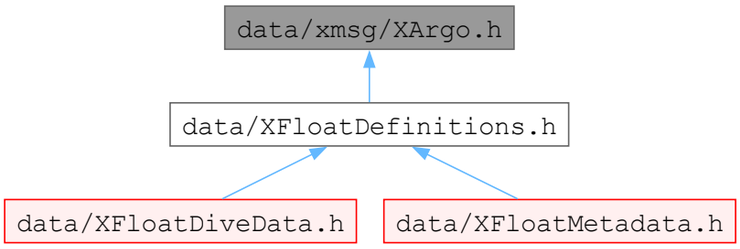
The util::xmsg::XArgo class header file.

```
#include "XMessage.h"
```

Include dependency graph for XArgo.h:



This graph shows which files directly or indirectly include this file:



Classes

- class util::xmsg::XArgo

  Class representing Argo X message.

Namespaces

- namespace util

  The utility namespace.
- namespace util::xmsg

  The X-Message utility namespace.

Enumerations

- enum XArgoInstrumentType_t {
  XARGO_INSRUMENT_TYPE_SOLO2 = 0 ,
  XARGO_INSRUMENT_TYPE_DEEP_ARGO = 1 ,
  XARGO_INSRUMENT_TYPE_ALAMO = 3 ,
  XARGO_INSRUMENT_TYPE_UNKNOWN = 99 }

  Enumeration of the Argo X-Message instrument type identifiers.

11.74.1 Detailed Description

The util::xmsg::XArgo class header file.

This is the header file for the Argo Data X-Message class, util::xmsg::XArgo. This X-Message object contains details about the dive cycle characteristics of the instrument as well as the sensor gain and offset values.

This file contains the class definition and all of its functionality.

Version

11.74.2 Enumeration Type Documentation

11.74.2.1 XArgoInstrumentType_t

```
enum XArgoInstrumentType_t
```

Enumeration of the Argo X-Message instrument type identifiers.

Enumerator

XARGO_INSRUMENT_TYPE_SOLO2	Argo X-Message instrument type identifier 0: The Solo-II Argo float identifier.
XARGO_INSRUMENT_TYPE_DEEP_ARGO	Argo X-Message instrument type identifier 1: The Deep Argo float identifier.
XARGO_INSRUMENT_TYPE_ALAMO	Argo X-Message instrument type identifier 3: The Air-Launchable Autonomous Micro-Observer (ALAMO) hurricane float type identifier.
XARGO_INSRUMENT_TYPE_UNKNOWN	Argo X-Message instrument type identifier 99: The unknown, unset, unspecified, or invalid instrument type identifier.

11.84.2 Macro Definition Documentation

11.84.2.1 XMSG_POS_INVALID_LAT

```
#define XMSG_POS_INVALID_LAT UTIL_POS_INVALID_LAT
```

Default/fill value for invalid position latitude.

Referenced by util::xmsg::XCompositeIridiumPosition::ComputeAverageIrdiumPosition().

11.84.2.2 XMSG_POS_INVALID_LON

```
#define XMSG_POS_INVALID_LON UTIL_POS_INVALID_LON
```

Default/fill value for invalid position longitude.

Referenced by util::xmsg::XCompositeIridiumPosition::ComputeAverageIrdiumPosition().

11.84.2.3 XMSG_POS_INVALID_STDERR

```
#define XMSG_POS_INVALID_STDERR UTIL_POS_INVALID_STDERR
```

Default/fill value for invalid position standard error.

Referenced by util::xmsg::XCompositeIridiumPosition::ComputeAverageIrdiumPosition().

11.84.2.4 XMSG_POS_INVALID_VAR

```
#define XMSG_POS_INVALID_VAR UTIL_POS_INVALID_VAR
```

Default/fill value for invalid position variance.

Referenced by util::xmsg::XCompositeIridiumPosition::ComputeAverageIrdiumPosition().

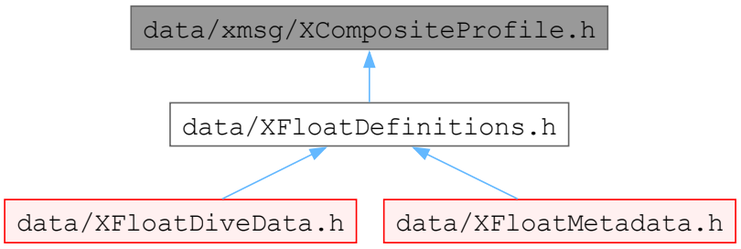
11.86 data/xmsg/XCompositeProfile.h File Reference

The util::xmsg::XCompositeProfile class header file.

`#include "AbstractXSensorDataComposite.h"`
Include dependency graph for XCompositeProfile.h:

This graph shows which files directly or indirectly include this file:



Classes

- class util::xmsg::XCompositeProfile

  Class representing the aggregate bin-averaged profile data for a single dive, composed from one or more bin-averaged profile data messages.

Namespaces

- namespace util

  The utility namespace.
- namespace util::xmsg

  The X-Message utility namespace.

11.86.1 Detailed Description

The util::xmsg::XCompositeProfile class header file.

Version

0.6

Date

Jul 17, 2014 3:07:43 PM

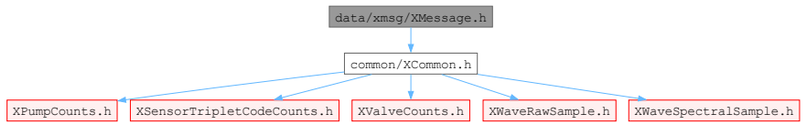
11.137 data/xmsg/XMessage.h File Reference

The util::xmsg::XMessage class header file.

```
#include "common/XCommon.h"
```

Include dependency graph for XMessage.h:



This graph shows which files directly or indirectly include this file:

Classes

- class util::xmsg::XMessage

  Class representing a message following the X format specification.

Namespaces

- namespace util

  The utility namespace.
- namespace util::xmsg

  The X-Message utility namespace.

```

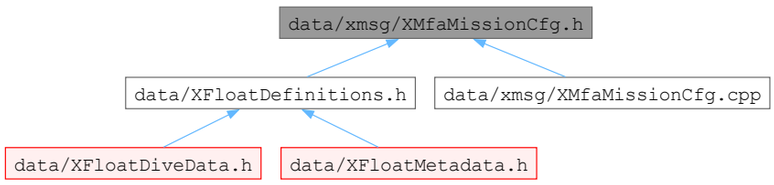
Include dependency graph for XMfaMissionCfg.h:

This graph shows which files directly or indirectly include this file:



Classes

- class util::xmsg::XMfaMissionCfg

  The ALAMO mission configuration (mission parameters) message class.

Namespaces

- namespace util

  The utility namespace.
- namespace util::xmsg

  The X-Message utility namespace.

11.142.1 Detailed Description

The util::xmsg::XMfaMissionCfg class header file.

Version

0.6

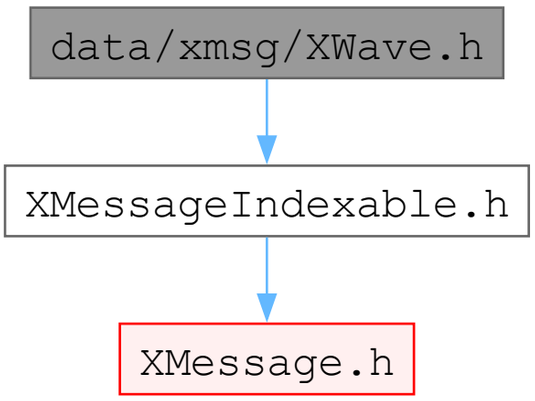
11.164 data/xmsg/XWave.h File Reference

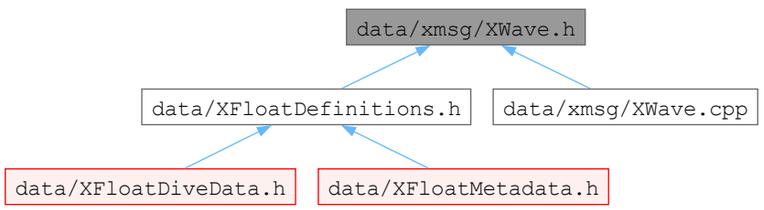
The util::xmsg::XWave class header file.

```
#include "XMessageIndexable.h"
```

Include dependency graph for XWave.h:



This graph shows which files directly or indirectly include this file:



Classes

- class util::xmsg::XWave

  Class representing measured ocean surface wave data X message.

Namespaces

- namespace util

  The utility namespace.
- namespace util::xmsg

  The X-Message utility namespace.

Macros

- #define XWAVE_INVALID_SF DBL_MAX

  The default/invalid sensitivity scale factor value for wave data.
- #define XWAVE_SIZE_ASSF_RAW (sizeof(util::xmsg::XWave::ASSF_RAW)/sizeof(double))

  The number of available accelerometer sensitivity scale factors for raw data.
- #define XWAVE_SIZE_ASSF_SPECTRAL (sizeof(util::xmsg::XWave::ASSF_SPECTRAL)/sizeof(double))

  The number of available accelerometer sensitivity scale factors for spectral.
- #define XWAVE_SIZE_FSAM (sizeof(util::xmsg::XWave::FSAM)/sizeof(double))

  The number of available sampling frequencies.
- #define XWAVE_SIZE_GSSF (sizeof(util::xmsg::XWave::GSSF)/sizeof(double))

  The number of available gyroscope sensitivity scale factors.
- #define XWAVE_SIZE_MSSF (sizeof(util::xmsg::XWave::MSSF)/sizeof(double))

  The number of available magnetometer sensitivity scale factors.

Enumerations

- enum util::xmsg::XWaveMode_t {

11.164.2 Macro Definition Documentation

11.164.2.1 XWAVE_INVALID_SF

```
#define XWAVE_INVALID_SF DBL_MAX
```

The default/invalid sensitivity scale factor value for wave data.

11.164.2.2 XWAVE_SIZE_ASSF_RAW

```
#define XWAVE_SIZE_ASSF_RAW (sizeof(util::xmsg::XWave::ASSF_RAW)/sizeof(double))
```

The number of available accelerometer sensitivity scale factors for raw data.

11.164.2.3 XWAVE_SIZE_ASSF_SPECTRAL

```
#define XWAVE_SIZE_ASSF_SPECTRAL (sizeof(util::xmsg::XWave::ASSF_SPECTRAL)/sizeof(double))
```

The number of available accelerometer sensitivity scale factors for spectral.

11.164.2.4 XWAVE_SIZE_FSAM

```
#define XWAVE_SIZE_FSAM (sizeof(util::xmsg::XWave::FSAM)/sizeof(double))
```

The number of available sampling frequencies.

11.164.2.5 XWAVE_SIZE_GSSF

```
#define XWAVE_SIZE_GSSF (sizeof(util::xmsg::XWave::GSSF)/sizeof(double))
```

The number of available gyroscope sensitivity scale factors.

11.164.2.6 XWAVE_SIZE_MSSF

```
#define XWAVE_SIZE_MSSF (sizeof(util::xmsg::XWave::MSSF)/sizeof(double))
```

The number of available magnetometer sensitivity scale factors.

11.166.1 Detailed Description

The main() function source file.

This file contains the main program entry point, main(), which defines the functional operation of the daemon thread. This thread is responsible for for performing the application initialization, instantiating and terminating the worker threads, maintaining the run-time lock, and finally invoking the exit handler.

11.166.2 Function Documentation

11.166.2.1 Initialize()

```
const util::config::LocalConfiguration & Initialize (
            int argc,
            char ** argv)
```

Initialize the application.

All startup initialization of the application is performed by this function. First, the local configuration initialization is invoked, which parses the configuration file and/or the command-line arguments and also acquires a run-time lock. Then the global logger is initialized, setting the sources, sinks, formats, and filters of the global logger. Next, the signal handlers are registered, defining the behavior of the application if a catchable signal is encountered from the system. Finally, requisite data and metadata is loaded from files on the local file system and from the SQL database.

Parameters

in	*argc*	The number of command-line arguments.
in	*argv*	The command-line argument list.

Exceptions

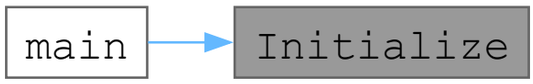
None.	Never throws.

Returns

The local configuration object.

Referenced by main().

Here is the caller graph for this function:



11.166.2.2 main()

```
int main (
            int argc,
            char ** argv)
```

The main program (daemon thread) entry point.

The operation of the daemon thread of the application is completely contained within this function. First, the program is initialized by calling Initialize() which parses the configuration options, acquires the run-time lock, sets up the global logger object, registers the signal handlers, and finally loads requisite data from both files on the local filesystem and the database. Then, the runtime lock will be checked and the thread will sleep for XFLT_THREAD_SLEEP_MS milliseconds. If the application is configured to run as a daemon, then the last step will be repeated indefinitely until a termination signal is received. Finally, the exit handler, util::sig::SignalHandler::ExitHandler(), is invoked to terminate the worker threads, save the locally cached data to the database, release the run-time lock, and flush the global logger.

Note

If, at any time during execution after initialization, a catchable signal is received, the execution of the daemon thread will be interrupted and the exit handler function util::sig::SignalHandler::ExitHandler() will be invoked. The exit handler terminates the worker threads, saves the locally cached data to the database, releases the run-time lock, and flushes the global logger.

Parameters

in	*argc*	The number of command-line arguments.
in	*argv*	The command-line argument list.

Exceptions

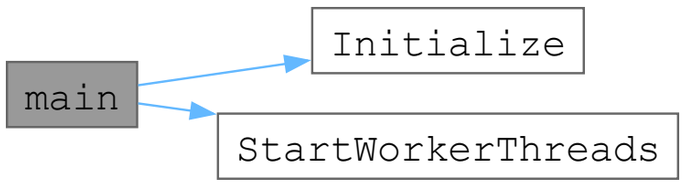
util::log::MessageException	if application initialization fails.

Returns

EXIT_SUCCESS on successful completion or non-zero value on failure.

References CATCH_NOTHROW, Initialize(), StartWorkerThreads(), XFLT_DAEMON_FLUSH_LOG_SEC, and XFLT_THREAD_SLEEP_MS.

Here is the call graph for this function:



11.166.2.3 StartWorkerThreads()

```
void StartWorkerThreads ()
```

Start worker threads.

A call to this function will instantiate all worker threads that comprise the pipeline of the application: (1) the mail retrieval thread, (2) the mail processing thread(s), and (3) the telemetry decoder threads.

Exceptions

None.	Never throws.

References CATCH_BLOCK, linf, and lout.

Referenced by main().

Here is the caller graph for this function:

11.166.2.4 TerminateWorkerThreads()

```
void TerminateWorkerThreads ()
```

Terminate the worker threads.

A call to this function will perform and orderly shutdown of the the worker threads. The threads will be shutdown in order of the pipeline of the application. Each thread or thread group will be allowed to complete its current task(s) before the shutdown occurs, and before shutting down the next stage of the threads in the pipeline. This way, all the data that is in the pipeline when the shutdown is invoked will be processes before the application terminates.

Warning

This function will block until all threads are shut down. If any of the worker threads hang, then this function may block indefinitely.

Exceptions

None.	Never throws.

References CATCH_BLOCK, linf, and lout.

Referenced by util::sig::SignalHandler::ExitHandler().

Here is the caller graph for this function:

11.167 Main.h File Reference

11.169.1 Detailed Description

The argo::iridium::xfloat::XFloatMailRetrievalService class source file.

This is the source file for the argo::iridium::xfloat::XFloatMailRetrievalService class, which defines the operation of the mail retrieval thread. This thread is the first stage in the processing pipeline and is is responsible for fetching email messages for the mail server and/or SQL database, and queuing them for consumption by the next stage in the processing pipeline, argo::iridium::xfloat::XFloatMailProcessingService.

The file contains the static member variables declared in the argo::iridium::xfloat::XFloatMailRetrievalService class. These include credentials and details needed for connecting to the mail server, which are set as a result of parsing the command-line and/or configuration file options during initialization.

11.172.1 Detailed Description

The argo::iridium::xfloat::XFloatMailProcessingService class source file.

This is the source file for the argo::iridium::xfloat::XFloatMailProcessingService class. This class defines the operation of the mail processing thread(s), which are the second stage in the processing pipeline. The mail processing thread consumes messages that were fetched from the mail server in the previous stage of the processing pipeline, the mail retrieval thread, argo::iridium::xfloat::XFloatMailRetrievalService. The messages are validated, saved to the SQL database, queued for consumption in the next stage of the processing pipeline, the telemetry decoder thread, argo::iridium::xfloat::XFloatTelemetryDecoderService, and their file representations are written to the local file system.

This file contains the static data members of the argo::iridium::xfloat::XFloatMailProcessingService class.

11.173.1 Detailed Description

The argo::iridium::xfloat::XFloatMailProcessingService class header file.

This is the header file for the argo::iridium::xfloat::XFloatMailProcessingService class. This class defines the operation of the mail processing thread(s), which are the second stage in the processing pipeline. The mail processing thread(s) consume messages that were fetched from the mail server in the previous stage of the processing pipeline, the mail retrieval thread, argo::iridium::xfloat::XFloatMailRetrievalService. The messages are validated, saved to the SQL database, queued for consumption in the next stage of the processing pipeline, the telemetry decoder thread, argo::iridium::xfloat::XFloatTelemetryDecoderService, and their file representations are written to the local file system.

This file contains the class definition and the majority of the functionality of the class.

00052  *  from the mail server in the previous stage of the processing pipeline, @ref
00053  *  XFloatMailRetrievalService. The messages are validated, saved to the SQL database, queued for
00054  *  consumption in the next stage of the processing pipeline, the telemetry decoder thread(s),
00055  *  @ref XFloatTelemetryDecoderService, and finally their file representations are written to the
00056  *  local file system.
00057  *
00058  *  Zero or more instance of this thread may be instantiated after application initialization,
00059  *  depending on the configuration options. Each thread enters a primary loop in which messages
00060  *  are fetched from a common queue and processed. If the incoming queue is empty, then the thread
00061  *  will sleep for intervals of @ref XFLT_THREAD_SLEEP_MS milliseconds.
00062  *
00063  *  The primary loop will  continue until the daemon thread signals termination. When termination
00064  *  is signaled, the remaining messages in the incoming queue will be processed, then all instances
```

```
00065  *  of this thread will die. This ensures that processing pipeline will be thoroughly flushed
00066  *  before application termination, and that no messages will be partially or incompletely
00067  *  processed.
00068  */

11.175.1 Detailed Description

The argo::iridium::xfloat::XFloatTelemetryDecoderService class source file.

This is the source file for the argo::iridium::xfloat::XFloatTelemetryDecoderService class. This class defines the operation of the telemetry decoder thread(s), which are the third stage in the processing pipeline. The telemetry decoder thread(s) consume mail messages that were processed by the previous stage of the processing pipeline, the mail processing thread(s), argo::iridium::xfloat::XFloatMailProcessingService. The processed mail messages are assigned to their corresponding dive data object. Then, the Iridium Short Burst Data (SBD) messages, that are supplied as attachments to the mail messages are decoded. The decoded data is contained in an instance of a class that inherits from util::xmsg::XMessage. The resultant object is also assigned to the dive data object.

This file contains the static data members of the argo::iridium::xfloat::XFloatTelemetryDecoderService class.

00305 
00306     /** Decode the telemetry data from a processed mail message.
00307      *
00308      *  This function is used to decode the binary Iridium Short Burst Data (SBD) message that is
00309      *  supplied as an attachment to the email message. Mail messages that are received from the
00310      *  previous stage in the processing pipeline, the mail processing thread(s), @ref
00311      *  XFloatMailProcessingService, are decoded using this function.
00312      *
00313      *  First, the function checks the message reference @c msg. If it is NULL, then the function
00314      *  throws an exception. Otherwise, it continues on to set the global logger attributes:
00315      *   - DiveID,
00316      *   - MsgUID,
00317      *   - PcktID,
00318      *   - MomsnID,
00319      *   - WhoiID,
00320      *   - DacID, and
00321      *   - WmoID.
00322      *
00323      *  These attributes are used by the global logger object for filtering, etc. The values of the
00324      *  attributes are assumed to be known since, if any were unknown, then the mail processing
00325      *  threads would have queried them from the SQL database.
00326      *
00327      *  Next, the float object, @c xfloat, that corresponds to the instrument that transmitted
00328      *  this message is retrieved. If the float object does not already exist, it will be created.
00329      *  Also, the metadata object for this instrument is retrieved, which contains information
00330      *  about the start-of-mission and deployment date/times. The time of flight of the message
00331      *  is examined to ensure that the message is valid. Messages that were transmitted after the
00332      *  start-of-mission or deployment date/times are discarded.
00333      *
00334      *  Then, the dive data object, @c xdive, which contains all the data received for a single
00335      *  instrument and single dive/cycle is retrieved from the float object. If the dive data
00336      *  object for this dive/cycle does not already exist, it will be created. The mail message,
00337      *  @c msg, is then assigned to the dive data object.
00338      *
00339      *  The SBD message is passed to the @ref ProcessDiveData() function to be decoded.
00340      *
00341      *  @param[in]       msg             A shared reference to the mail message to decode.

00524      *  thread(s).
00525      *
00526      *  This function defines the behavior of the telemetry decoder thread(s), which are
00527      *  responsible for decoding the binary data from the processed mail messages that are
00528      *  produced by the mail processing thread, @ref XFloatMailProcessingService. After
00529      *  initialization, zero or more instances of this thread are instantiated. The static
00530      *  configuration options for this thread are set as a result of parsing the command-line
00531      *  arguments and/or configuration file.
00532      *
00533      *  First, the scope thread attribute "ThreadName" is set to "sbd-decode". This attribute is
00534      *  used by the global logger object for filtering, etc. Then the thread enters its primary
00535      *  loop, in which it pops mail messages from the incoming queue one at a time and decodes
00536      *  the messages before passing them to the next stage in the processing pipeline, the
00537      *  post-processing analysis thread(s), @ref XFloatPostProcessingService. If the incoming
00538      *  message queue is empty, then the connection o the SQL database is closed, and the thread
00539      *  sleeps for @ref XFLT_THREAD_SLEEP_MS milliseconds.
00540      *
00541      *  Once termination is signaled by the daemon process i.e. @ref termination_signaled_ is
00542      *  TRUE, the thread will exit its primary loop and die.
00543      *
00544      *  @exception      None. Never throws.

11.178.1 Detailed Description

The argo::iridium::xfloat::XFloatPostProcessingService class source file.

This class is defines the operation of the post-processing analysis thread(s), which are the fourth stage of the processing pipeline. The post-processing analysis thread(s) are responsible for generating plots, Matlab, and NetCDF files as well as performing some analysis of the decoded telemetry fields in order to derive performance metrics of the instrument.

11.181.2 Macro Definition Documentation

11.181.2.1 XMTPS_DEBUG_FETCH_MAIL

```
#define XMTPS_DEBUG_FETCH_MAIL (false)
```

The debug-fetch-mail flag.

If TRUE, then additional debug messages will be printed during the mail fetch phase of thread operation.

11.181.2.2 XMTPS_THREAD_JOIN_SECONDS

```
#define XMTPS_THREAD_JOIN_SECONDS 120
```

The maximum duration to allow for threads to join upon termination, in seconds.

Referenced by argo::iridium::xfloat::XFloatMailRetrievalService::TerminateWorkerThread(), and argo::iridium::xfloat::XFloatPostProcessing

This graph shows which files directly or indirectly include this file:

Classes

- class util::log::Log

  The logger class.

Namespaces

- namespace util

  The utility namespace.
- namespace util::config

  The configuration utility namespace.
- namespace util::log

  The logging utility namespace.

Macros

- #define CATCH_BLOCK(msg)

  Standardized catch block for exception handling (throws exception).
- #define CATCH_NOTHROW(msg)

  Standardized catch block for exception handling (no throw).
- #define dbg1() LOG(util::log::LOG_DBG1) << __PRETTY_FUNCTION__ << ": "

  Returns an output stream for a debug trace level 1 message.
- #define dbg2() LOG(util::log::LOG_DBG2) << __PRETTY_FUNCTION__ << ": "

  Returns an output stream for a debug trace level 3 message.
- #define dbg3() LOG(util::log::LOG_DBG3) << __PRETTY_FUNCTION__ << ": "

  Returns an output stream for a debug trace level 2 message.
- #define DEFAULT_LOG_LEVEL util::log::LOG_LOG

  The default logging level to use, if none is specified in the run-time configuration.

- #define exc_catchAny(msg)

  Catch arbitrary exception (throws exception).
- #define exc_catchAny_noThrow(msg)

  Catch arbitrary exception (no throw).
- #define exc_catchStandard(e, msg)

  Catch standard exception (throws exception).
- #define exc_catchStandard_noThrow(e, msg)

  Catch standard exception (no throw).
- #define exc_diag(e) boost::diagnostic_information(e, true)

  Return a string containing diagnostic information for a given exception, e.
- #define EXC_THROW(msg) BOOST_THROW_EXCEPTION(util::log::MessageException(std::string() + msg))

  Throw an exception.
- #define ldbg() LOG(util::log::LOG_DBG)

  Returns an output stream for a debug message.
- #define lerr() LOG(util::log::LOG_ERR)

  Returns an output stream for an error message.
- #define lfat() LOG(util::log::LOG_FAT)

  Returns an output stream for a fatal error message.
- #define linf() LOG(util::log::LOG_INF)

  Returns an output stream for an info message.
- #define llog() LOG(util::log::LOG_LOG)

  Returns an output stream for a log message.
- #define LOG(level)

  Returns output stream for given log level.
- #define **LOG_INSTRUMENT_SPECIFIC** (false)
- #define **LOG_SET_SCOPED_THREAD_NAME**(NAME) BOOST_LOG_SCOPED_THREAD_ATTR("Thread↩ Name", boost::log::attributes::constant<string>(NAME));
- #define lout() LOG(util::log::LOG_LOG)

  Returns an output stream for a log message.
- #define lwrn() LOG(util::log::LOG_WRN)

  Returns an output stream for a warning message.
- #define N_LOG_LEVEL_NAMES 6

  The number of unique log level names.
- #define PP_STR(x) X_PP_STR(x)

  Returns a char of the name of a given preprocessor definition.*
- #define X_PP_STR(x) #x

  Returns a char of the value of a given preprocessor definition.*

Typedefs

- typedef blg::sources::severity_logger_mt< blg::trivial::severity_level > util::log::sev_logger_mt

  A thread-safe severity logger object type.

Enumerations

- enum util::log::LogLevel_t {
  util::log::LOG_FAT = 0 ,
  util::log::LOG_ERR = 1 ,
  util::log::LOG_WRN = 2 ,
  util::log::LOG_LOG = 3 ,

11.197.2.2 CATCH_NOTHROW

```
#define CATCH_NOTHROW(
              msg)
```

Standardized catch block for exception handling (no throw).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), argo::iridium::xfloat::XFloatDiveData::DecodeXMsgData(), argo::iridium::xfloat::XFloatMailRetrievalService::DisconnectFromMailServer(), util::sig::SignalHandler::ExitHandler(), argo::iridium::xfloat::XFloatMailRetrievalService::FetchMailMessagesFromFileSystem(), argo::iridium::xfloat::XFloatMailRetrievalService:: argo::iridium::xfloat::XFloatDiveData::GenerateListingString(), argo::iridium::xfloat::XFloatMetadata::LoadFile(), main(), argo::iridium::xfloat::XFloatMailProcessingService::operator()(), argo::iridium::xfloat::XFloatMailRetrievalService::operator()(), argo::iridium::xfloat::XFloatPostProcessingService::operator()(), argo::iridium::xfloat::XFloatTelemetryDecoderService::operator()(), argo::iridium::xfloat::XFloat::ResetCachedDiveData(), argo::iridium::xfloat::XFloat::SaveLocalCacheToDatabase(), argo::iridium::xfloat::XFloatDiveData::SaveObjectToDatabase(), util::mysql::SqlTableDescription< T >::SaveObjectToDatabase(), util::kml::KmlUtil::SetDefaultKmlStyle(), util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::Unp

11.197.2.3 dbg1

```
#define dbg1() LOG(util::log::LOG_DBG1) << __PRETTY_FUNCTION__ << ":  "
```

Returns an output stream for a debug trace level 1 message.

Referenced by util::xmsg::XWave::DecodeXMsgData(), util::thread::ThreadUtils::executeAndPipe(), argo::iridium::xfloat::XFloat::GetDiveD and argo::iridium::xfloat::XFloatMailRetrievalService::OpenMailInboxFolder().

11.197.2.4 dbg2

```
#define dbg2() LOG(util::log::LOG_DBG2) << __PRETTY_FUNCTION__ << ":  "
```

Returns an output stream for a debug trace level 3 message.

11.197.2.5 dbg3

```
#define dbg3() LOG(util::log::LOG_DBG3) << __PRETTY_FUNCTION__ << ":  "
```

Returns an output stream for a debug trace level 2 message.

11.197.2.6 DEFAULT_LOG_LEVEL

```
#define DEFAULT_LOG_LEVEL util::log::LOG_LOG
```

The default logging level to use, if none is specified in the run-time configuration.

Referenced by util::config::LocalConfiguration::ParseProgramOptions().

11.197.2.7 exc_catchAny

```
#define exc_catchAny(
              msg)
```

Value:

```
do {\
    exc_catchAny_noThrow(msg);\
    BOOST_THROW_EXCEPTION(util::log::MessageException(msg));\
} while(0)
```

Catch arbitrary exception (throws exception).

11.197.2.8 exc_catchAny_noThrow

```
#define exc_catchAny_noThrow(
                msg)
```

Value:

```
do {\
    lerr() « msg « std::endl\
        « " Caused by: " « __FILE__ « "(" « __LINE__ « "): "\
        « "Throw in " « __PRETTY_FUNCTION__;\
} while(0)
```

Catch arbitrary exception (no throw).

11.197.2.9 exc_catchStandard

```
#define exc_catchStandard(
                e,
                msg)
```

Value:

```
do {\
    BOOST_THROW_EXCEPTION(\
        util::log::MessageException(std::string(msg)+"\n\tCaused by:\n"+exc_diag(e))\
    );\
} while(0)
```

Catch standard exception (throws exception).

11.197.2.10 exc_catchStandard_noThrow

```
#define exc_catchStandard_noThrow(
                e,
                msg)
```

Value:

```
do {\
    lerr() « msg « std::endl\
        « __FILE__ « "(" « __LINE__ « "): Throw in " « __PRETTY_FUNCTION__ « std::endl\
        « "\tCaused by: " « std::endl\
        « exc_diag(e);\
} while(0)
```

Catch standard exception (no throw).

11.197.2.11 exc_diag

```
#define exc_diag(
                e) boost::diagnostic_information(e, true)
```

Return a string containing diagnostic information for a given exception, e.

Referenced by util::log::Log::Flush().

11.197.2.12 EXC_THROW

```
#define EXC_THROW(
              msg) BOOST_THROW_EXCEPTION(util::log::MessageException(std::string() + msg))
```

Throw an exception.

Referenced by argo::iridium::xfloat::XFloatDiveData::XFloatDiveData(), util::config::LocalConfiguration::AcquireRuntimeLock(), util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), util::xmsg::XCompositeSurfaceData::Aggreg util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AssignAuxTemperatureMe argo::iridium::xfloat::XFloatDiveData::AssignFallTimeSeries(), argo::iridium::xfloat::XFloatDiveData::AssignGps(), argo::iridium::xfloat::XFloatDiveData::AssignMailMessage(), util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AssignM util::xmsg::XMfaMissionCfg::AssignMessage(), argo::iridium::xfloat::XFloatDiveData::AssignParentInstrument(), util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AssignPressureMessage(argo::iridium::xfloat::XFloatDiveData::AssignPumpTimeSeries(), argo::iridium::xfloat::XFloatDiveData::AssignRiseTimeSeries(), util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AssignSalinityMessage(), util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AssignTemperatureMessa argo::iridium::xfloat::XFloatDiveData::AssignValveData(), util::config::LocalConfiguration::CheckRuntimeLock(), util::xmsg::XMessage::CheckXMsgData(), argo::iridium::xfloat::XFloatDiveData::DecodeMailMessageData(), argo::iridium::xfloat::XFloatT argo::iridium::xfloat::XFloatDiveData::DecodeXMsgData(), util::xmsg::XAlamoBit2::DecodeXMsgData(), util::xmsg::XAlamoBit::DecodeXM util::xmsg::XAlamoMissionConfiguration::DecodeXMsgData(), util::xmsg::XDriftPressure::DecodeXMsgData(), util::xmsg::XDriftSalinity::D util::xmsg::XDriftTemperature::DecodeXMsgData(), util::xmsg::XEngAscent::DecodeXMsgData(), util::xmsg::XEngBIT::DecodeXMsgData util::xmsg::XEngDescent::DecodeXMsgData(), util::xmsg::XEngDrift::DecodeXMsgData(), util::xmsg::XEngIce::DecodeXMsgData(), util::xmsg::XEngSurface::DecodeXMsgData(), util::xmsg::XFall::DecodeXMsgData(), util::xmsg::XGPS::DecodeXMsgData(), util::xmsg::XHiResPressure::DecodeXMsgData(), util::xmsg::XHiResSalinity::DecodeXMsgData(), util::xmsg::XHiResTemperature::Decod util::xmsg::XMfaMissionCfg::DecodeXMsgData(), util::xmsg::XProfilePressure::DecodeXMsgData(), util::xmsg::XProfileSalinity::DecodeXI util::xmsg::XProfileTemperature::DecodeXMsgData(), util::xmsg::XRise::DecodeXMsgData(), util::xmsg::XSurfaceData::DecodeXMsgData util::xmsg::XWave::DecodeXMsgData(), util::thread::ThreadUtils::executeAndPipe(), argo::iridium::xfloat::XFloatMailRetrievalService::Fetc argo::iridium::xfloat::XFloatMailRetrievalService::FetchMailMessagesFromServer(), util::date::DateUtils::GenerateJulianDay(), argo::iridium::xfloat::XFloatDiveData::GenerateListingString(), util::xmsg::XAlamoBit2::GenerateListingString(), util::xmsg::XAlamoBit::Ger util::xmsg::XAlamoMissionConfiguration::GenerateListingString(), util::xmsg::XEngAscent::GenerateListingString(), util::xmsg::XEngDescent::GenerateListingString(), util::xmsg::XEngDrift::GenerateListingString(), util::xmsg::XEngSurface::GenerateListin util::xmsg::XMfaMissionCfg::GenerateListingString(), util::xmsg::XWave::GenerateListingString(), util::mysql::SqlTableDescription< T >::G argo::iridium::xfloat::XFloatDiveData::GeneratePhyString(), util::mysql::MysqlUtils::GeneratePreparedStatement(), util::file::FileSystemUtils::GetDirectoryPath(), argo::iridium::xfloat::XFloatDiveData::GetDiveDataMailMessagesFromDatabase(), argo::iridium::xfloat::XFloatDiveData::GetDiveDataObjectFromDatabase(), util::xmsg::XPresCodeCounts::GetPhaseCodeName(), util::log::Log::InitializeLog(), util::file::FileSystemUtils::ListDirectories(), util::file::FileSystemUtils::ListFiles(), argo::iridium::xfloat::XFloatMet argo::iridium::xfloat::XFloatMetadata::LoadFile(), util::file::FileSystemUtils::MoveFileToDirectory(), argo::iridium::xfloat::XFloatMailMessag argo::iridium::xfloat::XFloatMailMessage::ParseMailMsg(), argo::iridium::xfloat::XFloatMailMessage::ParseMailMsgBody(), argo::iridium::xfloat::XFloatMailMessage::ParseMailMsgHeader(), argo::iridium::xfloat::XFloatMailMessage::ParseMailMsgSbdAttachmen util::config::LocalConfiguration::ParseProgramOptions(), argo::iridium::xfloat::XFloatTelemetryDecoderService::ProcessDiveData(), argo::iridium::xfloat::XFloatMailProcessingService::ProcessMailMsg(), util::sig::SignalHandler::RegisterSignalHandlers(), util::config::LocalConfiguration::ReleaseRuntimeLock(), util::mysql::SqlTableDescription< T >::SaveObjectToDatabase(), util::mysql::SqlTableDescription< T >::SelectValueFromDatabase(), util::xmsg::AbstractXFallRise::UnpackData(), util::xmsg::AbstractXSensorData::UnpackSensorData(), util::xmsg::AuxiliarySensorData::UnpackSensorData(), and argo::iridium::xfloat::XFloatMailMessage::WriteFiles().

11.197.2.13 ldbg

```
#define ldbg() LOG(util::log::LOG_DBG)
```

Returns an output stream for a debug message.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), util::xmsg::XCompositeSurfa util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AssignAuxTemperatureMe argo::iridium::xfloat::XFloatDiveData::AssignMailMessage(), util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AssignM util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AssignPressureMessage(util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AssignSalinityMessage(), util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AssignTemperatureMessa argo::iridium::xfloat::XFloatDiveData::ComputePressureOffsetFromSurfaceTimeSeries(), argo::iridium::xfloat::XFloatMailRetrievalService argo::iridium::xfloat::XFloatTelemetryDecoderService::DecodeMessage(), argo::iridium::xfloat::XFloatDiveData::DecodeXMsgData(), util::xmsg::XAlamoBit2::DecodeXMsgData(), util::xmsg::XAlamoMissionConfiguration::DecodeXMsgData(), util::xmsg::XGPS::DecodeXM util::xmsg::XMfaMissionCfg::DecodeXMsgData(), util::xmsg::XWave::DecodeXMsgData(), argo::iridium::xfloat::XFloatMailRetrievalService argo::iridium::xfloat::XFloatMailRetrievalService::FetchMailMessagesFromFileSystem(), argo::iridium::xfloat::XFloatMailRetrievalService:: argo::iridium::xfloat::XFloatDiveData::GenerateCompositeFallTimeSeriesData(), argo::iridium::xfloat::XFloatDiveData::GenerateComposit argo::iridium::xfloat::XFloatDiveData::GenerateCompositePumpTimeSeriesData(), argo::iridium::xfloat::XFloatDiveData::GenerateCompo util::file::FileSystemUtils::GetDirectoryPath(), argo::iridium::xfloat::XFloat::GetDiveData(), util::xmsg::AbstractXSensorDataComposite< P argo::iridium::xfloat::XFloatMetadata::LoadFile(), argo::iridium::xfloat::XFloatMailProcessingService::operator()(), argo::iridium::xfloat::XFloatMailRetrievalService::operator()(), argo::iridium::xfloat::XFloatPostProcessingService::operator()(), argo::iridium::xfloat::XFloatTelemetryDecoderService::operator()(), argo::iridium::xfloat::XFloatTelemetryDecoderService::ProcessDiveDa

11.197.2.14 lerr

```
#define lerr() LOG(util::log::LOG_ERR)
```

Returns an output stream for an error message.

Referenced by util::xmsg::XWave::DecodeXMsgData().

11.197.2.15 lfat

```
#define lfat() LOG(util::log::LOG_FAT)
```

Returns an output stream for a fatal error message.

11.197.2.16 linf

```
#define linf() LOG(util::log::LOG_INF)
```

Returns an output stream for an info message.

Referenced by argo::iridium::xfloat::XFloatDiveData::DecodeXMsgData(), argo::iridium::xfloat::XFloat::LoadLocalCacheFromDatabase(), argo::iridium::xfloat::XFloat::LoadMetadataFromFiles(), argo::iridium::xfloat::XFloatMailRetrievalService::operator()(), argo::iridium::xfloat::XFloatMailProcessingService::ProcessMailMsg(), util::sig::SignalHandler::RegisterSignalHandlers(), util::config::LocalConfiguration::ReleaseRuntimeLock(), argo::iridium::xfloat::XFloat::SaveLocalCacheToDatabase(), StartWorkerThreads(), TerminateWorkerThreads(), argo::iridium::xfloat::XFloat::WriteKmlFile(), argo::iridium::xfloat::XFloat::WriteKmlMas argo::iridium::xfloat::XFloatDiveData::WriteListingFile(), argo::iridium::xfloat::XFloatDiveData::WritePhyFile(), argo::iridium::xfloat::XFloatM argo::iridium::xfloat::XFloatMailMessage::WriteSbdFile(), and argo::iridium::xfloat::XFloat::WriteStatusFile().

11.197.2.17 llog

```
#define llog() LOG(util::log::LOG_LOG)
```

Returns an output stream for a log message.

11.197.2.18 LOG

```
#define LOG(
              level)
```

Value:

```
if (level > util::log::Log::log_reporting_level()) { /* Do nothing. */ }\
else util::log::Log(level)
```

Returns output stream for given log level.

11.197.2.19 lout

```
#define lout() LOG(util::log::LOG_LOG)
```

Returns an output stream for a log message.

Referenced by util::sig::SignalHandler::ExitHandler(), argo::iridium::xfloat::XFloatMailRetrievalService::FetchMailMessagesFromServer(), argo::iridium::xfloat::XFloat::LoadLocalCacheFromDatabase(), argo::iridium::xfloat::XFloat::LoadMetadataFromFiles(), argo::iridium::xfloat::XFloatMailRetrievalService::operator()(), argo::iridium::xfloat::XFloatTelemetryDecoderService::ProcessDiveData(), util::sig::SignalHandler::RegisterSignalHandlers(), util::config::LocalConfiguration::ReleaseRuntimeLock(), argo::iridium::xfloat::XFloat::Sa argo::iridium::xfloat::XFloat::StartupTasks(), StartWorkerThreads(), and TerminateWorkerThreads().

11.197.2.20 lwrn

```
#define lwrn() LOG(util::log::LOG_WRN)
```

Returns an output stream for a warning message.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), util::xmsg::XCompositeSurfa
util::xmsg::XMessage::CheckXMsgData(), argo::iridium::xfloat::XFloatDiveData::ComputePressureOffsetFromSurfaceTimeSeries(),

and util::xmsg::AbstractXSensorData::UnpackSensorData().

11.197.2.21 N_LOG_LEVEL_NAMES

```
#define N_LOG_LEVEL_NAMES 6
```

The number of unique log level names.

Deprecated Log names are no long used.

11.197.2.22 PP_STR

```
#define PP_STR(
              x) X_PP_STR(x)
```

Returns a char* of the name of a given preprocessor definition.

11.197.2.23 X_PP_STR

```
#define X_PP_STR(
              x) #x
```

Returns a char* of the value of a given preprocessor definition.

11.209.2 Macro Definition Documentation

11.209.2.1 UTIL_POS_INVALID_LAT

```
#define UTIL_POS_INVALID_LAT 99.99999
```

Default/fill value for invalid position latitude.

Referenced by util::xmsg::XGPS::DecodeXMsgData().

11.209.2.2 UTIL_POS_INVALID_LON

```
#define UTIL_POS_INVALID_LON 999.99999
```

Default/fill value for invalid position longitude.

Referenced by util::xmsg::XGPS::DecodeXMsgData().

11.209.2.3 UTIL_POS_INVALID_STDERR

```
#define UTIL_POS_INVALID_STDERR 9999.99
```

Default/fill value for invalid position standard error.

11.209.2.4 UTIL_POS_INVALID_VAR

```
#define UTIL_POS_INVALID_VAR 99.99
```

Default/fill value for invalid position variance.

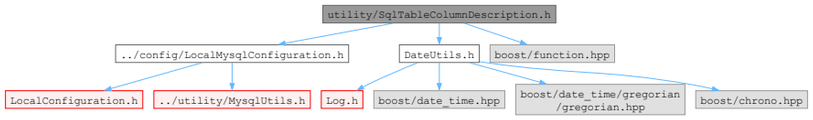
11.215 utility/SqlTableColumnDescription.h File Reference

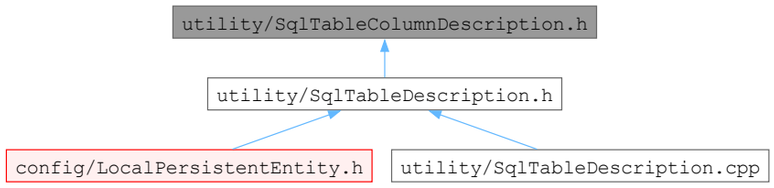
The util::mysql::SqlTableColumnDescription class header file.

```
#include "../config/LocalMysqlConfiguration.h"
#include "DateUtils.h"
#include <boost/function.hpp>
```

Include dependency graph for SqlTableColumnDescription.h:



This graph shows which files directly or indirectly include this file:



Classes

- class util::mysql::Column_bool< C >
  Template column description class for value of type bool.
- class util::mysql::Column_char< C >
  Template column description class for value of type double.
- class util::mysql::Column_double< C >
  Template column description class for value of type double.
- class util::mysql::Column_filesystem_path< C >
  Template column description class for value of type path.
- class util::mysql::Column_float< C >
  Template column description class for value of type float.
- class util::mysql::Column_int< C >
  Template column description class for value of type int.
- class util::mysql::Column_int16_t< C >
  Template column description class for value of type int16_t.
- class util::mysql::Column_long< C >
  Template column description class for value of type long.
- class util::mysql::Column_posix_time< C >
  Template column description class for value of type boost::posix_time::ptime.
- class util::mysql::Column_string< C >
  Template column description class for value of type string.
- class util::mysql::Column_uint16_t< C >
  Template column description class for value of type uint16_t.
- class util::mysql::Column_uint8_t< C >
  Template column description class for value of type uint8_t.
- class util::mysql::Column_vector_uint8_t< C >

Template column description class for value of type vector<uint8_t>.

- class util::mysql::SqlTableColumnDescription< C, T >

  The `SqlTableColumnDescription` class is a template class used to describe an SQL table column for class `C` and data member of type `T`.

- class util::mysql::SqlTableColumnDescriptionBase

  An abstract base class for the description of an SQL database table column.

Namespaces

- namespace util

  The utility namespace.

- namespace util::mysql

  The MySQL utility namespace.

Macros

- #define sql_ci16(T, ...) std::make_shared<util::mysql::Column_int16_t<T> >(__VA_ARGS__)

  Macro definition of SQL table column of type int16_t.

- #define sql_colb(T, ...) std::make_shared<util::mysql::Column_bool<T> >(__VA_ARGS__)

  Macro definition of SQL table column of type bool.

- #define sql_cold(T, ...) std::make_shared<util::mysql::Column_double<T> >(__VA_ARGS__)

  Macro definition of SQL table column of type double.

- #define sql_colf(T, ...) std::make_shared<util::mysql::Column_float<T> >(__VA_ARGS__)

  Macro definition of SQL table column of type float.

- #define sql_coli(T, ...) std::make_shared<util::mysql::Column_int<T> >(__VA_ARGS__)

  Macro definition of SQL table column of type int.

- #define sql_coll(T, ...) std::make_shared<util::mysql::Column_long<T> >(__VA_ARGS__)

  Macro definition of SQL table column of type long.

- #define sql_colp(T, ...) std::make_shared<util::mysql::Column_filesystem_path<T> >(__VA_ARGS__)

  Macro definition of SQL table column of type boost::filesystem::path.

- #define sql_cols(T, ...) std::make_shared<util::mysql::Column_string<T> >(__VA_ARGS__)

  Macro definition of SQL table column of type string.

- #define sql_colt(T, ...) std::make_shared<util::mysql::Column_posix_time<T> >(__VA_ARGS__)

  Macro definition of SQL table column of type boost::posix_time::ptime.

- #define sql_colv(T, ...) std::make_shared<util::mysql::Column_vector_uint8_t<T> >(__VA_ARGS__)

  Macro definition of SQL table column of type vector<uint8_t>.

- #define sql_cou8(T, ...) std::make_shared<util::mysql::Column_uint8_t<T> >(__VA_ARGS__)

  Macro definition of SQL table column of type uint8_t.

- #define sql_cu16(T, ...) std::make_shared<util::mysql::Column_uint16_t<T> >(__VA_ARGS__)

  Macro definition of SQL table column of type uint16_t.

Enumerations

- enum util::mysql::ColumDataType_t {
  COLUMN_DATA_TYPE_UNKOWN ,
  COLUMN_DATA_TYPE_BOOL ,
  COLUMN_DATA_TYPE_CHAR ,
  COLUMN_DATA_TYPE_DOUBLE ,
  COLUMN_DATA_TYPE_FILESYSTEM_PATH ,
  COLUMN_DATA_TYPE_FLOAT ,
  COLUMN_DATA_TYPE_INT ,
  COLUMN_DATA_TYPE_INT16_T ,
  COLUMN_DATA_TYPE_LONG ,
  COLUMN_DATA_TYPE_POSIX_TIME ,
  COLUMN_DATA_TYPE_STRING ,
  COLUMN_DATA_TYPE_TEST ,
  COLUMN_DATA_TYPE_UINT16_T ,
  COLUMN_DATA_TYPE_UINT8_T ,
  COLUMN_DATA_TYPE_VECTOR_UINT8_T }

  The ColumnDescription class is used to describe the attributes of a particular SQL table column including its name, type, and whether or not the column is part of the primary key for the SQL table.

11.215.1 Detailed Description

The util::mysql::SqlTableColumnDescription class header file.
