uint16_t argo::iridium::xfloat::XFloat::offset_temperature_surface () const  [inline]
```

Get the temperature offset value for surface data, in degC.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The temperature offset value for this instrument, in degC.

References util::thread::RecursiveLockable::mutex_, and offset_temperature_surface_.

10.86.3.69 phy_file_generation_is_enabled()

```
bool argo::iridium::xfloat::XFloat::phy_file_generation_is_enabled () const  [inline]
```

Is PHY file generation enabled?

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

TRUE if PHY file generation is enabled, or FALSE otherwise.

References util::thread::RecursiveLockable::mutex_, and phy_file_generation_is_enabled_.

10.86.3.70 ResetCachedDiveData()

```
void argo::iridium::xfloat::XFloat::ResetCachedDiveData (
            int dive)
```

Reset the dive data object for the given dive or cycle number.

This function releases the shared reference to the dive data object. It is called by the telemetry decoder thread once it determines that the dive data object is complete and no longer needed. Once all the shared references to the dive data object are released, then the object will be purged from memory.

Exceptions

None.	Never throws.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Parameters

in	*dive*	The dive or cycle number of the dive data object to reset.

References CATCH_NOTHROW.

10.86.3.71 ResetDiveData()

```
void argo::iridium::xfloat::XFloat::ResetDiveData ()
```

Reset the dive data objects for this float.

References CATCH_BLOCK.

10.86.3.72 SaveLocalCacheToDatabase()

```
void argo::iridium::xfloat::XFloat::SaveLocalCacheToDatabase ()  [static]
```

Save the local cache of X-Float objects to the database.

Exceptions

util::log::MessageException	if an error occurs.

References CATCH_NOTHROW, linf, and lout.

10.86.3.73 SaveObjectToDatabase()

```
void argo::iridium::xfloat::XFloat::SaveObjectToDatabase () const  [private], [virtual]
```

Save this float object to the database.

This function is used to persist the float object to the SQL database. If the float object has a non-NULL reference to a metadata object, then the metadata object will be persisted to the database as well.

Exceptions

util::log::MessageException	if an error occurs while saving this float object or its metadata object to the database.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Implements util::mysql::LocalPersistentEntity.

References CATCH_BLOCK, and ldbg.

10.86.3.74 SelectAllObjectsFromDatabase()

```
vector< shared_ptr< XFloat > > argo::iridium::xfloat::XFloat::SelectAllObjectsFromDatabase (
            const string & groupBy = "",
            const string & orderBy = "",
            const unsigned int & limit = 0,
            const unsigned int & offset = 0)  [static]
```

Select all XFloat objects from this SQL database table.

Parameters

in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Exceptions

util::log::MessageException	if an error occurs while querying the database.

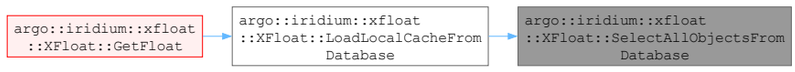
Returns

A vector of shared pointers to the object selected from the database.

References CATCH_BLOCK.

Referenced by LoadLocalCacheFromDatabase().

Here is the caller graph for this function:



10.86.3.75 SelectObjectFromDatabase()

```
shared_ptr< XFloat > argo::iridium::xfloat::XFloat::SelectObjectFromDatabase (
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            const unsigned int & offset = 0)  [static]
```

Get a single XFloat object from the database.

Parameters

in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*offset*	The SQL select statement result set row offset.

Exceptions

util::log::MessageException	if an error occurs while querying the database.

Returns

A shared pointer to the object selected from the database.

References CATCH_BLOCK.

10.86.3.76 SelectObjectsFromDatabase()

```
vector< shared_ptr< XFloat > > argo::iridium::xfloat::XFloat::SelectObjectsFromDatabase (
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            const unsigned int & limit = 0,
            const unsigned int & offset = 0)  [static]
```

Query float objects from the SQL database.

This function is used to query the SQL database table corresponding to the float class and construct a vector of float objects, populated from the results of the SQL query.

Exceptions

util::log::MessageException	if an error occurs while querying the database. or constructing the float objects from the result of the query.

Parameters

in	*where*	The SQL select statement "where-condition" clause.
in	*groupBy*	The SQL select statement "group-by expression" clause.
in	*orderBy*	The SQL select statement "order-by expression" clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset value.

Returns

A vector of shared references to the float objects constructed from the results of the SQL query.

References CATCH_BLOCK.

10.86.3.77 SelectValueFromDatabase()

```
template<typename TT >
template uint8_t argo::iridium::xfloat::XFloat::SelectValueFromDatabase< uint8_t > (
            const string & what,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            const unsigned int & offset = 0)  [static]
```

Select a value from the SQL database table that contains the persisted float objects.

This function may be used to select a singular value from the table that comprises the persisted float objects. For example, if an identifier is unknown, it is unnecessary to query the database to construct and entire float object to recover the identifier. Rather, this function may be used to recover the identifier without constructing a new object in the process.

Exceptions

util::log::MessageException	if the SQL database query fails or if an error occurs while attempting to interpret the result of the query.

Note

The result set of this query is always limited to a single result. That is, the result set row limit value is automatically set to one. If more than one row in the database table satisfy the "where condition" clause of the select statement, then only the value of the first result will be returned.

Parameters

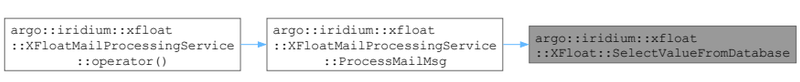
in	*what*	The SQL select statement "what" clause. This clause may only contain a singular result e.g. the name of the SQL database table column of interest.
in	*where*	The SQL select statement "where condition" clause.
in	*groupBy*	The SQL select statement "group-by expression" clause.
in	*orderBy*	The SQL select statement "order-by expression" clause.
in	*offset*	The SQL select statement result set row offset value.

Returns

The selected value from the SQL database table.

Referenced by argo::iridium::xfloat::XFloatMailProcessingService::ProcessMailMsg().

Here is the caller graph for this function:



10.86.3.78 set_argo_instrument_type()

```
void argo::iridium::xfloat::XFloat::set_argo_instrument_type (
            uint8_t argo_instrument_type)  [inline], [private]
```

Set the enumerated Argo instrument type identifier.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Parameters

in	*argo_instrument_type*	The enumerated Argo instrument type identifier to set.

References argo_instrument_type(), argo_instrument_type_, and util::thread::RecursiveLockable::mutex_.

Here is the call graph for this function:

10.86.3.79 set_fw_version()

```
void argo::iridium::xfloat::XFloat::set_fw_version (
            uint32_t fw_version)  [inline], [private]
```

Set the instrument firmware version.

Note

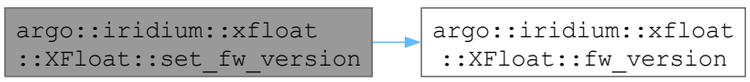
This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Parameters

in	*fw_version*	The firmware version

References fw_version(), fw_version_, and util::thread::RecursiveLockable::mutex_.

Here is the call graph for this function:



10.86.3.80 set_gain_pressure()

```
void argo::iridium::xfloat::XFloat::set_gain_pressure (
            uint16_t gain)  [inline], [private]
```

Set the instrument pressure gain value, in dBar/LSB.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Parameters

in	*gain*	The instrument pressure gain value to set, in dBar/LSB.

References gain_pressure_, and util::thread::RecursiveLockable::mutex_.

10.86.3.81 set_gain_pressure_surface()

```
void argo::iridium::xfloat::XFloat::set_gain_pressure_surface (
            uint16_t gain)  [inline], [private]
```

Set the instrument pressure gain value for surface data, in dBar/LSB.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Parameters

in	*gain*	The instrument pressure gain value to set, in dBar/LSB.

References gain_pressure_surface_, and util::thread::RecursiveLockable::mutex_.

10.86.3.82 set_gain_salinity()

```
void argo::iridium::xfloat::XFloat::set_gain_salinity (
            uint16_t gain)  [inline], [private]
```

Set the instrument salinity gain value, in PSU/LSB.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Parameters

in	*gain*	The instrument salinity gain value to set, in PSU/LSB.

References gain_salinity_, and util::thread::RecursiveLockable::mutex_.

10.86.3.83 set_gain_salinity_surface()

```
void argo::iridium::xfloat::XFloat::set_gain_salinity_surface (
            uint16_t gain)  [inline], [private]
```

Set the instrument salinity gain value for surface data, in PSU/LSB.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Parameters

in	*gain*	The instrument salinity gain value to set, in PSU/LSB.

References gain_salinity_surface_, and util::thread::RecursiveLockable::mutex_.

10.86.3.84 set_gain_temperature()

```
void argo::iridium::xfloat::XFloat::set_gain_temperature (
            uint16_t gain)  [inline], [private]
```

Set the instrument temperature gain value, in degC/LSB.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Parameters

in	*gain*	The instrument temperature gain value to set, in degC/LSB.

References gain_temperature_, and util::thread::RecursiveLockable::mutex_.

10.86.3.85 set_gain_temperature_surface()

```
void argo::iridium::xfloat::XFloat::set_gain_temperature_surface (
            uint16_t gain)  [inline], [private]
```

Set the instrument temperature gain value for surface data, in degC/LSB.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Parameters

in	*gain*	The instrument temperature gain value to set, in degC/LSB.

References gain_temperature_surface_, and util::thread::RecursiveLockable::mutex_.

10.86.3.86 set_id_dac()

```
void argo::iridium::Iridium::set_id_dac (
            int id_dac)  [inline], [protected], [inherited]
```

Set the unique Data Assembly Center (DAC) identifier.

Parameters

in	*id_dac*	The unique Data Assembly Center (DAC) identifier.

References argo::iridium::Iridium::id_dac(), argo::iridium::Iridium::id_dac_, and util::thread::RecursiveLockable::mutex_.

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignParentInstrument(), and set_metadata().

10.86.3.91 set_offset_pressure()

```
void argo::iridium::xfloat::XFloat::set_offset_pressure (
            uint16_t offs)  [inline], [private]
```

Set the instrument pressure offset value, in dBar.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Parameters

in	*offs*	The instrument pressure offset value to set, in dBar.

References util::thread::RecursiveLockable::mutex_, and offset_pressure_.

10.86.3.92 set_offset_pressure_surface()

```
void argo::iridium::xfloat::XFloat::set_offset_pressure_surface (
            uint16_t offs)  [inline], [private]
```

Set the instrument pressure offset value for surface data, in dBar.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Parameters

in	*offs*	The instrument pressure offset value to set, in dBar.

References util::thread::RecursiveLockable::mutex_, and offset_pressure_surface_.

10.86.3.93 set_offset_salinity()

```
void argo::iridium::xfloat::XFloat::set_offset_salinity (
            uint16_t offs)  [inline], [private]
```

Set the instrument salinity offset value, in PSU.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Parameters

in	*offs*	The instrument salinity offset value to set, in PSU.

References util::thread::RecursiveLockable::mutex_, and offset_salinity_.

10.86.3.94 set_offset_salinity_surface()

```
void argo::iridium::xfloat::XFloat::set_offset_salinity_surface (
            uint16_t offs)  [inline], [private]
```

Set the instrument salinity offset value for surface data, in PSU.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Parameters

in	*offs*	The instrument salinity offset value to set, in PSU.

References util::thread::RecursiveLockable::mutex_, and offset_salinity_surface_.

10.86.3.95 set_offset_temperature()

```
void argo::iridium::xfloat::XFloat::set_offset_temperature (
            uint16_t offs)  [inline], [private]
```

Set the instrument temperature offset value, in degC.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Parameters

in	*offs*	The instrument temperature offset value to set, in degC.

References util::thread::RecursiveLockable::mutex_, and offset_temperature_.

10.86.3.96 set_offset_temperature_surface()

```
void argo::iridium::xfloat::XFloat::set_offset_temperature_surface (
            uint16_t offs)  [inline], [private]
```

Set the instrument temperature offset value for surface data, in degC.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Parameters

in	*offs*	The instrument temperature offset value to set, in degC.

References util::thread::RecursiveLockable::mutex_, and offset_temperature_surface_.

10.86.3.97 set_phy_file_generation_is_enabled()

```
void argo::iridium::xfloat::XFloat::set_phy_file_generation_is_enabled (
            bool is_enabled)  [inline], [private]
```

Set the PHY-file-generation-is-enabled flag.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Parameters

in	*is_enabled*	The PHY-file-generation-is-enabled flag to set.

References util::thread::RecursiveLockable::mutex_, and phy_file_generation_is_enabled_.

10.86.3.98 set_start_of_mission_datetime()

```
void argo::iridium::xfloat::XFloat::set_start_of_mission_datetime (
            const ptime & datetime)  [inline], [private]
```

Set the date/time of the start-of-mission for this instrument.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Parameters

in	*datetime*	The date/time of the start-of-mission for this instrument to set.

References util::thread::RecursiveLockable::mutex_, and start_of_mission_datetime_.

10.86.3.99 set_xmsg_version_major()

```
void argo::iridium::xfloat::XFloat::set_xmsg_version_major (
            uint8_t xmsg_version_major)  [inline], [private]
```

Set the X-Message major version number.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Parameters

in	*xmsg_version_major*	The X-Message major version number to set.

References util::thread::RecursiveLockable::mutex_, xmsg_version_major(), and xmsg_version_major_.

Here is the call graph for this function:

10.86.3.100 set_xmsg_version_minor()

```
void argo::iridium::xfloat::XFloat::set_xmsg_version_minor (
            uint8_t xmsg_version_minor)  [inline], [private]
```

Set the X-Message minor version number.

Note

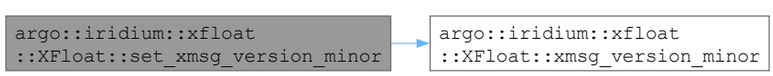
This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Parameters

in	*xmsg_version_minor*	The X-Message minor version number to set.

References util::thread::RecursiveLockable::mutex_, xmsg_version_minor(), and xmsg_version_minor_.

Here is the call graph for this function:



10.86.3.101 SetAllDefaultKmlSyles()

```
static void util::kml::KmlUtil::SetAllDefaultKmlSyles (
            const DocumentPtr & document)  [inline], [static], [inherited]
```

Add the default styles for every palette colour to a KML document.

Parameters

in	*document*	The KML document to add the styles to.

Exceptions

util::log::MessageException	if an error occurs.

References CATCH_BLOCK, and util::kml::KmlUtil::SetDefaultKmlStyle().

Referenced by GenerateKmlMasterDocument().

10.86.3.103 start_of_mission_datetime()

```
ptime argo::iridium::xfloat::XFloat::start_of_mission_datetime () const  [inline]
```

Get the date/time of the start-of-mission for this instrument.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The date/time of the start-of-mission for this instrument.

References util::thread::RecursiveLockable::mutex_, and start_of_mission_datetime_.

10.86.3.104 StartupTasks()

```
void argo::iridium::xfloat::XFloat::StartupTasks ()  [static]
```

Perform XFloat startup tasks.

If the user has specified that PHY file generation should be enabled or disabled for one or more floats, then PHY file generation flag will be updated by this function.

References CATCH_BLOCK, and Iout.

10.86.3.105 UnlockObject()

```
void util::thread::RecursiveLockable::UnlockObject ()  [inline], [inherited]
```

Unlock the object.

Exceptions

util::log::MessageException	if an error occurs.

References CATCH_BLOCK, and util::thread::RecursiveLockable::mutex_.

10.86.3.106 WriteKmlFile()

```
bool argo::iridium::xfloat::XFloat::WriteKmlFile ()  [private]
```

Write the Google Earth KML file for this float.

Returns

TRUE if the file was written, or FALSE if KML file generation is disabled or the KML file is already up-to-date.

References CATCH_BLOCK, and linf.

10.86.3.107 WriteKmlMasterFile()

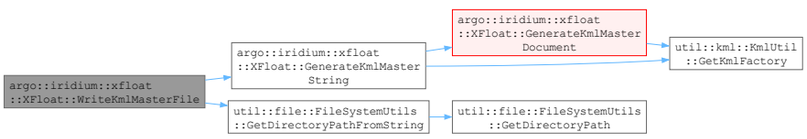
```
void argo::iridium::xfloat::XFloat::WriteKmlMasterFile ()  [static], [private]
```

Write the KML master file.

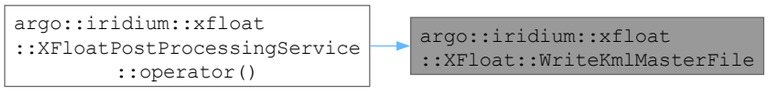
References CATCH_BLOCK, GenerateKmlMasterString(), util::file::FileSystemUtils::GetDirectoryPathFromString(), kml_directory_path_, kml_file_generation_is_enabled_, and linf.

Referenced by argo::iridium::xfloat::XFloatPostProcessingService::operator()().

Here is the call graph for this function:



Here is the caller graph for this function:



10.86.3.108 WriteStatusFile()

```
void argo::iridium::xfloat::XFloat::WriteStatusFile ()  [private]
```

Write the status file for this float.

References CATCH_BLOCK, and linf.

10.86.3.109 xmsg_version_major()

```
uint8_t argo::iridium::xfloat::XFloat::xmsg_version_major () const  [inline]
```

Get the X-Message major version identifier for this instrument.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

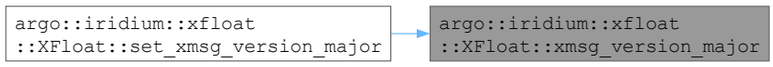
Returns

The X-Message major version identifier for this instrument.

References util::thread::RecursiveLockable::mutex_, and xmsg_version_major_.

Referenced by set_xmsg_version_major().

Here is the caller graph for this function:



10.86.3.110 xmsg_version_minor()

```
uint8_t argo::iridium::xfloat::XFloat::xmsg_version_minor () const  [inline]
```

Get the X-Message minor version identifier for this instrument.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

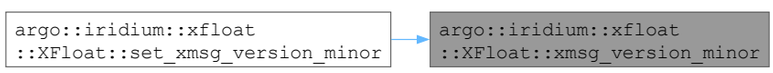
Returns

The X-Message minor version identifier for this instrument.

References util::thread::RecursiveLockable::mutex_, and xmsg_version_minor_.

Referenced by set_xmsg_version_minor().

Here is the caller graph for this function:



10.86.4 Friends And Related Symbol Documentation

10.86.4.1 Initialize

```
const util::config::LocalConfiguration & Initialize (
            int argc,
            char ** argv)  [friend]
```

Initialize the application.

All startup initialization of the application is performed by this function. First, the local configuration initialization is invoked, which parses the configuration file and/or the command-line arguments and also acquires a run-time lock. Then the global logger is initialized, setting the sources, sinks, formats, and filters of the global logger. Next, the signal handlers are registered, defining the behavior of the application if a catchable signal is encountered from the system. Finally, requisite data and metadata is loaded from files on the local file system and from the SQL database.

Parameters

in	*argc*	The number of command-line arguments.
in	*argv*	The command-line argument list.

Exceptions

None.	Never throws.

Returns

The local configuration object.

10.86.4.2 util::config::LocalConfiguration::GenerateCommandLineOptionsDescription

```
options_description util::config::LocalConfiguration::GenerateCommandLineOptionsDescription ()
[friend]
```

Friend function for populating some of the static members of this class from the command-line options.

10.86.4.3 util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription

```
options_description util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription
() [friend]
```

Friend function for populating some of the static members of this class from the configuration file options.

10.86.5 Member Data Documentation

10.86.5.1 address_

```
std::string util::mysql::LocalMysqlConfiguration::address_ [static], [private], [inherited]
```

The SQL server qualified name or IP address string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.86.5.2 argo_instrument_type_

```
XArgoInstrumentType_t argo::iridium::xfloat::XFloat::argo_instrument_type_ [private]
```

The enumerated Argo instrument type identifier.

This field is used to identify the specific type of instrument i.e. Solo-II, Deep Argo, or ALAMO/Hurricane floats. The value of this field may affect the behavior of some aspects of the application. For example, the manner in which some Iridium Short Burst Data (SBD) messages are decoded is dependent on the specific type of instrument.

Referenced by argo_instrument_type(), and set_argo_instrument_type().

10.86.5.3 dive2data_map_

```
flat_map<int, shared_ptr<XFloatDiveData> > argo::iridium::xfloat::XFloat::dive2data_map_ [private]
```

The dive-number-to-dive-data-object map.

This object is a flat map that contains shared references to all of the incomplete dive data objects that belong to this instrument. The dive data objects are uniquely indexed by the dive or cycle number. The map acts as a dynamic, local cache of the incomplete instrument dive data.

Each time a thread requests the dive data object from the float object using the GetDiveData() function, the dive or cycle number is used to look up the dive data object in this map. If the corresponding dive data object does already exist in the map, it will be created and added to the map before the shared reference is returned.

10.86.5.4 EARTH_RADIUS_KM_EQUATORIAL

```
const double util::position::PositionUtils::EARTH_RADIUS_KM_EQUATORIAL = 6378.1  [static], [private],
[inherited]
```

The equatorial radius of the earth, in kilometers.

Referenced by util::position::PositionUtils::CalculateEllipsoidHeight().

10.86.5.5 EARTH_RADIUS_KM_POLAR

```
const double util::position::PositionUtils::EARTH_RADIUS_KM_POLAR = 6356.1  [static], [private],
[inherited]
```

The polar radius of the earth, in kilometers.

Referenced by util::position::PositionUtils::CalculateEllipsoidHeight().

10.86.5.6 fw_version_

```
uint32_t argo::iridium::xfloat::XFloat::fw_version_  [private]
```

The reported instrument firmware version.

Referenced by fw_version(), and set_fw_version().

10.86.5.7 gain_pressure_

```
uint16_t argo::iridium::xfloat::XFloat::gain_pressure_  [private]
```

The pressure sensitivity gain factor, in dBar/LSB.

This field is used for decoding the drift or profile data encoded in the the Iridium Short Burst Data (SBD) messages. It along with the corresponding offset, is used to convert the raw sensor counts into scientific units.

Referenced by gain_pressure(), and set_gain_pressure().

10.86.5.8 gain_pressure_surface_

```
uint16_t argo::iridium::xfloat::XFloat::gain_pressure_surface_  [private]
```

The pressure sensitivity gain factor for surface data, in dBar/LSB.

This field is used for decoding the surface data encoded in the the Iridium Short Burst Data (SBD) messages. It along with the corresponding offset, is used to convert the raw sensor counts into scientific units.

Referenced by gain_pressure_surface(), and set_gain_pressure_surface().

10.86.5.9 gain_salinity_

```
uint16_t argo::iridium::xfloat::XFloat::gain_salinity_  [private]
```

The salinity sensitivity scale factor, in PSU/LSB.

This field is used for decoding the drift or profile data encoded in the the Iridium Short Burst Data (SBD) messages. It along with the corresponding offset, is used to convert the raw sensor counts into scientific units.

Referenced by gain_salinity(), and set_gain_salinity().

10.86.5.10 gain_salinity_surface_

uint16_t argo::iridium::xfloat::XFloat::gain_salinity_surface_ [private]

The salinity sensitivity scale factor for surface data, in PSU/LSB.

This field is used for decoding the surface data encoded in the the Iridium Short Burst Data (SBD) messages. It along with the corresponding offset, is used to convert the raw sensor counts into scientific units.

Referenced by gain_salinity_surface(), and set_gain_salinity_surface().

10.86.5.11 gain_temperature_

uint16_t argo::iridium::xfloat::XFloat::gain_temperature_ [private]

The temperature sensitivity gain factor, in degC/LSB.

This field is used for decoding the drift or profile data encoded in the the Iridium Short Burst Data (SBD) messages. It along with the corresponding offset, is used to convert the raw sensor counts into scientific units.

Referenced by gain_temperature(), and set_gain_temperature().

10.86.5.12 gain_temperature_surface_

uint16_t argo::iridium::xfloat::XFloat::gain_temperature_surface_ [private]

The temperature sensitivity gain factor for surface data, in degC/LSB.

This field is used for decoding the surface data encoded in the the Iridium Short Burst Data (SBD) messages. It along with the corresponding offset, is used to convert the raw sensor counts into scientific units.

Referenced by gain_temperature_surface(), and set_gain_temperature_surface().

10.86.5.13 id2float_map_

flat_map< int, shared_ptr< XFloat > > argo::iridium::xfloat::XFloat::id2float_map_ [static], [private]

The instrument-identifier-to-instrument-object map.

This object is a flat map that contains shared references to all of the instances of this class. It acts as a static, local cache of the instrument data. The object maps the unique instrument identifier to the corresponding float object. During application initialization, this map is populated as a result of querying all the known instruments from the SQL database.

When a specific float object is requested by any of the threads, this map is searched for the instrument object first. If the float object does not already exist, then it is created and added to this map.

Upon application termination, all of the float objects in this map are persisted to the SQL database so that they may be again loaded into this map when the application is restarted.

Accesses and modifications to this map are synchronized using the recursive mutex id2float_map_mutex_. The mutex provides an exclusive lock so that only one thread at a time may either access or modify this object.

Referenced by GetAllCachedFloats(), and GetFloat().

10.86.5.14 id2float_map_mutex_

recursive_mutex argo::iridium::xfloat::XFloat::id2float_map_mutex_ [static], [private]

The mutex lock for synchronizing access to the instrument-identifier-to-instrument-object map.

This mutual exclusion lock is used to ensure that accesses and modifications to the instrument-identifier-to-instrument-object map, id2float_map_, are synchronized so that only one thread at a time may either access or modify this object. Because the mutex is recursive, it may be locked multiple times by the same thread without causing the thread to block indefinitely.

Referenced by GetAllCachedFloats(), GetFloat(), and LoadLocalCacheFromDatabase().

10.86.5.15 id_dac_

```
int argo::iridium::Iridium::id_dac_  [private], [inherited]
```

The unique Data Assembly Center (DAC) identifier.

Referenced by argo::iridium::Iridium::id_dac(), and argo::iridium::Iridium::set_id_dac().

10.86.5.16 id_imei_

```
long argo::iridium::Iridium::id_imei_  [private], [inherited]
```

The unique International Mobile Equipment Identifier (IMEI).

Referenced by argo::iridium::Iridium::id_imei(), and argo::iridium::Iridium::set_id_imei().

10.86.5.17 id_instrument_

```
int argo::iridium::Iridium::id_instrument_  [private], [inherited]
```

The unique instrument identifier or instrument serial number.

Referenced by argo::iridium::Iridium::id_instrument(), and argo::iridium::Iridium::set_id_instrument().

10.86.5.18 id_wmo_

```
int argo::iridium::Iridium::id_wmo_  [private], [inherited]
```

The unique World Meteorological Organization (WMO) identifier.

Referenced by argo::iridium::Iridium::id_wmo(), and argo::iridium::Iridium::set_id_wmo().

10.86.5.19 instrument_ids_to_disable_phy_generation_

```
vector< unsigned int > argo::iridium::xfloat::XFloat::instrument_ids_to_disable_phy_generation_
[static], [private]
```

A list of instrument identifiers for which to disable PHY file generation.

On startup, the list of instruments contained by this vector will be used to set the XFloatDiveData::phy_file_generation_is_enabled_ at the start of execution of the mail retrieval thread.

The value of this field is set as a result of parsing the command-line arguments and/or configuration file options during application initialization.

Referenced by instrument_ids_to_disable_phy_generation().

10.86.5.20 instrument_ids_to_enable_phy_generation_

```
vector< unsigned int > argo::iridium::xfloat::XFloat::instrument_ids_to_enable_phy_generation_↩
[static], [private]
```

A list of instrument identifiers for which to enable PHY file generation.

On startup, the list of instruments contained by this vector will be used to set the XFloatDiveData::phy_file_generation_is_enabled_ at the start of execution of the mail retrieval thread. Subsequently, the dive data for these instruments will be reprocessed in order generate PHY files for previous dives.

The value of this field is set as a result of parsing the command-line arguments and/or configuration file options during application initialization.

Referenced by instrument_ids_to_enable_phy_generation().

10.86.5.21 kml_default_path_colors_

```
const Color32 util::kml::KmlUtil::kml_default_path_colors_  [static], [private], [inherited]
```

Initial value:

```
= {
        Color32(0xB0, 0xFF, 0x00, 0x00),
        Color32(0xB0, 0xFF, 0x80, 0x00),
        Color32(0xB0, 0xFF, 0xFF, 0x00),
        Color32(0xB0, 0x80, 0xFF, 0x00),
        Color32(0xB0, 0x00, 0xFF, 0x00),
        Color32(0xB0, 0x00, 0xFF, 0x80),
        Color32(0xB0, 0x00, 0xFF, 0xFF),
        Color32(0xB0, 0x00, 0x80, 0xFF),
        Color32(0xB0, 0x00, 0x00, 0xFF),
        Color32(0xB0, 0x80, 0x00, 0xFF),
        Color32(0xB0, 0xFF, 0x00, 0xFF),
        Color32(0xB0, 0xFF, 0x00, 0x80),
        Color32(0xB0, 0x80, 0x80, 0x080),
 }
```

The colour palette for instrument paths and placemarks, indexed by style index.

Referenced by util::kml::KmlUtil::GetDefaltKmlPathColor().

10.86.5.22 kml_default_path_style_ids_

```
const string util::kml::KmlUtil::kml_default_path_style_ids_  [static], [private], [inherited]
```

Initial value:

```
= {
        "path1",
        "path2",
        "path3",
        "path4",
        "path5",
        "path6",
        "path7",
        "path8",
        "path9",
        "pathA",
        "pathB",
        "pathC",
        "pathD",}
```

The KML style IDs of the path (line) styles, one per palette colour.

Referenced by util::kml::KmlUtil::GetDefaltKmlPathStyleId().

10.86.5.23 kml_default_placemark_style_ids_

```
const string util::kml::KmlUtil::kml_default_placemark_style_ids_  [static], [private], [inherited]
```

Initial value:

```
= {
        "dot1_1",
        "dot1_2",
        "dot1_3",
        "dot1_4",
        "dot1_5",
        "dot1_6",
        "dot1_7",
        "dot1_8",
        "dot1_9",
        "dot1_A",
        "dot1_B",
        "dot1_C",
        "dot1_D", }
```

The KML style IDs of the large placemark styles, one per palette colour.

Referenced by util::kml::KmlUtil::GetDefaltKmlPlacemarkStyleId().

10.86.5.24 kml_directory_path_

```
path argo::iridium::xfloat::XFloat::kml_directory_path_  [static], [private]
```

The KML file directory.

Referenced by WriteKmlMasterFile().

10.86.5.25 kml_document_

```
kmldom::DocumentPtr argo::iridium::xfloat::XFloat::kml_document_  [private]
```

The GE KML document.

10.86.5.26 kml_document_updated_

```
bool argo::iridium::xfloat::XFloat::kml_document_updated_  [private]
```

The KML document is updated flag.

10.86.5.27 kml_factory_

```
thread_specific_ptr< KmlFactory > util::kml::KmlUtil::kml_factory_  [static], [private], [inherited]
```

The libkml factory used to create KML elements, held per thread.

Warning

This holds libkml's process-wide factory (`KmlFactory::GetFactory()`), and the default cleanup deletes it when the owning thread exits or CloseKmlFactory() is called. Only the post-processing thread uses KML, so this currently happens only at shutdown.

Referenced by util::kml::KmlUtil::CloseKmlFactory(), and util::kml::KmlUtil::GetKmlFactory().

10.86.5.28 kml_file_generation_is_enabled_

```
bool argo::iridium::xfloat::XFloat::kml_file_generation_is_enabled_  [static], [private]
```

The global KML-file-generation-is-enabled flag.

The value of this field determines whether or not any KML files will be written to the local filesystem. If TRUE, then KML files will be written each time a complete set of dive data is received from a deployed instrument. Otherwise, if FALSE, no KML files will be written to the local filesystem.

The value of this field is set as a result of parsing the command-line arguments and/or configuration file options during application initialization.

Referenced by WriteKmlMasterFile().

10.86.5.29 kml_file_path_

```
path argo::iridium::xfloat::XFloat::kml_file_path_  [private]
```

The KMLfile path.

10.86.5.30 kml_file_updated_

```
bool argo::iridium::xfloat::XFloat::kml_file_updated_  [private]
```

The KML file is updated flag.

10.86.5.31 kml_small_placemark_style_ids_

```
const string util::kml::KmlUtil::kml_small_placemark_style_ids_  [static], [private], [inherited]
```

Initial value:

```
= {
        "dot1s_1",
        "dot1s_2",
        "dot1s_3",
        "dot1s_4",
        "dot1s_5",
        "dot1s_6",
        "dot1s_7",
        "dot1s_8",
        "dot1s_9",
        "dot1s_A",
        "dot1s_B",
        "dot1s_C",
        "dot1s_D", }
```

The KML style IDs of the small placemark styles, one per palette colour.

Referenced by util::kml::KmlUtil::GetSmallKmlPlacemarkStyleId().

10.86.5.32 kml_triangle_placemark_style_ids_

```
const string util::kml::KmlUtil::kml_triangle_placemark_style_ids_  [static], [private], [inherited]
```

Initial value:

```
= {
        "tri1_1",
        "tri1_2",
        "tri1_3",
        "tri1_4",
        "tri1_5",
        "tri1_6",
        "tri1_7",
        "tri1_8",
        "tri1_9",
        "tri1_A",
        "tri1_B",
        "tri1_C",
        "tri1_D", }
```

The KML style IDs of the triangle placemark styles, one per palette colour.

Referenced by util::kml::KmlUtil::GetTriangleKmlPlacemarkStyleId().

10.86.5.33 latest_gps_position_datetime_

```

```

The latest iridium position circular error probable radius.

10.86.5.38 latest_iridium_position_datetime_

```
ptime argo::iridium::xfloat::XFloat::latest_iridium_position_datetime_ [private]
```

The latest iridium position date/time.

10.86.5.39 latest_iridium_position_dive_number_

```
int argo::iridium::xfloat::XFloat::latest_iridium_position_dive_number_ [private]
```

The latest iridium position dive number.

10.86.5.40 latest_iridium_position_latitude_

```
double argo::iridium::xfloat::XFloat::latest_iridium_position_latitude_ [private]
```

The latest iridium position latitude.

10.86.5.41 latest_iridium_position_longitude_

```
double argo::iridium::xfloat::XFloat::latest_iridium_position_longitude_ [private]
```

The latest iridium position longitude.

10.86.5.42 latest_iridium_sbd_momsn_

```
int argo::iridium::xfloat::XFloat::latest_iridium_sbd_momsn_ [private]
```

The latest iridium position Mobile-Originated Message Number (MOMSN).

10.86.5.43 latest_iridium_sbd_mtmsn_

```
int argo::iridium::xfloat::XFloat::latest_iridium_sbd_mtmsn_ [private]
```

The latest iridium position Mobile-Terminated Message Number (MTMSN).

10.86.5.44 latest_iridium_startup_position_datetime_

```
ptime argo::iridium::xfloat::XFloat::latest_iridium_startup_position_datetime_ [private]
```

The latest startup iridium position date/time.

10.86.5.45 latest_iridium_startup_sbd_momsn_

```
int argo::iridium::xfloat::XFloat::latest_iridium_startup_sbd_momsn_ [private]
```

The latest startup iridium position Mobile-Originated Message Number (MOMSN).

10.86.5.46 metadata_

```
shared_ptr<XFloatMetadata> argo::iridium::xfloat::XFloat::metadata_  [private]
```

The instrument metadata.

This is a shared reference to this instrument metadata object corresponding to this instrument. During application initialization the metadata object is constructed from the metadata file on the local filesystem. If there is no metadata file corresponding to to this instrument, then the reference will be NULL.

This object contains the metadata for this instrument. It is object is used, in part, to determine whether the instrument has been deployed, and consequently, whether or not a PHY file should be generated once a the complete data for a dive is received. If the instrument object does not have a corresponding metadata object, then PHY files will NOT be generated for this instrument

Referenced by metadata(), and set_metadata().

10.86.5.47 mutex_

```
recursive_mutex util::thread::RecursiveLockable::mutex_  [mutable], [protected], [inherited]
```

Recursive mutual exclusion lock for synchronizing operations.

Referenced by util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AggregateS

10.86.5.48 netcdf_file_generation_is_enabled_

```
bool argo::iridium::xfloat::XFloat::netcdf_file_generation_is_enabled_  [private]
```

The NetCDF-file-generation-is-enabled flag.

10.86.5.49 offset_pressure_

```
uint16_t argo::iridium::xfloat::XFloat::offset_pressure_  [private]
```

The pressure offset, in dBar.

This field is used for decoding the drift or profile data encoded in the the Iridium Short Burst Data (SBD) messages. It along with the corresponding gain, is used to convert the raw sensor counts into scientific units.

Referenced by offset_pressure(), and set_offset_pressure().

10.86.5.50 offset_pressure_surface_

```
uint16_t argo::iridium::xfloat::XFloat::offset_pressure_surface_  [private]
```

The pressure offset for surface data, in dBar.

This field is used for decoding the surface data encoded in the the Iridium Short Burst Data (SBD) messages. It along with the corresponding gain, is used to convert the raw sensor counts into scientific units.

Referenced by offset_pressure_surface(), and set_offset_pressure_surface().

10.86.5.51 offset_salinity_

```
uint16_t argo::iridium::xfloat::XFloat::offset_salinity_  [private]
```

The salinity offset, in PSU.

This field is used for decoding the drift or profile data encoded in the the Iridium Short Burst Data (SBD) messages. It along with the corresponding gain, is used to convert the raw sensor counts into scientific units.

Referenced by offset_salinity(), and set_offset_salinity().

10.86.5.52 offset_salinity_surface_

```
uint16_t argo::iridium::xfloat::XFloat::offset_salinity_surface_  [private]
```

The salinity offset for surface data, in PSU.

This field is used for decoding the surface data encoded in the the Iridium Short Burst Data (SBD) messages. It along with the corresponding gain, is used to convert the raw sensor counts into scientific units.

Referenced by offset_salinity_surface(), and set_offset_salinity_surface().

10.86.5.53 offset_temperature_

```
uint16_t argo::iridium::xfloat::XFloat::offset_temperature_  [private]
```

The temperature offset, in degC.

This field is used for decoding the drift or profile data encoded in the the Iridium Short Burst Data (SBD) messages. It along with the corresponding gain, is used to convert the raw sensor counts into scientific units.

Referenced by offset_temperature(), and set_offset_temperature().

10.86.5.54 offset_temperature_surface_

```
uint16_t argo::iridium::xfloat::XFloat::offset_temperature_surface_  [private]
```

The temperature offset for surface data, in degC.

This field is used for decoding the surface data encoded in the the Iridium Short Burst Data (SBD) messages. It along with the corresponding gain, is used to convert the raw sensor counts into scientific units.

Referenced by offset_temperature_surface(), and set_offset_temperature_surface().

10.86.5.55 password_

```
std::string util::mysql::LocalMysqlConfiguration::password_  [static], [private], [inherited]
```

The SQL server account password string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.86.5.56 phy_file_generation_is_enabled_

```
bool argo::iridium::xfloat::XFloat::phy_file_generation_is_enabled_ [private]
```

The PHY-file-generation-enabled flag.

This field determines, in part, whether or not a PHY file will be generated once the complete data for a single dive is received from the instrument. If FALSE, then PHY files will NOT be generated for this instrument. Otherwise, if TRUE, PHY files for this instrument will be generated only if the other requisite conditions are met.

Referenced by phy_file_generation_is_enabled(), and set_phy_file_generation_is_enabled().

10.86.5.57 port_

```
unsigned int util::mysql::LocalMysqlConfiguration::port_ [static], [private], [inherited]
```

The SQL server port number.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.86.5.58 protocol_

```
std::string util::mysql::LocalMysqlConfiguration::protocol_ [static], [private], [inherited]
```

The protocol to use in the SQL server connection e.g.

"tcp".

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.86.5.59 schema_

```
std::string util::mysql::LocalMysqlConfiguration::schema_ [static], [private], [inherited]
```

The SQL server schema name.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.86.5.60 sql_connection_

```
thread_specific_ptr<Connection> util::mysql::MysqlUtils::sql_connection_ [static], [private],
[inherited]
```

Tthe thread-specific pointer to MySQL connection object.

Thread-specific MySQL connection, released by `MysqlUtils::CleanupSqlConnection()` when the thread exits.

Referenced by util::mysql::MysqlUtils::CloseSqlConnection(), and util::mysql::MysqlUtils::GetSqlConnection().

10.86.5.61 sql_driver_

```
thread_specific_ptr<MySQL_Driver> util::mysql::MysqlUtils::sql_driver_ [static], [private],
[inherited]
```

The thread-specific pointer to MySQL driver object.

Thread-specific reference to the MySQL driver.

Its cleanup function, `MysqlUtils::CleanupSqlDriver()`, does not delete the shared driver instance.

Referenced by util::mysql::MysqlUtils::GetSqlDriver().

10.86.5.62 sql_table_description_

```
const util::mysql::SqlTableDescription< XFloat > argo::iridium::xfloat::XFloat::sql_table_↩
description_ [static], [private]
```

The SQL table description object.

This SQL table description provides the details needed to map this object to a relational database table. It utilizes the accessor methods of the class and the details of the SQL table column to (1) create an SQL INSERT statement to save the object into the database, (2) populate one or more objects' fields as a result of an SQL SELECT query, or (3) query the SQL database to access one or more of the values that are stored the the SQL table corresponding to this object.

10.86.5.63 start_of_mission_datetime_

```
ptime argo::iridium::xfloat::XFloat::start_of_mission_datetime_ [private]
```

The date/time of startup of the instrument.

This field represents the most recent date/time that the instrument was started up. This field is used, in part, to validate incoming message from the instrument. Messages that have either and Iridium position or email header date/time that is subsequent to the value of this field will be discarded.

Generally, the value of this field is assigned from the date/time reported by the GPS message that is reported as a result of the instrument self-test when the instrument is started. However, if the instrument is unable to obtain a valid GPS fix, then the value of this field needs to be set by alternative means.

Todo Implement an alternative method to assign the value of this field if the date/time reported by the start-of-mission GPS position is invalid or unavailable.

Referenced by set_start_of_mission_datetime(), and start_of_mission_datetime().

10.86.5.64 status_directory_path_

```
path argo::iridium::xfloat::XFloat::status_directory_path_ [static], [private]
```

The global status file directory path.

All status files will be written to this directory.

10.86.5.65 status_file_generation_is_enabled_

```
bool argo::iridium::xfloat::XFloat::status_file_generation_is_enabled_ [static], [private]
```

The global status-file-generation-is-enabled flag.

If TRUE, then status files will be written.

10.86.5.66 status_file_path_

```
path argo::iridium::xfloat::XFloat::status_file_path_ [private]
```

The status file path.

10.86.5.67 status_file_updated_

```
bool argo::iridium::xfloat::XFloat::status_file_updated_ [private]
```

The status-file-is-updated flag.

10.86.5.68 user_

```
std::string util::mysql::LocalMysqlConfiguration::user_  [static], [private], [inherited]
```

The SQL server account username string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.86.5.69 xmsg_version_major_

```
uint8_t argo::iridium::xfloat::XFloat::xmsg_version_major_  [private]
```

The X-Message format major version number.

This field indicates the X-Message version used by this instrument's firmware. It affects the manner in which the X-↩ Messages are decoded that reflect the iterative version of the X-Message format.

Referenced by set_xmsg_version_major(), and xmsg_version_major().

10.86.5.70 xmsg_version_minor_

```
uint8_t argo::iridium::xfloat::XFloat::xmsg_version_minor_  [private]
```

The X-Message format minor version number.

This field indicates the X-Message version used by this instrument's firmware. It affects the manner in which the X-↩ Messages are decoded that reflect the iterative version of the X-Message format.

Referenced by set_xmsg_version_minor(), and xmsg_version_minor().

The documentation for this class was generated from the following files:

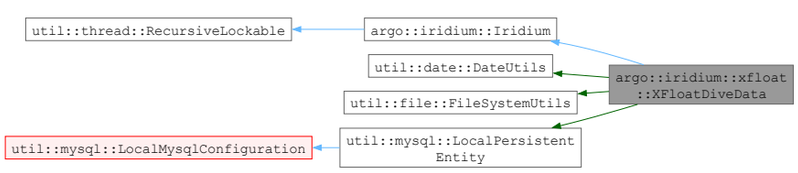
- data/XFloat.h
- data/XFloat.cpp

10.87 argo::iridium::xfloat::XFloatDiveData Class Reference

The instrument or float dive data class.

```
#include <XFloatDiveData.h>
```

Inheritance diagram for argo::iridium::xfloat::XFloatDiveData:



Public Member Functions

- XFloatDiveData ()

  The default constructor.
- XFloatDiveData (const shared_ptr< XFloat > &parent, int dive)

  Parameterized constructor.
- ~XFloatDiveData ()

  The destructor.
- XArgoInstrumentType_t argo_instrument_type () const

  Get the enumerated Argo instrument type identifier.
- bool CheckCompleteness ()

  Is this dive data object complete?
- float ComputePressureOffsetFromSurfaceTimeSeries (unsigned int max_num_dives)

  Compute this dive's surface pressure offset from the surface time-series data.
- int DecodeMailMessageData (shared_ptr< XFloatMailMessage > &msg)

  Decode the SBD data of a mail message into this dive data object.
- void DecodeXMsgData (const vector< uint8_t > &data, shared_ptr< vector< uint8_t > > xmsg_id_↩ types=shared_ptr< vector< uint8_t > >()) ATTR_NO_EXCEPTIONS

  Decode an X-Message from the binary message data.
- string GenerateListingString () const

  Generate a listing entry string representation of this dive data object.
- string GeneratePhyString () const

  Generate a PHY entry string representation of this dive data object.
- string **GeneratePressureCorrectionListingString** () const
- vector< shared_ptr< XFloatMailMessage > > GetDiveDataMailMessagesFromDatabase ()

  Get this dive's stored mail messages from the SQL database.
- void GetGainsAndOffsets (uint16_t &pg, uint16_t &po, uint16_t &tg, uint16_t &to, uint16_t &sg, uint16_t &so) const

  Get the pressure, temperature, and salinity sensor gains and offsets.
- shared_ptr< x::XGPS > GetGpsPositionEndOfDive () const

  Get the end-of-dive GPS message.
- shared_ptr< x::XGPS > **GetGpsPositionStartOfDive** () const
- shared_ptr< x::XGPS > **GetGpsProfilePosition** () const
- void GetSurfaceGainsAndOffsets (uint16_t &pg, uint16_t &po, uint16_t &tg, uint16_t &to, uint16_t &sg, uint16_t &so) const

  Get the pressure, temperature, and salinity sensor gains and offsets for surface data.
- bool **GpsPositionIsValidProfilePosition** (const shared_ptr< x::XGPS > x) const
- bool HasBinnedProfileData () const

  Does this dive data object have any binned profile data?
- bool **HasBinnedProfileSalinityData** () const
- bool HasCompleteBinnedProfileData () const

  Does this dive have complete binned profile data?
- bool HasCompleteProfileData () const

  Does this dive have complete binned or unbinned profile data?
- bool HasCompleteUnbinnedProfileData () const

  Does this dive have complete unbinned profile data?
- bool HasContiguousMomsns () const

  Do the messages that comprise this dive data object have contiguously increasing MOMSN numbers?
- bool HasContiguousPids () const

  Do the messages that comprise this dive data object have contiguously increasing packet index identifiers (PIDs) starting with zero?
- bool HasDiveData () const

  Does this dive data object have any dive data?
- bool HasDriftData () const

  Does this dive data object have any drift data?
- bool HasEngineeringData () const

  Does this dive data object have any engineering data?
- bool HasFallRiseData () const

  Does this dive data object have any rise or fall data?
- bool HasPositionData () const

  Does this dive data object have any position data?
- bool **HasProfileSalinityData** () const
- bool HasUnbinnedProfileData () const

  Does this dive data object have any unbinned profile data?

- bool **HasUnbinnedProfileSalinityData** () const
- bool HasValidGpsPosition () const

  Does this dive data object have a valid GPS position for this dive's profile data?
- bool HasValidIridiumPosition () const

  Does this dive data object have a valid Iridium position?
- bool HasValidPosition () const

  Does this dive data object have a valid position for this dive's profile data?
- bool **HasWaveData** () const
- int id_dac () const

  Get the unique Data Assembly Center (DAC) identifier.
- int id_dive () const

  Get the dive or cycle number of this dive data object.
- long id_imei () const

  Get the unique International Mobile Equipment Identifier (IMEI).
- int id_instrument () const

  Get the unique instrument identifier or instrument serial number.
- int id_wmo () const

  Get the unique World Meteorological Organization (WMO) identifier.
- const path & intermediate_listing_file_path () const

  Get the path to the intermediate listing file on the local filesystem.
- const ptime & **iridium_position_datetime_first** () const
- const ptime & **iridium_position_datetime_last** () const
- bool **is_complete** () const
- bool **is_listing_file_updated** () const
- bool **is_netcdf_file_updated** () const
- bool **is_phy_file_updated** () const
- bool **is_pres_offs_valid** () const
- bool **is_surface_pres_valid** () const
- bool LockObject (bool block)

  Lock the object.
- const path & **netcdf_file_path** () const
- uint16_t **num_sbd_msgs** () const
- shared_ptr< XFloat > **parent_instrument** () const
- const path & phy_file_path () const

  Get the path to the PHY listing file on the local filesystem.
- float **pres_offs** () const
- int **pres_offs_num_dives** () const
- int **pres_offs_num_samples** () const
- void ResetData ()
- void SaveObjectToDatabase () const

  Save this dive data object to the SQL database.
- bool SensorGainsAndOffsetsAreKnown () const

  Are the sensor gains and offsets known for this dive data object.
- float **surface_pres_max** () const
- float **surface_pres_mean** () const
- float **surface_pres_min** () const
- int **surface_pres_num_samples** () const
- float **surface_pres_variance** () const
- void UnlockObject ()

  Unlock the object.
- void WriteListingFile ()

  Write the listing file for this dive.
- void WritePhyFile ()

  Write the PHY file for this dive.

Static Public Member Functions

- static void DeleteFromDatabase (int id_instrument)

  Delete all dive data for an instrument from the SQL database.
- static void DeleteObjectsFromDatabase (const string &where)

  Delete dive data rows from the SQL database table.
- static string GenerateReadableHex (const vector< uint8_t > &data)

  Generate a human-readable hex string.
- static shared_ptr< XFloatDiveData > GetDiveDataObjectFromDatabase (const shared_ptr< XFloat > &x, int dive)

  Get a dive data object for a given instrument and dive number from the database, if it exists.
- static shared_ptr< XFloatDiveData > SelectObjectFromDatabase (const string &where="", const string &groupBy="", const string &orderBy="", const unsigned int &offset=0)

  Select a single dive data object from the SQL database table.
- static vector< shared_ptr< XFloatDiveData > > SelectObjectsFromDatabase (const string &where="", const string &groupBy="", const string &orderBy="", const unsigned int &limit=0, const unsigned int &offset=0)

  Select dive data objects from the SQL database table.
- template<typename TT >
  static TT SelectValueFromDatabase (const string &what, const string &where="", const string &groupBy="", const string &orderBy="", const unsigned int &offset=0)

  Select a single value from the dive data SQL database table.

Protected Member Functions

- void set_id_dac (int id_dac)

  Set the unique Data Assembly Center (DAC) identifier.
- void set_id_imei (long id_imei)

  Set the unique International Mobile Equipment Identifier (IMEI).
- void set_id_instrument (int id_instrument)

  Set the unique instrument identifier or instrument serial number.
- void set_id_wmo (int id_wmo)

  Set the unique World Meteorological Organization (WMO) identifier.

Static Protected Member Functions

- static void CloseSqlConnection ()

  Close the thread-specific MySQL connection if it is currently open.
- static shared_ptr< sql::ResultSet > **executeDeleteQuery** (const string &from, const string &where="")
- static shared_ptr< ResultSet > ExecuteQuery (Connection *con, const string &query)

  Execute an SQL query and return a shared pointer to the ResultSet object.
- static shared_ptr< sql::ResultSet > executeQuery (const string &query)

  Execute an SQL query and return a shared pointer to the ResultSet object.
- static shared_ptr< sql::ResultSet > executeSelectQuery (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)

  Execute an SQL select query and return a shared pointer to the ResultSet object.
- static int ExecuteUpdate (Connection *con, const string &update)

  Execute an SQL update and return the status code.
- static int executeUpdate (const string &update)

  Execute an SQL update and return the status code.
- static string GenerateCurrentUtcTimeIso8601String ()

  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- static string GenerateIso8601String (const ptime &p, bool extended=true)

  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)

  Convert a date/time to fractional days since a reference date/time.
- static shared_ptr< PreparedStatement > GeneratePreparedStatement (Connection *con, const string &statement)

  Generate a prepared SQL statement object for the given SQL statement.
- static shared_ptr< sql::PreparedStatement > generatePreparedStatement (const string &statement)

  Generate a prepared SQL statement object for the given SQL statement.
- static string GenerateSqlDeleteStr (const string &from, const string &where="")

  Generate an SQL DELETE statement.

- static string GenerateSqlSelectStr (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)

  Generate an SQL select statement.
- static ptime GetCurrentUtcTime ()

  Generate a POSIX time object representing the current date and time (rounded to the nearest second).
- static const path & GetDirectoryPath (const path &dir, bool create=false)

  Get a directory path.
- static path GetDirectoryPathFromString (const string &dir, bool create=false)

  Generate a boost::filesystem::path object from the directory path string.
- static thread_specific_ptr< Connection > & GetSqlConnection (string url, string user, string password, string schema)

  Get a thread-specific instance of a MySQL connection object.
- static sql::Connection * getSqlConnection ()

  Generate a thread-specific instance of a MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > & GetSqlDriver ()

  Get a thread-specific instance of a MySQL driver object.
- static vector< path > ListDirectories (const path &dir)

  List all directories contained in the given directory.
- static vector< path > ListFiles (path dir, size_t n=0)

  List all regular files contained in the given directory.
- static path MoveFileToDirectory (const path &file, const path &dir_dst, bool create_dir=false)

  Copy a file into a directory.

Protected Attributes

- recursive_mutex mutex_

  Recursive mutual exclusion lock for synchronizing operations.

Private Member Functions

- void AssignArgoData (const shared_ptr< x::XArgo > &x)

  Assign an Argo data message to this dive data object.
- void AssignAuxTemperatureBinned (const shared_ptr< x::XProfileTemperature > &x)

  Assign a binned auxiliary-channel profile temperature message to this dive data object.
- void AssignDriftPressure (const shared_ptr< x::XDriftPressure > &x)

  Assign a drift pressure message to this dive data object.
- void AssignDriftSalinity (const shared_ptr< x::XDriftSalinity > &x)

  Assign a drift salinity message to this dive data object.
- void AssignDriftTemperatre (const shared_ptr< x::XDriftTemperature > &x)

  Assign a drift temperature message to this dive data object.
- void AssignEngineeringAbort (const shared_ptr< x::XEngAbort > &x)

  Assign an engineering abort/beacon message to this dive data object.
- void AssignEngineeringAscent (const shared_ptr< x::XEngAscent > &x)

  Assign an engineering ascent message to this dive data object.
- void AssignEngineeringBitFail (const shared_ptr< x::XEngBITFail > &x)

  Assign an engineering BIT failed message to this dive data object.
- void AssignEngineeringBitPass (const shared_ptr< x::XEngBITPass > &x)

  Assign an engineering BIT passed message to this dive data object.
- void AssignEngineeringDescent (const shared_ptr< x::XEngDescent > &x)

  Assign an engineering descent message to this dive data object.
- void AssignEngineeringDiagnostic (const shared_ptr< x::XEngDiagnostic > &x)

  Assign an engineering diagnostic dive message to this dive data object.
- void AssignEngineeringDrift (const shared_ptr< x::XEngDrift > &x)

  Assign an engineering drift/park message to this dive data object.
- void AssignEngineeringIce (const shared_ptr< x::XEngIce > &x)

  Assign an engineering (ice) message to this dive data object.
- void AssignEngineeringStandard (const shared_ptr< x::XEngStandard > &x)

  Assign an engineering standard dive message to this dive data object.
- void AssignEngineeringSurface (const shared_ptr< x::XEngSurface > &x)

  Assign an engineering surface message to this dive data object.
- void AssignFallTimeSeries (const shared_ptr< x::XFall > &x)

  Assign a fall time-series message to this dive data object.

- void AssignGps (shared_ptr< x::XGPS > &x)

  Assign a GPS message to this dive data object.
- int AssignMailMessage (const shared_ptr< XFloatMailMessage > &msg)

  Assign a mail message to this dive data object.
- void AssignMissionCmdEchoback (const shared_ptr< x::XMissionCmdEcho > &x)

  Assign a ground-station command echo-back message to this dive data object.
- void AssignParentInstrument (const shared_ptr< XFloat > &flt)

  Set the shared pointer to the parent float object that owns this dive data.
- void AssignProfilePressureBinned (const shared_ptr< x::XProfilePressure > &x)

  Assign a bin-averaged profile pressure message to this dive data object.
- void AssignProfilePressureUnbinned (const shared_ptr< x::XHiResPressure > &x)

  Assign an unbinned profile pressure message to this dive data object.
- void AssignProfileSalinityBinned (const shared_ptr< x::XProfileSalinity > &x)

  Assign a bin-averaged profile salinity message to this dive data object.
- void AssignProfileSalinityUnbinned (const shared_ptr< x::XHiResSalinity > &x)

  Assign an unbinned profile salinity message to this dive data object.
- void AssignProfileTemperatureBinned (const shared_ptr< x::XProfileTemperature > &x)

  Assign a bin-averaged profile temperature message to this dive data object.
- void AssignProfileTemperatureUnbinned (const shared_ptr< x::XHiResTemperature > &x)

  Assign an unbinned profile temperature message to this dive data object.
- void AssignPumpTimeSeries (const shared_ptr< x::XPump > &x)

  Assign a pump time-series message to this dive data object.
- void AssignRiseTimeSeries (const shared_ptr< x::XRise > &x)

  Assign a rise time-series message to this dive data object.
- void AssignSurfaceTimeSeries (const shared_ptr< x::XSurfaceData > &x)

  Assign a surface pressure time-series message to this dive data object.
- void AssignValveData (const shared_ptr< x::XValve > &x)

  Assign a valve data message to this dive data object.
- shared_ptr< x::XCompositeFall > GenerateCompositeFallTimeSeriesData () const

  Generate a composite fall time-series data for this dive.
- shared_ptr< x::XCompositeIridiumPosition > GenerateCompositeIridiumPosition () const

  Generate a composite Iridium position for this dive.
- shared_ptr< x::XCompositePump > GenerateCompositePumpTimeSeriesData () const

  Get the composite pump time-series data for this dive.
- shared_ptr< x::XCompositeRise > GenerateCompositeRiseTimeSeriesData () const

  Get the composite rise time-series data for this dive.
- shared_ptr< x::XCompositeValve > **GenerateCompositeValveData** () const
- vector< int > GenerateOrderedMomsnList () const

  Generate a list of ordered Iridium message MOMSNs for this dive.
- vector< int > GenerateOrderedPidList () const

  Generate a list of ordered Iridium message PIDs for this dive.
- void set_argo_instrument_type (XArgoInstrumentType_t type)

  Set the enumerated Argo instrument type identifier.
- void **set_complete** (bool complete)
- void set_id_dive (int id_dive)

  Set the dive or cycle number of this dive data object.
- void set_intermediate_listing_file_path (const path &file_path)

  Set the path to the intermediate listing file.
- void **set_iridium_position_datetime_first** (const ptime &iridium_position_datetime_first)
- void **set_iridium_position_datetime_last** (const ptime &iridium_position_datetime_last)
- void **set_listing_file_updated** (bool listing_file_updated)
- void **set_netcdf_file_path** (const path &netcdf_file_path)
- void **set_netcdf_file_updated** (bool netcdf_file_updated=true)
- void **set_num_sbd_msgs** (uint16_t num_sbd_msgs)
- void set_phy_file_path (const path &file_path)

  Set the path to the PHY listing file.
- void **set_phy_file_updated** (bool phy_file_updated)
- void **set_pres_offs** (float pres_offs)
- void **set_pres_offs_num_dives** (int pres_offs_num_dives)
- void **set_pres_offs_num_samples** (int pres_offs_num_samples)
- void **set_pres_offs_valid** (bool pres_offs_valid)
- void **set_surface_pres_max** (float surface_pres_max)
- void **set_surface_pres_mean** (float surface_pres_mean)
- void **set_surface_pres_min** (float surface_pres_min)

- void **set_surface_pres_num_samples** (int surface_pres_num_samples)
- void **set_surface_pres_valid** (bool surface_pres_valid)
- void **set_surface_pres_variance** (float surface_pres_variance)
- void UpdateDerivedSurfaceDataFields ()

  Update the derived surface pressure fields from the surface time-series data.

Static Private Member Functions

- static void CleanupSqlConnection (Connection *con)

  Cleanup an SQL connection.
- static void CleanupSqlDriver (MySQL_Driver *driver)

  Function for memory cleanup of MySQL driver on destruct.

Private Attributes

- XArgoInstrumentType_t argo_instrument_type_

  The enumerated Argo instrument type identifier.
- bool complete_

  The dive-data-is-complete flag.
- int id_dac_

  The unique Data Assembly Center (DAC) identifier.
- int id_dive_

  The dive or cycle number of this dive data object.
- long id_imei_

  The unique International Mobile Equipment Identifier (IMEI).
- int id_instrument_

  The unique instrument identifier or instrument serial number.
- int id_wmo_

  The unique World Meteorological Organization (WMO) identifier.
- ptime iridium_position_datetime_first_

  The date/time of transmission of the first Iridium message sent by the instrument for this dive.
- ptime iridium_position_datetime_last_

  The date/time of transmission of the last Iridium message sent by the instrument for this dive.
- path listing_file_path_

  The path to the intermediate listing file for this dive data on the local filesystem.
- bool listing_file_updated_

  The listing-file-is-updated flag.
- static_vector< shared_ptr< XFloatMailMessage >, XMSG_MAX_MAIL > mail_messages_

  The mail messages for this dive data object.
- path netcdf_file_path_

  The NetCDF dimensions.
- bool netcdf_file_updated_

  The NetCDF-file-is-updated flag.
- uint16_t num_sbd_msgs_

  The number of SBD messages that have been received for this dive cycle.
- shared_ptr< XFloat > parent_instrument_

  The parent float or instrument object of this dive data object.
- path phy_file_path_

  The path to the PHY file for this dive data on the local filesystem.
- bool phy_file_updated_

  The phy-file-is-updated flag.
- float pres_offs_

  The computed surface pressure offset for this dive.
- int pres_offs_num_dives_

  The number of dives used to compute the surface pressure offset.
- int pres_offs_num_samples_

  The number of samples used to compute the surface pressure offset.
- bool pres_offs_valid_

  The surface-pressure offset-is-valid flag.
- float surface_pres_max_

  The maximum reported surface pressure.
- float surface_pres_mean_

The mean surface pressure.

- float surface_pres_min_

  The minimum reported surface pressure.

- int surface_pres_num_samples_

  The number of surface pressure samples reported.

- bool surface_pres_valid_

  The surface-pressure-is-valid flag.

- float surface_pres_variance_

  The surface pressure variance.

- shared_ptr< x::XAcousticPosition > xmsg_acoustic_positions_

  A vector of pointers to the acoustic position messages.

- shared_ptr< x::XArgo > xmsg_argo_data_

  A pointer to the Argo data message.

- x::XCompositeDrift xmsg_composite_drift_data_

  The composite drift data object.

- x::XCompositeProfile xmsg_composite_profile_binned_

  The composite binned profile data object.

- x::XCompositeHiResProfile xmsg_composite_profile_unbinned_

  The composite unbinned profile data object.

- shared_ptr< x::XEngAbort > xmsg_engineering_data_abort_

  A pointer to the engineering abort message.

- shared_ptr< x::XEngAscent > xmsg_engineering_data_ascent_

  A pointer the the engineering ascent message.

- shared_ptr< x::XEngBITFail > xmsg_engineering_data_bit_fail_

  A pointer to the engineering BIT failed message.

- shared_ptr< x::XEngBITPass > xmsg_engineering_data_bit_passed_

  A pointer to the engineering BIT passed message.

- shared_ptr< x::XEngDescent > xmsg_engineering_data_descent_

  A pointer to the engineering descent message.

- shared_ptr< x::XEngDiagnostic > xmsg_engineering_data_diagnostic_dive_

  A pointer to the engineering diagnostic or startup message.

- shared_ptr< x::XEngDrift > xmsg_engineering_data_drift_

  A pointer to the engineering drift message.

- shared_ptr< x::XEngIce > xmsg_engineering_data_ice_

  A pointer to the ice-detection engineering message.

- shared_ptr< x::XEngStandard > xmsg_engineering_data_standard_dive_

  A pointer to the standard dive-cycle engineering message.

- shared_ptr< x::XEngSurface > xmsg_engineering_data_surface_

  A pointer to the engineering surface message.

- static_vector< shared_ptr< x::XFall >, XMSG_MAX_FALL > xmsg_fall_time_series_

  A static vector of pointers to the fall time-series messages.

- static_vector< shared_ptr< x::XGPS >, XMSG_MAX_GPS > xmsg_gps_positions_

  A static vector of pointers to the GPS position message(s).

- x::XMfaMissionCfg xmsg_mission_cfg_

  The MFA mission configruation object.

- vector< shared_ptr< x::XMissionCmdEcho > > xmsg_mission_cmd_echoback_

  A vector of pointer to mission configuration command upload echo-back messages.

- static_vector< shared_ptr< x::XPump >, XMSG_MAX_PUMP > xmsg_pump_time_series_

  A static vector of pointers to the pump time-series messages.

- static_vector< shared_ptr< x::XRise >, XMSG_MAX_RISE > xmsg_rise_time_series_

  A static vector of pointers to the fall time-series messages.

- x::XCompositeSurfaceData xmsg_surface_time_series_

  The surface pressure time-series object.

- static_vector< shared_ptr< x::XValve >, XMSG_MAX_VALVE > xmsg_valve_data_

  Valve operation messages.

- shared_ptr< x::XWave > xmsg_wave_field_

  A static vector of pointers to the surface wave field data messages.

Static Private Attributes

- static string address_
  The SQL server qualified name or IP address string.
- static path intermediate_listing_directory_path_
  The intermediate listing directory path on the local filesystem.
- static bool intermediate_listing_file_generation_is_enabled_
  The global intermediate-listing-file-generation-is-enabled flag.
- static path netcdf_directory_path_
  The NetCDF directory path on the local filesystem.
- static bool netcdf_file_generation_is_enabled_
  The global NetCDF-file-generation-is-enabled flag.
- static const ptime netcdf_reference_datetime_
  The NetCDF referecne date/time.
- static string password_
  The SQL server account password string.
- static path phy_directory_path_
  The PHY directory path on the local filesystem.
- static bool phy_file_generation_is_enabled_
  The global PHY-file-generation-is-enabled flag.
- static unsigned int port_
  The SQL server port number.
- static bool pressure_offset_correction_enabled_list_file_
  The global surface-pressure-offset-correction-is-enabled-in-intermediate-listing-files flag.
- static bool pressure_offset_correction_enabled_netcdf_file_
  The global surface-pressure-offset-correction-is-enabled-in-NetCDF-files flag.
- static bool pressure_offset_correction_enabled_phy_file_
  The global surface-pressure-offset-correction-is-enabled-in-PHY-files flag.
- static string protocol_
  The protocol to use in the SQL server connection e.g.
- static string schema_
  The SQL server schema name.
- static thread_specific_ptr< Connection > sql_connection_
  Tthe thread-specific pointer to MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > sql_driver_
  The thread-specific pointer to MySQL driver object.
- static const util::mysql::SqlTableDescription< XFloatDiveData > sql_table_description_
  The SQL table description object.
- static string user_
  The SQL server account username string.

Friends

- shared_ptr< XFloatDiveData > std::make_shared ()
  Friend function for creating an X-Float object using the private constructor and a shared pointer to that object.
- options_description util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription ()
  Friend function for populating some of the static data members of this class from the configuration file.
- class **XFloat**
- class **XFloatTelemetryDecoderService**

10.87.1 Detailed Description

The instrument or float dive data class.

This class contains all of the mail messages and corresponding decoded telemetry data for an instrument for a single dive. Each time a mail message is received by the telemetry decoder thread, XFloatTelemetryDecoderService, the corresponding dive data object is retrieved and the mail message is assigned to it. Then, the binary data from the attached Iridium Short Burst Data (SBD) message is decoded by calling DecodeXMsgData(). As a result of decoding the binary message data, an object corresponding to the message type is created and its field are populated from the decoded data in the binary message. The newly created object will be of a type that inherits from util::xmsg::XMessage. A shared reference to the object is assigned to the dive data object.

This class contains the functionality for writing the formatted intermediate and PHY listing files to the local filesystem. Each time a new message is received, the entire intermediate listing file will be written to the local filesystem, overwriting the previous listing file, if it exists. The PHY file is written only when the dive data object is determined to contain the complete data for dive, and only if the instrument has been deployed i.e. it has a metadata file with valid DAC and WMO identifiers.

Note

This object is lockable. It contains a recursive mutual exclusion (mutex) lock in order to synchronize access to and modification of objects of this type by various worker threads. Once the object is locked, any other thread that attempts to access or modify the object will block until the initial lock is released. Since the mutex is recursive, the object may be locked multiple times by the same thread without causing the thread to block indefinitely.

This class is mapped to an SQL database table by the sql_table_description_ object. This allows some or all of the field of this class to be persisted to the SQL database. Likewise, an object of this type may be constructed from the results of an SQL query to the corresponding table.

Todo Devise a scheme to ensure that the dive data objects do not remain in memory indefinitely if one or more message for the dive or cycle are not received and the dive data object is not completed.

10.87.2 Constructor & Destructor Documentation

10.87.2.1 XFloatDiveData() [1/2]

```
argo::iridium::xfloat::XFloatDiveData::XFloatDiveData ()
```

The default constructor.

Exceptions

None.	Never throws.

10.87.2.2 XFloatDiveData() [2/2]

```
argo::iridium::xfloat::XFloatDiveData::XFloatDiveData (
            const shared_ptr< XFloat > & parent,
            int dive)
```

Parameterized constructor.

Parameters

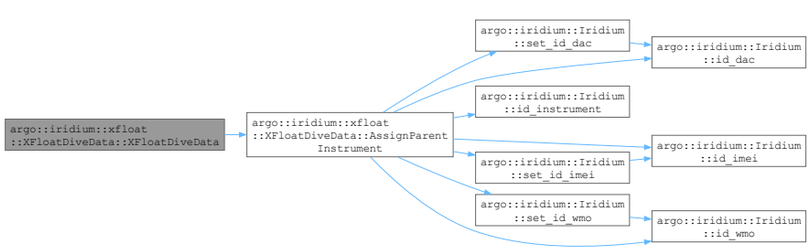
in	*parent*	A pointer to the float object that owns this dive data.
in	*dive*	The cycle or dive number of this dive.

Exceptions

util::log::MessageException	if an error occurs during construction, or if xFloat is NULL.

References AssignParentInstrument(), CATCH_BLOCK, and EXC_THROW.

Here is the call graph for this function:



10.87.2.3 ~XFloatDiveData()

```
argo::iridium::xfloat::XFloatDiveData::~XFloatDiveData ()
```

The destructor.

10.87.3 Member Function Documentation

10.87.3.1 argo_instrument_type()

```
XArgoInstrumentType_t argo::iridium::xfloat::XFloatDiveData::argo_instrument_type () const  [inline]
```

Get the enumerated Argo instrument type identifier.

Returns

The enumerated Argo instrument type identifier.

References argo_instrument_type_, and util::thread::RecursiveLockable::mutex_.

10.87.3.2 AssignArgoData()

```
void argo::iridium::xfloat::XFloatDiveData::AssignArgoData (
            const shared_ptr< x::XArgo > & x)  [private]
```

Assign an Argo data message to this dive data object.

Parameters

in	*x*	A pointer to the Argo data message to assign.

References util::thread::RecursiveLockable::mutex_, parent_instrument_, and xmsg_argo_data_.

10.87.3.3 AssignAuxTemperatureBinned()

```
void argo::iridium::xfloat::XFloatDiveData::AssignAuxTemperatureBinned (
            const shared_ptr< x::XProfileTemperature > & x)  [inline], [private]
```

Assign a binned auxiliary-channel profile temperature message to this dive data object.

Parameters

in	*x*	A pointer to the auxiliary-channel profile temperature message.

Exceptions

util::log::MessageException	if a message with the same index has already been assigned.

References util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AssignAuxTem
util::thread::RecursiveLockable::mutex_, and xmsg_composite_profile_binned_.

Here is the call graph for this function:

10.87.3.4 AssignDriftPressure()

```
void argo::iridium::xfloat::XFloatDiveData::AssignDriftPressure (
            const shared_ptr< x::XDriftPressure > & x)  [inline], [private]
```

Assign a drift pressure message to this dive data object.

Note

This vector is sorted upon insertion by order of non-decreasing message indices.

Parameters

in	*x*	A pointer to the drift pressure message to assign.

References util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AssignPressu
util::thread::RecursiveLockable::mutex_, and xmsg_composite_drift_data_.

Here is the call graph for this function:

10.87.3.5 AssignDriftSalinity()

```
void argo::iridium::xfloat::XFloatDiveData::AssignDriftSalinity (
            const shared_ptr< x::XDriftSalinity > & x)  [inline], [private]
```

Assign a drift salinity message to this dive data object.

Note

This vector is sorted upon insertion by order of non-decreasing message indices.

Parameters

in	*x*	A pointer to the drift salinity message to assign.

References util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AssignSalinity
util::thread::RecursiveLockable::mutex_, and xmsg_composite_drift_data_.

Here is the call graph for this function:

10.87.3.6 AssignDriftTemperatre()

```
void argo::iridium::xfloat::XFloatDiveData::AssignDriftTemperatre (
            const shared_ptr< x::XDriftTemperature > & x)  [inline], [private]
```

Assign a drift temperature message to this dive data object.

Note

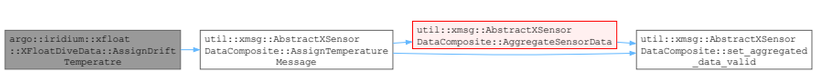
This vector is sorted upon insertion by order of non-decreasing message indices.

Parameters

in	*x*	A pointer to the drift temperature message to assign.

References util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AssignTemper
util::thread::RecursiveLockable::mutex_, and xmsg_composite_drift_data_.

Here is the call graph for this function:



10.87.3.7 AssignEngineeringAbort()

```
void argo::iridium::xfloat::XFloatDiveData::AssignEngineeringAbort (
            const shared_ptr< x::XEngAbort > & x)  [inline], [private]
```

Assign an engineering abort/beacon message to this dive data object.

Parameters

in	*x*	A pointer to the engineering abort/beacon message to assign.

References util::thread::RecursiveLockable::mutex_, and xmsg_engineering_data_abort_.

10.87.3.8 AssignEngineeringAscent()

```
void argo::iridium::xfloat::XFloatDiveData::AssignEngineeringAscent (
            const shared_ptr< x::XEngAscent > & x)  [inline], [private]
```

Assign an engineering ascent message to this dive data object.

Note

This message type is used by ALAMO floats only.

Parameters

in	*x*	A pointer to the XXengineering ascentX message to assign.

References util::thread::RecursiveLockable::mutex_, and xmsg_engineering_data_ascent_.

10.87.3.9 AssignEngineeringBitFail()

```
void argo::iridium::xfloat::XFloatDiveData::AssignEngineeringBitFail (
            const shared_ptr< x::XEngBITFail > & x)  [inline], [private]
```

Assign an engineering BIT failed message to this dive data object.

Parameters

in	*x*	A pointer to the engineering BIT failed message to assign.

References util::thread::RecursiveLockable::mutex_, and xmsg_engineering_data_bit_fail_.

10.87.3.10 AssignEngineeringBitPass()

```
void argo::iridium::xfloat::XFloatDiveData::AssignEngineeringBitPass (
            const shared_ptr< x::XEngBITPass > & x)  [inline], [private]
```

Assign an engineering BIT passed message to this dive data object.

Parameters

in	*x*	A pointer to the engineering BIT passed message to assign.

References util::thread::RecursiveLockable::mutex_, and xmsg_engineering_data_bit_passed_.

10.87.3.11 AssignEngineeringDescent()

```
void argo::iridium::xfloat::XFloatDiveData::AssignEngineeringDescent (
            const shared_ptr< x::XEngDescent > & x)  [inline], [private]
```

Assign an engineering descent message to this dive data object.

Note

This message type is used by ALAMO floats only.

Parameters

in	*x*	A pointer to the engineering descent message to assign.

References util::thread::RecursiveLockable::mutex_, and xmsg_engineering_data_descent_.

10.87.3.12 AssignEngineeringDiagnostic()

```
void argo::iridium::xfloat::XFloatDiveData::AssignEngineeringDiagnostic (
            const shared_ptr< x::XEngDiagnostic > & x)  [inline], [private]
```

Assign an engineering diagnostic dive message to this dive data object.

Parameters

in	*x*	A pointer to the engineering diagnostic dive message to assign.

References util::thread::RecursiveLockable::mutex_, and xmsg_engineering_data_diagnostic_dive_.

10.87.3.13 AssignEngineeringDrift()

```
void argo::iridium::xfloat::XFloatDiveData::AssignEngineeringDrift (
            const shared_ptr< x::XEngDrift > & x)  [inline], [private]
```

Assign an engineering drift/park message to this dive data object.

Note

This message type is used by ALAMO floats only.

Parameters

in	*x*	A pointer to the engineering drift/park message to assign.

References util::thread::RecursiveLockable::mutex_, and xmsg_engineering_data_drift_.

10.87.3.14 AssignEngineeringIce()

```
void argo::iridium::xfloat::XFloatDiveData::AssignEngineeringIce (
            const shared_ptr< x::XEngIce > & x)  [inline], [private]
```

Assign an engineering (ice) message to this dive data object.

Replaces any previously assigned engineering (ice) message.

Parameters

in	*x*	A pointer to the engineering (ice) message to assign.

References util::thread::RecursiveLockable::mutex_, and xmsg_engineering_data_ice_.

10.87.3.15 AssignEngineeringStandard()

```
void argo::iridium::xfloat::XFloatDiveData::AssignEngineeringStandard (
            const shared_ptr< x::XEngStandard > & x)  [inline], [private]
```

Assign an engineering standard dive message to this dive data object.

Parameters

in	*x*	A pointer to the engineering standard dive message to assign.

References util::thread::RecursiveLockable::mutex_, and xmsg_engineering_data_standard_dive_.

10.87.3.16 AssignEngineeringSurface()

```
void argo::iridium::xfloat::XFloatDiveData::AssignEngineeringSurface (
            const shared_ptr< x::XEngSurface > & x)  [inline], [private]
```

Assign an engineering surface message to this dive data object.

Note

This message type is used by ALAMO floats only.

Parameters

in	*x*	A pointer to the engineering surface message to assign.

References util::thread::RecursiveLockable::mutex_, and xmsg_engineering_data_surface_.

10.87.3.17 AssignFallTimeSeries()

```
void argo::iridium::xfloat::XFloatDiveData::AssignFallTimeSeries (
            const shared_ptr< x::XFall > & x)  [inline], [private]
```

Assign a fall time-series message to this dive data object.

Note

This vector is sorted upon insertion by order of non-decreasing message indices.

Parameters

in	*x*	A pointer to the fall time-series message to assign.

References EXC_THROW, util::thread::RecursiveLockable::mutex_, and xmsg_fall_time_series_.

10.87.3.18 AssignGps()

```
void argo::iridium::xfloat::XFloatDiveData::AssignGps (
            shared_ptr< x::XGPS > & x)  [private]
```

Assign a GPS message to this dive data object.

Note

If the GPS message is the startup/BIT GPS message, then the position date/time will be used to set the parent start-of-mission time.

Parameters

in	*x*	The GPS message to set.

References CATCH_BLOCK, CATCH_NOTHROW, EXC_THROW, util::date::DateUtils::GetCurrentUtcTime(), util::thread::RecursiveLockable::mutex_, XFLT_POS_INVALID_LAT, XFLT_POS_INVALID_LON, and xmsg_gps_positions_.

Here is the call graph for this function:

10.87.3.19 AssignMailMessage()

```
int argo::iridium::xfloat::XFloatDiveData::AssignMailMessage (
            const shared_ptr< XFloatMailMessage > & x)  [private]
```

Assign a mail message to this dive data object.

Exceptions

util::log::MessageException	if !x or an error occurs.

Note

This vector is sorted upon insertion by order of non-decreasing message indices.

Parameters

in	*x*	The mail message to assign.

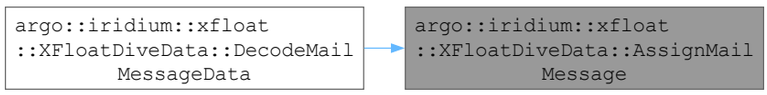
Returns

0 on successful assignment of the mail message to this dive data object, 1 if a duplicate mail message UID is encountered, or 2 if the mail message was assigned but is a retransmission of an already assigned message (identical SBD data), so its SBD data should not be decoded again.

References CATCH_BLOCK, EXC_THROW, ldbg, mail_messages_, util::thread::RecursiveLockable::mutex_, and num_sbd_msgs_.

Referenced by DecodeMailMessageData().

Here is the caller graph for this function:



10.87.3.20 AssignMissionCmdEchoback()

```
void argo::iridium::xfloat::XFloatDiveData::AssignMissionCmdEchoback (
            const shared_ptr< x::XMissionCmdEcho > & x)  [inline], [private]
```

Assign a ground-station command echo-back message to this dive data object.

Parameters

in	*x*	A pointer to the ground-station command echo-back message to assign.

References util::thread::RecursiveLockable::mutex_, and xmsg_mission_cmd_echoback_.

10.87.3.21 AssignParentInstrument()

```
void argo::iridium::xfloat::XFloatDiveData::AssignParentInstrument (
            const shared_ptr< XFloat > & parent)  [private]
```

Set the shared pointer to the parent float object that owns this dive data.

Note

This dive data object will be locked for the scope of this function.

Parameters

in	*parent*	The shared pointer to the parent float object to set.

References CATCH_BLOCK, EXC_THROW, argo::iridium::Iridium::id_dac(), argo::iridium::Iridium::id_imei(), argo::iridium::Iridium::id_instrument(), argo::iridium::Iridium::id_wmo(), util::thread::RecursiveLockable::mutex_, parent_instrument_, argo::iridium::Iridium::set_id_dac(), argo::iridium::Iridium::set_id_imei(), argo::iridium::Iridium::set_id_wmo(), and XFLT_ID_UNKNOWN.

Referenced by XFloatDiveData().

10.87.3.22 AssignProfilePressureBinned()

```
void argo::iridium::xfloat::XFloatDiveData::AssignProfilePressureBinned (
            const shared_ptr< x::XProfilePressure > & x)  [inline], [private]
```

Assign a bin-averaged profile pressure message to this dive data object.

Note

This vector is sorted upon insertion by order of non-decreasing message indices.

Parameters

in	*x*	A pointer to the bin-averaged profile pressure message to assign.

References util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AssignPressu util::thread::RecursiveLockable::mutex_, and xmsg_composite_profile_binned_.

Here is the call graph for this function:

```
void argo::iridium::xfloat::XFloatDiveData::AssignProfilePressureUnbinned (
            const shared_ptr< x::XHiResPressure > & x)  [inline], [private]
```

Assign an unbinned profile pressure message to this dive data object.

Note

This vector is sorted upon insertion by order of non-decreasing message indices.

Parameters

in	*x*	A pointer to the unbinned profile pressure message to assign.

References util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AssignPressu
util::thread::RecursiveLockable::mutex_, and xmsg_composite_profile_unbinned_.

Here is the call graph for this function:

10.87.3.24 AssignProfileSalinityBinned()

```
void argo::iridium::xfloat::XFloatDiveData::AssignProfileSalinityBinned (
            const shared_ptr< x::XProfileSalinity > & x)  [inline], [private]
```

Assign a bin-averaged profile salinity message to this dive data object.

Note

This vector is sorted upon insertion by order of non-decreasing message indices.

Parameters

in	*x*	A pointer to the bin-averaged profile salinity message to assign.

References util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AssignSalinity
util::thread::RecursiveLockable::mutex_, and xmsg_composite_profile_binned_.

void argo::iridium::xfloat::XFloatDiveData::AssignProfileSalinityUnbinned (
            const shared_ptr< x::XHiResSalinity > & x)  [inline], [private]
```

Assign an unbinned profile salinity message to this dive data object.

Note

This vector is sorted upon insertion by order of non-decreasing message indices.

Parameters

in	*x*	A pointer to the unbinned profile salinity message to assign.

References util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AssignSalinity
util::thread::RecursiveLockable::mutex_, and xmsg_composite_profile_unbinned_.

Here is the call graph for this function:

10.87.3.26 AssignProfileTemperatureBinned()

```
void argo::iridium::xfloat::XFloatDiveData::AssignProfileTemperatureBinned (
            const shared_ptr< x::XProfileTemperature > & x)  [inline], [private]
```

Assign a bin-averaged profile temperature message to this dive data object.

Note

This vector is sorted upon insertion by order of non-decreasing message indices.

Parameters

in	*x*	A pointer to the bin-averaged profile temperature message to assign.

References util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AssignTemper
util::thread::RecursiveLockable::mutex_, and xmsg_composite_profile_binned_.

Here is the call graph for this function:

10.87.3.27 AssignProfileTemperatureUnbinned()

```
void argo::iridium::xfloat::XFloatDiveData::AssignProfileTemperatureUnbinned (
            const shared_ptr< x::XHiResTemperature > & x)  [inline], [private]
```

Assign an unbinned profile temperature message to this dive data object.

Note

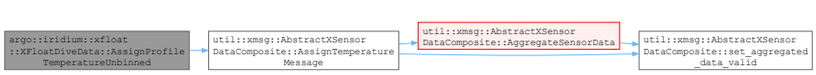
This vector is sorted upon insertion by order of non-decreasing message indices.

Parameters

in	*x*	A pointer to the unbinned profile temperature message to assign.

References util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AssignTemper
util::thread::RecursiveLockable::mutex_, and xmsg_composite_profile_unbinned_.

Here is the call graph for this function:



10.87.3.28 AssignPumpTimeSeries()

```
void argo::iridium::xfloat::XFloatDiveData::AssignPumpTimeSeries (
            const shared_ptr< x::XPump > & x)  [inline], [private]
```

Assign a pump time-series message to this dive data object.

Note

This vector is sorted upon insertion by order of non-decreasing message indices.

Parameters

in	*x*	A pointer to the pump time-series message to assign.

References EXC_THROW, util::thread::RecursiveLockable::mutex_, and xmsg_pump_time_series_.

10.87.3.29 AssignRiseTimeSeries()

```
void argo::iridium::xfloat::XFloatDiveData::AssignRiseTimeSeries (
            const shared_ptr< x::XRise > & x)  [inline], [private]
```

Assign a rise time-series message to this dive data object.

Note

This vector is sorted upon insertion by order of non-decreasing message indices.

Parameters

in	*x*	A pointer to the rise time-series message to assign.

References EXC_THROW, util::thread::RecursiveLockable::mutex_, and xmsg_rise_time_series_.

10.87.3.30 AssignSurfaceTimeSeries()

```
void argo::iridium::xfloat::XFloatDiveData::AssignSurfaceTimeSeries (
            const shared_ptr< x::XSurfaceData > & x)  [inline], [private]
```

Assign a surface pressure time-series message to this dive data object.

Note

This message type is used by ALAMO floats only.

This vector is sorted upon insertion by order of non-decreasing message indices.

Parameters

in	*x*	A pointer to the surface pressure time-series message to assign.

References util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AssignMessage(), CATCH_BLOCK, util::thread::RecursiveLockable::mutex_, and xmsg_surface_time_series_.

Here is the call graph for this function:

10.87.3.31 AssignValveData()

```
void argo::iridium::xfloat::XFloatDiveData::AssignValveData (
            const shared_ptr< x::XValve > & x)  [inline], [private]
```

Assign a valve data message to this dive data object.

Note

The valve data messages are kept sorted by message index.

Parameters

in	*x*	A pointer to the valve data message to assign.

Exceptions

util::log::MessageException	if a message with the same index has already been assigned.

References EXC_THROW, util::thread::RecursiveLockable::mutex_, and xmsg_valve_data_.

10.87.3.32 CheckCompleteness()

```
bool argo::iridium::xfloat::XFloatDiveData::CheckCompleteness ()
```

Is this dive data object complete?

This function determines if the dive data is complete and sets the complete_ flag accordingly. The completeness of the dive data is determined by CheckCompleteness() which is invoked after each new mail message is decoded and assigned to this dive data object.

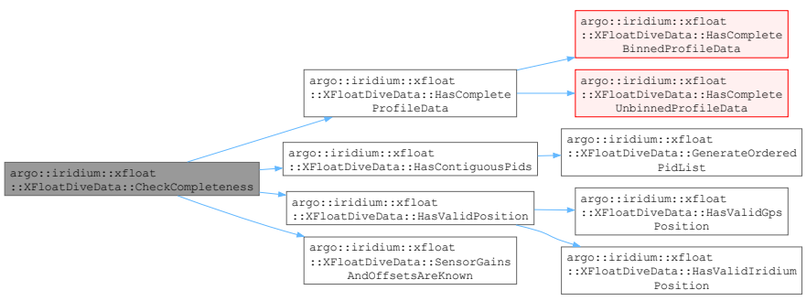
The dive data is determined to be complete if the dive data object meets all of the following criteria: it contains a complete set of profile data, the sensor gains and offsets for this dive are known (i.e. the Argo data message has been received), it contains a set of mail messages with contiguous packet identifiers (PIDs) starting at PID=0, and it contains a valid position for the profile. These criteria is determined by the functions HasCompleteProfileData(), SensorGainsAndOffsetsAreKnown(), HasContiguousPids(), HasValidPosition(), respectively.

Returns

TRUE if all data has been received for this dive, or false otherwise.

References CATCH_BLOCK, HasCompleteProfileData(), HasContiguousPids(), HasValidPosition(), util::thread::RecursiveLockable::mutex
and SensorGainsAndOffsetsAreKnown().

Here is the call graph for this function:



10.87.3.33 CleanupSqlConnection()

```
static void util::mysql::MysqlUtils::CleanupSqlConnection (
            Connection * con)  [inline], [static], [private], [inherited]
```

Cleanup an SQL connection.

This function for memory cleanup of the SQL connection on destruction. The thread-specific SQL connection object will be deleted if it exists.

Parameters

in	*con*	The SQL connection to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL connection object.

References CATCH_BLOCK.

10.87.3.34 CleanupSqlDriver()

```
static void util::mysql::MysqlUtils::CleanupSqlDriver (
            MySQL_Driver * driver)  [inline], [static], [private], [inherited]
```

Function for memory cleanup of MySQL driver on destruct.

Signals the SQL driver to end operation, if it exists.

Parameters

in	*driver*	Driver to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL driver object.

References CATCH_BLOCK.

10.87.3.35 CloseSqlConnection()

```
static void util::mysql::MysqlUtils::CloseSqlConnection ()  [inline], [static], [inherited]
```

Close the thread-specific MySQL connection if it is currently open.

If the thread local MySQL connection is not currently open, then this function will have no effect.

Note

The MySQL connection should be closed when idle to prevent the connection from timing out and throwing exceptions.

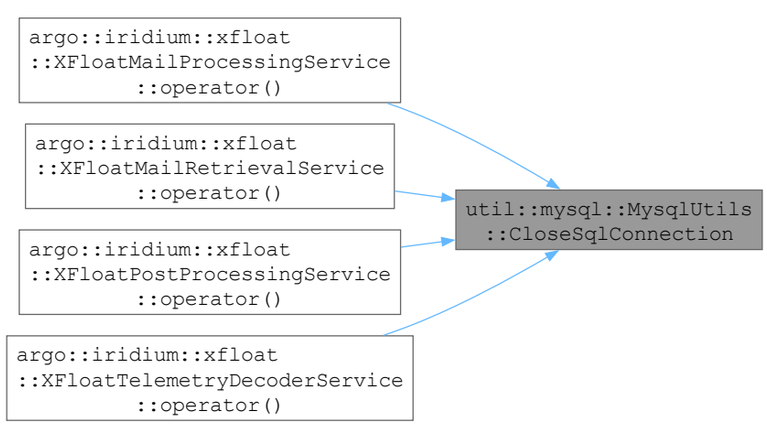
Exceptions

log::MessageException	if an error occurs while attempting to close the MySQL connection.

References CATCH_BLOCK, and util::mysql::MysqlUtils::sql_connection_.

Referenced by argo::iridium::xfloat::XFloatMailProcessingService::operator()(), argo::iridium::xfloat::XFloatMailRetrievalService::operator(
argo::iridium::xfloat::XFloatPostProcessingService::operator()(), and argo::iridium::xfloat::XFloatTelemetryDecoderService::operator()().

Here is the caller graph for this function:



10.87.3.36 ComputePressureOffsetFromSurfaceTimeSeries()

```
float argo::iridium::xfloat::XFloatDiveData::ComputePressureOffsetFromSurfaceTimeSeries (
            unsigned int max_num_dives)
```

Compute this dive's surface pressure offset from the surface time-series data.

The offset is the mean of the surface pressure means (see UpdateDerivedSurfaceDataFields()) of this dive and up to `max_num_dives` preceding dives, counting only dives whose surface pressure is valid. Each dive counts equally, regardless of its number of samples. The result is stored in the pressure offset fields (`pres_offs`, `pres_offs_num_dives`, `pres_offs_num_samples`, `pres_offs_valid`), which the listing and PHY output use for the pressure offset correction.

The offset is only computed for instruments whose conductivity sensor needs the correction (WMO instrument types 866, 867 and 875). For SBE sensors (868, 873, 876) and unknown types the offset is left invalid; an unexpected type is logged as a warning. It is also left invalid if no dive has valid surface pressure data.

Note

Preceding dives are loaded with XFloat::GetDiveData(), which may read them from the database.

Parameters

in	*max_num_dives*	The maximum number of preceding dives to include (0 = none, and the offset is not computed).

Exceptions

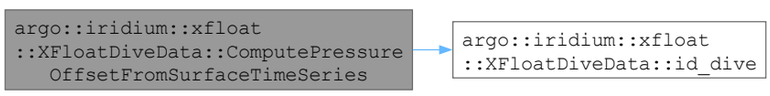
util::log::MessageException	if an error occurs.

Returns

Always 0; read the result from the pressure offset fields.

References CATCH_BLOCK, id_dive(), ldbg, lwrn, util::thread::RecursiveLockable::mutex_, and XFLT_ID_UNKNOWN.

Here is the call graph for this function:



10.87.3.37 DecodeMailMessageData()

```
int argo::iridium::xfloat::XFloatDiveData::DecodeMailMessageData (
            shared_ptr< XFloatMailMessage > & msg)
```

Decode the SBD data of a mail message into this dive data object.

Messages transmitted more than 15 minutes before the instrument's start-of-mission or deployment date/time are ignored. Otherwise, the mail message is assigned to this dive (see AssignMailMessage()), its SBD data is decoded into X-messages (see DecodeXMsgData()), the X-message type identifiers are stored in the mail message, and the parent instrument's IMEI and latest Iridium position are updated.

A message with a duplicate message ID is not assigned or decoded. A retransmission (a message whose SBD data is identical to one already assigned to this dive) is assigned, but its SBD data is not decoded again.

Parameters

in	*msg*	The mail message to decode.

Exceptions

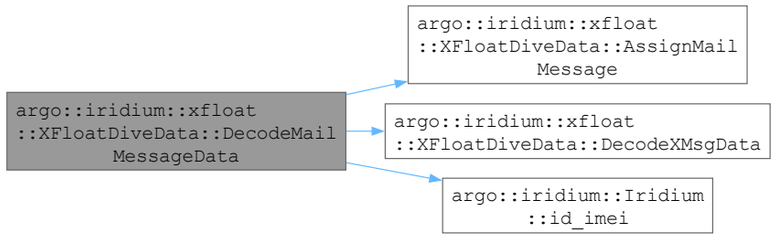
util::log::MessageException	if `msg` is NULL or an error occurs while decoding.

Returns

1 if the message is ignored because it was transmitted before the start-of-mission or deployment date/time, or 0 otherwise (including duplicates and retransmissions).

References AssignMailMessage(), CATCH_BLOCK, DecodeXMsgData(), EXC_THROW, argo::iridium::Iridium::id_imei(), and lwrn.

Here is the call graph for this function:



10.87.3.38 DecodeXMsgData()

```
void argo::iridium::xfloat::XFloatDiveData::DecodeXMsgData (
            const vector< uint8_t > & data,
            shared_ptr< vector< uint8_t > > xmsg_id_types = shared_ptr<vector<uint8_t> >())
```

Decode an X-Message from the binary message data.

Exceptions

None.	Never throws.

Parameters

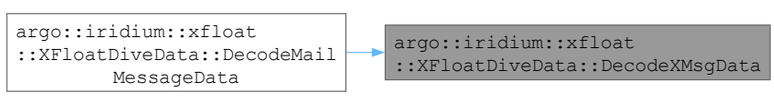
`in`	*data*	The binary message data to decode.
`out`	*xmsg_id_types*	A list of the x-message type identifiers contained in the `data` message.

Todo Verify the X-Message checksum value during the decoding of the X-Message data.

References CATCH_BLOCK, CATCH_NOTHROW, EXC_THROW, ldbg, linf, lwrn, and u16.

Referenced by DecodeMailMessageData().

Here is the caller graph for this function:



10.87.3.39 DeleteFromDatabase()

```
static void argo::iridium::xfloat::XFloatDiveData::DeleteFromDatabase (
            int id_instrument)  [inline], [static]
```

Delete all dive data for an instrument from the SQL database.

Deletes every GPS message row (see util::xmsg::XGPS::DeleteFromDatabase(int)) and every dive data row for the instrument. This is used when an instrument's messages are reprocessed, so that the dives can be rebuilt from the stored mail messages. Stored mail messages are not deleted.

Warning

This permanently removes all of the instrument's dive and GPS rows.

Parameters

in	*id_instrument*	The unique instrument identifier (serial number).

Exceptions

util::log::MessageException	if a delete query fails.

References CATCH_BLOCK, argo::iridium::Iridium::id_instrument(), and sql_table_description_.

Referenced by argo::iridium::xfloat::XFloatMailRetrievalService::operator()().

```
static void argo::iridium::xfloat::XFloatDiveData::DeleteObjectsFromDatabase (
            const string & where)  [inline], [static]
```

Delete dive data rows from the SQL database table.

Parameters

in	*where*	The SQL "where-condition" clause selecting the rows to delete.

Exceptions

util::log::MessageException	if the delete query fails.

References CATCH_BLOCK, and sql_table_description_.

10.87.3.41 ExecuteQuery()

```
static shared_ptr< ResultSet > util::mysql::MysqlUtils::ExecuteQuery (
            Connection * con,
            const string & query)  [inline], [static], [inherited]
```

Execute an SQL query and return a shared pointer to the ResultSet object.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*query*	The SQL query to execute. This must be a well-formatted SQL query string.

Exceptions

log::MessageException	if 'con' is null, 'query' is a malfored SQL string, or any other error occurs.

Returns

A shared pointer to the query ResultSet object.

            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [static], [inherited]
```

Execute an SQL select query and return a shared pointer to the ResultSet object.

Parameters

in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table–references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Exceptions

log::MessageException	if an error occurs while executing the query.

Returns

10.87.3.50 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

Returns

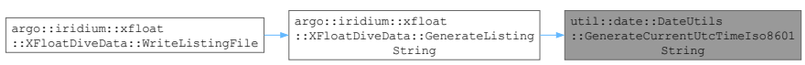
An ISO8601 format date/time string representation of the current time.

References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by GenerateListingString().

Here is the call graph for this function:

Here is the caller graph for this function:



10.87.3.51 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

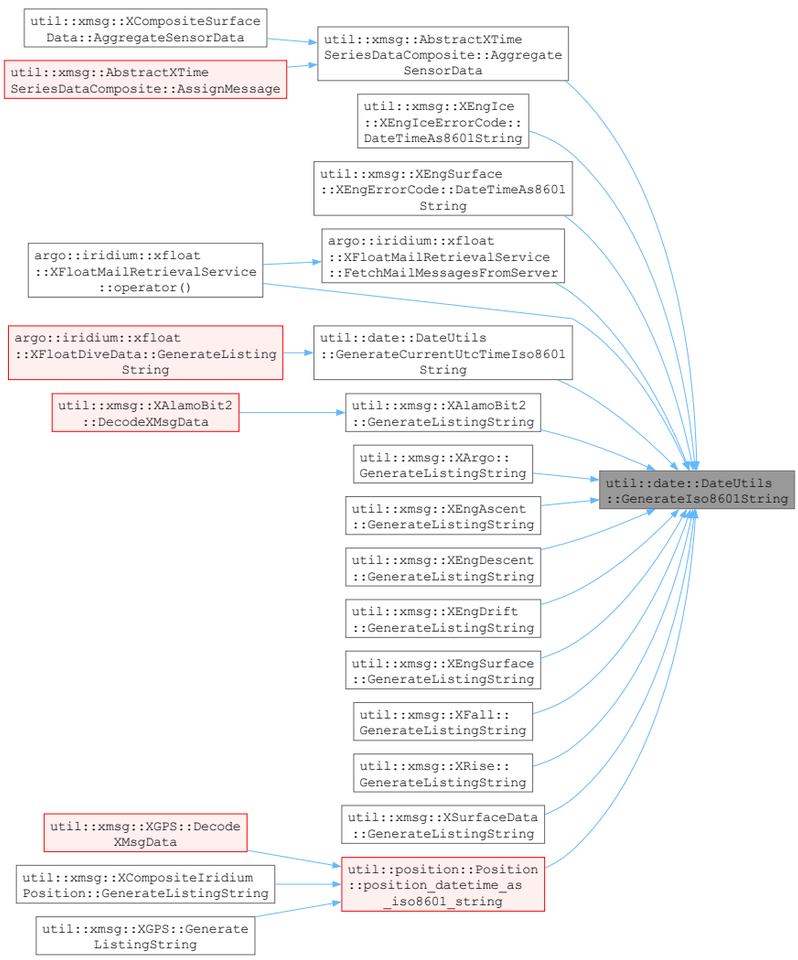
Here is the caller graph for this function:



10.87.3.52 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref_dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.87.3.53 GenerateListingString()

```
string argo::iridium::xfloat::XFloatDiveData::GenerateListingString () const
```

Generate a listing entry string representation of this dive data object.

Exceptions

util::log::MessageException	if an error occurs while generating the string representation.

Returns

A listing entry string representation of this dive data object.

10.87.3.57 GeneratePreparedStatement()

```
static shared_ptr< PreparedStatement > util::mysql::MysqlUtils::GeneratePreparedStatement (
            Connection * con,
            const string & statement)  [inline], [static], [inherited]
```

Generate a prepared SQL statement object for the given SQL statement.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*statement*	The SQL statement to prepare. This must be a well-formed SQL string.

Exceptions

log::MessageException	if 'con' is NULL, 'statement' is not a valid SQL string, or if an error occurs.

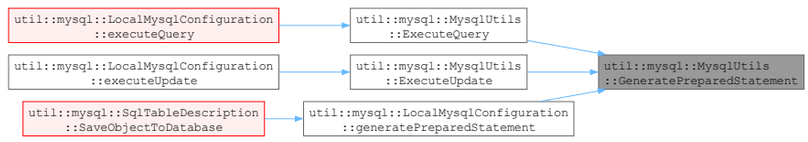
Returns

A prepared SQL statement object generated from the given SQL statement.

References CATCH_BLOCK, and EXC_THROW.

Referenced by util::mysql::MysqlUtils::ExecuteQuery(), util::mysql::MysqlUtils::ExecuteUpdate(), and util::mysql::LocalMysqlConfiguration:

Here is the caller graph for this function:



10.87.3.58 generatePreparedStatement()

```
std::shared_ptr< sql::PreparedStatement > util::mysql::LocalMysqlConfiguration::generatePrepared↩
Statement (
            const string & statement)  [static], [inherited]
```

Generate a prepared SQL statement object for the given SQL statement.

Parameters

in	*statement*	The SQL statement to prepare. This must be a well-formed SQL string.

Exceptions

log::MessageException	if 'statement' is not a valid SQL string or if an error occurs while generating the prepared statement object..

Returns

A prepared SQL statement object generated from the given SQL statement.

References util::mysql::MysqlUtils::GeneratePreparedStatement(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.87.3.59 GenerateReadableHex()

```
string argo::iridium::xfloat::XFloatDiveData::GenerateReadableHex (
            const vector< uint8_t > & data)  [static]
```

Generate a human-readable hex string.

Parameters

in	*data*	The message data.

Returns

A human readable hex representation of the data.

References CATCH_BLOCK.

10.87.3.60 GenerateSqlDeleteStr()

```
static string util::mysql::MysqlUtils::GenerateSqlDeleteStr (
            const string & from,
            const string & where = "")  [inline], [static], [inherited]
```

Generate an SQL DELETE statement.

Warning

Without a `where` clause, the statement deletes every row in the table.

Parameters

in	*from*	The name of the table to delete from.
in	*where*	The SQL "where-condition" clause (empty = all rows).

Returns

The SQL statement.

10.87.3.61 GenerateSqlSelectStr()

```
static string util::mysql::MysqlUtils::GenerateSqlSelectStr (
            const string & what,
            const string & from,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [inline], [static], [inherited]
```

Generate an SQL select statement.

Parameters

in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table-references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Returns

The SQL select statement.

10.87.3.62 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

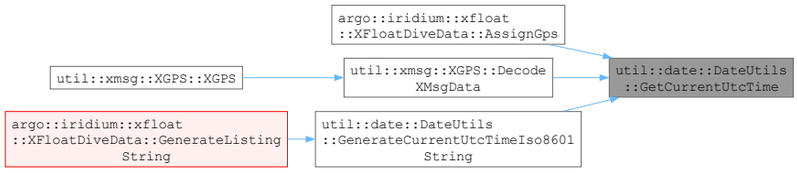
Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

Here is the caller graph for this function:



10.87.3.63 GetDirectoryPath()

```
static const path & util::file::FileSystemUtils::GetDirectoryPath (
            const path & dir,
            bool create = false)  [inline], [static], [inherited]
```

Get a directory path.

Exceptions

MessageException	if create == FALSE and the directory specified by path does not exist.

Parameters

in	*dir*	Directory path.
in	*create*	If TRUE, the directory specified by path will be created if it does not already exists. If FALSE, an exception will be thrown if the directory does not exist.

Returns

dir

References CATCH_BLOCK, EXC_THROW, and ldbg.

Referenced by util::file::FileSystemUtils::GetDirectoryPathFromString(), and util::file::FileSystemUtils::MoveFileToDirectory().

10.87.3.64 GetDirectoryPathFromString()

```
static path util::file::FileSystemUtils::GetDirectoryPathFromString (
            const string & dir,
            bool create = false)  [inline], [static], [inherited]
```

Generate a boost::filesystem::path object from the directory path string.

Exceptions

MessageException	if create == FALSE and the directory specified by path does not exist.

Parameters

in	*dir*	Directory path string.
in	*create*	If TRUE, the directory specified by path will be created if it does not already exists. If FALSE, an exception will be thrown if the directory does not exist.

Returns

A boost::filesystem::path object from the directory path string.

10.87.3.65 GetDiveDataMailMessagesFromDatabase()

```
vector< shared_ptr< XFloatMailMessage > > argo::iridium::xfloat::XFloatDiveData::GetDiveData↩
MailMessagesFromDatabase ()
```

Get this dive's stored mail messages from the SQL database.

Selects the valid mail messages (`msg_is_valid` = 1) for this instrument and dive. Messages transmitted more than 15 minutes before the instrument's start-of-mission or deployment date/time are excluded. Used to rebuild a dive object loaded from the database.

Exceptions

util::log::MessageException	if the instrument or dive identifier is unknown, or the query fails.

Returns

The matching mail messages.

References CATCH_BLOCK, EXC_THROW, argo::iridium::xfloat::XFloat::GetFloat(), id_dive(), argo::iridium::Iridium::id_instrument(), util::thread::RecursiveLockable::mutex_, argo::iridium::xfloat::XFloatMailMessage::SelectObjectsFromDatabase(), XFLT_DIVE_UNKNOWN, and XFLT_ID_UNKNOWN.

(
            const shared_ptr< XFloat > & xfloat,
            int dive)  [static]
```

Get a dive data object for a given instrument and dive number from the database, if it exists.

Parameters

in	*xfloat*	A shared pointer to the instrument object. Must not be NULL.
in	*dive*	The dive number.

Exceptions

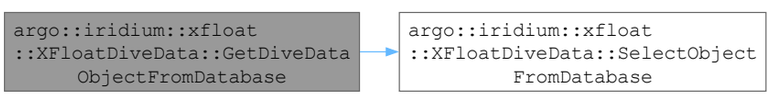
util::log::MessageException	if an error occurs while querying the database or xfloat is NULL.

Returns

A shared pointer to the dive data object or NULL if a corresponding entry does not exist in the database.

References CATCH_BLOCK, EXC_THROW, SelectObjectFromDatabase(), and XFLT_ID_UNKNOWN.

Here is the call graph for this function:



10.87.3.67 GetGainsAndOffsets()

```
void argo::iridium::xfloat::XFloatDiveData::GetGainsAndOffsets (
            uint16_t & pg,
            uint16_t & po,
            uint16_t & tg,
            uint16_t & to,
            uint16_t & sg,
            uint16_t & so) const
```

Get the pressure, temperature, and salinity sensor gains and offsets.

Parameters

out	*pg*	The pressure sensitivity gain factor, in dBar/LSB.
out	*po*	The pressure offset, in dBar.
out	*tg*	The temperature sensitivity gain factor, in degC/LSB.
out	*to*	The temperature offset, in degC.
out	*sg*	The salinity sensitivity scale factor, in PSU/LSB.
out	*so*	The salinity offset, in PSU.

            string user,
            string password,
            string schema)  [inline], [static], [inherited]
```

Get a thread-specific instance of a MySQL connection object.

A new connection will be created, if necessary.

Parameters

in	*url*	The MySQL host server qualified address.
in	*user*	The MySQL account username.
in	*password*	The MySQL account password.
in	*schema*	The MySQL account schema name.

Exceptions

log::MessageException	if an error occurs while creating a new thread-specific instance of the SQL connection object

Returns

A thread-specific instance of a MySQL connection object.

References CATCH_BLOCK, util::mysql::MysqlUtils::GetSqlDriver(), and util::mysql::MysqlUtils::sql_connection_.

Returns

TRUE if this dive data object has any engineering data, or FALSE otherwise.

References util::thread::RecursiveLockable::mutex_, xmsg_engineering_data_abort_, xmsg_engineering_data_ascent_, xmsg_engineering_data_bit_fail_, xmsg_engineering_data_bit_passed_, xmsg_engineering_data_descent_, xmsg_engineering_data_dia xmsg_engineering_data_drift_, xmsg_engineering_data_standard_dive_, and xmsg_engineering_data_surface_.

Referenced by GenerateListingString().

Here is the caller graph for this function:

10.87.3.82 HasFallRiseData()

```
bool argo::iridium::xfloat::XFloatDiveData::HasFallRiseData () const
```

Does this dive data object have any rise or fall data?

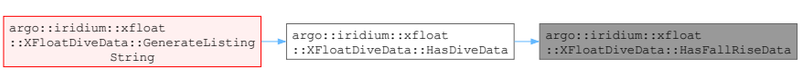
Returns

TRUE if this dive data object has any rise or fall data, or FALSE otherwise.

References util::thread::RecursiveLockable::mutex_, xmsg_fall_time_series_, and xmsg_rise_time_series_.

Referenced by HasDiveData().

Here is the caller graph for this function:



10.87.3.83 HasPositionData()

```
bool argo::iridium::xfloat::XFloatDiveData::HasPositionData () const
```

Does this dive data object have any position data?

Returns

TRUE if this dive data object has any position data, or FALSE otherwise.

References mail_messages_, util::thread::RecursiveLockable::mutex_, and xmsg_gps_positions_.

Referenced by GenerateListingString().

Here is the caller graph for this function:

10.87.3.84 HasUnbinnedProfileData()

```
bool argo::iridium::xfloat::XFloatDiveData::HasUnbinnedProfileData () const
```

Does this dive data object have any unbinned profile data?

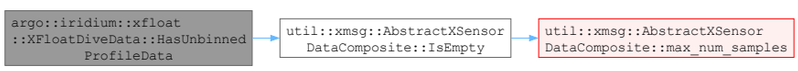
Returns

TRUE if this dive data object has any unbinned profile data, or FALSE otherwise.

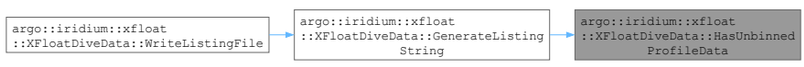
References util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::IsEmpty(), util::thread::RecursiveLockable::mutex_, and xmsg_composite_profile_unbinned_.

Referenced by GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:



10.87.3.85 HasValidGpsPosition()

```
bool argo::iridium::xfloat::XFloatDiveData::HasValidGpsPosition () const
```

Does this dive data object have a valid GPS position for this dive's profile data?

This function checks if the dive data object has a valid GPS position that accurately represents the position and date/time of the profile data for this dive.

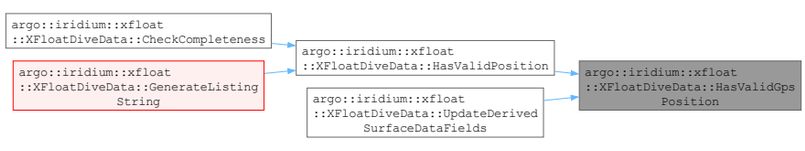
Returns

TRUE if this dive data object has a valid GPS position, or FALSE otherwise.

References CATCH_BLOCK, and util::thread::RecursiveLockable::mutex_.

Referenced by HasValidPosition(), and UpdateDerivedSurfaceDataFields().

Here is the caller graph for this function:



10.87.3.86 HasValidIridiumPosition()

```
bool argo::iridium::xfloat::XFloatDiveData::HasValidIridiumPosition () const
```

Does this dive data object have a valid Iridium position?

This function checks if the dive data object has a valid Iridium position that accurately represents the position and date/time of the profile data for this dive cycle.

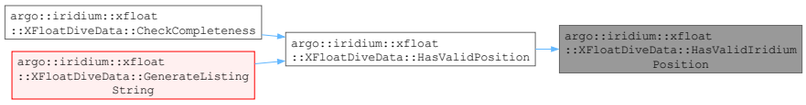
Returns

TRUE if this dive data object has a valid composite Iridium position, or FALSE otherwise.

Todo Implement the functionality to determine if a dive data object has a valid Iridium position that accurately represents the position and date/time of the profile data for this dive cycle.

Referenced by HasValidPosition().

Here is the caller graph for this function:



10.87.3.87 HasValidPosition()

```
bool argo::iridium::xfloat::XFloatDiveData::HasValidPosition () const
```

Does this dive data object have a valid position for this dive's profile data?

Check if we have either a valid GPS position, or a valid composite Iridium position to represent the profile location.

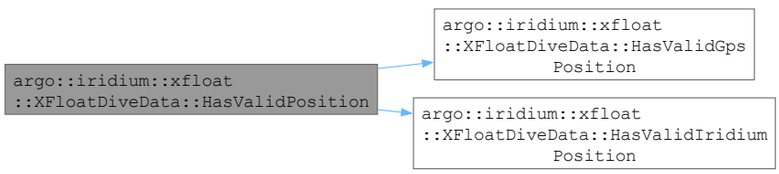
Returns

TRUE if this dive data object has a valid position for this dive's profile data, or FALSE otherwise.

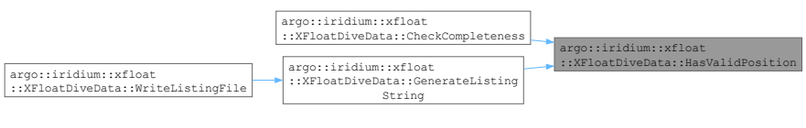
References HasValidGpsPosition(), and HasValidIridiumPosition().

Referenced by CheckCompleteness(), and GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:



10.87.3.88 id_dac()

```
int argo::iridium::Iridium::id_dac () const  [inline], [inherited]
```

Get the unique Data Assembly Center (DAC) identifier.

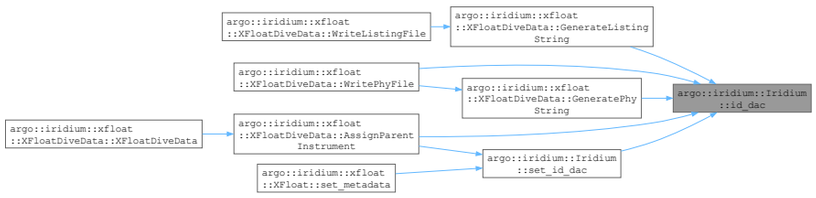
Returns

The unique Data Assembly Center (DAC) identifier.

References argo::iridium::Iridium::id_dac_, and util::thread::RecursiveLockable::mutex_.

Referenced by AssignParentInstrument(), GenerateListingString(), GeneratePhyString(), argo::iridium::Iridium::set_id_dac(), and WritePhyFile().

Here is the caller graph for this function:



10.87.3.89 id_dive()

```
int argo::iridium::xfloat::XFloatDiveData::id_dive () const  [inline]
```

Get the dive or cycle number of this dive data object.

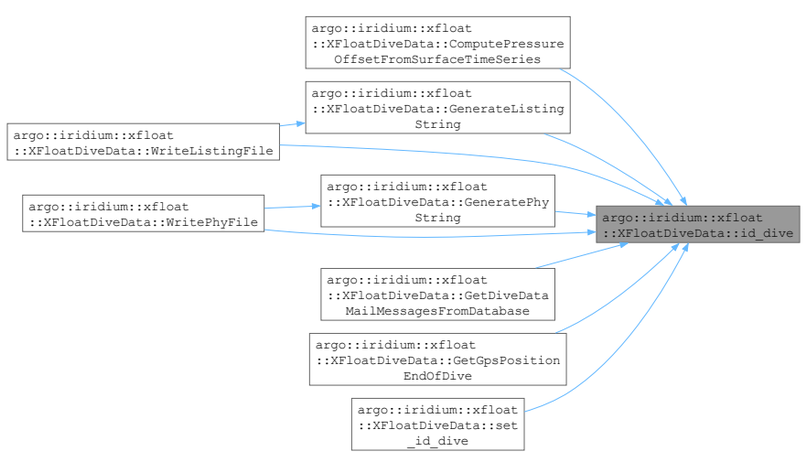
Returns

The dive or cycle number of this dive data object.

References id_dive_, and util::thread::RecursiveLockable::mutex_.

Referenced by ComputePressureOffsetFromSurfaceTimeSeries(), GenerateListingString(), GeneratePhyString(), GetDiveDataMailMessagesFromDatabase(), GetGpsPositionEndOfDive(), set_id_dive(), WriteListingFile(), and WritePhyFile().

Here is the caller graph for this function:



10.87.3.90 id_imei()

```
long argo::iridium::Iridium::id_imei () const  [inline], [inherited]
```

Get the unique International Mobile Equipment Identifier (IMEI).

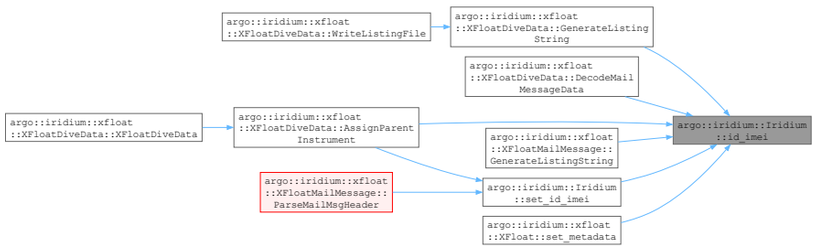
Returns

The unique International Mobile Equipment Identifier (IMEI).

References argo::iridium::Iridium::id_imei_, and util::thread::RecursiveLockable::mutex_.

Referenced by AssignParentInstrument(), DecodeMailMessageData(), GenerateListingString(), argo::iridium::xfloat::XFloatMailMessage::
argo::iridium::Iridium::set_id_imei(), and argo::iridium::xfloat::XFloat::set_metadata().

Here is the caller graph for this function:



10.87.3.91 id_instrument()

```
int argo::iridium::Iridium::id_instrument () const  [inline], [inherited]
```

Get the unique instrument identifier or instrument serial number.

Returns

The unique instrument identifier or instrument serial number.

References argo::iridium::Iridium::id_instrument_, and util::thread::RecursiveLockable::mutex_.

Referenced by AssignParentInstrument(), DeleteFromDatabase(), GenerateListingString(), argo::iridium::xfloat::XFloatMailMessage::Gene
GetDiveDataMailMessagesFromDatabase(), GetGpsPositionEndOfDive(), argo::iridium::Iridium::set_id_instrument(),

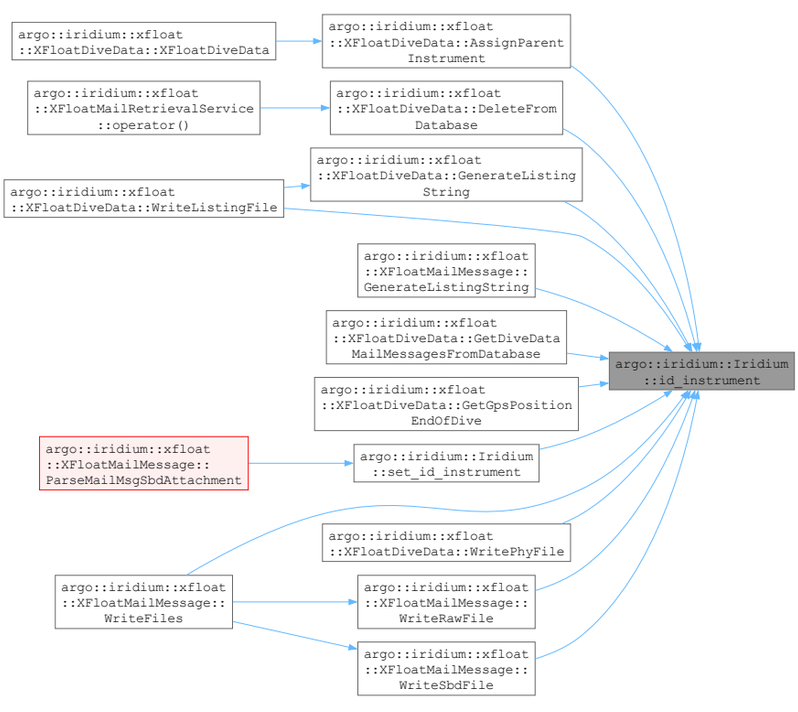
and argo::iridium::xfloat::XFloatMailMessage::WriteSbdFile().

Here is the caller graph for this function:



10.87.3.92 id_wmo()

```
int argo::iridium::Iridium::id_wmo () const  [inline], [inherited]
```

Get the unique World Meteorological Organization (WMO) identifier.

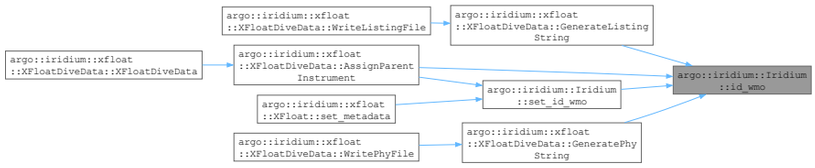
Returns

The unique World Meteorological Organization (WMO) identifier.

References argo::iridium::Iridium::id_wmo_, and util::thread::RecursiveLockable::mutex_.

Referenced by AssignParentInstrument(), GenerateListingString(), GeneratePhyString(), and argo::iridium::Iridium::set_id_wmo().

Here is the caller graph for this function:



10.87.3.93 intermediate_listing_file_path()

```
const path & argo::iridium::xfloat::XFloatDiveData::intermediate_listing_file_path () const  [inline]
```

Get the path to the intermediate listing file on the local filesystem.

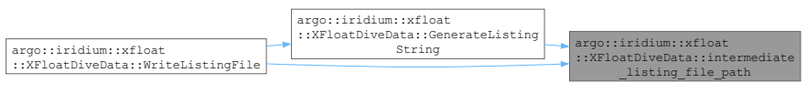
Returns

The path to the intermediate listing file on the local filesystem.

References listing_file_path_, and util::thread::RecursiveLockable::mutex_.

Referenced by GenerateListingString(), and WriteListingFile().

Here is the caller graph for this function:



10.87.3.94 ListDirectories()

```
static vector< path > util::file::FileSystemUtils::ListDirectories (
            const path & dir)  [inline], [static], [inherited]
```

List all directories contained in the given directory.

Parameters

in	*dir*	The path to the directory of interest.

Exceptions

log::MessageException	if the directory does not exist, is not a directory, or an error occurs.

Returns

A vector of paths to all the directories contained in the given directory.

References CATCH_BLOCK, and EXC_THROW.

10.87.3.95 ListFiles()

```
static vector< path > util::file::FileSystemUtils::ListFiles (
            path dir,
            size_t n = 0)  [inline], [static], [inherited]
```

List all regular files contained in the given directory.

Parameters

in	*dir*	The path to the directory of interest.
in	*n*	If n>0, the maximum number of paths to return, else no effect.

Exceptions

log::MessageException	if the directory does not exist, is not a directory, or an error occurs.

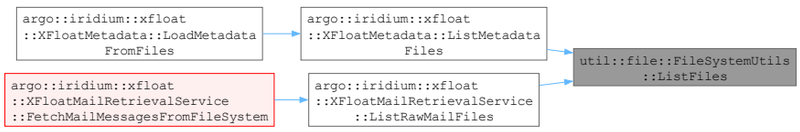
Returns

A vector of paths to all the regular files contained in the given directory.

References CATCH_BLOCK, and EXC_THROW.

Referenced by argo::iridium::xfloat::XFloatMetadata::ListMetadataFiles(), and argo::iridium::xfloat::XFloatMailRetrievalService::ListRawMa

Here is the caller graph for this function:



10.87.3.96 LockObject()

```
bool util::thread::RecursiveLockable::LockObject (
            bool block)  [inline], [inherited]
```

Lock the object.

Parameters

in	*block*	If TRUE, then the calling thread will block until the lock becomes available.

Exceptions

util::log::MessageException	if an error occurs.

Returns

TRUE if the lock was successfully obtained, or FALSE if block is FALSE and another thread owns the lock on the mutex.

References CATCH_BLOCK, and util::thread::RecursiveLockable::mutex_.

10.87.3.97 MoveFileToDirectory()

```
static path util::file::FileSystemUtils::MoveFileToDirectory (
            const path & file,
            const path & dir_dst,
            bool create_dir = false)  [inline], [static], [inherited]
```

Copy a file into a directory.

Warning

Despite its name, this function copies the file and does not remove the source. If a file with the same name already exists in the destination directory, it is left unchanged. It is not currently called.

Parameters

in	*file*	The file to copy.
in	*dir_dst*	The destination directory.
in	*create_dir*	If TRUE, create the destination directory if it does not exist.

Exceptions

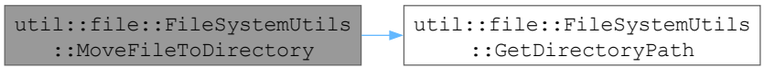
util::log::MessageException	if the file does not exist, is not a regular file, or cannot be copied.

Returns

The path of the file in the destination directory.

References CATCH_BLOCK, EXC_THROW, and util::file::FileSystemUtils::GetDirectoryPath().

Here is the call graph for this function:



10.87.3.98 phy_file_path()

```
const path & argo::iridium::xfloat::XFloatDiveData::phy_file_path () const  [inline]
```

Get the path to the PHY listing file on the local filesystem.

Returns

The path to the PHY listing file on the local filesystem.

References util::thread::RecursiveLockable::mutex_, and phy_file_path_.

Referenced by WritePhyFile().

Here is the caller graph for this function:

10.87.3.99 ResetData()

```
void argo::iridium::xfloat::XFloatDiveData::ResetData ()
```

Todo Implement NC variable generation for XFloatDiveData

References CATCH_BLOCK, mail_messages_, util::thread::RecursiveLockable::mutex_, util::xmsg::AbstractXSensorDataComposite< PF
util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::Reset(), xmsg_acoustic_positions_, xmsg_argo_data_,

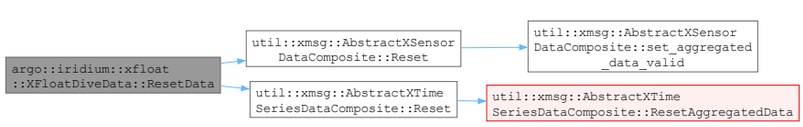
Here is the call graph for this function:



10.87.3.100 SaveObjectToDatabase()

```
void argo::iridium::xfloat::XFloatDiveData::SaveObjectToDatabase () const  [virtual]
```

Save this dive data object to the SQL database.

The parent instrument object is saved first, so that its row exists before the dive row that references it.

The parent instrument object is saved first, so that its row exists before the dive row that references it. Otherwise, the dive data for a float that is not yet in the database would fail the foreign key constraint.

Exceptions

util::log::MessageException	if an error occurs while saving the dive data or GPS message objects.

Implements util::mysql::LocalPersistentEntity.

References CATCH_BLOCK, CATCH_NOTHROW, ldbg, util::thread::RecursiveLockable::mutex_, sql_table_description_, and xmsg_gps_positions_.

10.87.3.101 SelectObjectFromDatabase()

```
static shared_ptr< XFloatDiveData > argo::iridium::xfloat::XFloatDiveData::SelectObjectFrom↩
Database (
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            const unsigned int & offset = 0)  [inline], [static]
```

Select a single dive data object from the SQL database table.

Parameters

in	*where*	The SQL select statement "where-condition" clause.
in	*groupBy*	The SQL select statement "group-by expression" clause.
in	*orderBy*	The SQL select statement "order-by expression" clause.
in	*offset*	The SQL select statement result set row offset value.

Exceptions

util::log::MessageException	if the query fails.

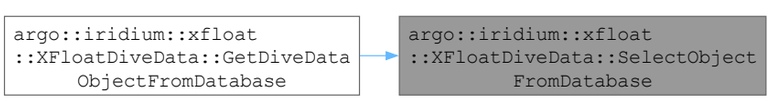
Returns

The first dive data object matching the query.

References CATCH_BLOCK, sql_table_description_, and std::make_shared.

Referenced by GetDiveDataObjectFromDatabase().

Here is the caller graph for this function:



10.87.3.102 SelectObjectsFromDatabase()

```
static vector< shared_ptr< XFloatDiveData > > argo::iridium::xfloat::XFloatDiveData::Select↩
ObjectsFromDatabase (
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            const unsigned int & limit = 0,
            const unsigned int & offset = 0)  [inline], [static]
```

Select dive data objects from the SQL database table.

Parameters

in	*where*	The SQL select statement "where-condition" clause.
in	*groupBy*	The SQL select statement "group-by expression" clause.
in	*orderBy*	The SQL select statement "order-by expression" clause.
in	*limit*	The SQL select statement result set row limit value (0 = no limit).
in	*offset*	The SQL select statement result set row offset value.

Exceptions

util::log::MessageException	if the query fails.

Returns

The dive data objects matching the query.

References CATCH_BLOCK, and sql_table_description_.

10.87.3.103 SelectValueFromDatabase()

```
template<typename TT >
static TT argo::iridium::xfloat::XFloatDiveData::SelectValueFromDatabase (
            const string & what,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            const unsigned int & offset = 0)  [inline], [static]
```

Select a single value from the dive data SQL database table.

Template Parameters

TT	The type of the value to select.

Parameters

in	*what*	The SQL select statement "what" clause (a single column or expression).
in	*where*	The SQL select statement "where-condition" clause.
in	*groupBy*	The SQL select statement "group-by expression" clause.
in	*orderBy*	The SQL select statement "order-by expression" clause.
in	*offset*	The SQL select statement result set row offset value.

Exceptions

util::log::MessageException	if the query fails.

Returns

The value from the first matching row.

References sql_table_description_.

10.87.3.104 SensorGainsAndOffsetsAreKnown()

```
bool argo::iridium::xfloat::XFloatDiveData::SensorGainsAndOffsetsAreKnown () const
```

Are the sensor gains and offsets known for this dive data object.

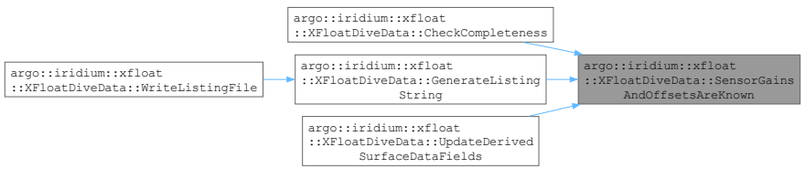
Returns

TRUE if the gains and offsets are known, or FALSE otherwise.

References util::thread::RecursiveLockable::mutex_, and xmsg_argo_data_.

Referenced by CheckCompleteness(), GenerateListingString(), and UpdateDerivedSurfaceDataFields().

Here is the caller graph for this function:



10.87.3.105 set_argo_instrument_type()

```
void argo::iridium::xfloat::XFloatDiveData::set_argo_instrument_type (
            XArgoInstrumentType_t type)  [inline], [private]
```

Set the enumerated Argo instrument type identifier.

Parameters

in	*type*	The enumerated Argo instrument type identifier.

References argo_instrument_type_, and util::thread::RecursiveLockable::mutex_.

10.87.3.106 set_id_dac()

```
void argo::iridium::Iridium::set_id_dac (
            int id_dac)  [inline], [protected], [inherited]
```

Set the unique Data Assembly Center (DAC) identifier.

Parameters

in	*id_dac*	The unique Data Assembly Center (DAC) identifier.

References argo::iridium::Iridium::id_dac(), argo::iridium::Iridium::id_dac_, and util::thread::RecursiveLockable::mutex_.

Referenced by AssignParentInstrument(), and argo::iridium::xfloat::XFloat::set_metadata().

10.87.3.111 set_intermediate_listing_file_path()

```
void argo::iridium::xfloat::XFloatDiveData::set_intermediate_listing_file_path (
            const path & file_path)  [inline], [private]
```

Set the path to the intermediate listing file.

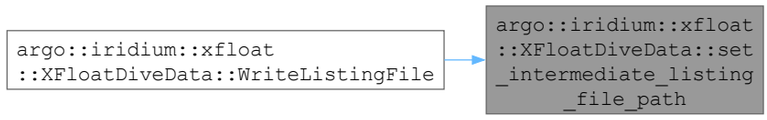
Parameters

in	*file_path*	The path to the intermediate listing file.

References listing_file_path_, and util::thread::RecursiveLockable::mutex_.

Referenced by WriteListingFile().

Here is the caller graph for this function:



10.87.3.112 set_phy_file_path()

```
void argo::iridium::xfloat::XFloatDiveData::set_phy_file_path (
            const path & file_path)  [inline], [private]
```

Set the path to the PHY listing file.

Parameters

in	*file_path*	The path to the PHY listing file.

References util::thread::RecursiveLockable::mutex_, and phy_file_path_.

Referenced by WritePhyFile().

Here is the caller graph for this function:

10.87.3.113 UnlockObject()

```
void util::thread::RecursiveLockable::UnlockObject ()  [inline], [inherited]
```

Unlock the object.

Exceptions

util::log::MessageException	if an error occurs.

References CATCH_BLOCK, and util::thread::RecursiveLockable::mutex_.

10.87.3.114 UpdateDerivedSurfaceDataFields()

```
void argo::iridium::xfloat::XFloatDiveData::UpdateDerivedSurfaceDataFields ()  [inline], [private]
```

Update the derived surface pressure fields from the surface time-series data.

Computes the surface pressure maximum, mean, minimum, number of samples and variance from the surface time series (see xmsg_surface_time_series_), using the surface sensor gains and offsets. These fields feed the surface pressure offset correction (see ComputePressureOffsetFromSurfaceTimeSeries()).

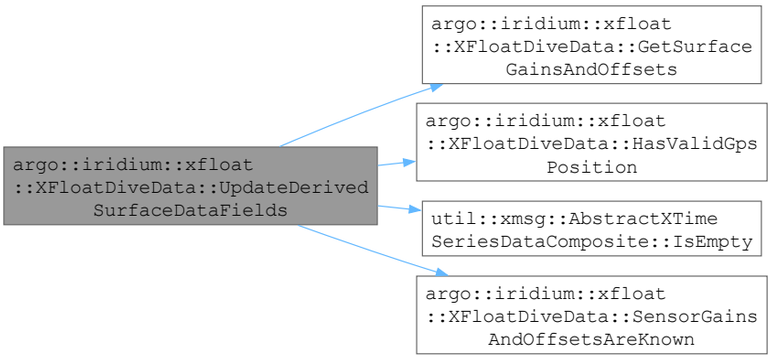
The fields are set to XMSG_SENS_BAD_PRES and marked invalid if the sensor gains and offsets are unknown, there is no surface data, or the mean surface pressure is outside ±5 dbar. Otherwise they are set, and marked valid only if the surface time series is complete and the dive has a valid GPS position.

Exceptions

util::log::MessageException	if an error occurs.

References CATCH_BLOCK, GetSurfaceGainsAndOffsets(), HasValidGpsPosition(), util::xmsg::AbstractXTimeSeriesDataComposite< M ldbg, util::thread::RecursiveLockable::mutex_, SensorGainsAndOffsetsAreKnown(), XMSG_SENS_BAD_PRES, and xmsg_surface_time_series_.

Here is the call graph for this function:



10.87.3.115 WriteListingFile()

```
void argo::iridium::xfloat::XFloatDiveData::WriteListingFile ()
```

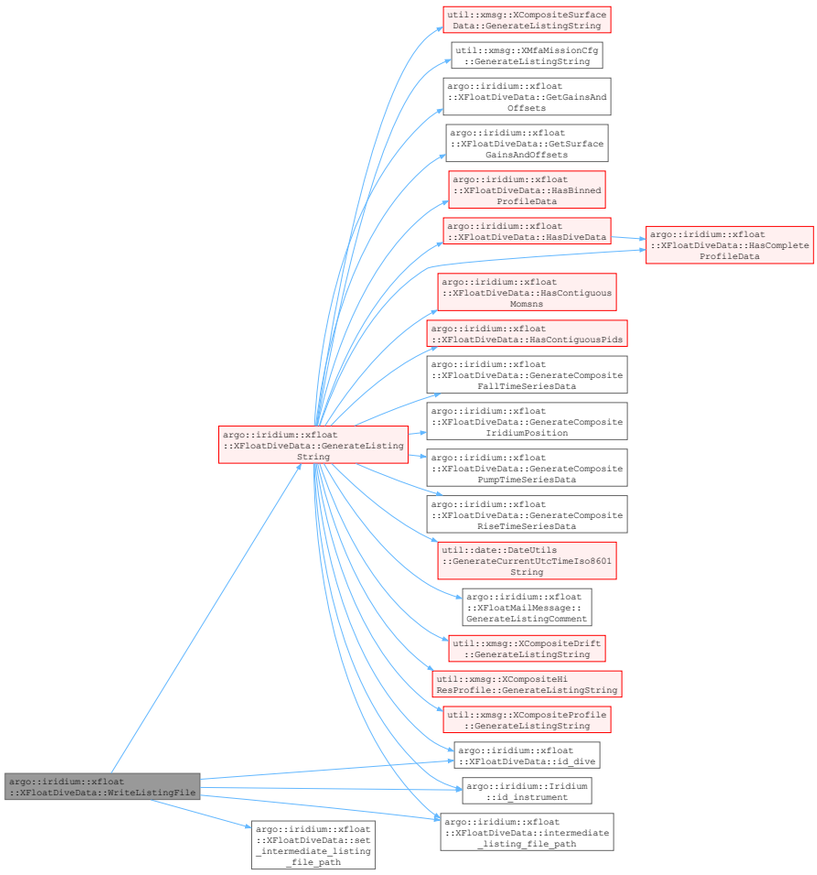
Write the listing file for this dive.

Exceptions

util::log::MessageException	if an error occurs while writing the listing file.

References CATCH_BLOCK, GenerateListingString(), id_dive(), argo::iridium::Iridium::id_instrument(), intermediate_listing_file_generatio intermediate_listing_file_path(), linf, util::thread::RecursiveLockable::mutex_, and set_intermediate_listing_file_path().

Here is the call graph for this function:



10.87.3.116 WritePhyFile()

```
void argo::iridium::xfloat::XFloatDiveData::WritePhyFile ()
```

Write the PHY file for this dive.

Exceptions

util::log::MessageException	if an error occurs while writing the PHY file.

References CATCH_BLOCK, GeneratePhyString(), util::file::FileSystemUtils::GetDirectoryPathFromString(), argo::iridium::Iridium::id_dac(id_dive(), argo::iridium::Iridium::id_instrument(), linf, util::thread::RecursiveLockable::mutex_, parent_instrument_, phy_directory_path_, phy_file_generation_is_enabled_, phy_file_path(), and set_phy_file_path().

10.87.4 Friends And Related Symbol Documentation

10.87.4.1 std::make_shared

```
shared_ptr< XFloatDiveData > std::make_shared ()  [friend]
```

Friend function for creating an X-Float object using the private constructor and a shared pointer to that object.

Referenced by GenerateCompositeFallTimeSeriesData(), GenerateCompositeIridiumPosition(), GenerateCompositePumpTimeSeriesDat
GenerateCompositeRiseTimeSeriesData(), GetGpsPositionEndOfDive(), and SelectObjectFromDatabase().

10.87.4.2 util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription

```
options_description util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription
()  [friend]
```

Friend function for populating some of the static data members of this class from the configuration file.

10.87.5 Member Data Documentation

10.87.5.1 address_

```
std::string util::mysql::LocalMysqlConfiguration::address_  [static], [private], [inherited]
```

The SQL server qualified name or IP address string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.87.5.2 argo_instrument_type_

```
XArgoInstrumentType_t argo::iridium::xfloat::XFloatDiveData::argo_instrument_type_  [private]
```

The enumerated Argo instrument type identifier.

This field is used to identify the specific type of instrument i.e. Solo-II, Deep Argo, or ALAMO/Hurricane floats. The value of this field may affect the behavior of some aspects of the application. For example, the manner in which some Iridium Short Burst Data (SBD) messages are decoded is dependent on the specific type of instrument.

Referenced by argo_instrument_type(), and set_argo_instrument_type().

10.87.5.3 complete_

```
bool argo::iridium::xfloat::XFloatDiveData::complete_  [private]
```

The dive-data-is-complete flag.

The value of this field indicates whether the dive data object is complete. The completeness of the dive data is determined by CheckCompleteness() which is invoked after each new mail message is decoded and assigned to this dive data object.

The dive data is determined to be complete if the dive data object meets all of the following criteria: it contains a complete set of profile data, the sensor gains and offsets for this dive are known (i.e. the Argo data message has been received), it contains a set of mail messages with contiguous packet identifiers (PIDs) starting at PID=0, and it contains a valid position for the profile. These criteria is determined by the functions HasCompleteProfileData(), SensorGainsAndOffsetsAreKnown(), HasContiguousPids(), HasValidPosition(), respectively.

10.87.5.4 id_dac_

```
int argo::iridium::Iridium::id_dac_  [private], [inherited]
```

The unique Data Assembly Center (DAC) identifier.

Referenced by argo::iridium::Iridium::id_dac(), and argo::iridium::Iridium::set_id_dac().

10.87.5.5 id_dive_

```
int argo::iridium::xfloat::XFloatDiveData::id_dive_  [private]
```

The dive or cycle number of this dive data object.

This field is used to index the dive data object for a given instrument. Together, the unique instrument identifier and the dive or cycle number provide a unique index of the dive data object.

Referenced by id_dive(), and set_id_dive().

10.87.5.6 id_imei_

```
long argo::iridium::Iridium::id_imei_  [private], [inherited]
```

The unique International Mobile Equipment Identifier (IMEI).

Referenced by argo::iridium::Iridium::id_imei(), and argo::iridium::Iridium::set_id_imei().

10.87.5.7 id_instrument_

```
int argo::iridium::Iridium::id_instrument_  [private], [inherited]
```

The unique instrument identifier or instrument serial number.

Referenced by argo::iridium::Iridium::id_instrument(), and argo::iridium::Iridium::set_id_instrument().

10.87.5.8 id_wmo_

```
int argo::iridium::Iridium::id_wmo_  [private], [inherited]
```

The unique World Meteorological Organization (WMO) identifier.

Referenced by argo::iridium::Iridium::id_wmo(), and argo::iridium::Iridium::set_id_wmo().

10.87.5.9 intermediate_listing_directory_path_

path argo::iridium::xfloat::XFloatDiveData::intermediate_listing_directory_path_ [static], [private]

The intermediate listing directory path on the local filesystem.

The value of this field determines the base directory to which intermediate listing files will be written. Intermediate listing files will be written to subdirectories of this path, which are organized by the unique instrument identifiers. Intermediate listing files will be written each time a new message is received from an instrument.

The value of this field is set as a result of parsing the command-line arguments and/or configuration file options during application initialization.

10.87.5.10 intermediate_listing_file_generation_is_enabled_

bool argo::iridium::xfloat::XFloatDiveData::intermediate_listing_file_generation_is_enabled_↩ [static], [private]

The global intermediate-listing-file-generation-is-enabled flag.

The value of this field determines whether or not any intermediate listing files will be written to the local filesystem. If TRUE, the intermediate listing files will be written as new messages are received by the application. Otherwise, if FALSE, no intermediate listing files will be written to the local filesystem.

The value of this field is set as a result of parsing the command-line arguments and/or configuration file options during application initialization.

Referenced by WriteListingFile().

10.87.5.11 iridium_position_datetime_first_

ptime argo::iridium::xfloat::XFloatDiveData::iridium_position_datetime_first_ [private]

The date/time of transmission of the first Iridium message sent by the instrument for this dive.

This field is updated as a result of assigning a mail message to this dive data object by calling the function AssignMailMessage(const shared_ptr<XFloatMailMessage>& x).

10.87.5.12 iridium_position_datetime_last_

ptime argo::iridium::xfloat::XFloatDiveData::iridium_position_datetime_last_ [private]

The date/time of transmission of the last Iridium message sent by the instrument for this dive.

This field is updated as a result of assigning a mail message to this dive data object by calling the function AssignMailMessage(const shared_ptr<XFloatMailMessage>& x).

10.87.5.13 listing_file_path_

path argo::iridium::xfloat::XFloatDiveData::listing_file_path_ [private]

The path to the intermediate listing file for this dive data on the local filesystem.

This field is set as a result of writing the intermediate listing file i.e. by calling WriteListingFile(). This path is relative to the listing directory, which is specified by the static data member intermediate_listing_directory_path_.

Referenced by intermediate_listing_file_path(), and set_intermediate_listing_file_path().

10.87.5.14 listing_file_updated_

bool argo::iridium::xfloat::XFloatDiveData::listing_file_updated_ [private]

The listing-file-is-updated flag.

10.87.5.15 mail_messages_

static_vector<shared_ptr<XFloatMailMessage>, XMSG_MAX_MAIL> argo::iridium::xfloat::XFloatDive↩
Data::mail_messages_ [private]

The mail messages for this dive data object.

This vector contains a set of shared reference to the mail messages that contain the telemetry data for this dive. Each time a mail message is received by the telemetry decoder thread, it is assigned to the corresponding dive data object before the thread goes on to decode the message.

This set of mail message may be used to reprocess the telemetry data for a dive, if necessary. For example, if a new Argo message arrives with different sensor gain and offset values than the previous dive, then the sensor data messages may be reprocessed using the new sensor gain and offset values.

Referenced by AssignMailMessage(), GenerateCompositeIridiumPosition(), GenerateListingString(), GenerateOrderedMomsnList(), GenerateOrderedPidList(), GeneratePhyString(), HasPositionData(), and ResetData().

10.87.5.16 mutex_

recursive_mutex util::thread::RecursiveLockable::mutex_ [mutable], [protected], [inherited]

Recursive mutual exclusion lock for synchronizing operations.

10.87.5.17 netcdf_directory_path_

`path argo::iridium::xfloat::XFloatDiveData::netcdf_directory_path_ [static], [private]`

The NetCDF directory path on the local filesystem.

The value of this field determines the base directory to which NetCDF files will be written. NetCDF files will be written to subdirectories of this path, which are organized by the unique instrument identifiers. NetCDF files will be written each time a new message is received from an instrument that completes all the necessary data for that dive and NetCDF file generation is enabled for that instrument.

The value of this field is set as a result of parsing the command-line arguments and/or configuration file options during application initialization.

10.87.5.18 netcdf_file_generation_is_enabled_

`bool argo::iridium::xfloat::XFloatDiveData::netcdf_file_generation_is_enabled_ [static], [private]`

The global NetCDF-file-generation-is-enabled flag.

The value of this field determines whether or not any NetCDF files will be written to the local filesystem. If TRUE, then NetCDF files will be written each time a complete set of dive data is received from a deployed instrument and NetCDF file generation is enabled for that instrument. Otherwise, if FALSE, no NetCDF files will be written to the local filesystem.

The value of this field is set as a result of parsing the command-line arguments and/or configuration file options during application initialization.

10.87.5.19 netcdf_file_path_

```
path argo::iridium::xfloat::XFloatDiveData::netcdf_file_path_  [private]
```

The NetCDF dimensions.

The NetCDF file path.

10.87.5.20 netcdf_file_updated_

```
bool argo::iridium::xfloat::XFloatDiveData::netcdf_file_updated_  [private]
```

The NetCDF-file-is-updated flag.

10.87.5.21 netcdf_reference_datetime_

```
const ptime argo::iridium::xfloat::XFloatDiveData::netcdf_reference_datetime_  [static], [private]
```

The NetCDF referecne date/time.

This field is used as the reference date/time for generation of NetCDF files where dates are represented as days since 00:00Z on this date and the fractional remainder represents the time-of-day. The value of this field represents the date/time 1950-01-01T00:00:00Z.

10.87.5.22 num_sbd_msgs_

```
uint16_t argo::iridium::xfloat::XFloatDiveData::num_sbd_msgs_  [private]
```

The number of SBD messages that have been received for this dive cycle.

Referenced by AssignMailMessage().

10.87.5.23 parent_instrument_

```
shared_ptr<XFloat> argo::iridium::xfloat::XFloatDiveData::parent_instrument_  [private]
```

The parent float or instrument object of this dive data object.

This field provides a shared back-reference to the instrument object that owns this dive data object. This field specifies the any-to-one or many-to-one relationship between dive data object and instrument objects.

Every dive data object must have a parent instrument object. In other words, value of this field should never be NULL.

Referenced by AssignArgoData(), AssignParentInstrument(), GenerateListingString(), GeneratePhyString(), and WritePhyFile().

10.87.5.24 password_

```
std::string util::mysql::LocalMysqlConfiguration::password_  [static], [private], [inherited]
```

The SQL server account password string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.87.5.25 phy_directory_path_

```
path argo::iridium::xfloat::XFloatDiveData::phy_directory_path_  [static], [private]
```

The PHY directory path on the local filesystem.

The value of this field determines the base directory to which PHY files will be written. PHY files will be written to subdirectories of this path, which are organized by the unique instrument identifiers. PHY files will be written each time a new message is received from an instrument that completes all the necessary data for that dive and PHY file generation is enabled for that instrument.

The value of this field is set as a result of parsing the command-line arguments and/or configuration file options during application initialization.

Referenced by WritePhyFile().

10.87.5.26 phy_file_generation_is_enabled_

```
bool argo::iridium::xfloat::XFloatDiveData::phy_file_generation_is_enabled_  [static], [private]
```

The global PHY-file-generation-is-enabled flag.

The value of this field determines whether or not any PHY files will be written to the local filesystem. If TRUE, then PHY files will be written each time a complete set of dive data is received from a deployed instrument and PHY file generation is enabled for that instrument. Otherwise, if FALSE, no PHY files will be written to the local filesystem.

The value of this field is set as a result of parsing the command-line arguments and/or configuration file options during application initialization.

Referenced by WritePhyFile().

10.87.5.27 phy_file_path_

```
path argo::iridium::xfloat::XFloatDiveData::phy_file_path_  [private]
```

The path to the PHY file for this dive data on the local filesystem.

This field is set as a result of writing the PHY listing file i.e. by calling WritePhyFile(). This path is relative to the PHY listing directory, which is specified by the static data member, intermediate_listing_directory_path_.

Referenced by phy_file_path(), and set_phy_file_path().

10.87.5.28 phy_file_updated_

```
bool argo::iridium::xfloat::XFloatDiveData::phy_file_updated_  [private]
```

The phy-file-is-updated flag.

10.87.5.29 port_

```
unsigned int util::mysql::LocalMysqlConfiguration::port_  [static], [private], [inherited]
```

The SQL server port number.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.87.5.30 pres_offs_

```
float argo::iridium::xfloat::XFloatDiveData::pres_offs_  [private]
```

The computed surface pressure offset for this dive.

10.87.5.31 pres_offs_num_dives_

```
int argo::iridium::xfloat::XFloatDiveData::pres_offs_num_dives_  [private]
```

The number of dives used to compute the surface pressure offset.

10.87.5.32 pres_offs_num_samples_

```
int argo::iridium::xfloat::XFloatDiveData::pres_offs_num_samples_  [private]
```

The number of samples used to compute the surface pressure offset.

10.87.5.33 pres_offs_valid_

```
bool argo::iridium::xfloat::XFloatDiveData::pres_offs_valid_  [private]
```

The surface-pressure offset-is-valid flag.

10.87.5.34 pressure_offset_correction_enabled_list_file_

```
bool argo::iridium::xfloat::XFloatDiveData::pressure_offset_correction_enabled_list_file_  [static],
[private]
```

The global surface-pressure-offset-correction-is-enabled-in-intermediate-listing-files flag.

The value of this flag determines whether the surface pressure offset correction is applied to all of the pressure values in the intermediate listing files. If TRUE, the surface pressure offset correction will be applied to the intermediate listing files. Otherwise, the pressure offset correction will not be applied.

The value of this field is set as a result of parsing the command-line arguments and/or configuration file options during application initialization.

Referenced by GenerateListingString().

10.87.5.35 pressure_offset_correction_enabled_netcdf_file_

```
bool argo::iridium::xfloat::XFloatDiveData::pressure_offset_correction_enabled_netcdf_file_↩
[static], [private]
```

The global surface-pressure-offset-correction-is-enabled-in-NetCDF-files flag.

The value of this flag determines whether the surface pressure offset correction is applied to all of the pressure values in the NetCDF files. If TRUE, the surface pressure offset correction will be applied to the NetCDF files. Otherwise, the pressure offset correction will not be applied.

The value of this field is set as a result of parsing the command-line arguments and/or configuration file options during application initialization.

10.87.5.36 pressure_offset_correction_enabled_phy_file_

```
bool argo::iridium::xfloat::XFloatDiveData::pressure_offset_correction_enabled_phy_file_  [static],
[private]
```

The global surface-pressure-offset-correction-is-enabled-in-PHY-files flag.

The value of this flag determines whether the surface pressure offset correction is applied to all of the pressure values in the PHY files. If TRUE, the surface pressure offset correction will be applied to the PHY files. Otherwise, the pressure offset correction will not be applied.

The value of this field is set as a result of parsing the command-line arguments and/or configuration file options during application initialization.

Referenced by GeneratePhyString().

10.87.5.37 protocol_

std::string util::mysql::LocalMysqlConfiguration::protocol_ [static], [private], [inherited]

The protocol to use in the SQL server connection e.g.

"tcp".

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.87.5.38 schema_

std::string util::mysql::LocalMysqlConfiguration::schema_ [static], [private], [inherited]

The SQL server schema name.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.87.5.39 sql_connection_

thread_specific_ptr<Connection> util::mysql::MysqlUtils::sql_connection_ [static], [private], [inherited]

Tthe thread-specific pointer to MySQL connection object.

Thread-specific MySQL connection, released by `MysqlUtils::CleanupSqlConnection()` when the thread exits.

Referenced by util::mysql::MysqlUtils::CloseSqlConnection(), and util::mysql::MysqlUtils::GetSqlConnection().

10.87.5.40 sql_driver_

thread_specific_ptr<MySQL_Driver> util::mysql::MysqlUtils::sql_driver_ [static], [private], [inherited]

The thread-specific pointer to MySQL driver object.

Thread-specific reference to the MySQL driver.

Its cleanup function, `MysqlUtils::CleanupSqlDriver()`, does not delete the shared driver instance.

Referenced by util::mysql::MysqlUtils::GetSqlDriver().

10.87.5.41 sql_table_description_

const util::mysql::SqlTableDescription< XFloatDiveData > argo::iridium::xfloat::XFloatDiveData↩ ::sql_table_description_ [static], [private]

The SQL table description object.

This SQL table description provides the details needed to map this object to a relational database table. It utilizes the accessor methods of the class and the details of the SQL table column to (1) create an SQL INSERT statement to save the object into the database, (2) populate one or more objects' fields as a result of an SQL SELECT query, or (3) query the SQL database to access one or more of the values that are stored the the SQL table corresponding to this object.

Referenced by DeleteFromDatabase(), DeleteObjectsFromDatabase(), SaveObjectToDatabase(), SelectObjectFromDatabase(), SelectObjectsFromDatabase(), and SelectValueFromDatabase().

10.87.5.42 surface_pres_max_

float argo::iridium::xfloat::XFloatDiveData::surface_pres_max_ [private]

The maximum reported surface pressure.

10.87.5.43 surface_pres_mean_

```
float argo::iridium::xfloat::XFloatDiveData::surface_pres_mean_  [private]
```

The mean surface pressure.

10.87.5.44 surface_pres_min_

```
float argo::iridium::xfloat::XFloatDiveData::surface_pres_min_  [private]
```

The minimum reported surface pressure.

10.87.5.45 surface_pres_num_samples_

```
int argo::iridium::xfloat::XFloatDiveData::surface_pres_num_samples_  [private]
```

The number of surface pressure samples reported.

10.87.5.46 surface_pres_valid_

```
bool argo::iridium::xfloat::XFloatDiveData::surface_pres_valid_  [private]
```

The surface-pressure-is-valid flag.

10.87.5.47 surface_pres_variance_

```
float argo::iridium::xfloat::XFloatDiveData::surface_pres_variance_  [private]
```

The surface pressure variance.

10.87.5.48 user_

```
std::string util::mysql::LocalMysqlConfiguration::user_  [static], [private], [inherited]
```

The SQL server account username string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.87.5.49 xmsg_acoustic_positions_

```
shared_ptr<x::XAcousticPosition> argo::iridium::xfloat::XFloatDiveData::xmsg_acoustic_positions↩
_  [private]
```

A vector of pointers to the acoustic position messages.

Note

This message type is used by MIZ floats only.

This vector is sorted upon insertion by order of non-decreasing message indices.

Referenced by GenerateListingString(), and ResetData().

10.87.5.50 xmsg_argo_data_

```
shared_ptr<x::XArgo> argo::iridium::xfloat::XFloatDiveData::xmsg_argo_data_  [private]
```

A pointer to the Argo data message.

Referenced by AssignArgoData(), GenerateListingString(), GetGainsAndOffsets(), GetSurfaceGainsAndOffsets(), ResetData(), and SensorGainsAndOffsetsAreKnown().

10.87.5.51 xmsg_composite_drift_data_

x::XCompositeDrift argo::iridium::xfloat::XFloatDiveData::xmsg_composite_drift_data_ [private]

The composite drift data object.

This object contains all of the drift data for this dive/cycle.

Referenced by AssignDriftPressure(), AssignDriftSalinity(), AssignDriftTemperatre(), GenerateListingString(), HasDriftData(), and ResetData().

10.87.5.52 xmsg_composite_profile_binned_

x::XCompositeProfile argo::iridium::xfloat::XFloatDiveData::xmsg_composite_profile_binned_ [private]

The composite binned profile data object.

This object contains all of the binned profile data for this dive/cycle.

Referenced by AssignAuxTemperatureBinned(), AssignProfilePressureBinned(), AssignProfileSalinityBinned(), AssignProfileTemperatureBinned(), GenerateListingString(), GeneratePhyString(), HasBinnedProfileData(), HasCompleteBinnedProfileDa and ResetData().

10.87.5.53 xmsg_composite_profile_unbinned_

x::XCompositeHiResProfile argo::iridium::xfloat::XFloatDiveData::xmsg_composite_profile_unbinned↩
_ [private]

The composite unbinned profile data object.

This object contains all of the unbinned profile data for this dive/cycle.

Referenced by AssignProfilePressureUnbinned(), AssignProfileSalinityUnbinned(), AssignProfileTemperatureUnbinned(), GenerateListingString(), GeneratePhyString(), HasCompleteUnbinnedProfileData(), HasUnbinnedProfileData(), and ResetData().

10.87.5.54 xmsg_engineering_data_abort_

shared_ptr<x::XEngAbort> argo::iridium::xfloat::XFloatDiveData::xmsg_engineering_data_abort_↩
[private]

A pointer to the engineering abort message.

Referenced by AssignEngineeringAbort(), GenerateListingString(), HasEngineeringData(), and ResetData().

10.87.5.55 xmsg_engineering_data_ascent_

shared_ptr<x::XEngAscent> argo::iridium::xfloat::XFloatDiveData::xmsg_engineering_data_ascent_↩
[private]

A pointer the the engineering ascent message.

Note

This message type is used by ALAMO floats only.

Referenced by AssignEngineeringAscent(), GenerateListingString(), HasEngineeringData(), and ResetData().

10.87.5.56 xmsg_engineering_data_bit_fail_

```
shared_ptr<x::XEngBITFail> argo::iridium::xfloat::XFloatDiveData::xmsg_engineering_data_bit_↩
fail_ [private]
```

A pointer to the engineering BIT failed message.

Referenced by AssignEngineeringBitFail(), GenerateListingString(), HasEngineeringData(), and ResetData().

10.87.5.57 xmsg_engineering_data_bit_passed_

```
shared_ptr<x::XEngBITPass> argo::iridium::xfloat::XFloatDiveData::xmsg_engineering_data_bit_↩
passed_ [private]
```

A pointer to the engineering BIT passed message.

Referenced by AssignEngineeringBitPass(), GenerateListingString(), HasEngineeringData(), and ResetData().

10.87.5.58 xmsg_engineering_data_descent_

```
shared_ptr<x::XEngDescent> argo::iridium::xfloat::XFloatDiveData::xmsg_engineering_data_descent↩
_ [private]
```

A pointer to the engineering descent message.

Note

This message type is used by ALAMO floats only.

Referenced by AssignEngineeringDescent(), GenerateListingString(), HasEngineeringData(), and ResetData().

10.87.5.59 xmsg_engineering_data_diagnostic_dive_

```
shared_ptr<x::XEngDiagnostic> argo::iridium::xfloat::XFloatDiveData::xmsg_engineering_data_↩
diagnostic_dive_ [private]
```

A pointer to the engineering diagnostic or startup message.

Referenced by AssignEngineeringDiagnostic(), GenerateListingString(), HasEngineeringData(), and ResetData().

10.87.5.60 xmsg_engineering_data_drift_

```
shared_ptr<x::XEngDrift> argo::iridium::xfloat::XFloatDiveData::xmsg_engineering_data_drift_↩
[private]
```

A pointer to the engineering drift message.

Note

This message type is used by ALAMO floats only.

Referenced by AssignEngineeringDrift(), GenerateListingString(), HasEngineeringData(), and ResetData().

10.87.5.61 xmsg_engineering_data_ice_

```
shared_ptr<x::XEngIce> argo::iridium::xfloat::XFloatDiveData::xmsg_engineering_data_ice_ [private]
```

A pointer to the ice-detection engineering message.

Referenced by AssignEngineeringIce(), GenerateListingString(), and ResetData().

10.87.5.62 xmsg_engineering_data_standard_dive_

shared_ptr<x::XEngStandard> argo::iridium::xfloat::XFloatDiveData::xmsg_engineering_data_standard_dive_ [private]

A pointer to the standard dive-cycle engineering message.

Referenced by AssignEngineeringStandard(), GenerateListingString(), HasEngineeringData(), and ResetData().

10.87.5.63 xmsg_engineering_data_surface_

shared_ptr<x::XEngSurface> argo::iridium::xfloat::XFloatDiveData::xmsg_engineering_data_surface_ [private]

A pointer to the engineering surface message.

Note

This message type is used by ALAMO floats only.

Referenced by AssignEngineeringSurface(), GenerateListingString(), HasEngineeringData(), and ResetData().

10.87.5.64 xmsg_fall_time_series_

static_vector<shared_ptr<x::XFall>, XMSG_MAX_FALL> argo::iridium::xfloat::XFloatDiveData::xmsg_fall_time_series_ [private]

A static vector of pointers to the fall time-series messages.

Note

This vector is sorted upon insertion by order of non-decreasing message indices.

Referenced by AssignFallTimeSeries(), GenerateCompositeFallTimeSeriesData(), GenerateListingString(), HasFallRiseData(), and ResetData().

10.87.5.65 xmsg_gps_positions_

static_vector<shared_ptr<x::XGPS>, XMSG_MAX_GPS> argo::iridium::xfloat::XFloatDiveData::xmsg_gps_positions_ [private]

A static vector of pointers to the GPS position message(s).

Note

This vector is sorted upon insertion by order of non-decreasing message indices.

Referenced by AssignGps(), GenerateListingString(), GetGpsPositionEndOfDive(), HasPositionData(), ResetData(), and SaveObjectToDatabase().

10.87.5.66 xmsg_mission_cfg_

x::XMfaMissionCfg argo::iridium::xfloat::XFloatDiveData::xmsg_mission_cfg_ [private]

The MFA mission configruation object.

Referenced by GenerateListingString().

10.87.5.67 xmsg_mission_cmd_echoback_

```
vector<shared_ptr<x::XMissionCmdEcho> > argo::iridium::xfloat::XFloatDiveData::xmsg_mission_↩
cmd_echoback_ [private]
```

A vector of pointer to mission configuration command upload echo-back messages.

Note

These messages are unordered.

Referenced by AssignMissionCmdEchoback(), GenerateListingString(), and ResetData().

10.87.5.68 xmsg_pump_time_series_

```
static_vector<shared_ptr<x::XPump>, XMSG_MAX_PUMP> argo::iridium::xfloat::XFloatDiveData::xmsg↩
_pump_time_series_ [private]
```

A static vector of pointers to the pump time-series messages.

Note

This vector is sorted upon insertion by order of non-decreasing message indices.

Referenced by AssignPumpTimeSeries(), GenerateCompositePumpTimeSeriesData(), GenerateListingString(), and ResetData().

10.87.5.69 xmsg_rise_time_series_

```
static_vector<shared_ptr<x::XRise>, XMSG_MAX_RISE> argo::iridium::xfloat::XFloatDiveData::xmsg↩
_rise_time_series_ [private]
```

A static vector of pointers to the fall time-series messages.

Note

This vector is sorted upon insertion by order of non-decreasing message indices.

Referenced by AssignRiseTimeSeries(), GenerateCompositeRiseTimeSeriesData(), GenerateListingString(), HasFallRiseData(), and ResetData().

10.87.5.70 xmsg_surface_time_series_

```
x::XCompositeSurfaceData argo::iridium::xfloat::XFloatDiveData::xmsg_surface_time_series_ [private]
```

The surface pressure time-series object.

Referenced by AssignSurfaceTimeSeries(), GenerateListingString(), HasDiveData(), ResetData(), and UpdateDerivedSurfaceDataFields()

10.87.5.71 xmsg_valve_data_

```
static_vector<shared_ptr<x::XValve>, XMSG_MAX_VALVE> argo::iridium::xfloat::XFloatDiveData↩
::xmsg_valve_data_ [private]
```

Valve operation messages.

Referenced by AssignValveData(), GenerateListingString(), and ResetData().

10.87.5.72 xmsg_wave_field_

```
shared_ptr<x::XWave> argo::iridium::xfloat::XFloatDiveData::xmsg_wave_field_  [private]
```

A static vector of pointers to the surface wave field data messages.

Note

This vector is sorted upon insertion by order of non-decreasing message indices.

Referenced by GenerateListingString().

The documentation for this class was generated from the following files:

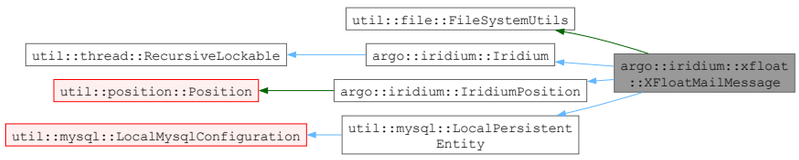
- data/XFloatDiveData.h
- data/XFloat.cpp
- data/XFloatDiveData.cpp
- data/XFloatMailMessage.cpp

10.88 argo::iridium::xfloat::XFloatMailMessage Class Reference

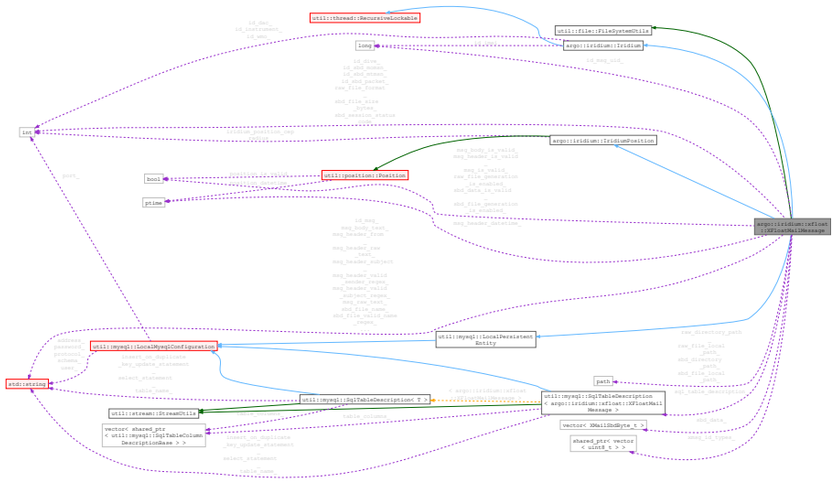
The mail message class.

```
#include <XFloatMailMessage.h>
```

Inheritance diagram for argo::iridium::xfloat::XFloatMailMessage:



Collaboration diagram for argo::iridium::xfloat::XFloatMailMessage:



Public Member Functions

- XFloatMailMessage ()

  The default constructor.
- XFloatMailMessage (const vmime::shared_ptr< vmime::net::message > &msg)

  Construct from a VMime mail message.
- ~XFloatMailMessage ()

  The destructor.
- const string GenerateListingString () const

  Generate the listing file entry string for this mail message.
- const string **GenerateSbdHexListingString** () const
- int id_dac () const

  Get the unique Data Assembly Center (DAC) identifier.
- int id_dive () const

  Get the cycle or dive number of this mail message.
- long id_imei () const

  Get the unique International Mobile Equipment Identifier (IMEI).
- int id_instrument () const

  Get the unique instrument identifier or instrument serial number.
- string id_msg () const

  Get the mail message unique identifier string.
- long id_msg_uid () const

  Get the mail message unique identifier.
- int id_sbd_momsn () const

  Get the Iridium Short Burst Data (SBD) Service Mobile Originated Message Sequence Number (MOMSN) identifier.
- int id_sbd_mtmsn () const

  Get the Iridium Short Burst Data (SBD) Service Mobile Terminated Message Sequence Number (MTMSN) identifier.
- int id_sbd_packet () const

  Get the Iridium Short Burst Data (SBD) message packet index.
- int id_wmo () const

  Get the unique World Meteorological Organization (WMO) identifier.
- string iridium_position_as_iso6709_string () const

  Get a formatted string representing the Iridium position composed using the ISO 6709 standard.
- int iridium_position_cep_radius () const

  Get the Iridium position Circular Error Probable (CEP) radius, in kilometers.
- ptime iridium_position_datetime () const

  Get the Iridium position date/time.
- string iridium_position_datetime_as_iso8601_string () const

  Get a formatted string representing the Iridium position date/time composed using the ISO 8601 standard.
- bool iridium_position_is_valid () const

  Get the Iridium position is valid flag.
- double iridium_position_latitude () const

  Get the Iridium position latitude.
- double iridium_position_longitude () const

  Get the Iridium position longitude.
- bool LockObject (bool block)

  Lock the object.
- bool msg_body_is_valid () const

  Is the body of the mail message valid?
- string msg_body_text () const

  Get the mail message body text.
- ptime msg_header_datetime () const

  Get the mail message header date/time.
- string msg_header_from () const

  Get the mail message header FROM field.
- bool msg_header_is_valid () const

  Is the header of the mail message valid?
- string msg_header_raw_text () const

  Get the message header raw text.
- string msg_header_subject () const

  Get the mail message header SUBJECT field.
- bool msg_is_valid () const

  Is the mail message valid?

- string msg_raw_text () const

  Get the full mail message raw text.
- path raw_file_local_path () const

  Get the path to the raw mail message file on the local filesystem.
- void SaveObjectToDatabase () const

  Save this mail message object to the SQL database.
- vector< uint8_t > sbd_data () const

  Get the Iridium Short Burst Data (SBD) binary data.
- bool sbd_data_is_valid () const

  Is the Iridium Short Burst Data (SBD) message valid?
- path sbd_file_local_path () const

  Get the path to the Iridium Short Burst Data (SBD) binary file on the local filesystem.
- string sbd_file_name () const

  Get the Iridium Short Burst Data (SBD) email attachment filename.
- int sbd_file_size_bytes () const

  Get the size of the Iridium Short Burst Data (SBD) message, in bytes.
- int sbd_session_status_code () const

  Get the Iridium Short Burst Data (SBD) session status code.
- string sbd_session_status_string () const

  Get the Iridium Short Burst Data (SBD) session status string.
- void UnlockObject ()

  Unlock the object.
- const shared_ptr< vector< uint8_t > > & **xmsg_id_types** () const

Static Public Member Functions

- static void CloseSqlConnection ()

  Close the thread-specific MySQL connection if it is currently open.
- static shared_ptr< sql::ResultSet > **executeDeleteQuery** (const string &from, const string &where="")
- static shared_ptr< ResultSet > ExecuteQuery (Connection *con, const string &query)

  Execute an SQL query and return a shared pointer to the ResultSet object.
- static shared_ptr< sql::ResultSet > executeQuery (const string &query)

  Execute an SQL query and return a shared pointer to the ResultSet object.
- static shared_ptr< sql::ResultSet > executeSelectQuery (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)

  Execute an SQL select query and return a shared pointer to the ResultSet object.
- static int ExecuteUpdate (Connection *con, const string &update)

  Execute an SQL update and return the status code.
- static int executeUpdate (const string &update)

  Execute an SQL update and return the status code.
- static string GenerateListingComment ()

  Get the mail message listing file comment string.
- static shared_ptr< PreparedStatement > GeneratePreparedStatement (Connection *con, const string &statement)

  Generate a prepared SQL statement object for the given SQL statement.
- static shared_ptr< sql::PreparedStatement > generatePreparedStatement (const string &statement)

  Generate a prepared SQL statement object for the given SQL statement.
- static string GenerateSqlDeleteStr (const string &from, const string &where="")

  Generate an SQL DELETE statement.
- static string GenerateSqlSelectStr (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)

  Generate an SQL select statement.
- static thread_specific_ptr< Connection > & GetSqlConnection (string url, string user, string password, string schema)

  Get a thread-specific instance of a MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > & GetSqlDriver ()

  Get a thread-specific instance of a MySQL driver object.

Protected Member Functions

- ptime position_datetime () const

  Get the date/time of the position.
- string position_datetime_as_iso8601_string () const

  Get a formatted string representing the position date/time composed using the ISO 8601 standard.
- bool position_is_valid () const

  Is the position valid?
- double position_latitude () const

  Get the latitude of the position, in decimal degrees.
- double position_longitude () const

  Get the longitude of the position, in decimal degrees.
- string postition_as_iso6709_string () const

  Get a formatted string representing the position composed using the ISO 6709 standard.
- void set_gps_position_datetime (unsigned int gpsWeek, unsigned int gpsDay, unsigned int gpsHour=0, unsigned int gpsMinute=0, unsigned int gpsSecond=0)

  Set the date and time of this position from the given GPS week, day, and time.
- void set_id_dac (int id_dac)

  Set the unique Data Assembly Center (DAC) identifier.
- void set_id_imei (long id_imei)

  Set the unique International Mobile Equipment Identifier (IMEI).
- void set_id_instrument (int id_instrument)

  Set the unique instrument identifier or instrument serial number.
- void set_id_wmo (int id_wmo)

  Set the unique World Meteorological Organization (WMO) identifier.
- void set_iridium_position_cep_radius (int iridium_position_cep_radius)

  Set the Iridium position Circular Error Probable (CEP) radius, in kilometers.
- void set_iridium_position_datetime (const ptime &iridium_position_datetime)

  Set the Iridium position date/time.
- void set_iridium_position_is_valid (bool iridium_position_is_valid)

  Set the Iridium position is valid flag.
- void set_iridium_position_latitude (double iridium_position_latitude)

  Set the Iridium position latitude, in decimal degrees.
- void set_iridium_position_longitude (double iridium_position_longitude)

  Set the Iridium position longitude, in decimal degrees.
- void set_position_datetime (const ptime &datetime)

  Set the date/time of the position.
- void set_position_is_valid (bool is_valid=true)

  Set the position is valid flag.
- void set_position_latitude (double lat)

  Set the latitude of the position, in decimal degrees.
- void set_position_longitude (double lon)

  Set the longitude of the position, in decimal degrees.

Static Protected Member Functions

- static float **bitcastUint32ToFloat** (uint32_t u)
- template<typename T >
  static double CalculateEllipsoidHeight (T lat)

  Get the approximate surface altitude or height of earth for a given latitude, in kilometers.
- template<typename T >
  static double CalculateGeographicDistance (T lat1, T lon1, T lat0, T lon0)

  Get the geographical distance between two position, in kilometers, from the positions' locations, in decimal degrees.
- template<typename T >
  static double degToRad (T deg)

  Convert angular units from from degrees to decimal radians.
- static string GenerateCurrentUtcTimeIso8601String ()

  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- template<typename T >
  static std::string GenerateIso6709String (T lat, T lon)

  Generate an IS06709 string representation of the position given by (`lat`, `lon`).
- static string GenerateIso8601String (const ptime &p, bool extended=true)

  Generate an ISO8601 format date/time string representation of a POSIX time object.

- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)

  Convert a date/time to fractional days since a reference date/time.
- static ptime GetCurrentUtcTime ()

  Generate a POSIX time object representing the current date and time (rounded to the nearest second).
- static const path & GetDirectoryPath (const path &dir, bool create=false)

  Get a directory path.
- static path GetDirectoryPathFromString (const string &dir, bool create=false)

  Generate a boost::filesystem::path object from the directory path string.
- static sql::Connection * getSqlConnection ()

  Generate a thread-specific instance of a MySQL connection object.
- template<typename T >
  static bool IsPositionValid (T lat, T lon)

  Check position validity.
- static vector< path > ListDirectories (const path &dir)

  List all directories contained in the given directory.
- static vector< path > ListFiles (path dir, size_t n=0)

  List all regular files contained in the given directory.
- static path MoveFileToDirectory (const path &file, const path &dir_dst, bool create_dir=false)

  Copy a file into a directory.

Protected Attributes

- recursive_mutex mutex_

  Recursive mutual exclusion lock for synchronizing operations.

Private Member Functions

- void ParseMailMsg (const vmime::shared_ptr< vmime::message > &msg)

  Parse a mail message.
- void ParseMailMsg (const vmime::shared_ptr< vmime::net::message > &msg)

  Parse a mail message.
- void ParseMailMsgBody (const vmime::shared_ptr< vmime::message > &msg)

  Parse the mail message body.
- void ParseMailMsgHeader (const vmime::shared_ptr< const vmime::header > &head)

  Parse the mail message header.
- void ParseMailMsgSbdAttachment (const vmime::shared_ptr< vmime::message > &msg)

  Parse the mail message SBD attachment.
- void set_id_dive (int id_dive)

  Set the dive or cycle number of this mail message.
- void set_id_msg (const string &id_msg)

  Set the mail message unique identifier string.
- void set_id_msg_uid (long id_msg_uid)

  Set the mail message unique identifier.
- void set_id_sbd_momsn (int momsn)

  Set the Iridium Short Burst Data (SBD) Service Mobile Originated Message Sequence Number (MOMSN).
- void set_id_sbd_mtmsn (int mtmsn)

  Set the Iridium Short Burst Data (SBD) Service Mobile Terminated Message Sequence Number (MTMSN).
- void set_id_sbd_packet (int id_sbd_packet)

  Set the Iridium Short Burst Data (SBD) message packet index.
- void set_msg_body_is_valid (bool is_valid)

  Set the message-body-is-valid flag.
- void set_msg_body_text (const string &msg_body_text)

  Set the mail message body text.
- void set_msg_header_datetime (const ptime &datetime)

  Set the mail message header date/time.
- void set_msg_header_from (const string &from)

  Set the mail message header FROM field value.
- void set_msg_header_is_valid (bool is_valid)

  Set the mail-message-header-is-valid flag.
- void set_msg_header_raw_text (const string &text)

  Set the mail message header raw text.
- void set_msg_header_subject (const string &subject)

Set the mail message header SUBJECT field value.

- void set_msg_is_valid (bool is_valid)

  Set the mail-message-is-valid flag.
- void set_msg_raw_text (const string &text)

  Set the full mail message raw text.
- void set_raw_file_local_path (const path &path)

  Set the path to the raw mail message file on the local file system.
- void set_sbd_data (const vector< uint8_t > &sbd_data)

  Set the Iridium Short Burst Data (SBD) for this mail message.
- void set_sbd_data_is_valid (bool is_valid)

  Set the SBD-message-is-valid flag.
- void set_sbd_file_local_path (const path &path)

  Set the path to the Iridium Short Burst Data (SBD) message file on the local file system.
- void set_sbd_file_name (const string &name)

  Set the name of the Iridium Short Burst Data (SBD) file.
- void set_sbd_file_size_bytes (int size)

  Set the size of the Iridium Short Burst Data (SBD) message, in bytes.
- void set_sbd_session_status_code (int code)

  Set the Iridium Short Burst Data (SBD) session status code.
- void set_sbd_session_status_string (const string &str)

  Set the Iridium Short Burst Data (SBD) session status string.
- void **set_xmsg_id_types** (const shared_ptr< vector< uint8_t > > &xmsg_id_types)
- void WriteFiles ()

  Write the mail message files.
- void WriteRawFile ()

  Write the RAW mail message file.
- void WriteSbdFile ()

  Write the binary Iridium Short Burst Data (SBD) file.

Static Private Member Functions

- static void CleanupSqlConnection (Connection *con)

  Cleanup an SQL connection.
- static void CleanupSqlDriver (MySQL_Driver *driver)

  Function for memory cleanup of MySQL driver on destruct.
- static vector< shared_ptr< XFloatMailMessage > > SelectAllObjectsFromDatabase (const string &groupBy="", const string &orderBy="", const unsigned int &limit=0, const unsigned int &offset=0)

  Select all mail message objects from the SQL database table.
- static shared_ptr< XFloatMailMessage > SelectObjectFromDatabase (const string &where="", const string &groupBy="", const string &orderBy="", const unsigned int &offset=0)

  Select a single mail message object from the SQL database table.
- static vector< shared_ptr< XFloatMailMessage > > SelectObjectsFromDatabase (const string &where="", const string &groupBy="", const string &orderBy="", const unsigned int &limit=0, const unsigned int &offset=0)

  Query mail message objects from the SQL database.
- template<typename TT >
  static TT SelectValueFromDatabase (const string &what, const string &where="", const string &groupBy="", const string &orderBy="", const unsigned int &offset=0)

  Select a value from the SQL database table that contains the persisted mail message objects.

Private Attributes

- int id_dac_

  The unique Data Assembly Center (DAC) identifier.
- int id_dive_

  The dive or cycle number of this mail message object.
- long id_imei_

  The unique International Mobile Equipment Identifier (IMEI).
- int id_instrument_

  The unique instrument identifier or instrument serial number.
- string id_msg_

  The mail message unique identifier string.
- long id_msg_uid_

The mail message unique identifier (UID).

- int id_sbd_momsn_

  The Iridium Short Burst Data (SBD) Service Mobile Originated Message Sequence Number (MOMSN) identifier.
- int id_sbd_mtmsn_

  The Iridium Short Burst Data (SBD) Service Mobile Terminated Message Sequence Number (MTMSN) identifier.
- int id_sbd_packet_

  The Iridium Short Burst Data (SBD) message packet index.
- int id_wmo_

  The unique World Meteorological Organization (WMO) identifier.
- int iridium_position_cep_radius_

  Iridium position Circular Error Probable (CEP) radius, in kilometers.
- bool msg_body_is_valid_

  The mail message body is valid flag.
- string msg_body_text_

  The mail message body text.
- ptime msg_header_datetime_

  The mail message header date/time.
- string msg_header_from_

  The mail message header FROM field.
- bool msg_header_is_valid_

  The mail message header is valid flag.
- string msg_header_raw_text_

  The mail message header raw text.
- string msg_header_subject_

  The mail message header SUBJECT field.
- bool msg_is_valid_

  The mail message is valid flag.
- string msg_raw_text_

  The full mail message raw text.
- ptime position_datetime_

  The date and time of the position.
- bool position_is_valid_

  The valid position indicator.
- double position_latitude_

  The latitude of the position, in decimal degrees.
- double position_longitude_

  The longitude of the position, in decimal degrees.
- path raw_file_local_path_

  The path to the raw mail message file on the local filesystem.
- XMailSbdData_t sbd_data_

  The Iridium Short Burst Data (SBD) binary data.
- bool sbd_data_is_valid_

  The Iridium Short Burst Data (SBD) binary data is valid flag.
- path sbd_file_local_path_

  The path to the Iridium Short Burst Data (SBD) binary file on the local filesystem.
- string sbd_file_name_

  The Iridium Short Burst Data (SBD) email attachment filename.
- int sbd_file_size_bytes_

  The size of the Iridium Short Burst Data (SBD) message, in bytes.
- int sbd_session_status_code_

  The Iridium Short Burst Data (SBD) session status code.
- string sbd_session_status_string_

  The Iridium Short Burst Data (SBD) session status string.
- shared_ptr< vector< uint8_t > > **xmsg_id_types_**

Static Private Attributes

- static string address_

  The SQL server qualified name or IP address string.
- static const double EARTH_RADIUS_KM_EQUATORIAL = 6378.1

  The equatorial radius of the earth, in kilometers.
- static const double EARTH_RADIUS_KM_POLAR = 6356.1

  The polar radius of the earth, in kilometers.
- static string msg_header_valid_sender_regex_

  The mail message header valid sender regular expression.
- static string msg_header_valid_subject_regex_

  The mail message header valid subject regular expression.
- static string password_

  The SQL server account password string.
- static unsigned int port_

  The SQL server port number.
- static string protocol_

  The protocol to use in the SQL server connection e.g.
- static path raw_directory_path_

  The RAW mail message file directory.
- static int raw_file_format_

  The raw mail message file format.
- static bool raw_file_generation_is_enabled_

  The global RAW-mail-message-file-generation-is-enabled flag.
- static path sbd_directory_path_

  The SBD file directory.
- static bool sbd_file_generation_is_enabled_

  The global binary-SBD-file-generation-is-enabled flag.
- static string sbd_file_valid_name_regex_

  The valid SBD file email attachment filename regular expression.
- static string schema_

  The SQL server schema name.
- static thread_specific_ptr< Connection > sql_connection_

  Tthe thread-specific pointer to MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > sql_driver_

  The thread-specific pointer to MySQL driver object.
- static const util::mysql::SqlTableDescription< XFloatMailMessage > sql_table_description_

  The SQL table description object.
- static string user_

  The SQL server account username string.

Friends

- ostream & operator<< (ostream &os, const XFloatMailMessage &mail)

  The stream insertion operator overload function for XFloatMailMessage.
- istream & operator>> (istream &is, XFloatMailMessage &mail)

  The stream extraction operator overload function for XFloatMailMessage.
- options_description util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription ()

  Friend function for populating some of the static members of this class from the configuration file options.
- class **XFloat**
- class **XFloatDiveData**
- class **XFloatMailProcessingService**
- class **XFloatMailRetrievalService**

10.88.1 Detailed Description

The mail message class.

This class represents a single mail message received from the Iridium system, including fields that are parsed from the various parts of the mail message and the attached Iridium Short Burst Data (SBD) file. It is used to parse, validate, and write the mail message files to the local filesystem.

Note

This class is mapped to an SQL database table by the sql_table_description_ object. This allows some or all of the field of this class to be persisted to the SQL database. Likewise, an object of this type may be constructed from the results of an SQL query to the corresponding table.

10.88.2 Constructor & Destructor Documentation

10.88.2.1 XFloatMailMessage() [1/2]

```
argo::iridium::xfloat::XFloatMailMessage::XFloatMailMessage ()  [inline]
```

The default constructor.

References sbd_data_.

10.88.2.2 XFloatMailMessage() [2/2]

```
argo::iridium::xfloat::XFloatMailMessage::XFloatMailMessage (
            const vmime::shared_ptr< vmime::net::message > & msg)  [inline]
```

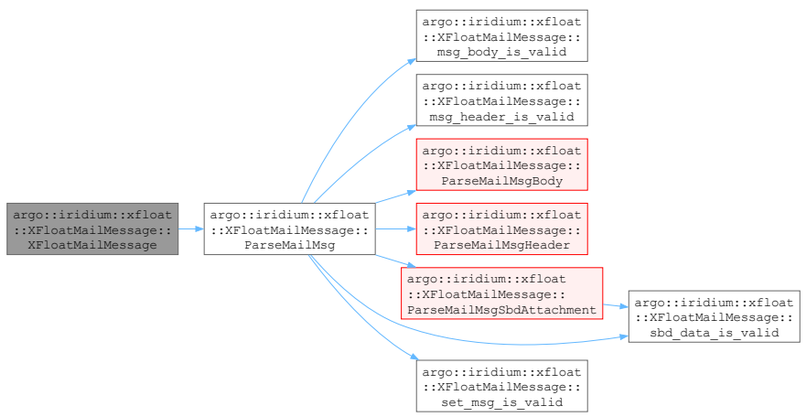
Construct from a VMime mail message.

Parameters

in	*msg*	The mail message.

References CATCH_BLOCK, ParseMailMsg(), and sbd_data_.

Here is the call graph for this function:



10.88.2.3 ~XFloatMailMessage()

```
argo::iridium::xfloat::XFloatMailMessage::~XFloatMailMessage ()  [inline]
```

The destructor.

10.88.3 Member Function Documentation

10.88.3.1 CalculateEllipsoidHeight()

```
template<typename T >
static double util::position::PositionUtils::CalculateEllipsoidHeight (
            T lat)  [inline], [static], [inherited]
```

Get the approximate surface altitude or height of earth for a given latitude, in kilometers.

Warning

This method provides approximate surface height estimates only! This approximation is calculated from a reference ellipsoid – a mathematically-defined surface that approximates the geoid, the truer figure of the Earth.

Parameters

in	*lat*	The geographic latitude of interest, in decimal degrees.

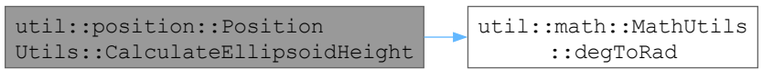
Returns

The approximate surface altitude or height of earth for the given latitude, in kilometers.

References util::math::MathUtils::degToRad(), util::position::PositionUtils::EARTH_RADIUS_KM_EQUATORIAL, and util::position::PositionUtils::EARTH_RADIUS_KM_POLAR.

Referenced by util::position::PositionUtils::CalculateGeographicDistance().

Here is the call graph for this function:



Here is the caller graph for this function:

10.88.3.2 CalculateGeographicDistance()

```
template<typename T >
static double util::position::PositionUtils::CalculateGeographicDistance (
            T lat1,
            T lon1,
            T lat0,
            T lon0)  [inline], [static], [inherited]
```

Get the geographical distance between two position, in kilometers, from the positions' locations, in decimal degrees.

Warning

This method provides approximate geographic estimates only! This approximation is calculated from a reference ellipsoid – a mathematically-defined surface that approximates the geoid, the truer figure of the Earth.

Note

This method uses the 'haversine' formula to calculate the great-circle distance between two points – that is, the shortest distance over the earth's surface – giving an 'as-the-crow-flies' distance between the points (ignoring any hills they fly over, of course!).

Parameters

in	*lat1*	The latitude of the geographic final position, in decimal degrees North.
in	*lon1*	The longitude of the geographic final position, in decimal degrees East.
in	*lat0*	The latitude of the geographic initial position, in decimal degrees North.
in	*lon0*	The longitude of the geographic initial position, in decimal degrees East.

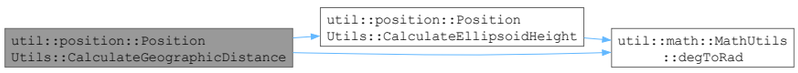
Returns

The geographical distance between the two given positions, in kilometers.

References util::position::PositionUtils::CalculateEllipsoidHeight(), and util::math::MathUtils::degToRad().

Referenced by util::xmsg::XCompositeIridiumPosition::ComputeAverageIrdiumPosition().

Here is the call graph for this function:



Here is the caller graph for this function:

10.88.3.3 CleanupSqlConnection()

```
static void util::mysql::MysqlUtils::CleanupSqlConnection (
            Connection * con)  [inline], [static], [private], [inherited]
```

Cleanup an SQL connection.

This function for memory cleanup of the SQL connection on destruction. The thread-specific SQL connection object will be deleted if it exists.

Parameters

in	*con*	The SQL connection to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL connection object.

References CATCH_BLOCK.

10.88.3.4 CleanupSqlDriver()

```
static void util::mysql::MysqlUtils::CleanupSqlDriver (
            MySQL_Driver * driver)  [inline], [static], [private], [inherited]
```

Function for memory cleanup of MySQL driver on destruct.

Signals the SQL driver to end operation, if it exists.

Parameters

in	*driver*	Driver to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL driver object.

References CATCH_BLOCK.

10.88.3.5 CloseSqlConnection()

```
static void util::mysql::MysqlUtils::CloseSqlConnection ()  [inline], [static], [inherited]
```

Close the thread-specific MySQL connection if it is currently open.

If the thread local MySQL connection is not currently open, then this function will have no effect.

Note

The MySQL connection should be closed when idle to prevent the connection from timing out and throwing exceptions.

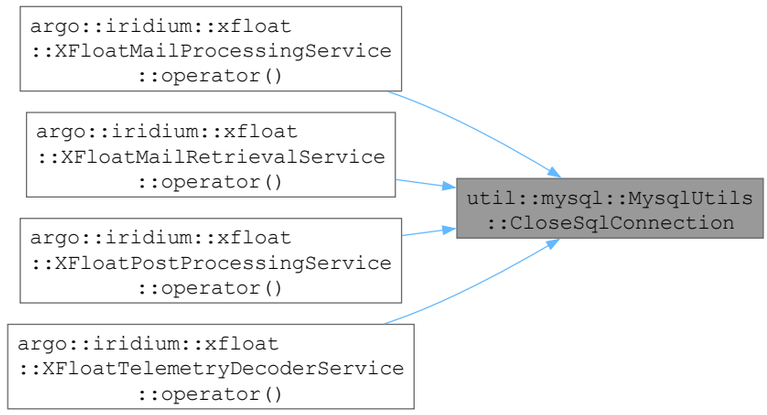
Exceptions

log::MessageException	if an error occurs while attempting to close the MySQL connection.

References CATCH_BLOCK, and util::mysql::MysqlUtils::sql_connection_.

Referenced by argo::iridium::xfloat::XFloatMailProcessingService::operator()(), argo::iridium::xfloat::XFloatMailRetrievalService::operator(
argo::iridium::xfloat::XFloatPostProcessingService::operator()(), and argo::iridium::xfloat::XFloatTelemetryDecoderService::operator()().

Here is the caller graph for this function:



10.88.3.6 degToRad()

```
template<typename T >
static double util::math::MathUtils::degToRad (
            T deg)  [inline], [static], [inherited]
```

Convert angular units from from degrees to decimal radians.

Parameters

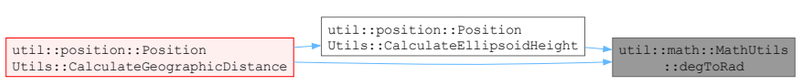
in	*deg*	Angle in integer or decimal degrees to convert to radians.

Returns

Angle in decimal radians.

Referenced by util::position::PositionUtils::CalculateEllipsoidHeight(), and util::position::PositionUtils::CalculateGeographicDistance().

Here is the caller graph for this function:



10.88.3.7 ExecuteQuery()

```
static shared_ptr< ResultSet > util::mysql::MysqlUtils::ExecuteQuery (
            Connection * con,
            const string & query)  [inline], [static], [inherited]
```

Execute an SQL query and return a shared pointer to the ResultSet object.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*query*	The SQL query to execute. This must be a well-formatted SQL query string.

Exceptions

log::MessageException	if 'con' is null, 'query' is a malfored SQL string, or any other error occurs.

Returns

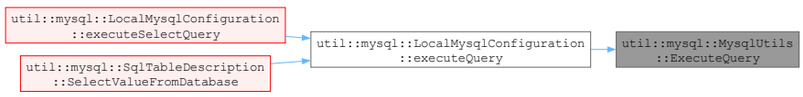
A shared pointer to the query ResultSet object.

References CATCH_BLOCK, and util::mysql::MysqlUtils::GeneratePreparedStatement().

Referenced by util::mysql::LocalMysqlConfiguration::executeQuery().

Here is the call graph for this function:

Here is the caller graph for this function:



10.88.3.8 executeQuery()

```
shared_ptr< sql::ResultSet > util::mysql::LocalMysqlConfiguration::executeQuery (
            const string & query)  [static], [inherited]
```

Execute an SQL query and return a shared pointer to the ResultSet object.

Parameters

in	*query*	The SQL query to execute. This must be a well-formatted SQL query string.

Exceptions

log::MessageException	'query' is a malfored SQL string or any other error occurs while executing the query.

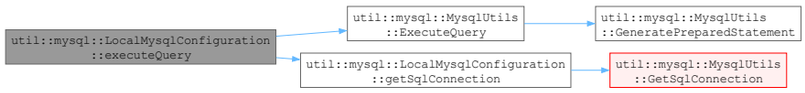
Returns

A shared pointer to the query ResultSet object.

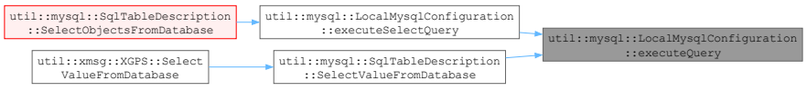
References util::mysql::MysqlUtils::ExecuteQuery(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

Referenced by util::mysql::LocalMysqlConfiguration::executeSelectQuery(), and util::mysql::SqlTableDescription< T >::SelectValueFromD

Here is the call graph for this function:



Here is the caller graph for this function:



10.88.3.9 executeSelectQuery()

```
shared_ptr< sql::ResultSet > util::mysql::LocalMysqlConfiguration::executeSelectQuery (
            const string & what,
            const string & from,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [static], [inherited]
```

Execute an SQL select query and return a shared pointer to the ResultSet object.

Parameters

in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table–references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Exceptions

log::MessageException	if an error occurs while executing the query.

Returns

A shared pointer to the ResultSet object.

References CATCH_BLOCK, util::mysql::LocalMysqlConfiguration::executeQuery(), and util::mysql::MysqlUtils::GenerateSqlSelectStr().

Referenced by util::mysql::SqlTableDescription< T >::SelectObjectsFromDatabase().

Here is the call graph for this function:

Here is the caller graph for this function:

10.88.3.10 ExecuteUpdate()

```
static int util::mysql::MysqlUtils::ExecuteUpdate (
            Connection * con,
            const string & update)  [inline], [static], [inherited]
```

Execute an SQL update and return the status code.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*update*	The SQL update to execute. This must be a well-formatted SQL update string.

Exceptions

log::MessageException	if 'con' is null, 'update' is a malformed SQL string, or any other error occurs.

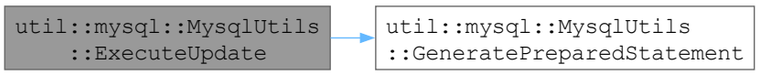
Returns

The update status code.

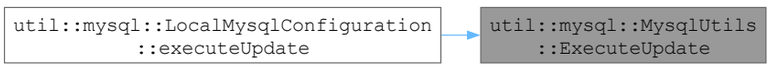
References CATCH_BLOCK, and util::mysql::MysqlUtils::GeneratePreparedStatement().

Referenced by util::mysql::LocalMysqlConfiguration::executeUpdate().

Here is the call graph for this function:



Here is the caller graph for this function:



10.88.3.11 executeUpdate()

```
int util::mysql::LocalMysqlConfiguration::executeUpdate (
            const string & update)  [static], [inherited]
```

Execute an SQL update and return the status code.

Parameters

in	*update*	The SQL update to execute. This must be a well-formatted SQL update string.

Exceptions

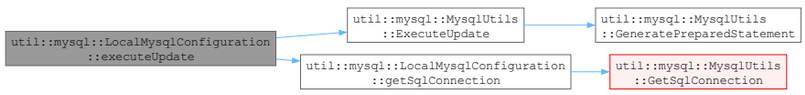
log::MessageException	if 'update' is a malformed SQL string, or any other error occurs while executing the update.

Returns

The update status code.

References util::mysql::MysqlUtils::ExecuteUpdate(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

Here is the call graph for this function:



10.88.3.12 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

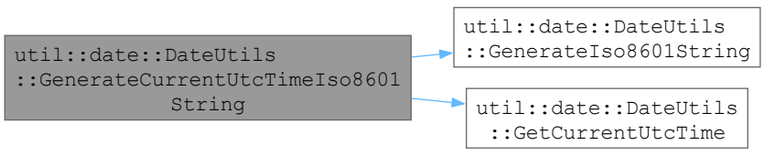
Returns

An ISO8601 format date/time string representation of the current time.

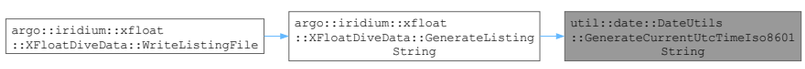
References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:



10.88.3.13 GenerateIso6709String()

```
template<typename T >
static std::string util::position::PositionUtils::GenerateIso6709String (
            T lat,
            T lon)  [inline], [static], [inherited]
```

Generate an IS06709 string representation of the position given by (`lat`, `lon`).

Parameters

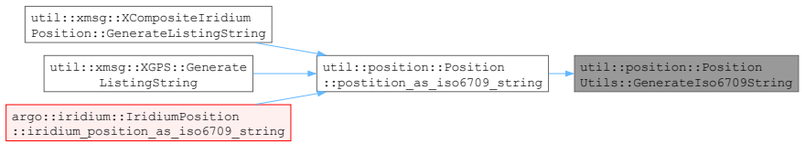
in	*lat*	The latitude of the position, in degrees North.
in	*lon*	The longitude of the position, in degrees East.

Returns

An IS06709 string representation of the position given by (`lat`, `lon`).

Referenced by util::position::Position::postition_as_iso6709_string().

Here is the caller graph for this function:



10.88.3.14 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

10.88.3.15 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref↩ _dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.88.3.16 GenerateListingComment()

```
static string argo::iridium::xfloat::XFloatMailMessage::GenerateListingComment ()  [inline], [static]
```

Get the mail message listing file comment string.

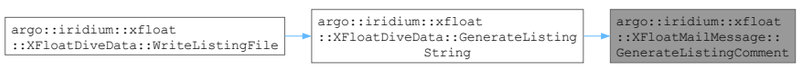
Returns

The mail message listing file comment string.

References CATCH_BLOCK.

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the caller graph for this function:



10.88.3.17 GenerateListingString()

```
const string argo::iridium::xfloat::XFloatMailMessage::GenerateListingString () const  [inline]
```

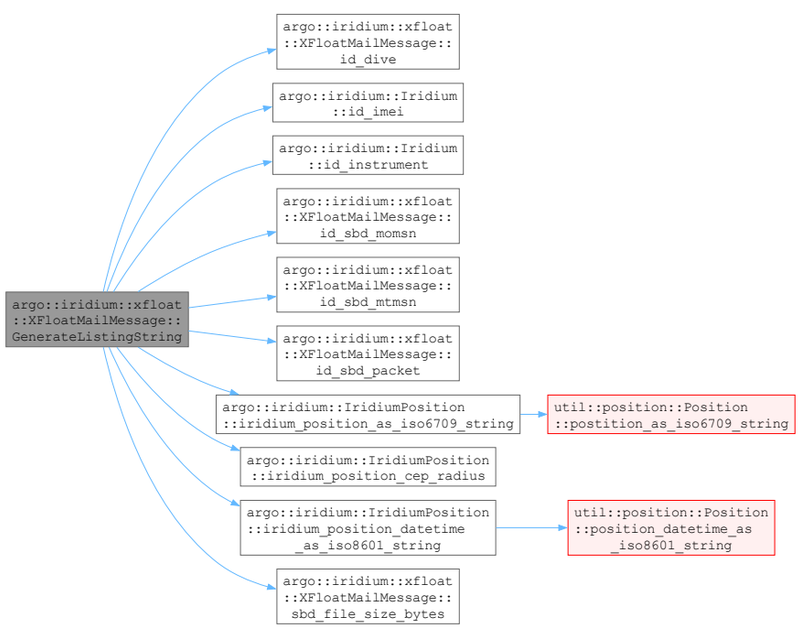
Generate the listing file entry string for this mail message.

Returns

The listing file entry string for this mail message.

References CATCH_BLOCK, id_dive(), argo::iridium::Iridium::id_imei(), argo::iridium::Iridium::id_instrument(), id_sbd_momsn(), id_sbd_mtmsn(), id_sbd_packet(), argo::iridium::IridiumPosition::iridium_position_as_iso6709_string(), argo::iridium::IridiumPosition::iridium_position_cep_radius(), argo::iridium::IridiumPosition::iridium_position_datetime_as_iso8601_string() and sbd_file_size_bytes().

Here is the call graph for this function:



10.88.3.18 GeneratePreparedStatement()

```
static shared_ptr< PreparedStatement > util::mysql::MysqlUtils::GeneratePreparedStatement (
            Connection * con,
            const string & statement)  [inline], [static], [inherited]
```

Generate a prepared SQL statement object for the given SQL statement.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*statement*	The SQL statement to prepare. This must be a well-formed SQL string.

Exceptions

log::MessageException	if 'con' is NULL, 'statement' is not a valid SQL string, or if an error occurs.

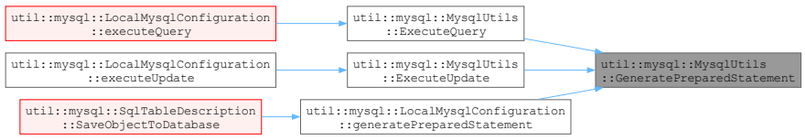
Returns

A prepared SQL statement object generated from the given SQL statement.

References CATCH_BLOCK, and EXC_THROW.

Referenced by util::mysql::MysqlUtils::ExecuteQuery(), util::mysql::MysqlUtils::ExecuteUpdate(), and util::mysql::LocalMysqlConfiguration:

Here is the caller graph for this function:



10.88.3.19 generatePreparedStatement()

```
std::shared_ptr< sql::PreparedStatement > util::mysql::LocalMysqlConfiguration::generatePrepared↩
Statement (
            const string & statement)  [static], [inherited]
```

Generate a prepared SQL statement object for the given SQL statement.

Parameters

in	*statement*	The SQL statement to prepare. This must be a well-formed SQL string.

Exceptions

log::MessageException	if 'statement' is not a valid SQL string or if an error occurs while generating the prepared statement object..

Returns

A prepared SQL statement object generated from the given SQL statement.

References util::mysql::MysqlUtils::GeneratePreparedStatement(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

Referenced by util::mysql::SqlTableDescription< T >::SaveObjectToDatabase().

10.88.3.20 GenerateSqlDeleteStr()

```
static string util::mysql::MysqlUtils::GenerateSqlDeleteStr (
            const string & from,
            const string & where = "")  [inline], [static], [inherited]
```

Generate an SQL DELETE statement.

Warning

Without a `where` clause, the statement deletes every row in the table.

Parameters

in	*from*	The name of the table to delete from.
in	*where*	The SQL "where-condition" clause (empty = all rows).

Returns

The SQL statement.

10.88.3.21 GenerateSqlSelectStr()

```
static string util::mysql::MysqlUtils::GenerateSqlSelectStr (
            const string & what,
            const string & from,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [inline], [static], [inherited]
```

Generate an SQL select statement.

Parameters

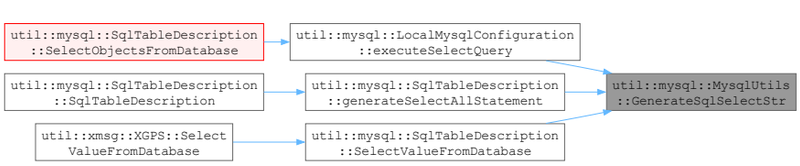
in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table-references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Returns

The SQL select statement.

Referenced by util::mysql::LocalMysqlConfiguration::executeSelectQuery(), util::mysql::SqlTableDescription< T >::generateSelectAllState
and util::mysql::SqlTableDescription< T >::SelectValueFromDatabase().

Here is the caller graph for this function:



10.88.3.22 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

10.88.3.23 GetDirectoryPath()

```
static const path & util::file::FileSystemUtils::GetDirectoryPath (
            const path & dir,
            bool create = false)  [inline], [static], [inherited]
```

Get a directory path.

Exceptions

MessageException	if create == FALSE and the directory specified by path does not exist.

Parameters

in	*dir*	Directory path.
in	*create*	If TRUE, the directory specified by path will be created if it does not already exists. If FALSE, an exception will be thrown if the directory does not exist.

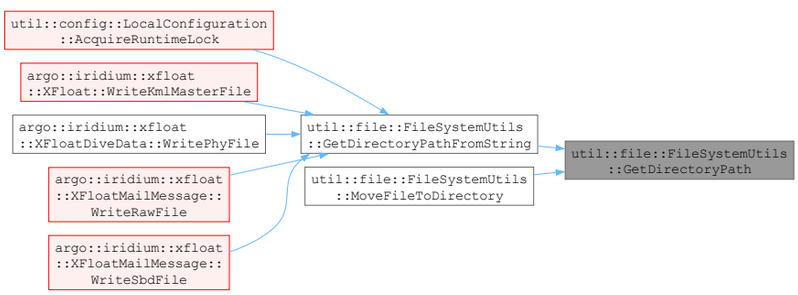
Returns

dir

References CATCH_BLOCK, EXC_THROW, and ldbg.

Referenced by util::file::FileSystemUtils::GetDirectoryPathFromString(), and util::file::FileSystemUtils::MoveFileToDirectory().

Here is the caller graph for this function:



10.88.3.24 GetDirectoryPathFromString()

```
static path util::file::FileSystemUtils::GetDirectoryPathFromString (
            const string & dir,
            bool create = false)  [inline], [static], [inherited]
```

Generate a boost::filesystem::path object from the directory path string.

Exceptions

MessageException	if create == FALSE and the directory specified by path does not exist.

Parameters

in	*dir*	Directory path string.
in	*create*	If TRUE, the directory specified by path will be created if it does not already exists. If FALSE, an exception will be thrown if the directory does not exist.

Returns

A boost::filesystem::path object from the directory path string.

References CATCH_BLOCK, and util::file::FileSystemUtils::GetDirectoryPath().

Referenced by util::config::LocalConfiguration::AcquireRuntimeLock(), argo::iridium::xfloat::XFloat::WriteKmlMasterFile(), argo::iridium::xfloat::XFloatDiveData::WritePhyFile(), WriteRawFile(), and WriteSbdFile().

10.88.3.25 GetSqlConnection()

```
static thread_specific_ptr< Connection > & util::mysql::MysqlUtils::GetSqlConnection (
            string url,
            string user,
            string password,
            string schema)  [inline], [static], [inherited]
```

Get a thread-specific instance of a MySQL connection object.

A new connection will be created, if necessary.

Parameters

in	*url*	The MySQL host server qualified address.
in	*user*	The MySQL account username.
in	*password*	The MySQL account password.
in	*schema*	The MySQL account schema name.

Exceptions

log::MessageException	if an error occurs while creating a new thread-specific instance of the SQL connection object

Returns

A thread-specific instance of a MySQL connection object.

References CATCH_BLOCK, util::mysql::MysqlUtils::GetSqlDriver(), and util::mysql::MysqlUtils::sql_connection_.

Here is the caller graph for this function:

10.88.3.32 id_msg()

```
string argo::iridium::xfloat::XFloatMailMessage::id_msg () const  [inline]
```

Get the mail message unique identifier string.

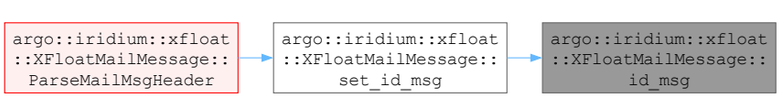
Returns

The mail message unique identifier string.

References id_msg_, and util::thread::RecursiveLockable::mutex_.

Referenced by set_id_msg().

Here is the caller graph for this function:



10.88.3.33 id_msg_uid()

```
long argo::iridium::xfloat::XFloatMailMessage::id_msg_uid () const  [inline]
```

Get the mail message unique identifier.

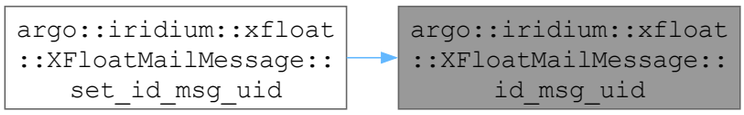
Returns

The mail message unique identifier.

References id_msg_uid_, and util::thread::RecursiveLockable::mutex_.

Referenced by set_id_msg_uid().

Here is the caller graph for this function:



10.88.3.34 id_sbd_momsn()

```
int argo::iridium::xfloat::XFloatMailMessage::id_sbd_momsn () const  [inline]
```

Get the Iridium Short Burst Data (SBD) Service Mobile Originated Message Sequence Number (MOMSN) identifier.

Returns

The Iridium Short Burst Data (SBD) Service Mobile Originated Message Sequence Number (MOMSN) identifier.

References id_sbd_momsn_, and util::thread::RecursiveLockable::mutex_.

Referenced by GenerateListingString(), WriteRawFile(), and WriteSbdFile().

10.88.3.35 id_sbd_mtmsn()

```
int argo::iridium::xfloat::XFloatMailMessage::id_sbd_mtmsn () const  [inline]
```

Get the Iridium Short Burst Data (SBD) Service Mobile Terminated Message Sequence Number (MTMSN) identifier.

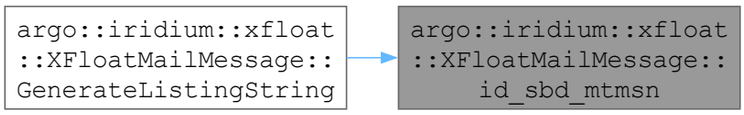
Returns

The Iridium Short Burst Data (SBD) Service Mobile Terminated Message Sequence Number (MTMSN) identifier.

References id_sbd_mtmsn_, and util::thread::RecursiveLockable::mutex_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.88.3.36 id_sbd_packet()

```
int argo::iridium::xfloat::XFloatMailMessage::id_sbd_packet () const  [inline]
```

Get the Iridium Short Burst Data (SBD) message packet index.

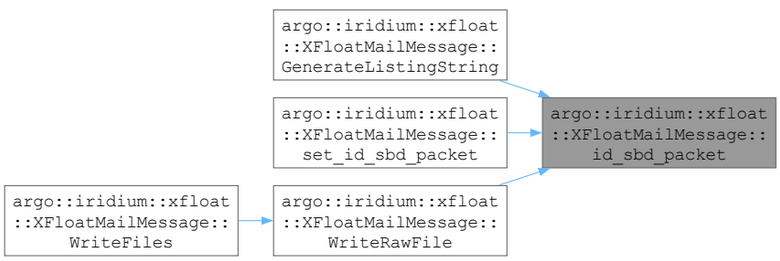
Returns

The Iridium Short Burst Data (SBD) message packet index.

References id_sbd_packet_, and util::thread::RecursiveLockable::mutex_.

Referenced by GenerateListingString(), set_id_sbd_packet(), and WriteRawFile().

Here is the caller graph for this function:



10.88.3.37 id_wmo()

```
int argo::iridium::Iridium::id_wmo () const  [inline], [inherited]
```

Get the unique World Meteorological Organization (WMO) identifier.

Returns

The unique World Meteorological Organization (WMO) identifier.

References argo::iridium::Iridium::id_wmo_, and util::thread::RecursiveLockable::mutex_.

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignParentInstrument(), argo::iridium::xfloat::XFloatDiveData::GenerateListingStrir

10.88.3.42 iridium_position_is_valid()

```
bool argo::iridium::IridiumPosition::iridium_position_is_valid () const  [inline], [inherited]
```

Get the Iridium position is valid flag.

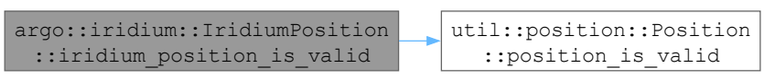
Returns

TRUE if the Iridium position is valid, or FALSE otherwise.

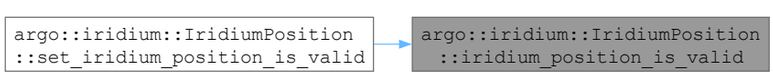
References util::position::Position::position_is_valid().

Referenced by argo::iridium::IridiumPosition::set_iridium_position_is_valid().

Here is the call graph for this function:



Here is the caller graph for this function:



10.88.3.43 iridium_position_latitude()

```
double argo::iridium::IridiumPosition::iridium_position_latitude () const  [inline], [inherited]
```

Get the Iridium position latitude.

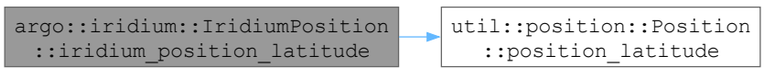
Returns

The Iridium position latitude.

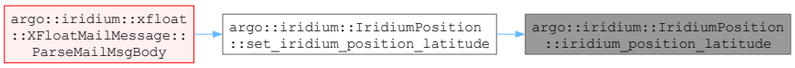
References util::position::Position::position_latitude().

Referenced by argo::iridium::IridiumPosition::set_iridium_position_latitude().

Here is the call graph for this function:



Here is the caller graph for this function:



10.88.3.44 iridium_position_longitude()

```
double argo::iridium::IridiumPosition::iridium_position_longitude () const  [inline], [inherited]
```

Get the Iridium position longitude.

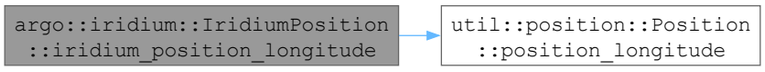
Returns

The Iridium position longitude.

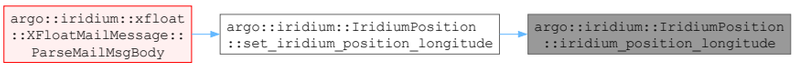
References util::position::Position::position_longitude().

Referenced by argo::iridium::IridiumPosition::set_iridium_position_longitude().

Here is the call graph for this function:



Here is the caller graph for this function:



10.88.3.45 IsPositionValid()

```
template<typename T >
static bool util::position::PositionUtils::IsPositionValid (
            T lat,
            T lon)  [inline], [static], [inherited]
```

Check position validity.

Parameters

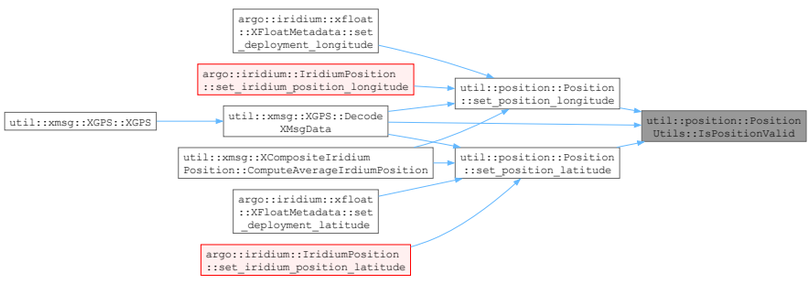
in	*lat*	Latitude of position.
in	*lon*	Longitude of position.

Returns

TRUE if (lat, lon) represents a valid geographical position, or FALSE otherwise.

Referenced by util::xmsg::XGPS::DecodeXMsgData(), util::position::Position::set_position_latitude(), and util::position::Position::set_positio

Here is the caller graph for this function:



10.88.3.46 ListDirectories()

```
static vector< path > util::file::FileSystemUtils::ListDirectories (
            const path & dir)  [inline], [static], [inherited]
```

List all directories contained in the given directory.

Parameters

in	*dir*	The path to the directory of interest.

Exceptions

log::MessageException	if the directory does not exist, is not a directory, or an error occurs.

Returns

A vector of paths to all the directories contained in the given directory.

References CATCH_BLOCK, and EXC_THROW.

10.88.3.47 ListFiles()

```
static vector< path > util::file::FileSystemUtils::ListFiles (
            path dir,
            size_t n = 0)  [inline], [static], [inherited]
```

List all regular files contained in the given directory.

Parameters

in	*dir*	The path to the directory of interest.
in	*n*	If n>0, the maximum number of paths to return, else no effect.

Exceptions

log::MessageException	if the directory does not exist, is not a directory, or an error occurs.

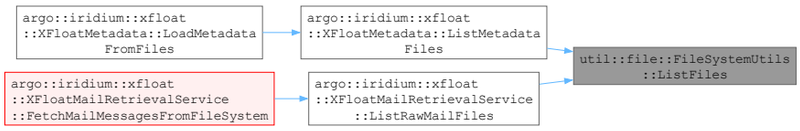
Returns

A vector of paths to all the regular files contained in the given directory.

References CATCH_BLOCK, and EXC_THROW.

Referenced by argo::iridium::xfloat::XFloatMetadata::ListMetadataFiles(), and argo::iridium::xfloat::XFloatMailRetrievalService::ListRawMa

Here is the caller graph for this function:



10.88.3.48 LockObject()

```
bool util::thread::RecursiveLockable::LockObject (
            bool block)  [inline], [inherited]
```

Lock the object.

Parameters

in	*block*	If TRUE, then the calling thread will block until the lock becomes available.

Exceptions

util::log::MessageException	if an error occurs.

Returns

TRUE if the lock was successfully obtained, or FALSE if block is FALSE and another thread owns the lock on the mutex.

References CATCH_BLOCK, and util::thread::RecursiveLockable::mutex_.

10.88.3.49 MoveFileToDirectory()

```
static path util::file::FileSystemUtils::MoveFileToDirectory (
            const path & file,
            const path & dir_dst,
            bool create_dir = false)  [inline], [static], [inherited]
```

Copy a file into a directory.

Warning

Despite its name, this function copies the file and does not remove the source. If a file with the same name already exists in the destination directory, it is left unchanged. It is not currently called.

Parameters

in	*file*	The file to copy.
in	*dir_dst*	The destination directory.
in	*create_dir*	If TRUE, create the destination directory if it does not exist.

Exceptions

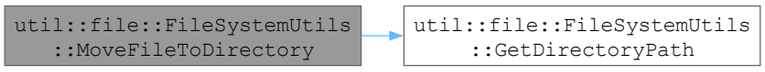
util::log::MessageException	if the file does not exist, is not a regular file, or cannot be copied.

Returns

The path of the file in the destination directory.

References CATCH_BLOCK, EXC_THROW, and util::file::FileSystemUtils::GetDirectoryPath().

Here is the call graph for this function:



10.88.3.50 msg_body_is_valid()

```
bool argo::iridium::xfloat::XFloatMailMessage::msg_body_is_valid () const  [inline]
```

Is the body of the mail message valid?

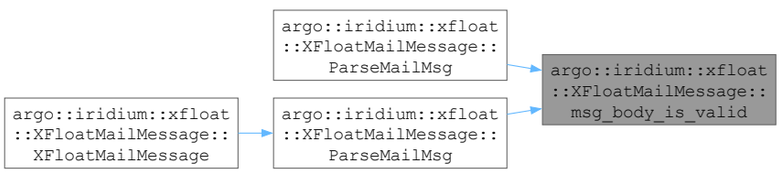
Returns

TRUE if the body of the mail message is valid, or FALSE otherwise.

References msg_body_is_valid_, and util::thread::RecursiveLockable::mutex_.

Referenced by ParseMailMsg(), and ParseMailMsg().

Here is the caller graph for this function:



10.88.3.51 msg_body_text()

```
string argo::iridium::xfloat::XFloatMailMessage::msg_body_text () const  [inline]
```

Get the mail message body text.

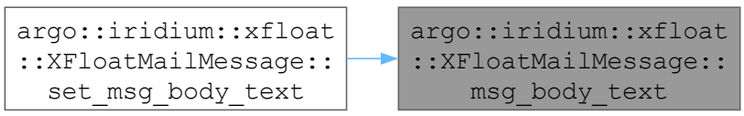
Returns

The mail message body text.

References msg_body_text_, and util::thread::RecursiveLockable::mutex_.

Referenced by set_msg_body_text().

Here is the caller graph for this function:



10.88.3.52 msg_header_datetime()

```
ptime argo::iridium::xfloat::XFloatMailMessage::msg_header_datetime () const  [inline]
```

Get the mail message header date/time.

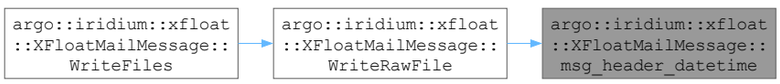
Returns

The mail message header date/time.

References msg_header_datetime_, and util::thread::RecursiveLockable::mutex_.

Referenced by WriteRawFile().

Here is the caller graph for this function:



10.88.3.53 msg_header_from()

```
string argo::iridium::xfloat::XFloatMailMessage::msg_header_from () const  [inline]
```

Get the mail message header FROM field.

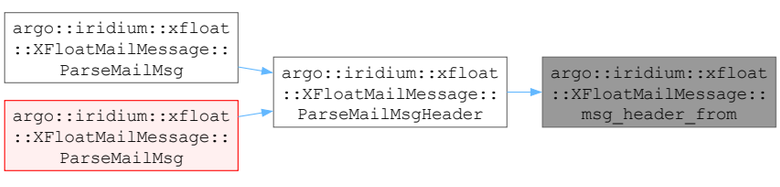
Returns

The mail message header FROM field.

References msg_header_from_, and util::thread::RecursiveLockable::mutex_.

Referenced by ParseMailMsgHeader().

Here is the caller graph for this function:



10.88.3.54 msg_header_is_valid()

```
bool argo::iridium::xfloat::XFloatMailMessage::msg_header_is_valid () const  [inline]
```

Is the header of the mail message valid?

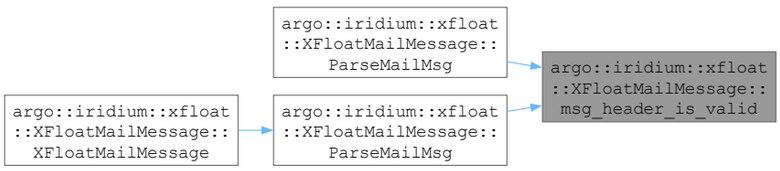
Returns

TRUE if the header of the mail message is valid, or FALSE otherwise.

References msg_header_is_valid_, and util::thread::RecursiveLockable::mutex_.

Referenced by ParseMailMsg(), and ParseMailMsg().

Here is the caller graph for this function:



10.88.3.55 msg_header_raw_text()

```
string argo::iridium::xfloat::XFloatMailMessage::msg_header_raw_text () const  [inline]
```

Get the message header raw text.

Returns

The message header raw text.

References msg_header_raw_text_, and util::thread::RecursiveLockable::mutex_.

10.88.3.56 msg_header_subject()

```
string argo::iridium::xfloat::XFloatMailMessage::msg_header_subject () const  [inline]
```

Get the mail message header SUBJECT field.

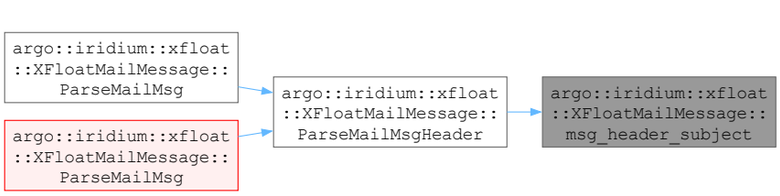
Returns

The mail message header SUBJECT field.

References msg_header_subject_, and util::thread::RecursiveLockable::mutex_.

Referenced by ParseMailMsgHeader().

Here is the caller graph for this function:



10.88.3.57 msg_is_valid()

```
bool argo::iridium::xfloat::XFloatMailMessage::msg_is_valid () const  [inline]
```

Is the mail message valid?

Returns

TRUE if the mail message is valid, or FALSE otherwise.

References msg_is_valid_, and util::thread::RecursiveLockable::mutex_.

10.88.3.58 msg_raw_text()

```
string argo::iridium::xfloat::XFloatMailMessage::msg_raw_text () const  [inline]
```

Get the full mail message raw text.

Returns

The full mail message raw text.

References msg_raw_text_, and util::thread::RecursiveLockable::mutex_.

10.88.3.59 ParseMailMsg() [1/2]

```
void argo::iridium::xfloat::XFloatMailMessage::ParseMailMsg (
            const vmime::shared_ptr< vmime::message > & msg)  [inline], [private]
```

Parse a mail message.

This function is used to parse and validate a mail message. As a result of parsing the mail message, the fields of this class are populated.

Exceptions

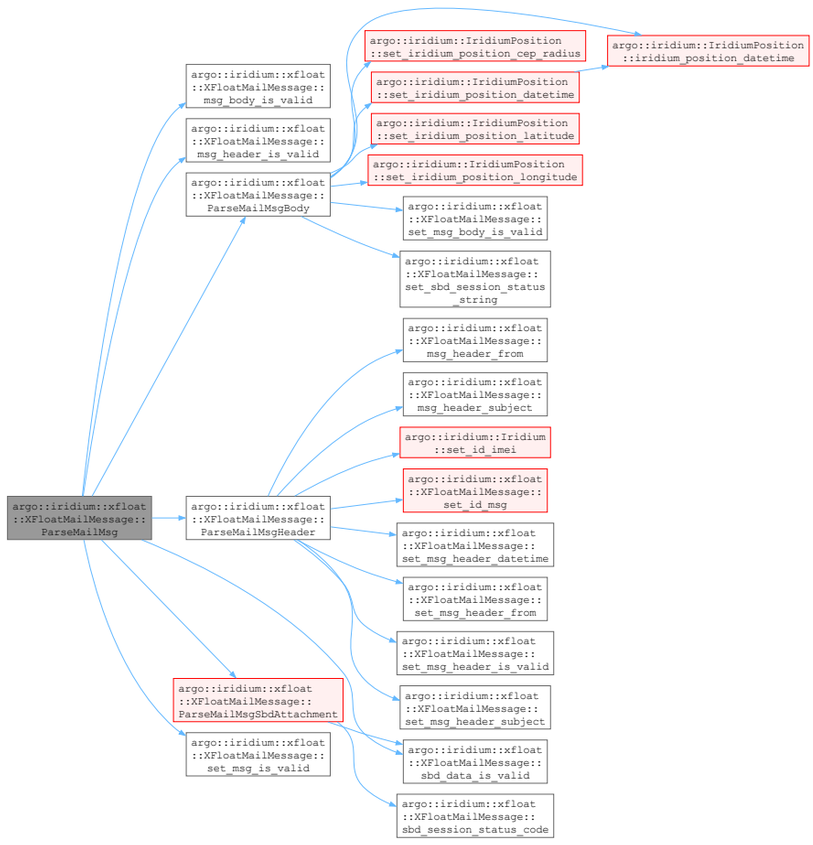
log::util::MessageException	if `msg` is NULL or an error occurs while parsing the various parts of the mail message.

Parameters

`in`	*msg*	The mail message to parse.

References CATCH_BLOCK, EXC_THROW, msg_body_is_valid(), msg_header_is_valid(), msg_raw_text_, util::thread::RecursiveLockable::mutex_, ParseMailMsgBody(), ParseMailMsgHeader(), ParseMailMsgSbdAttachment(), sbd_data_is_valid(), and set_msg_is_valid().

Here is the call graph for this function:



10.88.3.60 ParseMailMsg() [2/2]

```
void argo::iridium::xfloat::XFloatMailMessage::ParseMailMsg (
            const vmime::shared_ptr< vmime::net::message > & msg)  [inline], [private]
```

Parse a mail message.

This function is used to parse and validate a mail message. As a result of parsing the mail message, the fields of this class are populated.

Exceptions

log::util::MessageException	if `msg` is NULL or an error occurs while parsing the various parts of the mail message.

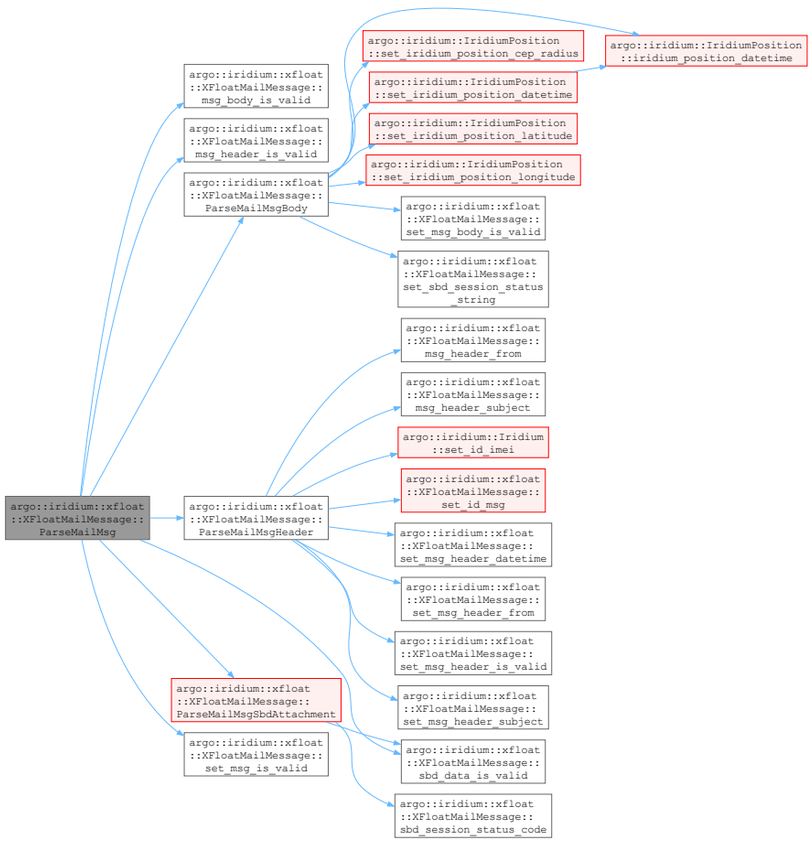
Parameters

`in`	*msg*	The mail message to parse.

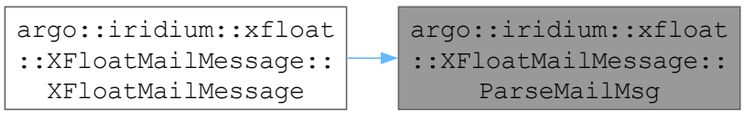
References CATCH_BLOCK, EXC_THROW, id_msg_uid_, msg_body_is_valid(), msg_header_is_valid(), msg_raw_text_, util::thread::RecursiveLockable::mutex_, ParseMailMsgBody(), ParseMailMsgHeader(), ParseMailMsgSbdAttachment(), sbd_data_is_valid(), and set_msg_is_valid().

Referenced by XFloatMailMessage().

Here is the call graph for this function:



Here is the caller graph for this function:



10.88.3.61 ParseMailMsgBody()

```
void argo::iridium::xfloat::XFloatMailMessage::ParseMailMsgBody (
            const vmime::shared_ptr< vmime::message > & msg)  [inline], [private]
```

Parse the mail message body.

This function is used to parse and validate the mail message body. The body of a valid mail message includes information about the Iridium session which are parsed in order to populate the corresponding fields of this class.

Exceptions

log::util::MessageException	if `msg` is NULL or an error occurs while parsing the body of the mail message.

Parameters

`in`	*msg*	The message to parse

References CATCH_BLOCK, EXC_THROW, id_sbd_momsn_, id_sbd_mtmsn_, argo::iridium::IridiumPosition::iridium_position_datetime(), msg_body_text_, util::thread::RecursiveLockable::mutex_, sbd_file_size_bytes_, sbd_session_status_code_, argo::iridium::IridiumPosition::set_iridium_position_cep_radius(), argo::iridium::IridiumPosition::set_iridium_position_datetime(), argo::iridium::IridiumPosition::set_iridium_position_latitude(), argo::iridium::IridiumPosition::set_iridium_position_longitude(), set_msg_body_is_valid(), set_sbd_session_status_string(), and XMSG_ID_UNKNOWN.

10.88.3.62 ParseMailMsgHeader()

```
void argo::iridium::xfloat::XFloatMailMessage::ParseMailMsgHeader (
            const vmime::shared_ptr< const vmime::header > & head)  [inline], [private]
```

Parse the mail message header.

This function is used to parse and validate the mail message header. As a result of parsing the mail message, the field of this class relating to the mail message header are populated.

Exceptions

log::util::MessageException	if `head` is NULL or an error occurs while parsing the header of the mail message.

Parameters

`in`	*head*	The mail message header to parse.

References CATCH_BLOCK, EXC_THROW, msg_header_from(), msg_header_raw_text_, msg_header_subject(), msg_header_valid_sender_regex_, msg_header_valid_subject_regex_, util::thread::RecursiveLockable::mutex_, argo::iridium::Iridium::set_id_imei(), set_id_msg(), set_msg_header_datetime(), set_msg_header_from(), set_msg_header_is_valid(), and set_msg_header_subject().

void argo::iridium::xfloat::XFloatMailMessage::ParseMailMsgSbdAttachment (
            const vmime::shared_ptr< vmime::message > & msg)  [inline], [private]
```

Parse the mail message SBD attachment.

This function is used to parse and validate the attachment of the mail message. A valid mail message contains a binary SBD file attachment that represents the data transmitted by the instrument.

Exceptions

log::util::MessageException	if `msg` is NULL or an error occurs while parsing the attachment of the mail message.

Parameters

`in`	*msg*	The mail message to parse.

References CATCH_BLOCK, EXC_THROW, i16, id_dive_, id_sbd_packet_, util::thread::RecursiveLockable::mutex_, sbd_data_, sbd_data_is_valid(), sbd_file_name_, sbd_file_valid_name_regex_, sbd_session_status_code(), argo::iridium::Iridium::set_id_instrument(), set_sbd_data_is_valid(), u08, u16, and XMSG_SBD_MIN_BYTES.

10.88.3.70 raw_file_local_path()

```
path argo::iridium::xfloat::XFloatMailMessage::raw_file_local_path () const  [inline]
```

Get the path to the raw mail message file on the local filesystem.

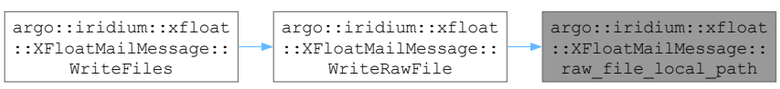
Returns

The path to the raw mail message file on the local filesystem.

References util::thread::RecursiveLockable::mutex_, and raw_file_local_path_.

Referenced by WriteRawFile().

Here is the caller graph for this function:



10.88.3.71 SaveObjectToDatabase()

```
void argo::iridium::xfloat::XFloatMailMessage::SaveObjectToDatabase () const  [inline], [virtual]
```

Save this mail message object to the SQL database.

Exceptions

util::log::MessageException	if an error occurs.

Implements util::mysql::LocalPersistentEntity.

References CATCH_BLOCK, util::thread::RecursiveLockable::mutex_, and sql_table_description_.

10.88.3.72 sbd_data()

```
vector< uint8_t > argo::iridium::xfloat::XFloatMailMessage::sbd_data () const  [inline]
```

Get the Iridium Short Burst Data (SBD) binary data.

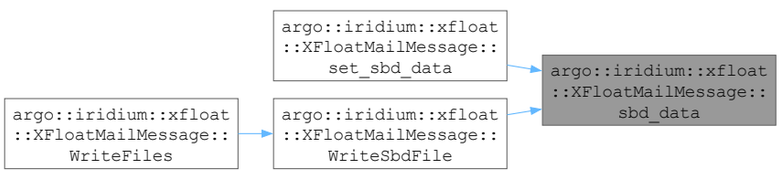
Returns

The Iridium Short Burst Data (SBD) binary data.

References util::thread::RecursiveLockable::mutex_, and sbd_data_.

Referenced by set_sbd_data(), and WriteSbdFile().

Here is the caller graph for this function:



10.88.3.73 sbd_data_is_valid()

```
bool argo::iridium::xfloat::XFloatMailMessage::sbd_data_is_valid () const  [inline]
```

Is the Iridium Short Burst Data (SBD) message valid?

Returns

TRUE if the Iridium Short Burst Data (SBD) message is valid, or FALSE otherwise.

References util::thread::RecursiveLockable::mutex_, and sbd_data_is_valid_.

Referenced by ParseMailMsg(), ParseMailMsg(), ParseMailMsgSbdAttachment(), WriteRawFile(), and WriteSbdFile().

10.88.3.77 sbd_session_status_code()

```
int argo::iridium::xfloat::XFloatMailMessage::sbd_session_status_code () const  [inline]
```

Get the Iridium Short Burst Data (SBD) session status code.

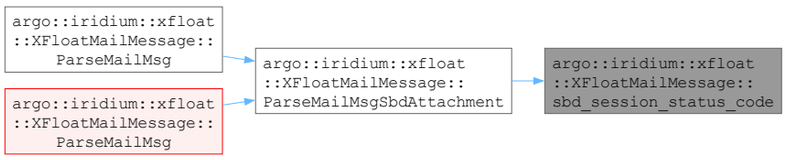
Returns

The Iridium Short Burst Data (SBD) session status code.

References util::thread::RecursiveLockable::mutex_, and sbd_session_status_code_.

Referenced by ParseMailMsgSbdAttachment().

Here is the caller graph for this function:



10.88.3.78 sbd_session_status_string()

```
string argo::iridium::xfloat::XFloatMailMessage::sbd_session_status_string () const  [inline]
```

Get the Iridium Short Burst Data (SBD) session status string.

Returns

The Iridium Short Burst Data (SBD) session status string.

References util::thread::RecursiveLockable::mutex_, and sbd_session_status_string_.

10.88.3.79 SelectAllObjectsFromDatabase()

```
static vector< shared_ptr< XFloatMailMessage > > argo::iridium::xfloat::XFloatMailMessage::↩
SelectAllObjectsFromDatabase (
            const string & groupBy = "",
            const string & orderBy = "",
            const unsigned int & limit = 0,
            const unsigned int & offset = 0)  [inline], [static], [private]
```

Select all mail message objects from the SQL database table.

Parameters

in	*groupBy*	The SQL select statement "group-by expression" clause.
in	*orderBy*	The SQL select statement "order-by expression" clause.
in	*limit*	The SQL select statement result set row limit value (0 = no limit).
in	*offset*	The SQL select statement result set row offset value.

Exceptions

util::log::MessageException	if the query fails.

Returns

The mail message objects.

References CATCH_BLOCK, and sql_table_description_.

10.88.3.80 SelectObjectFromDatabase()

```
static shared_ptr< XFloatMailMessage > argo::iridium::xfloat::XFloatMailMessage::SelectObject↩
FromDatabase (
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            const unsigned int & offset = 0)  [inline], [static], [private]
```

Select a single mail message object from the SQL database table.

Parameters

in	*where*	The SQL select statement "where-condition" clause.
in	*groupBy*	The SQL select statement "group-by expression" clause.
in	*orderBy*	The SQL select statement "order-by expression" clause.
in	*offset*	The SQL select statement result set row offset value.

Exceptions

util::log::MessageException	if the query fails.

Returns

The first mail message object matching the query.

References CATCH_BLOCK, and sql_table_description_.

10.88.3.81 SelectObjectsFromDatabase()

```
static vector< shared_ptr< XFloatMailMessage > > argo::iridium::xfloat::XFloatMailMessage::↩
SelectObjectsFromDatabase (
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            const unsigned int & limit = 0,
            const unsigned int & offset = 0)  [inline], [static], [private]
```

Query mail message objects from the SQL database.

This function is used to query the SQL database table corresponding to the mail message class and construct a vector of mail message objects, populated from the results of the SQL query.

Exceptions

util::log::MessageException	if an error occurs while querying the database or constructing the float objects from the result of the query.

Parameters

in	*where*	The SQL select statement "where-condition" clause.
in	*groupBy*	The SQL select statement "group-by expression" clause.
in	*orderBy*	The SQL select statement "order-by expression" clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset value.

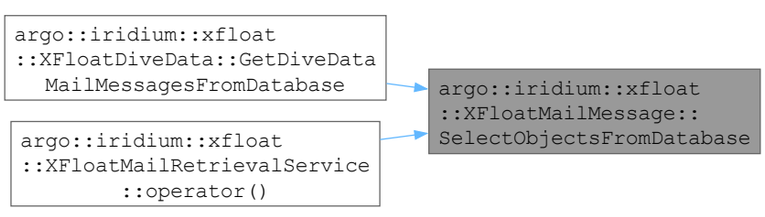
Returns

A vector of shared references to the float objects constructed from the results of the SQL query.

References CATCH_BLOCK, and sql_table_description_.

Referenced by argo::iridium::xfloat::XFloatDiveData::GetDiveDataMailMessagesFromDatabase(), and argo::iridium::xfloat::XFloatMailRetr

Here is the caller graph for this function:



10.88.3.82 SelectValueFromDatabase()

```
template<typename TT >
static TT argo::iridium::xfloat::XFloatMailMessage::SelectValueFromDatabase (
            const string & what,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            const unsigned int & offset = 0)  [inline], [static], [private]
```

Select a value from the SQL database table that contains the persisted mail message objects.

This function may be used to select a singular value from the table that comprises the persisted mail message objects.

Exceptions

util::log::MessageException	if the SQL database query fails or if an error occurs while attempting to interpret the result of the query.

Note

The result set of this query is always limited to a single result. That is, the result set row limit value is automatically set to one. If more than one row in the database table satisfy the "where condition" clause of the select statement, then only the value of the first result will be returned.

Parameters

in	*what*	The SQL select statement "what" clause. This clause may only contain a singular result e.g. the name of the SQL database table column of interest.
in	*where*	The SQL select statement "where condition" clause.
in	*groupBy*	The SQL select statement "group-by expression" clause.
in	*orderBy*	The SQL select statement "order-by expression" clause.
in	*offset*	The SQL select statement result set row offset value.

Returns

The selected value from the SQL database table.

References sql_table_description_.

10.88.3.83 set_gps_position_datetime()

```
void util::position::Position::set_gps_position_datetime (
            unsigned int gpsWeek,
            unsigned int gpsDay,
            unsigned int gpsHour = 0,
            unsigned int gpsMinute = 0,
            unsigned int gpsSecond = 0)  [inline], [protected], [inherited]
```

Set the date and time of this position from the given GPS week, day, and time.

Parameters

in	*gpsWeek*	The GPS week, in weeks since midnight of January 6, 1980.
in	*gpsDay*	The GPS day of week (0 - 6).
in	*gpsHour*	The UTC hour of day (0 - 23).
in	*gpsMinute*	The UTC minute of hour (0 - 59)..
in	*gpsSecond*	The UTC second of minute (0 - 59).

```
void argo::iridium::xfloat::XFloatMailMessage::set_sbd_file_local_path (
            const path & path)  [inline], [private]
```

Set the path to the Iridium Short Burst Data (SBD) message file on the local file system.

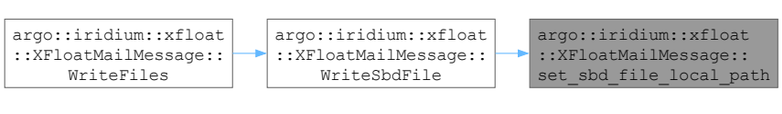
Parameters

in	*path*	The path to the Iridium Short Burst Data (SBD) message file on the local file system.

References util::thread::RecursiveLockable::mutex_, and sbd_file_local_path_.

Referenced by WriteSbdFile().

Here is the caller graph for this function:



10.88.3.116 set_sbd_file_name()

```
void argo::iridium::xfloat::XFloatMailMessage::set_sbd_file_name (
            const string & name)  [inline], [private]
```

Set the name of the Iridium Short Burst Data (SBD) file.

Parameters

in	*name*	The name of the Iridium Short Burst Data (SBD) file.

References util::thread::RecursiveLockable::mutex_, and sbd_file_name_.

10.88.3.117 set_sbd_file_size_bytes()

```
void argo::iridium::xfloat::XFloatMailMessage::set_sbd_file_size_bytes (
            int size)  [inline], [private]
```

Set the size of the Iridium Short Burst Data (SBD) message, in bytes.

Parameters

in	*size*	The size of the Iridium Short Burst Data (SBD) message, in bytes.

References util::thread::RecursiveLockable::mutex_, and sbd_file_size_bytes_.

10.88.3.118 set_sbd_session_status_code()

```
void argo::iridium::xfloat::XFloatMailMessage::set_sbd_session_status_code (
            int code)  [inline], [private]
```

Set the Iridium Short Burst Data (SBD) session status code.

Parameters

in	*code*	The Iridium Short Burst Data (SBD) session status code.

References util::thread::RecursiveLockable::mutex_, and sbd_session_status_code_.

10.88.3.119 set_sbd_session_status_string()

```
void argo::iridium::xfloat::XFloatMailMessage::set_sbd_session_status_string (
            const string & str)  [inline], [private]
```

Set the Iridium Short Burst Data (SBD) session status string.

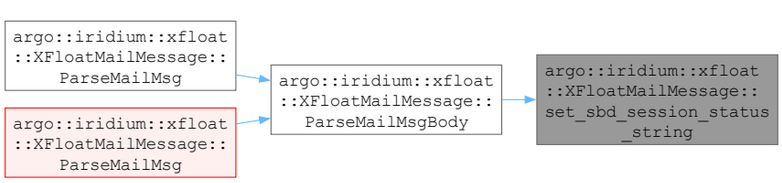
Parameters

in	*str*	The Iridium Short Burst Data (SBD) session status string.

References util::thread::RecursiveLockable::mutex_, and sbd_session_status_string_.

Referenced by ParseMailMsgBody().

Here is the caller graph for this function:



10.88.3.120 UnlockObject()

```
void util::thread::RecursiveLockable::UnlockObject ()  [inline], [inherited]
```

Unlock the object.

Exceptions

util::log::MessageException	if an error occurs.

References CATCH_BLOCK, and util::thread::RecursiveLockable::mutex_.

10.88.3.121 WriteFiles()

```
void argo::iridium::xfloat::XFloatMailMessage::WriteFiles ()  [inline], [private]
```

Write the mail message files.

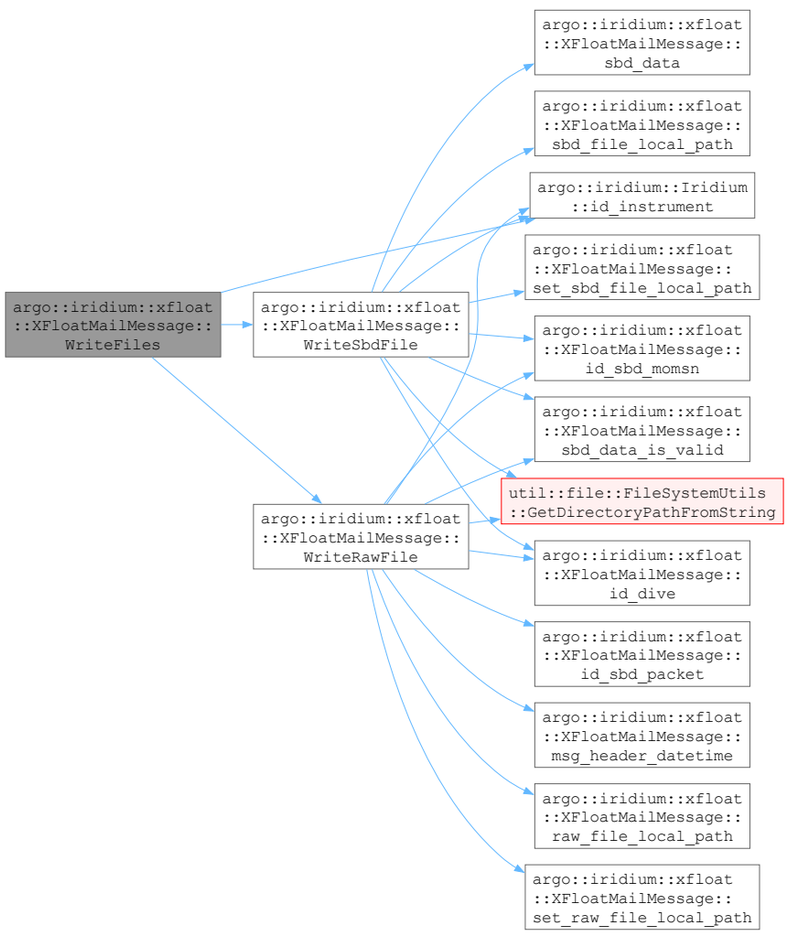
This function is used to write the RAW and SBD files to the local filesystem. First, the function checks if the unique instrument identifier is known. If the unique instrument identifier is unknown, the function will throw an exception. Otherwise, the function will continue on to write the RAW mail message file and the binary SBD message file to the local filesystem, if their respective criteria are met.

Exceptions

util::log::MessageException	if the unique instrument identifier is unknown, or if an error occurs while writing the mail files to the local filesystem,

References CATCH_BLOCK, EXC_THROW, argo::iridium::Iridium::id_instrument(), WriteRawFile(), WriteSbdFile(), and XFLT_ID_UNKNOWN.

Here is the call graph for this function:



10.88.3.122 WriteRawFile()

```
void argo::iridium::xfloat::XFloatMailMessage::WriteRawFile ()  [private]
```

Write the RAW mail message file.

This function is used to write the raw mail message file to the local filesystem. If the global RAW-file-generation-is-enabled flag, raw_file_generation_is_enabled_, is FALSE, then this function will have no effect. Otherwise, the function will generate the path to the RAW mail file on the local filesystem and write the file to that path. If the RAW mail message file already exists, then it is left unchanged and is not rewritten.

The path to the RAW mail message file will be constructed in the format [RAW-DIR]/[WWWW]/raw[WWWW]-[MMMMM]-[DDDD]-[PPP].txt, where

- [RAW-DIR] is the RAW mail directory path specified, by raw_directory_path_,
- [WWWW] is the four-digit unique instrument serial number,
- [MMMMM] is the five-digit MOMSN number,
- [DDDD] is the four-digit dive or cycle number, and
- [PPP] is the three-digit SBD packet number.

If the mail message does not contain valid SBD data, then the path is [RAW-DIR]/[WWWW]/raw[WWWW]-[MMMMM]-incomplete-[DATETIME].txt, where [DATETIME] is the mail header date/time in ISO 8601 basic format.

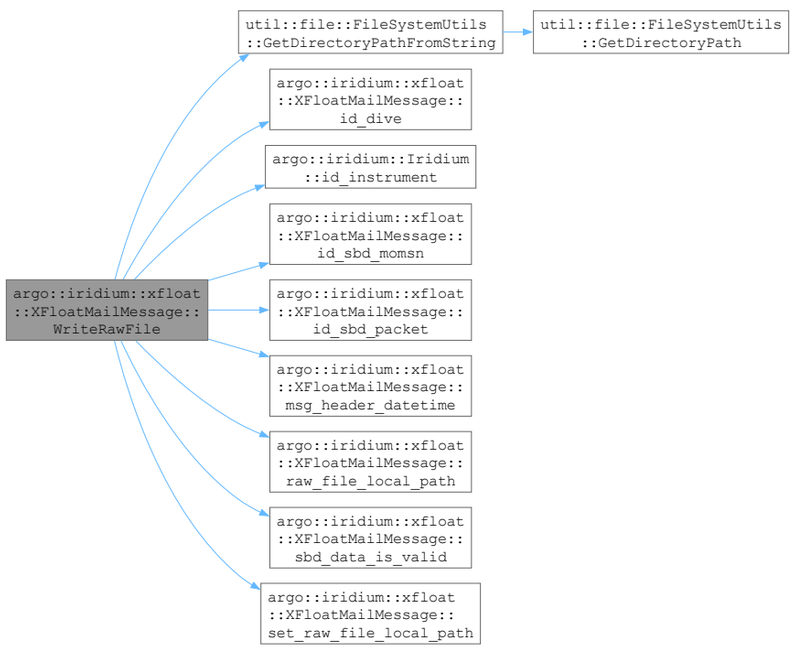
Exceptions

log::util::MessageException	if an error occurs while writing the file.

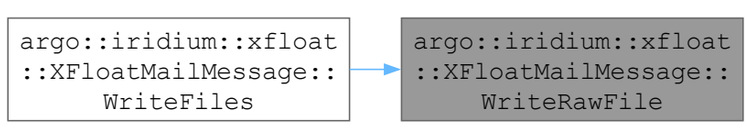
References CATCH_BLOCK, util::file::FileSystemUtils::GetDirectoryPathFromString(), id_dive(), argo::iridium::Iridium::id_instrument(), id_sbd_momsn(), id_sbd_packet(), linf, msg_header_datetime(), raw_directory_path_, raw_file_generation_is_enabled_, raw_file_local_path(), sbd_data_is_valid(), and set_raw_file_local_path().

Referenced by WriteFiles().

Here is the call graph for this function:



Here is the caller graph for this function:



10.88.3.123 WriteSbdFile()

```
void argo::iridium::xfloat::XFloatMailMessage::WriteSbdFile ()  [inline], [private]
```

Write the binary Iridium Short Burst Data (SBD) file.

This function is used to write the binary SBD file to the local filesystem. If either the global SBD-file-generation-is-enabled flag, sbd_file_generation_is_enabled_, or the SBD-data-is-valid field, sbd_data_is_valid_, is FALSE, then this function will have no effect.

Otherwise, if the SBD data is valid and global SBD-file-generation-is-enabled flag is TRUE, then the SBD file path will be generated. If the SBD file already exists at the constructed path, then it will not be overwritten. If the file does not already exist, it will be written.

The path to the binary SBD message file will be constructed in the format [SBD-DIR]/[WWWW]/[WWWW]-[MMMMMM]-[DDDD].sbd, where

- [SBD-DIR] is the SBD mail directory path specified, by sbd_directory_path_,
- [WWWW] is the four-digit unique instrument serial number,
- [MMMMMM] is the six-digit MOMSN number, and
- [DDDD] is the four-digit dive or cycle number.

Exceptions

util::log::MessageException	if an error occurs while writing the binary SBD file to the local filesystem.

References CATCH_BLOCK, util::file::FileSystemUtils::GetDirectoryPathFromString(), id_dive(), argo::iridium::Iridium::id_instrument(), id_sbd_momsn(), linf, util::thread::RecursiveLockable::mutex_, sbd_data(), sbd_data_is_valid(), sbd_directory_path_, sbd_file_generation_is_enabled_, sbd_file_local_path(), and set_sbd_file_local_path().

Referenced by WriteFiles().

Here is the call graph for this function:

10.88.4 Friends And Related Symbol Documentation

10.88.4.1 operator<<

```
ostream & operator<< (
            ostream & os,
            const XFloatMailMessage & mail)  [friend]
```

The stream insertion operator overload function for XFloatMailMessage.

Generates and inserts a RAW mail string representation of the mail message.

Exceptions

util::log::MessageException	of an error occurs.

Parameters

in	*os*	The ostream object.
in	*mail*	The mail message object.

Returns

The ostream object, os.

10.88.4.2 operator>>

```
istream & operator>> (
            istream & is,
            XFloatMailMessage & mail)  [friend]
```

The stream extraction operator overload function for XFloatMailMessage.

Parses mail message from istream.

Exceptions

util::log::MessageException	of an error occurs.

Parameters

in	*is*	The istream object.
in	*mail*	The mail message object.

Returns

The istream object, is.

10.88.4.3 util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription

```
options_description util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription
() [friend]
```

Friend function for populating some of the static members of this class from the configuration file options.

10.88.5 Member Data Documentation

10.88.5.1 address_

```
std::string util::mysql::LocalMysqlConfiguration::address_  [static], [private], [inherited]
```

The SQL server qualified name or IP address string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.88.5.2 EARTH_RADIUS_KM_EQUATORIAL

```
const double util::position::PositionUtils::EARTH_RADIUS_KM_EQUATORIAL = 6378.1  [static], [private],
[inherited]
```

The equatorial radius of the earth, in kilometers.

Referenced by util::position::PositionUtils::CalculateEllipsoidHeight().

10.88.5.3 EARTH_RADIUS_KM_POLAR

```
const double util::position::PositionUtils::EARTH_RADIUS_KM_POLAR = 6356.1  [static], [private],
[inherited]
```

The polar radius of the earth, in kilometers.

Referenced by util::position::PositionUtils::CalculateEllipsoidHeight().

10.88.5.4 id_dac_

```
int argo::iridium::Iridium::id_dac_  [private], [inherited]
```

The unique Data Assembly Center (DAC) identifier.

Referenced by argo::iridium::Iridium::id_dac(), and argo::iridium::Iridium::set_id_dac().

10.88.5.5 id_dive_

```
int argo::iridium::xfloat::XFloatMailMessage::id_dive_  [private]
```

The dive or cycle number of this mail message object.

This field is provides a non-unique index of the dive or cycle number of the mail message object for a given instrument. It is used to determine to which dive this mail message belongs. Together, the dive or cycle number and the Iridium Short Burst Data (SBD) packet index, id_sbd_packet_, provide a unique index of the mail message. However, these fields are not used as the primary index of the mail message objects.

The value of this field is set as a result of parsing the mail message attachment. The value is read from the header of the attached SBD file. If the mail message has no SBD attachment, or the attachment is invalid, then the value of this field will be set to XFLT_DIVE_UNKNOWN, which specifies an unknown dive or cycle number.

Referenced by id_dive(), ParseMailMsgSbdAttachment(), and set_id_dive().

10.88.5.6 id_imei_

```
long argo::iridium::Iridium::id_imei_  [private], [inherited]
```

The unique International Mobile Equipment Identifier (IMEI).

Referenced by argo::iridium::Iridium::id_imei(), and argo::iridium::Iridium::set_id_imei().

10.88.5.7 id_instrument_

```
int argo::iridium::Iridium::id_instrument_  [private], [inherited]
```

The unique instrument identifier or instrument serial number.

Referenced by argo::iridium::Iridium::id_instrument(), and argo::iridium::Iridium::set_id_instrument().

10.88.5.8 id_msg_

```
string argo::iridium::xfloat::XFloatMailMessage::id_msg_  [private]
```

The mail message unique identifier string.

This character sequence is a unique identifier for the mail message that is assigned by the mail server. However, this value is not used a primary identifier because the mail server all provides a unique integer identifier.

The value of this field is set as a result of parsing the mail message header. All mail messages will be assigned a unique identifier string, regardless of their validity.

Referenced by id_msg(), and set_id_msg().

10.88.5.9 id_msg_uid_

```
long argo::iridium::xfloat::XFloatMailMessage::id_msg_uid_  [private]
```

The mail message unique identifier (UID).

This unique integer identifier is assigned by the remote mail server. It is used as the primary unique identifier for a mail message.

The mail messages' UIDs also specify the order in which the mail messages were received by the mail server. Each message that the mail server receives is assigned a monotonically increasing UID value. Thus this field is also used to determine which mail messages have already been fetch from the mail server. When the mail retrieval thread, XFloatMailRetrievalService, queries the maximum UID of mail messages that have been persisted to the SQL database. The result of the query plus one determines the minimum UID of the mail messages to fetch from the mail server.

The value of this field is set as a result of parsing the mail message header. All mail messages will be assigned a unique integer identifier, regardless of their validity.

Referenced by id_msg_uid(), ParseMailMsg(), and set_id_msg_uid().

10.88.5.10 id_sbd_momsn_

```
int argo::iridium::xfloat::XFloatMailMessage::id_sbd_momsn_  [private]
```

The Iridium Short Burst Data (SBD) Service Mobile Originated Message Sequence Number (MOMSN) identifier.

This identifier, provided by the Iridium system, uniquely identifies the sequence number of messages successfully sent from the instrument to the ground station. For each new message that is transmitted from the instrument, this number is incremented. It is provided in the body of the email from the Iridium system along with information about the position, etc.

The value of this field is set as a result of parsing the mail message body text. If the mail message body is invalid, then the value of this field will be set to XFLT_ID_UNKNOWN.

Warning

> This identifier should NOT be used to unique identify mail messages for a given instrument. If the instrument experiences a incomplete or failed Iridium transmission that results in an email from the Iridium system, then MOMSN will NOT be incremented for that message. Thus, there may exist multiple mail messages with the same MOMSN identifier.

Referenced by id_sbd_momsn(), ParseMailMsgBody(), and set_id_sbd_momsn().

10.88.5.11 id_sbd_mtmsn_

```
int argo::iridium::xfloat::XFloatMailMessage::id_sbd_mtmsn_  [private]
```

The Iridium Short Burst Data (SBD) Service Mobile Terminated Message Sequence Number (MTMSN) identifier.

This identifier, provided by the Iridium system, uniquely identifies the sequence number of messages successfully sent from the ground station to the instrument. For each new message that is transmitted to the instrument from the ground station, this number is incremented. It is provided in the body of the email from the Iridium system along with information about the position, etc.

The value of this field is set as a result of parsing the mail message body text. If the mail message body is invalid, then the value of this field will be set to XFLT_ID_UNKNOWN.

Referenced by id_sbd_mtmsn(), ParseMailMsgBody(), and set_id_sbd_mtmsn().

10.88.5.12 id_sbd_packet_

```
int argo::iridium::xfloat::XFloatMailMessage::id_sbd_packet_  [private]
```

The Iridium Short Burst Data (SBD) message packet index.

This identifier uniquely indexes each SBD message transmitted for a single dive. It is used both to reconstruct the sequence in which the message were transmitted and to determine whether any of the message in the sequence are missing. A complete set of mail messages for a given dive will have a sequence of monotonically increasing SBD packet identifiers starting with a value of zero.

The value of this field is set as a result of parsing the mail message attachment. The value is read from the header of the attached SBD file. If the mail message has no SBD attachment, or the attachment is invalid, then the value of this field will be set to XFLT_DIVE_UNKNOWN, which specifies an unknown SBD message packet index.

Referenced by id_sbd_packet(), ParseMailMsgSbdAttachment(), and set_id_sbd_packet().

10.88.5.13 id_wmo_

```
int argo::iridium::Iridium::id_wmo_  [private], [inherited]
```

The unique World Meteorological Organization (WMO) identifier.

Referenced by argo::iridium::Iridium::id_wmo(), and argo::iridium::Iridium::set_id_wmo().

10.88.5.14 iridium_position_cep_radius_

```
int argo::iridium::IridiumPosition::iridium_position_cep_radius_  [private], [inherited]
```

Iridium position Circular Error Probable (CEP) radius, in kilometers.

This field defines the estimate of an error of the Iridium position. It is provided by the Iridium system, along with the Iridium position, in the body of the email containing the Iridium SBD message.

Since multiple Iridium messages are transmitted for each dive cycle, a better estimate of the instrument position is provided by a composite position, constructed from two or more individual positions. To compute this composite position, each position is weighted proportionally to the inverse of the CEP radius.

Referenced by argo::iridium::IridiumPosition::iridium_position_cep_radius(), and argo::iridium::IridiumPosition::set_iridium_position_cep_r

10.88.5.15 msg_body_is_valid_

```
bool argo::iridium::xfloat::XFloatMailMessage::msg_body_is_valid_  [private]
```

The mail message body is valid flag.

This field specifies the validity of the mail message body. It is set as a result of parsing the mail message body text, which contains information about the Iridium session including the Iridium position, date/time, status, and message identifiers.

Referenced by msg_body_is_valid(), and set_msg_body_is_valid().

10.88.5.16 msg_body_text_

```
string argo::iridium::xfloat::XFloatMailMessage::msg_body_text_  [private]
```

The mail message body text.

This field contains the full text of the body of the mail message. The body of a valid mail message includes information about the Iridium session that is parsed and stored in the corresponding field of this object. These field include

- the MOMSN identifier,
- the MTMSN identifier,
- the time of the Iridium session,
- the Iridium session status code and status string, and
- the Iridium position and Circular Error Probable (CEP) radius.

Referenced by msg_body_text(), ParseMailMsgBody(), and set_msg_body_text().

10.88.5.17 msg_header_datetime_

```
ptime argo::iridium::xfloat::XFloatMailMessage::msg_header_datetime_  [private]
```

The mail message header date/time.

This field represents the date/time-of-flight of the mail message from the Iridium system. The value of this field, is set as a result of parsing the mail message header.

Note

This date/time, along with the Iridium session time may be used to calculate the latency of the Iridium system.

Referenced by msg_header_datetime(), and set_msg_header_datetime().

10.88.5.18 msg_header_from_

```
string argo::iridium::xfloat::XFloatMailMessage::msg_header_from_  [private]
```

The mail message header FROM field.

This field represents the sender of the mail message. This field is used to validate the mail message by ensuring the only messages from desired senders are consumed by the application. The value of this field is set as a result of parsing the mail message header.

Referenced by msg_header_from(), and set_msg_header_from().

10.88.5.19 msg_header_is_valid_

```
bool argo::iridium::xfloat::XFloatMailMessage::msg_header_is_valid_  [private]
```

The mail message header is valid flag.

This field indicates the validity of the mail message header. It is set as a result of parsing the mail message header. The criteria for a valid mail message header is that

- the SUBJECT field of the mail message header matches the valid sender regular expression, msg_header_valid_sender_regex_, and
- the FROM field of the mail message header matcher the valid subject regular expression, msg_header_valid_subject_regex_.

Referenced by msg_header_is_valid(), and set_msg_header_is_valid().

10.88.5.20 msg_header_raw_text_

```
string argo::iridium::xfloat::XFloatMailMessage::msg_header_raw_text_  [private]
```

The mail message header raw text.

This field contains the "raw" text of the mail message header. This text represents the header of the mail message in its native form, which includes additional information about routing, etc. that is not currently parsed from the mail message header.

Referenced by msg_header_raw_text(), ParseMailMsgHeader(), and set_msg_header_raw_text().

10.88.5.21 msg_header_subject_

```
string argo::iridium::xfloat::XFloatMailMessage::msg_header_subject_  [private]
```

The mail message header SUBJECT field.

This field contains the text of the subject line of the mail message. It is used to validate the mail message by ensuring that only messages with the proper subject line are consumed by the application. In addition, a valid mail message contains the IMEI number in the subject line. The subject line is parsed to determine the IMEI of the instrument that transmitted the message.

Referenced by msg_header_subject(), and set_msg_header_subject().

10.88.5.22 msg_header_valid_sender_regex_

```
string argo::iridium::xfloat::XFloatMailMessage::msg_header_valid_sender_regex_  [static], [private]
```

The mail message header valid sender regular expression.

This regular expression is used the validate the FROM field of the email message header. If the mail message header FROM field does not match this regular expression, the the mail message will be considered invalid and will be discarded.

The value of this field is set as a result of parsing the command-line arguments and/or configuration file options during application initialization. If the value is unspecified, then it defaults to a value of XMAIL_DFLT_MSG_HEADER_VALID_SNDR_REGEX.

Referenced by ParseMailMsgHeader().

10.88.5.23 msg_header_valid_subject_regex_

```
string argo::iridium::xfloat::XFloatMailMessage::msg_header_valid_subject_regex_  [static], [private]
```

The mail message header valid subject regular expression.

This regular expression is used to validate the SUBJECT field of the email message header. If the mail message header SUBJECT field does not match this regular expression, the the mail message will be considered invalid and will be discarded.

The value of this field is set as a result of parsing the command-line arguments and/or configuration file options during application initialization. If the value is unspecified, then it defaults to a value of XMAIL_DFLT_MSG_HEADER_VALID_SUBJ_REGEX.

Referenced by ParseMailMsgHeader().

10.88.5.24 msg_is_valid_

```
bool argo::iridium::xfloat::XFloatMailMessage::msg_is_valid_  [private]
```

The mail message is valid flag.

This flag indicates the validity of the mail message. It is set as a result of parsing the mail message. The criteria for a valid mail message is that

- the mail message header is valid (see msg_header_is_valid_),
- the mail message body is valid (see msg_body_is_valid_), and
- the mail message SBD file attachment is valid (see sbd_data_is_valid_).

Referenced by msg_is_valid(), and set_msg_is_valid().

10.88.5.25 msg_raw_text_

```
string argo::iridium::xfloat::XFloatMailMessage::msg_raw_text_  [private]
```

The full mail message raw text.

This field contains the full mail message text in its raw form. This represents the native ASCII format of the mail message.

Referenced by msg_raw_text(), ParseMailMsg(), ParseMailMsg(), and set_msg_raw_text().

10.88.5.26 mutex_

```
recursive_mutex util::thread::RecursiveLockable::mutex_  [mutable], [protected], [inherited]
```

Recursive mutual exclusion lock for synchronizing operations.

10.88.5.27 password_

`std::string util::mysql::LocalMysqlConfiguration::password_ [static], [private], [inherited]`

The SQL server account password string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.88.5.28 port_

`unsigned int util::mysql::LocalMysqlConfiguration::port_ [static], [private], [inherited]`

The SQL server port number.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.88.5.29 position_datetime_

`ptime util::position::Position::position_datetime_ [private], [inherited]`

The date and time of the position.

Referenced by util::position::Position::position_datetime(), util::position::Position::position_datetime_as_iso8601_string(), and util::position::Position::set_position_datetime().

10.88.5.30 position_is_valid_

```
bool util::position::Position::position_is_valid_  [private], [inherited]
```

The valid position indicator.

Referenced by util::position::Position::position_is_valid(), and util::position::Position::set_position_is_valid().

10.88.5.31 position_latitude_

```
double util::position::Position::position_latitude_  [private], [inherited]
```

The latitude of the position, in decimal degrees.

Referenced by util::position::Position::position_latitude(), util::position::Position::postition_as_iso6709_string(), util::position::Position::set_position_latitude(), and util::position::Position::set_position_longitude().

10.88.5.32 position_longitude_

```
double util::position::Position::position_longitude_  [private], [inherited]
```

The longitude of the position, in decimal degrees.

Referenced by util::position::Position::position_longitude(), util::position::Position::postition_as_iso6709_string(), util::position::Position::set_position_latitude(), and util::position::Position::set_position_longitude().

10.88.5.33 protocol_

```
std::string util::mysql::LocalMysqlConfiguration::protocol_  [static], [private], [inherited]
```

The protocol to use in the SQL server connection e.g.

"tcp".

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.88.5.34 raw_directory_path_

```
path argo::iridium::xfloat::XFloatMailMessage::raw_directory_path_  [static], [private]
```

The RAW mail message file directory.

This field determines the directory to which RAW mail message files are written. If enabled, RAW mail message files will be written to subdirectories of this directory that are organized by the unique instrument identifiers.

The value of this field is set as a result of parsing the command-line arguments and/or configuration file options during application initialization.

Referenced by WriteRawFile().

10.88.5.35 raw_file_format_

```
int argo::iridium::xfloat::XFloatMailMessage::raw_file_format_  [static], [private]
```

The raw mail message file format.

The value of this field determines the format of the raw mail message that is written to the local filesystem. The support formats are enumerated by XFloatMailRawFileFormat_t.

The value of this field is set as a result of parsing the command-line arguments and/or configuration file options during application initialization. If the value is unspecified, then it defaults to a value of XMAIL_DFLT_RAW_FILE_FORMAT.

10.88.5.36 raw_file_generation_is_enabled_

bool argo::iridium::xfloat::XFloatMailMessage::raw_file_generation_is_enabled_ [static], [private]

The global RAW-mail-message-file-generation-is-enabled flag.

This flag determines whether the ASCII RAW mail message files are written to the local filesystem. If TRUE, then the RAW mail message files will be written to subdirectories of the raw mail message directory which is specified by raw_directory_path_. Otherwise, if FALSE, raw mail message will not be written to the local filesystem.

The value of this field is set as a result of parsing the command-line arguments and/or configuration file options during application initialization. If the value is unspecified, then it defaults to a value of XMAIL_DFLT_SBD_FILE_VALID_NAME_REGEX.

Referenced by WriteRawFile().

10.88.5.37 raw_file_local_path_

path argo::iridium::xfloat::XFloatMailMessage::raw_file_local_path_ [private]

The path to the raw mail message file on the local filesystem.

This path is set as a result of writing the raw mail message file to the local filesystem. This path is relative to the raw file directory, which is specified by raw_directory_path_.

Referenced by raw_file_local_path(), and set_raw_file_local_path().

10.88.5.38 sbd_data_

XMailSbdData_t argo::iridium::xfloat::XFloatMailMessage::sbd_data_ [private]

The Iridium Short Burst Data (SBD) binary data.

This field contains the binary data that is read from the SBD file attachment. The content of this data is exactly that which was transmitted by the instrument.

Referenced by XFloatMailMessage(), XFloatMailMessage(), ParseMailMsgSbdAttachment(), sbd_data(), and set_sbd_data().

10.88.5.39 sbd_data_is_valid_

bool argo::iridium::xfloat::XFloatMailMessage::sbd_data_is_valid_ [private]

The Iridium Short Burst Data (SBD) binary data is valid flag.

This field indicates whether the attached SBD message is valid. The criteria for a valid SBD message is that

- the mail message has a file attachment,
- the filename of the attached file matches the SBD file email attachment filename regular expression, sbd_file_valid_name_regex_,
- the Iridium session status code, sbd_session_status_code_, has a value of zero, and
- the SBD message size, in bytes, is greater than or equal to XMSG_SBD_MIN_BYTES.

Referenced by sbd_data_is_valid(), and set_sbd_data_is_valid().

10.88.5.40 sbd_directory_path_

path argo::iridium::xfloat::XFloatMailMessage::sbd_directory_path_ [static], [private]

The SBD file directory.

This field determines the directory to which the binary Iridium Short Burst Data (SBD) files are written. If enabled, SBD files will be written to subdirectories of this directory that are organized by the unique instrument identifiers.

The value of this field is set as a result of parsing the command-line arguments and/or configuration file options during application initialization.

Referenced by WriteSbdFile().

10.88.5.41 sbd_file_generation_is_enabled_

```
bool argo::iridium::xfloat::XFloatMailMessage::sbd_file_generation_is_enabled_  [static], [private]
```

The global binary-SBD-file-generation-is-enabled flag.

This flag determines whether binary Iridium Short Burst Data (SBD) files are written to the local file system. If TRUE, then SBD files will be written to subdirectories of the SBD directory which is specified by sbd_directory_path_. Otherwise, if FALSE, SBD files will not be written to the local filesystem.

The value of this field is set as a result of parsing the command-line arguments and/or configuration file options during application initialization. If the value is unspecified, then it defaults to a value of FALSE.

Referenced by WriteSbdFile().

10.88.5.42 sbd_file_local_path_

```
path argo::iridium::xfloat::XFloatMailMessage::sbd_file_local_path_  [private]
```

The path to the Iridium Short Burst Data (SBD) binary file on the local filesystem.

This path is set as a result of writing the binary SBD message file to the local filesystem. This path is relative to the SBD file directory, which is specified by sbd_directory_path_.

Referenced by sbd_file_local_path(), and set_sbd_file_local_path().

10.88.5.43 sbd_file_name_

```
string argo::iridium::xfloat::XFloatMailMessage::sbd_file_name_  [private]
```

The Iridium Short Burst Data (SBD) email attachment filename.

This field represents the name of the file attached to the mail message. This field is used, in part, to determined the validity of the SBD message attachment.

Referenced by ParseMailMsgSbdAttachment(), sbd_file_name(), and set_sbd_file_name().

10.88.5.44 sbd_file_size_bytes_

```
int argo::iridium::xfloat::XFloatMailMessage::sbd_file_size_bytes_  [private]
```

The size of the Iridium Short Burst Data (SBD) message, in bytes.

This field is parsed from the body of the mail message. It should match the size of the SBD data, sbd_data_, which is read from the mail message attachment.

Referenced by ParseMailMsgBody(), sbd_file_size_bytes(), and set_sbd_file_size_bytes().

10.88.5.45 sbd_file_valid_name_regex_

```
string argo::iridium::xfloat::XFloatMailMessage::sbd_file_valid_name_regex_  [static], [private]
```

The valid SBD file email attachment filename regular expression.

This regular expression is used to validate the filename of the email message attachment. If the filename of the file attachment to the mail message matches this regular expression, then the mail message will be considered valid. Otherwise, if the filename does not match this regular expression, then the mail message will be considered invalid and will be discarded.

The value of this field is set as a result of parsing the command-line arguments and/or configuration file options during application initialization. If the value is unspecified, then it defaults to a value of XMAIL_DFLT_SBD_FILE_VALID_NAME_REGEX.

Referenced by ParseMailMsgSbdAttachment().

10.88.5.46 sbd_session_status_code_

```
int argo::iridium::xfloat::XFloatMailMessage::sbd_session_status_code_  [private]
```

The Iridium Short Burst Data (SBD) session status code.

This field is parsed from the body of the mail message. It indicates that status of the Iridium session. A successful Iridium session reports a status code of 0. An unsuccessful Iridium session reports a non-zero status code, where the exact value of the status code indicates a specific error or type of error in the Iridium session.

Referenced by ParseMailMsgBody(), sbd_session_status_code(), and set_sbd_session_status_code().

10.88.5.47 sbd_session_status_string_

```
string argo::iridium::xfloat::XFloatMailMessage::sbd_session_status_string_  [private]
```

The Iridium Short Burst Data (SBD) session status string.

This field is parsed from the body of the mail message. It contains a brief description of the status of the Iridium session that is indicated by the status code, sbd_session_status_code_.

Referenced by sbd_session_status_string(), and set_sbd_session_status_string().

10.88.5.48 schema_

```
std::string util::mysql::LocalMysqlConfiguration::schema_  [static], [private], [inherited]
```

The SQL server schema name.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.88.5.49 sql_connection_

```
thread_specific_ptr<Connection> util::mysql::MysqlUtils::sql_connection_  [static], [private],
[inherited]
```

Tthe thread-specific pointer to MySQL connection object.

Thread-specific MySQL connection, released by `MysqlUtils::CleanupSqlConnection()` when the thread exits.

Referenced by util::mysql::MysqlUtils::CloseSqlConnection(), and util::mysql::MysqlUtils::GetSqlConnection().

10.88.5.50 sql_driver_

```
thread_specific_ptr<MySQL_Driver> util::mysql::MysqlUtils::sql_driver_  [static], [private],
[inherited]
```

The thread-specific pointer to MySQL driver object.

Thread-specific reference to the MySQL driver.

Its cleanup function, `MysqlUtils::CleanupSqlDriver()`, does not delete the shared driver instance.

Referenced by util::mysql::MysqlUtils::GetSqlDriver().

10.88.5.51 sql_table_description_

```
const util::mysql::SqlTableDescription< XFloatMailMessage > argo::iridium::xfloat::XFloatMail↩
Message::sql_table_description_  [static], [private]
```

The SQL table description object.

This SQL table description provides the details needed to map this object to a relational database table. It utilizes the accessor methods of the class and the details of the SQL table column to (1) create an SQL INSERT statement to save the object into the database, (2) populate one or more objects' fields as a result of an SQL SELECT query, or (3) query the SQL database to access one or more of the values that are stored the the SQL table corresponding to this object.

Referenced by SaveObjectToDatabase(), SelectAllObjectsFromDatabase(), SelectObjectFromDatabase(), SelectObjectsFromDatabase(), and SelectValueFromDatabase().

10.88.5.52 user_

```
std::string util::mysql::LocalMysqlConfiguration::user_  [static], [private], [inherited]
```

The SQL server account username string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

The documentation for this class was generated from the following files:

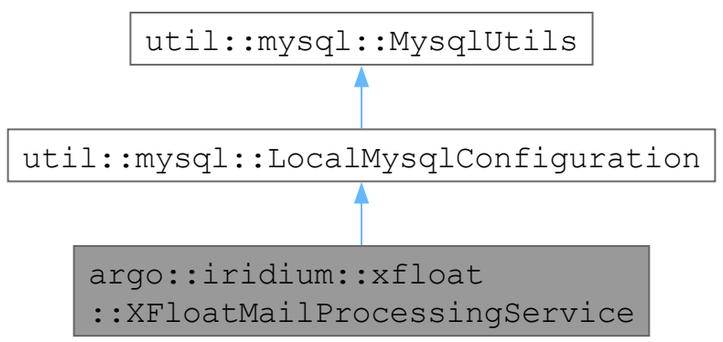
- data/XFloatMailMessage.h
- data/XFloatMailMessage.cpp

10.89 argo::iridium::xfloat::XFloatMailProcessingService Class Reference

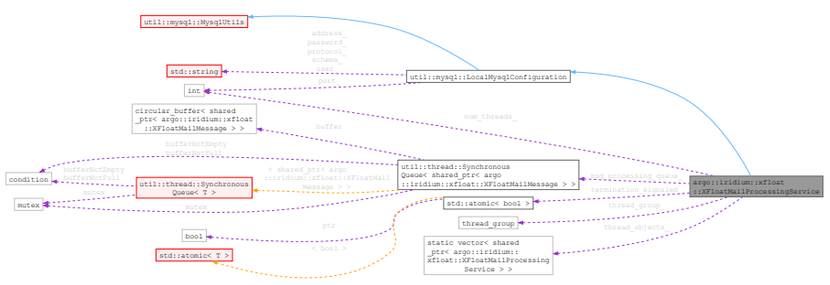
The mail processing thread class.

```
#include <stage2_MailProcessingThread.h>
```

Inheritance diagram for argo::iridium::xfloat::XFloatMailProcessingService:



Collaboration diagram for argo::iridium::xfloat::XFloatMailProcessingService:



Public Member Functions

- XFloatMailProcessingService ()

  The constructor.
- ~XFloatMailProcessingService ()

  The destructor.
- void operator() () ATTR_NO_EXCEPTIONS

  Functor operator overload function: the main entry point for the mail processing thread(s).

Static Public Member Functions

- static void CloseSqlConnection ()

  Close the thread-specific MySQL connection if it is currently open.
- static shared_ptr< sql::ResultSet > **executeDeleteQuery** (const string &from, const string &where="")
- static shared_ptr< ResultSet > ExecuteQuery (Connection *con, const string &query)

  Execute an SQL query and return a shared pointer to the ResultSet object.
- static shared_ptr< sql::ResultSet > executeQuery (const string &query)

  Execute an SQL query and return a shared pointer to the ResultSet object.
- static shared_ptr< sql::ResultSet > executeSelectQuery (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)

  Execute an SQL select query and return a shared pointer to the ResultSet object.
- static int ExecuteUpdate (Connection *con, const string &update)

  Execute an SQL update and return the status code.
- static int executeUpdate (const string &update)

  Execute an SQL update and return the status code.
- static shared_ptr< PreparedStatement > GeneratePreparedStatement (Connection *con, const string &statement)

  Generate a prepared SQL statement object for the given SQL statement.
- static shared_ptr< sql::PreparedStatement > generatePreparedStatement (const string &statement)

  Generate a prepared SQL statement object for the given SQL statement.
- static string GenerateSqlDeleteStr (const string &from, const string &where="")

  Generate an SQL DELETE statement.
- static string GenerateSqlSelectStr (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)

  Generate an SQL select statement.
- static thread_specific_ptr< Connection > & GetSqlConnection (string url, string user, string password, string schema)

  Get a thread-specific instance of a MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > & GetSqlDriver ()

  Get a thread-specific instance of a MySQL driver object.
- static bool MsgProcessingQueuePush (const shared_ptr< XFloatMailMessage > &msg, bool block=true)

  Push a mail message into the mail processing queue.
- static void MsgProcessingQueuePushAll (vector< shared_ptr< XFloatMailMessage > >::const_iterator first, vector< shared_ptr< XFloatMailMessage > >::const_iterator last)

  Push multiple mail messages into the mail processing queue.
- static unsigned int num_threads ()

  Get the number of mail message processing threads.
- static void StartWorkerThreads () ATTR_NO_EXCEPTIONS

  Instantiate the mail processing worker thread(s).
- static void TerminateWorkerThreads () ATTR_NO_EXCEPTIONS

  Terminate the mail processing worker thread(s).

Static Protected Member Functions

- static sql::Connection * getSqlConnection ()

  Generate a thread-specific instance of a MySQL connection object.

Private Member Functions

- void ProcessMailMsg (const shared_ptr< XFloatMailMessage > &msg) const

  Process a mail message.

Static Private Member Functions

- static void CleanupSqlConnection (Connection ∗con)

  Cleanup an SQL connection.
- static void CleanupSqlDriver (MySQL_Driver ∗driver)

  Function for memory cleanup of MySQL driver on destruct.
- static bool MsgProcessingQueuePop (shared_ptr< XFloatMailMessage > &msg, bool block=false)

  Pop a mail message out of the mail processing queue.
- static void set_termination_signaled (bool termination_signaled=true)

  Set the termination signaled flag.

Static Private Attributes

- static string address_

  The SQL server qualified name or IP address string.
- static util::thread::SynchronousQueue< shared_ptr< XFloatMailMessage > > msg_processing_queue_

  The incoming mail message processing queue.
- static unsigned int num_threads_

  The number of mail processing threads.
- static string password_

  The SQL server account password string.
- static unsigned int port_

  The SQL server port number.
- static string protocol_

  The protocol to use in the SQL server connection e.g.
- static string schema_

  The SQL server schema name.
- static thread_specific_ptr< Connection > sql_connection_

  Tthe thread-specific pointer to MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > sql_driver_

  The thread-specific pointer to MySQL driver object.
- static std::atomic< bool > termination_signaled_

  The termination signaled flag.
- static thread_group thread_group_

  The mail processing thread group.
- static vector< shared_ptr< XFloatMailProcessingService > > thread_objects_

  The mail processing thread object(s).
- static string user_

  The SQL server account username string.

Friends

- po::options_description util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription ()

  Friend function for populating some of the static members of this class from the configuration file options.

10.89.1 Detailed Description

The mail processing thread class.

This class defines the operation of the mail processing thread(s), which are the second stage in the processing pipeline. The mail processing thread(s) consumes messages that were fetched from the mail server in the previous stage of the processing pipeline, XFloatMailRetrievalService. The messages are validated, saved to the SQL database, queued for consumption in the next stage of the processing pipeline, the telemetry decoder thread(s), XFloatTelemetryDecoderService, and finally their file representations are written to the local file system.

Zero or more instance of this thread may be instantiated after application initialization, depending on the configuration options. Each thread enters a primary loop in which messages are fetched from a common queue and processed. If the incoming queue is empty, then the thread will sleep for intervals of XFLT_THREAD_SLEEP_MS milliseconds.

The primary loop will continue until the daemon thread signals termination. When termination is signaled, the remaining messages in the incoming queue will be processed, then all instances of this thread will die. This ensures that processing pipeline will be thoroughly flushed before application termination, and that no messages will be partially or incompletely processed.

10.89.2 Constructor & Destructor Documentation

10.89.2.1 XFloatMailProcessingService()

```
argo::iridium::xfloat::XFloatMailProcessingService::XFloatMailProcessingService ()
```

The constructor.

10.89.2.2 ~XFloatMailProcessingService()

```
argo::iridium::xfloat::XFloatMailProcessingService::~XFloatMailProcessingService ()
```

The destructor.

10.89.3 Member Function Documentation

10.89.3.1 CleanupSqlConnection()

```
static void util::mysql::MysqlUtils::CleanupSqlConnection (
            Connection * con)  [inline], [static], [private], [inherited]
```

Cleanup an SQL connection.

This function for memory cleanup of the SQL connection on destruction. The thread-specific SQL connection object will be deleted if it exists.

Parameters

in	*con*	The SQL connection to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL connection object.

References CATCH_BLOCK.

10.89.3.2 CleanupSqlDriver()

```
static void util::mysql::MysqlUtils::CleanupSqlDriver (
            MySQL_Driver * driver)  [inline], [static], [private], [inherited]
```

Function for memory cleanup of MySQL driver on destruct.

Signals the SQL driver to end operation, if it exists.

Parameters

in	*driver*	Driver to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL driver object.

References CATCH_BLOCK.

10.89.3.3 CloseSqlConnection()

```
static void util::mysql::MysqlUtils::CloseSqlConnection ()  [inline], [static], [inherited]
```

Close the thread-specific MySQL connection if it is currently open.

If the thread local MySQL connection is not currently open, then this function will have no effect.

Note

The MySQL connection should be closed when idle to prevent the connection from timing out and throwing exceptions.

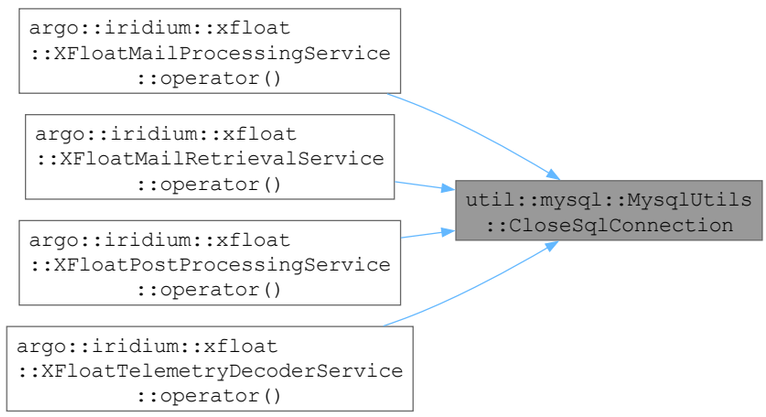
Exceptions

log::MessageException	if an error occurs while attempting to close the MySQL connection.

References CATCH_BLOCK, and util::mysql::MysqlUtils::sql_connection_.

Referenced by operator()(), argo::iridium::xfloat::XFloatMailRetrievalService::operator()(), argo::iridium::xfloat::XFloatPostProcessingServi and argo::iridium::xfloat::XFloatTelemetryDecoderService::operator()().

Here is the caller graph for this function:



10.89.3.4 ExecuteQuery()

```
static shared_ptr< ResultSet > util::mysql::MysqlUtils::ExecuteQuery (
            Connection * con,
            const string & query)  [inline], [static], [inherited]
```

Execute an SQL query and return a shared pointer to the ResultSet object.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*query*	The SQL query to execute. This must be a well-formatted SQL query string.

Exceptions

log::MessageException	if 'con' is null, 'query' is a malfored SQL string, or any other error occurs.

Returns

A shared pointer to the query ResultSet object.

References CATCH_BLOCK, and util::mysql::MysqlUtils::GeneratePreparedStatement().

Referenced by util::mysql::LocalMysqlConfiguration::executeQuery().

Here is the call graph for this function:

Here is the caller graph for this function:

10.89.3.5 executeQuery()

```
shared_ptr< sql::ResultSet > util::mysql::LocalMysqlConfiguration::executeQuery (
            const string & query)  [static], [inherited]
```

Execute an SQL query and return a shared pointer to the ResultSet object.

Parameters

in	*query*	The SQL query to execute. This must be a well-formatted SQL query string.

Exceptions

log::MessageException	'query' is a malfored SQL string or any other error occurs while executing the query.

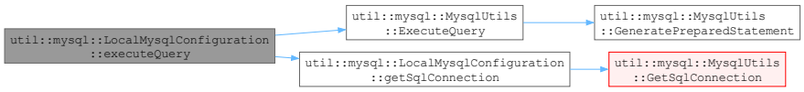
Returns

A shared pointer to the query ResultSet object.

References util::mysql::MysqlUtils::ExecuteQuery(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

Referenced by util::mysql::LocalMysqlConfiguration::executeSelectQuery(), and util::mysql::SqlTableDescription< T >::SelectValueFromD

Here is the call graph for this function:



Here is the caller graph for this function:

10.89.3.6 executeSelectQuery()

```
shared_ptr< sql::ResultSet > util::mysql::LocalMysqlConfiguration::executeSelectQuery (
            const string & what,
            const string & from,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [static], [inherited]
```

Execute an SQL select query and return a shared pointer to the ResultSet object.

Parameters

in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table–references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Exceptions

log::MessageException	if an error occurs while executing the query.

Returns

A shared pointer to the ResultSet object.

References CATCH_BLOCK, util::mysql::LocalMysqlConfiguration::executeQuery(), and util::mysql::MysqlUtils::GenerateSqlSelectStr().

Referenced by util::mysql::SqlTableDescription< T >::SelectObjectsFromDatabase().

10.89.3.7 ExecuteUpdate()

```
static int util::mysql::MysqlUtils::ExecuteUpdate (
            Connection * con,
            const string & update)  [inline], [static], [inherited]
```

Execute an SQL update and return the status code.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*update*	The SQL update to execute. This must be a well-formatted SQL update string.

Exceptions

log::MessageException	if 'con' is null, 'update' is a malformed SQL string, or any other error occurs.

Returns

The update status code.

References CATCH_BLOCK, and util::mysql::MysqlUtils::GeneratePreparedStatement().

Referenced by util::mysql::LocalMysqlConfiguration::executeUpdate().

10.89.3.8 executeUpdate()

```
int util::mysql::LocalMysqlConfiguration::executeUpdate (
            const string & update)  [static], [inherited]
```

Execute an SQL update and return the status code.

Parameters

in	*update*	The SQL update to execute. This must be a well-formatted SQL update string.

Exceptions

log::MessageException	if 'update' is a malformed SQL string, or any other error occurs while executing the update.

Returns

The update status code.

References util::mysql::MysqlUtils::ExecuteUpdate(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.89.3.9 GeneratePreparedStatement()

```
static shared_ptr< PreparedStatement > util::mysql::MysqlUtils::GeneratePreparedStatement (
            Connection * con,
            const string & statement)  [inline], [static], [inherited]
```

Generate a prepared SQL statement object for the given SQL statement.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*statement*	The SQL statement to prepare. This must be a well-formed SQL string.

Exceptions

log::MessageException	if 'con' is NULL, 'statement' is not a valid SQL string, or if an error occurs.

Returns

A prepared SQL statement object generated from the given SQL statement.

References CATCH_BLOCK, and EXC_THROW.

Referenced by util::mysql::MysqlUtils::ExecuteQuery(), util::mysql::MysqlUtils::ExecuteUpdate(), and util::mysql::LocalMysqlConfiguration:

10.89.3.10 generatePreparedStatement()

```
std::shared_ptr< sql::PreparedStatement > util::mysql::LocalMysqlConfiguration::generatePrepared↩
Statement (
            const string & statement)  [static], [inherited]
```

Generate a prepared SQL statement object for the given SQL statement.

Parameters

in	*statement*	The SQL statement to prepare. This must be a well-formed SQL string.

Exceptions

log::MessageException	if 'statement' is not a valid SQL string or if an error occurs while generating the prepared statement object..

Returns

A prepared SQL statement object generated from the given SQL statement.

References util::mysql::MysqlUtils::GeneratePreparedStatement(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

Referenced by util::mysql::SqlTableDescription< T >::SaveObjectToDatabase().

10.89.3.11 GenerateSqlDeleteStr()

```
static string util::mysql::MysqlUtils::GenerateSqlDeleteStr (
            const string & from,
            const string & where = "")  [inline], [static], [inherited]
```

Generate an SQL DELETE statement.

Warning

Without a `where` clause, the statement deletes every row in the table.

Parameters

in	*from*	The name of the table to delete from.
in	*where*	The SQL "where-condition" clause (empty = all rows).

Returns

The SQL statement.

10.89.3.12 GenerateSqlSelectStr()

```
static string util::mysql::MysqlUtils::GenerateSqlSelectStr (
            const string & what,
            const string & from,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [inline], [static], [inherited]
```

Generate an SQL select statement.

Parameters

in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table-references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Returns

The SQL select statement.

Referenced by util::mysql::LocalMysqlConfiguration::executeSelectQuery(), util::mysql::SqlTableDescription< T >::generateSelectAllState
and util::mysql::SqlTableDescription< T >::SelectValueFromDatabase().

10.89.3.13 GetSqlConnection()

```
static thread_specific_ptr< Connection > & util::mysql::MysqlUtils::GetSqlConnection (
            string url,
            string user,
            string password,
            string schema)  [inline], [static], [inherited]
```

Get a thread-specific instance of a MySQL connection object.

A new connection will be created, if necessary.

Parameters

in	*url*	The MySQL host server qualified address.
in	*user*	The MySQL account username.
in	*password*	The MySQL account password.
in	*schema*	The MySQL account schema name.

Exceptions

log::MessageException	if an error occurs while creating a new thread-specific instance of the SQL connection object

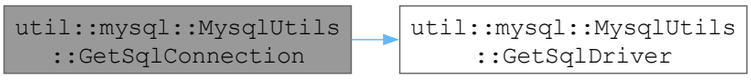
Returns

A thread-specific instance of a MySQL connection object.

References CATCH_BLOCK, util::mysql::MysqlUtils::GetSqlDriver(), and util::mysql::MysqlUtils::sql_connection_.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

Here is the call graph for this function:



Here is the caller graph for this function:

10.89.3.14 getSqlConnection()

`sql::Connection * util::mysql::LocalMysqlConfiguration::getSqlConnection () [static], [protected], [inherited]`

Generate a thread-specific instance of a MySQL connection object.

A new connection will be created, if necessary.

Exceptions

log::MessageException	if an error occurs while generating the SQL connection object.

Returns

A thread-specific instance of a MySQL connection object.

References util::mysql::LocalMysqlConfiguration::address_, CATCH_BLOCK, util::mysql::MysqlUtils::GetSqlConnection(), util::mysql::LocalMysqlConfiguration::password_, util::mysql::LocalMysqlConfiguration::port_, util::mysql::LocalMysqlConfiguration::protoc util::mysql::LocalMysqlConfiguration::schema_, and util::mysql::LocalMysqlConfiguration::user_.

10.89.3.15 GetSqlDriver()

```
static thread_specific_ptr< MySQL_Driver > & util::mysql::MysqlUtils::GetSqlDriver ()  [inline],
[static], [inherited]
```

Get a thread-specific instance of a MySQL driver object.

A new driver will created, if necessary.

Exceptions

log::MessageException	if an error occurs while creating a new thread-specific instance of the SQL driver object

Returns

A thread-specific instance of a MySQL driver object.

References CATCH_BLOCK, and util::mysql::MysqlUtils::sql_driver_.

Referenced by util::mysql::MysqlUtils::GetSqlConnection().

Here is the caller graph for this function:

10.89.3.16 MsgProcessingQueuePop()

```
bool argo::iridium::xfloat::XFloatMailProcessingService::MsgProcessingQueuePop (
            shared_ptr< XFloatMailMessage > & msg,
            bool block = false)  [static], [private]
```

Pop a mail message out of the mail processing queue.

This function is used by the mail processing thread(s) to receive mail messages produced by the previous stage in the processing pipeline, the mail retrieval thread, XFloatMailRetrievalService. The mail message processing queue is synchronous, so the underlying pop function is atomic.

Parameters

out	*msg*	The destination of the mail message to pop out of the queue.
in	*block*	If TRUE, this function will block until the queue is not empty. If FALSE, this function will return FALSE if the queue is empty (and no element will be popped out of the queue).

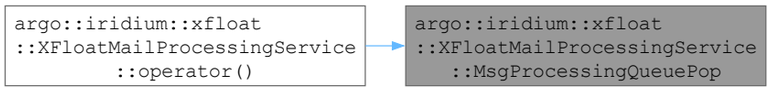
Returns

TRUE if the element was successfully popped out of the queue, or FALSE otherwise.

References msg_processing_queue_.

Referenced by operator()().

Here is the caller graph for this function:



10.89.3.17 MsgProcessingQueuePush()

```
bool argo::iridium::xfloat::XFloatMailProcessingService::MsgProcessingQueuePush (
            const shared_ptr< XFloatMailMessage > & msg,
            bool block = true)  [static]
```

Push a mail message into the mail processing queue.

This function is used by the previous stage in the processing pipeline, the mail retrieval thread, XFloatMailRetrievalService, to pass a mail message to the mail processing thread(s). The mail message processing queue is synchronous, so the underlying push function is atomic.

Parameters

in	*msg*	The mail message to push into the mail processing queue.
in	*block*	If TRUE, this function will block until the queue is not full. If FALSE, this function will return FALSE if the queue is full (and the element will not be pushed into the queue).

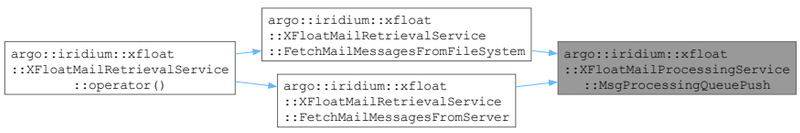
Returns

TRUE if the element was successfully pushed into the queue, or FALSE otherwise.

References msg_processing_queue_.

Referenced by argo::iridium::xfloat::XFloatMailRetrievalService::FetchMailMessagesFromFileSystem(), and argo::iridium::xfloat::XFloatMa

Here is the caller graph for this function:



10.89.3.18 MsgProcessingQueuePushAll()

```
void argo::iridium::xfloat::XFloatMailProcessingService::MsgProcessingQueuePushAll (
            vector< shared_ptr< XFloatMailMessage > >::const_iterator first,
            vector< shared_ptr< XFloatMailMessage > >::const_iterator last)  [static]
```

Push multiple mail messages into the mail processing queue.

This function is used by the previous stage in the processing pipeline, the mail retrieval thread, XFloatMailRetrievalService, to pass a group of mail messages to the mail processing thread. The mail message processing queue is synchronous, so the underlying push function is atomic.

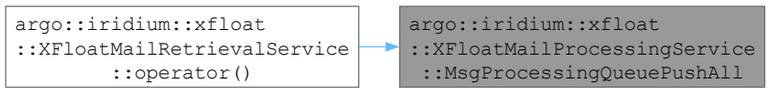
Parameters

in	*first,last*	Input iterators to the initial and final positions in a range. The range used is [first,last), which includes all the elements between first and last, including the element pointed by first but not the element pointed by last.

References msg_processing_queue_.

Referenced by argo::iridium::xfloat::XFloatMailRetrievalService::operator()().

Here is the caller graph for this function:



10.89.3.19 num_threads()

```
unsigned int argo::iridium::xfloat::XFloatMailProcessingService::num_threads ()  [static]
```

Get the number of mail message processing threads.

Returns

The number of mail message processing threads.

References num_threads_.

10.89.3.20 operator()()

```
void argo::iridium::xfloat::XFloatMailProcessingService::operator() ()
```

Functor operator overload function: the main entry point for the mail processing thread(s).

This function defines the behavior of the mail processing thread(s), which are responsible for processing the messages fetched from the mail server by the mail retrieval thread, XFloatMailRetrievalService. After initialization, zero or more instances of this thread are instantiated. The static configuration options for this thread are set as a result of parsing the command-line arguments and/or configuration file.

First, the scope thread attribute "ThreadName" is set to "mail-process". This attribute is used by the global logger object for filtering, etc. Then the thread enters its primary loop, in which it pops mail messages from the incoming queue one at a time and processes the messages before passing them to the next stage in the processing pipeline, XFloatTelemetryDecoderService. If the incoming message queue is empty, then the connection to the SQL database is closed, and the thread sleeps for XFLT_THREAD_SLEEP_MS milliseconds.

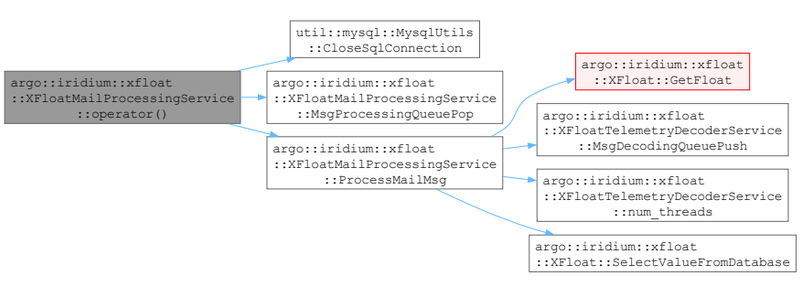
Once termination is signaled by the daemon process i.e. termination_signaled_ is TRUE, the thread will exit its primary loop and die.

Exceptions

None.	Never throws.

References CATCH_NOTHROW, util::mysql::MysqlUtils::CloseSqlConnection(), ldbg, MsgProcessingQueuePop(), ProcessMailMsg(), termination_signaled_, and XFLT_THREAD_SLEEP_MS.

Here is the call graph for this function:



10.89.3.21 ProcessMailMsg()

```
void argo::iridium::xfloat::XFloatMailProcessingService::ProcessMailMsg (
            const shared_ptr< XFloatMailMessage > & msg) const  [private]
```

Process a mail message.

This function is responsible for processing and validating a mail message before queuing the message for consumption by the next thread in the processing pipeline, XFloatTelemetryDecoderService.

First, the function checks the message reference `msg`. If it is NULL, then the function throws an exception. Otherwise, it continues on to set the global logger attributes:

- DiveID,
- MsgUID,
- PcktID,
- MomsnID,
- WhoiID,
- DacID, and
- WmoID.

If the values of the WhoiID, DacID, or WmoID attributes are unknown, the thread will attempt to query these identifiers from the SQL database. These attributes are used by the global logger object for filtering, etc.

Next, the message processing begins. If the message header is invalid, then the message is discarded. Otherwise, if the header is valid, the message is save to the SQL database. If the SBD data is valid, then the message is queued for consumption by the next thread in the processing pipeline, XFloatTelemetryDecoderService.

Finally, the raw mail file and binary SBD data file are written to the local filesystem. The SQL database entry for the mail messages is then updated with the paths to the files on the local filesystem.

Parameters

in	*msg*	A shared reference to the mail message to process.

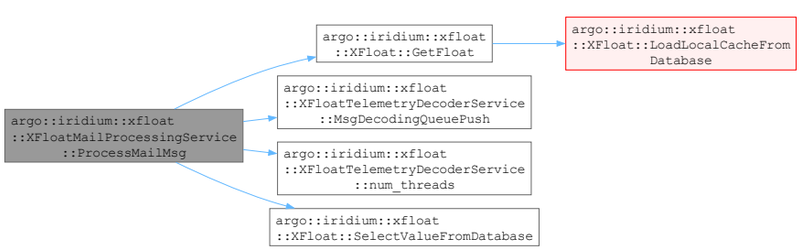
Exceptions

util::log::MessageException	if an error occurs while processing the mail message or the shared pointer to the mail message is NULL.

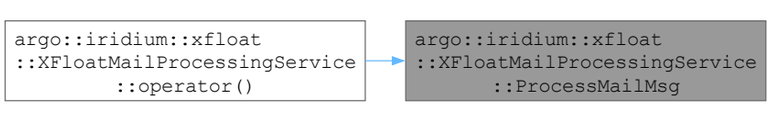
References CATCH_BLOCK, EXC_THROW, argo::iridium::xfloat::XFloat::GetFloat(), ldbg, linf, lwrn, argo::iridium::xfloat::XFloatTelemetryI argo::iridium::xfloat::XFloatTelemetryDecoderService::num_threads(), argo::iridium::xfloat::XFloat::SelectValueFromDatabase(), and XFLT_ID_UNKNOWN.

Referenced by operator()().

Here is the call graph for this function:



Here is the caller graph for this function:



10.89.3.22 set_termination_signaled()

```
void argo::iridium::xfloat::XFloatMailProcessingService::set_termination_signaled (
            bool termination_signaled = true)  [static], [private]
```

Set the termination signaled flag.

This function is called by TerminateWorkerThreads() in order to cause all currently running instances of the mail processing thread to exit their primary loop and die.

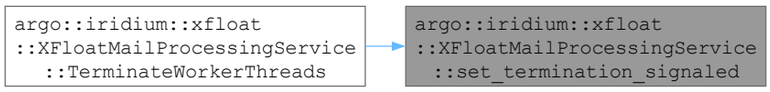
Parameters

in	*termination_signaled*	The termination signaled value to set.

References termination_signaled_.

Referenced by TerminateWorkerThreads().

Here is the caller graph for this function:



10.89.3.23 StartWorkerThreads()

```
void argo::iridium::xfloat::XFloatMailProcessingService::StartWorkerThreads ()  [static]
```

Instantiate the mail processing worker thread(s).

This function is used by the daemon thread to instantiate zero or more mail processing threads after initialization. The number of threads that are instantiated by this function is determined by the value of num_threads_, which is set as a result of parsing the command-line argument and/or configuration file during initialization.

Each thread is instantiated by creating an instance of this class, which is pushed into the thread_objects_ vector, and invoking the functor of each object. Each thread that is created is added to the thread_group_ object.

Exceptions

None.	Never throws.

References ldbg, num_threads_, thread_group_, and thread_objects_.

10.89.3.24 TerminateWorkerThreads()

```
void argo::iridium::xfloat::XFloatMailProcessingService::TerminateWorkerThreads ()  [static]
```

Terminate the mail processing worker thread(s).

This function is used by the daemon thread to kill the mail message processing worker thread(s) upon application termination. The function signals termination, and then attempts to join the thread group.

Warning

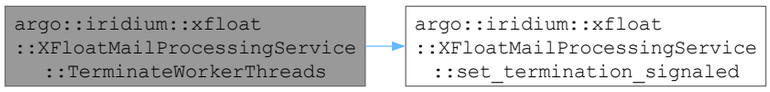
> If any of the mail message processing threads fails to terminate properly, then the `join_all()` function could block indefinitely. Precautions have been take to ensure that this does not happen, but it may still be possible.

Exceptions

None.	Never throws.

References ldbg, num_threads_, set_termination_signaled(), and thread_group_.

Here is the call graph for this function:



10.89.4 Friends And Related Symbol Documentation

10.89.4.1 util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription

```
po::options_description util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription
() [friend]
```

Friend function for populating some of the static members of this class from the configuration file options.

10.89.5 Member Data Documentation

10.89.5.1 address_

```
std::string util::mysql::LocalMysqlConfiguration::address_ [static], [private], [inherited]
```

The SQL server qualified name or IP address string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.89.5.2 msg_processing_queue_

```
util::thread::SynchronousQueue< shared_ptr< XFloatMailMessage > > argo::iridium::xfloat::↩
XFloatMailProcessingService::msg_processing_queue_ [static], [private]
```

The incoming mail message processing queue.

This synchronous FIFO queue is used to pass messages produced by the previous stage of the processing pipeline, the mail retrieval thread, XFloatMailRetrievalService, to the mail processing thread(s). All the operations performed by on the queue are atomic. Depending on the number of mail processing threads, this queue may function as a one-to-one queue or one-to-many queue.

Referenced by MsgProcessingQueuePop(), MsgProcessingQueuePush(), and MsgProcessingQueuePushAll().

10.89.5.3 num_threads_

```
unsigned int argo::iridium::xfloat::XFloatMailProcessingService::num_threads_ [static], [private]
```

The number of mail processing threads.

The value of this field determines the number of mail processing threads that are instantiated after initialization. Its value is set as a result of parsing the configuration file and/or command-line arguments during initialization. If the value is unspecified, then it defaults to a value of CFG_DEFAULT_NPROC.

Referenced by num_threads(), StartWorkerThreads(), and TerminateWorkerThreads().

10.89.5.4 password_

```
std::string util::mysql::LocalMysqlConfiguration::password_  [static], [private], [inherited]
```

The SQL server account password string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.89.5.5 port_

```
unsigned int util::mysql::LocalMysqlConfiguration::port_  [static], [private], [inherited]
```

The SQL server port number.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.89.5.6 protocol_

```
std::string util::mysql::LocalMysqlConfiguration::protocol_  [static], [private], [inherited]
```

The protocol to use in the SQL server connection e.g.

"tcp".

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.89.5.7 schema_

```
std::string util::mysql::LocalMysqlConfiguration::schema_  [static], [private], [inherited]
```

The SQL server schema name.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.89.5.8 sql_connection_

```
thread_specific_ptr<Connection> util::mysql::MysqlUtils::sql_connection_  [static], [private],
[inherited]
```

Tthe thread-specific pointer to MySQL connection object.

Thread-specific MySQL connection, released by `MysqlUtils::CleanupSqlConnection()` when the thread exits.

Referenced by util::mysql::MysqlUtils::CloseSqlConnection(), and util::mysql::MysqlUtils::GetSqlConnection().

10.89.5.9 sql_driver_

```
thread_specific_ptr<MySQL_Driver> util::mysql::MysqlUtils::sql_driver_  [static], [private],
[inherited]
```

The thread-specific pointer to MySQL driver object.

Thread-specific reference to the MySQL driver.

Its cleanup function, `MysqlUtils::CleanupSqlDriver()`, does not delete the shared driver instance.

Referenced by util::mysql::MysqlUtils::GetSqlDriver().

10.89.5.10 termination_signaled_

std::atomic< bool > argo::iridium::xfloat::XFloatMailProcessingService::termination_signaled_↩
[static], [private]

The termination signaled flag.

This flag is used to signal termination of the mail processing thread(s). During normal operation, the value of this field will be FALSE. Once termination is signaled, it will become TRUE causing all of the instances of the mail processing thread to process the remaining messages in the incoming queue, exiting their primary loop, and then die.

Referenced by operator()(), and set_termination_signaled().

10.89.5.11 thread_group_

thread_group argo::iridium::xfloat::XFloatMailProcessingService::thread_group_ [static], [private]

The mail processing thread group.

This object represents the group of mail processing threads that are instantiated after initialization. Each new thread that is instantiated is added to this group. Upon termination, the thread group is joined.

Referenced by StartWorkerThreads(), and TerminateWorkerThreads().

10.89.5.12 thread_objects_

vector< shared_ptr< XFloatMailProcessingService > > argo::iridium::xfloat::XFloatMailProcessing↩
Service::thread_objects_ [static], [private]

The mail processing thread object(s).

Each instance of the mail processing thread is created by invoking the functor of an instance of this runnable class. Each instance of this object that is created during instantiation of a new thread is stored in this vector.

Referenced by StartWorkerThreads().

10.89.5.13 user_

std::string util::mysql::LocalMysqlConfiguration::user_ [static], [private], [inherited]

The SQL server account username string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

The documentation for this class was generated from the following files:

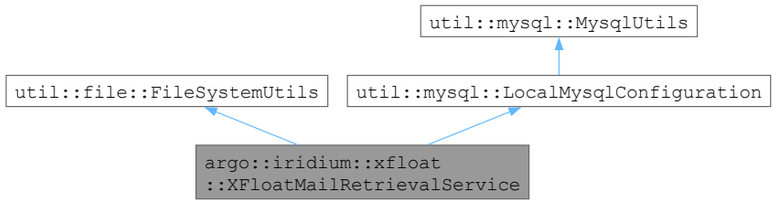
- stage2_MailProcessingThread.h
- stage2_MailProcessingThread.cpp

10.90 argo::iridium::xfloat::XFloatMailRetrievalService Class Reference

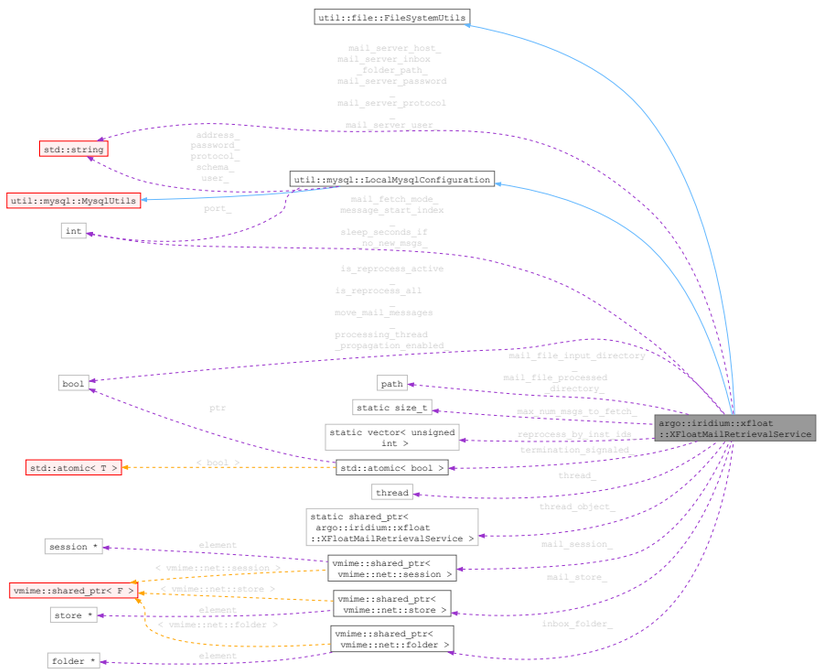
The mail retrieval thread class.

`#include <stage1_MailRetrievalThread.h>`

Inheritance diagram for argo::iridium::xfloat::XFloatMailRetrievalService:



Collaboration diagram for argo::iridium::xfloat::XFloatMailRetrievalService:



Public Member Functions

- XFloatMailRetrievalService (bool prop=(XFloatMailProcessingService::num_threads() > 0))

  The constructor.
- ~XFloatMailRetrievalService ()

  The destructor.
- void operator() () ATTR_NO_EXCEPTIONS

  Functor operator overload function: the main entry point for the mail retrieval thread.

Static Public Member Functions

- static void CloseSqlConnection ()

  Close the thread-specific MySQL connection if it is currently open.
- static shared_ptr< sql::ResultSet > **executeDeleteQuery** (const string &from, const string &where="")
- static shared_ptr< ResultSet > ExecuteQuery (Connection *con, const string &query)

  Execute an SQL query and return a shared pointer to the ResultSet object.
- static shared_ptr< sql::ResultSet > executeQuery (const string &query)

  Execute an SQL query and return a shared pointer to the ResultSet object.

- static shared_ptr< sql::ResultSet > executeSelectQuery (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)

  Execute an SQL select query and return a shared pointer to the ResultSet object.
- static int ExecuteUpdate (Connection *con, const string &update)

  Execute an SQL update and return the status code.
- static int executeUpdate (const string &update)

  Execute an SQL update and return the status code.
- static shared_ptr< PreparedStatement > GeneratePreparedStatement (Connection *con, const string &statement)

  Generate a prepared SQL statement object for the given SQL statement.
- static shared_ptr< sql::PreparedStatement > generatePreparedStatement (const string &statement)

  Generate a prepared SQL statement object for the given SQL statement.
- static string GenerateSqlDeleteStr (const string &from, const string &where="")

  Generate an SQL DELETE statement.
- static string GenerateSqlSelectStr (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)

  Generate an SQL select statement.
- static const path & GetDirectoryPath (const path &dir, bool create=false)

  Get a directory path.
- static path GetDirectoryPathFromString (const string &dir, bool create=false)

  Generate a boost::filesystem::path object from the directory path string.
- static thread_specific_ptr< Connection > & GetSqlConnection (string url, string user, string password, string schema)

  Get a thread-specific instance of a MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > & GetSqlDriver ()

  Get a thread-specific instance of a MySQL driver object.
- static vector< path > ListDirectories (const path &dir)

  List all directories contained in the given directory.
- static vector< path > ListFiles (path dir, size_t n=0)

  List all regular files contained in the given directory.
- static path MoveFileToDirectory (const path &file, const path &dir_dst, bool create_dir=false)

  Copy a file into a directory.
- static void StartWorkerThread () ATTR_NO_EXCEPTIONS

  Instantiate the mail retrieval worker thread.
- static void TerminateWorkerThread () ATTR_NO_EXCEPTIONS

  Terminate the mail retrieval worker thread.

Static Protected Member Functions

- static sql::Connection * getSqlConnection ()

  Generate a thread-specific instance of a MySQL connection object.

Private Member Functions

- vmime::shared_ptr< vmime::net::store > ConnectToMailServer ()

  Connect to the mail server.
- void DisconnectFromMailServer () ATTR_NO_EXCEPTIONS

  Disconnect from the mail server.
- size_t FetchMailMessagesFromFileSystem ()

  Fetch a batch of messages from the file system.
- size_t FetchMailMessagesFromServer ()

  Fetch a batch of mail messages from the mail server.
- string GenerateMailServerUrlString () const

  Generate the mail server URL string.
- const vmime::shared_ptr< vmime::net::session > & mail_session ()

  Get the mail session object.
- const vmime::shared_ptr< vmime::net::folder > & OpenMailInboxFolder ()

  Open the inbox folder on the remote mail server.

Static Private Member Functions

- static void CleanupSqlConnection (Connection *con)

  Cleanup an SQL connection.
- static void CleanupSqlDriver (MySQL_Driver *driver)

  Function for memory cleanup of MySQL driver on destruct.
- static vector< path > ListRawMailFiles ()

  List the paths raw mail files on the local filesystem.
- static void set_termination_signaled (bool termination_signaled=true)

  Set the termination signaled flag.

Private Attributes

- vmime::shared_ptr< vmime::net::folder > inbox_folder_

  The VMime inbox folder object reference.
- vmime::shared_ptr< vmime::net::session > mail_session_

  The VMime session object reference.
- vmime::shared_ptr< vmime::net::store > mail_store_

  The VMime mail store object reference.
- bool processing_thread_propagation_enabled_

  Is propagation of mail messages to the mail processing thread enabled?

Static Private Attributes

- static string address_

  The SQL server qualified name or IP address string.
- static bool **is_reprocess_active_**
- static bool is_reprocess_all_

  The reprocess-all-mail-messages boolean flag.
- static int mail_fetch_mode_

  The mail fetch mode flag.
- static path **mail_file_input_directory_**
- static path **mail_file_processed_directory_**
- static string mail_server_host_

  The mail server host qualified name or IP address string.
- static string mail_server_inbox_folder_path_

  The mail server remote incoming mail message folder path string.
- static string mail_server_password_

  The mail server account password string.
- static string mail_server_protocol_

  The mail server protocol name string.
- static string mail_server_user_

  The mail server account username string.
- static size_t max_num_msgs_to_fetch_

  The maximum number of messages to simultaneously fetch from the mail server.
- static unsigned int message_start_index_

  The starting index of the sequence of messages to fetch.
- static bool move_mail_messages_

  Move mail messages flag.
- static string password_

  The SQL server account password string.
- static unsigned int port_

  The SQL server port number.
- static string protocol_

  The protocol to use in the SQL server connection e.g.
- static vector< unsigned int > reprocess_by_inst_ids_

  A vector containing the unique instrument identifier of messages to reprocess from the SQL database.
- static string schema_

  The SQL server schema name.
- static unsigned int sleep_seconds_if_no_new_msgs_

  The time to sleep if no new mail messages are fetched, in seconds.
- static thread_specific_ptr< Connection > sql_connection_

Tthe thread-specific pointer to MySQL connection object.

- static thread_specific_ptr< MySQL_Driver > sql_driver_

  The thread-specific pointer to MySQL driver object.
- static std::atomic< bool > termination_signaled_

  The termination signaled flag.
- static thread thread_

  The instance of the mail retrieval thread.
- static shared_ptr< XFloatMailRetrievalService > thread_object_

  The mail retrieval thread object.
- static string user_

  The SQL server account username string.

Friends

- options_description util::config::LocalConfiguration::GenerateCommandLineOptionsDescription ()

  Friend function for populating static members of this class from the command-line options.
- options_description util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription ()

  Friend function for populating some of the static members of this class from the configuration file options.

10.90.1 Detailed Description

The mail retrieval thread class.

This class defines the operation of the mail retrieval thread, which is responsible for fetching email messages for the mail server and/or SQL database, and queuing them for consumption by the next stage in the processing pipeline, XFloatMailProcessingService. The mail retrieval thread is the first stage in the processing pipeline.

A single instance of this thread will be instantiated after application initialization. The function of the thread is defined by functor operator overload function. The thread enters a primary loop in which mail messages are queried from the database and mail server. If no messages are returned, the thread disconnects from the mail server and database, and sleeps for a period of time before resuming the loop. The loop continues until termination is signaled by the daemon thread, at which point the thread will disconnect from the mail server and die.

All the credentials for connecting to the mail server are stored as static members of this class. These values are set as a result of parsing the command-line and/or configuration options during application initialization.

10.90.2 Constructor & Destructor Documentation

10.90.2.1 XFloatMailRetrievalService()

```
argo::iridium::xfloat::XFloatMailRetrievalService::XFloatMailRetrievalService (
            bool prop = (XFloatMailProcessingService::num_threads() > 0))
```

The constructor.

Parameters

in	*prop*	TRUE if propagation of mail messages to the mail processing thread is enabled, or FALSE otherwise.

10.90.2.2 ~XFloatMailRetrievalService()

```
argo::iridium::xfloat::XFloatMailRetrievalService::~XFloatMailRetrievalService ()
```

The destructor.

10.90.3 Member Function Documentation

10.90.3.1 CleanupSqlConnection()

```
static void util::mysql::MysqlUtils::CleanupSqlConnection (
            Connection * con)  [inline], [static], [private], [inherited]
```

Cleanup an SQL connection.

This function for memory cleanup of the SQL connection on destruction. The thread-specific SQL connection object will be deleted if it exists.

Parameters

in	*con*	The SQL connection to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL connection object.

References CATCH_BLOCK.

10.90.3.2 CleanupSqlDriver()

```
static void util::mysql::MysqlUtils::CleanupSqlDriver (
            MySQL_Driver * driver)  [inline], [static], [private], [inherited]
```

Function for memory cleanup of MySQL driver on destruct.

Signals the SQL driver to end operation, if it exists.

Parameters

in	*driver*	Driver to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL driver object.

References CATCH_BLOCK.

10.90.3.3 CloseSqlConnection()

```
static void util::mysql::MysqlUtils::CloseSqlConnection ()  [inline], [static], [inherited]
```

Close the thread-specific MySQL connection if it is currently open.

If the thread local MySQL connection is not currently open, then this function will have no effect.

Note

The MySQL connection should be closed when idle to prevent the connection from timing out and throwing exceptions.

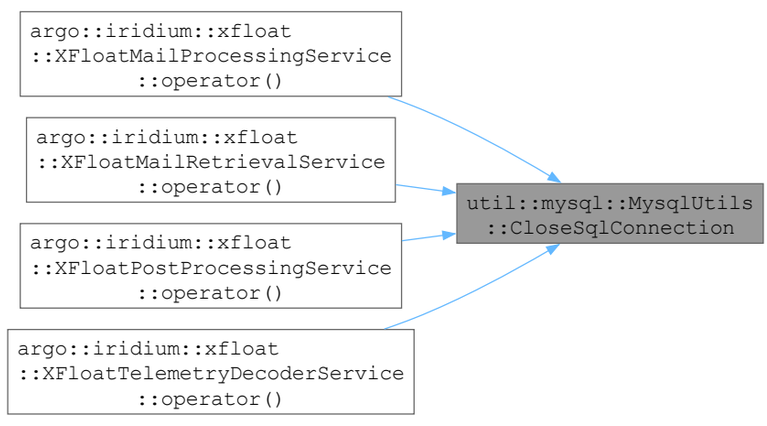
Exceptions

log::MessageException	if an error occurs while attempting to close the MySQL connection.

References CATCH_BLOCK, and util::mysql::MysqlUtils::sql_connection_.

Referenced by argo::iridium::xfloat::XFloatMailProcessingService::operator()(), operator()(), argo::iridium::xfloat::XFloatPostProcessingSe and argo::iridium::xfloat::XFloatTelemetryDecoderService::operator()().

Here is the caller graph for this function:



10.90.3.4 ConnectToMailServer()

```
vmime::shared_ptr< vmime::net::store > argo::iridium::xfloat::XFloatMailRetrievalService::↩
ConnectToMailServer () [private]
```

Connect to the mail server.

If the thread is not connected to the mail server i.e. mail_store_ is NULL, then this function creates the mail_store_ object from the mail server URL string and attempts to connect to the mail server. If the thread is already connected to the mail server, then this function will have no effect.

Exceptions

log::MessageException	if the function fails to connect to the mail server.

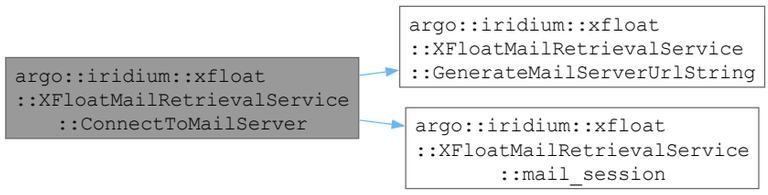
Returns

A shared reference to mail_store_.

References CATCH_BLOCK, GenerateMailServerUrlString(), ldbg, mail_server_host_, mail_session(), and mail_store_.

Referenced by OpenMailInboxFolder().

Here is the call graph for this function:



Here is the caller graph for this function:

10.90.3.5 DisconnectFromMailServer()

```
void argo::iridium::xfloat::XFloatMailRetrievalService::DisconnectFromMailServer () [private]
```

Disconnect from the mail server.

This function disconnects from the mail server and releases the reference to the VMime objects. If the thread is already disconnected from the mail server, then this function will have no effect. Otherwise, the inbox_folder_ object is closed and released. Then, the mail_store_ object is disconnected and released. Finally, the mail_session_ object is released.

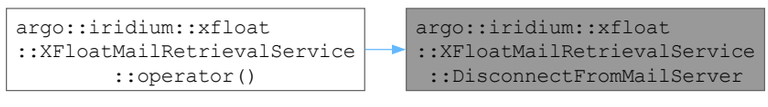
Exceptions

log::MessageException	if an error occurs while attempting to disconnect from the mail server.

References CATCH_BLOCK, CATCH_NOTHROW, inbox_folder_, ldbg, mail_session_, and mail_store_.

Referenced by operator()().

Here is the caller graph for this function:



10.90.3.6 ExecuteQuery()

```
static shared_ptr< ResultSet > util::mysql::MysqlUtils::ExecuteQuery (
            Connection * con,
            const string & query)  [inline], [static], [inherited]
```

Execute an SQL query and return a shared pointer to the ResultSet object.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*query*	The SQL query to execute. This must be a well-formatted SQL query string.

Exceptions

log::MessageException	if 'con' is null, 'query' is a malfored SQL string, or any other error occurs.

Returns

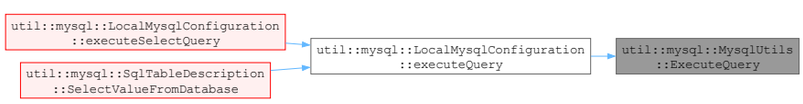
A shared pointer to the query ResultSet object.

References CATCH_BLOCK, and util::mysql::MysqlUtils::GeneratePreparedStatement().

Referenced by util::mysql::LocalMysqlConfiguration::executeQuery().

Here is the call graph for this function:

Here is the caller graph for this function:



10.90.3.7 executeQuery()

```
shared_ptr< sql::ResultSet > util::mysql::LocalMysqlConfiguration::executeQuery (
            const string & query)  [static], [inherited]
```

Execute an SQL query and return a shared pointer to the ResultSet object.

Parameters

in	*query*	The SQL query to execute. This must be a well-formatted SQL query string.

Exceptions

log::MessageException	'query' is a malfored SQL string or any other error occurs while executing the query.

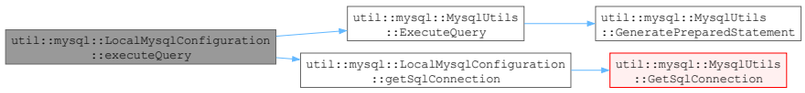
Returns

A shared pointer to the query ResultSet object.

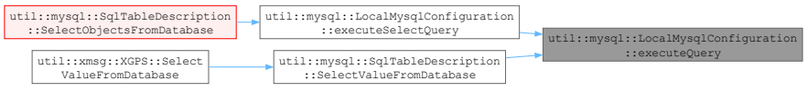
References util::mysql::MysqlUtils::ExecuteQuery(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

Referenced by util::mysql::LocalMysqlConfiguration::executeSelectQuery(), and util::mysql::SqlTableDescription< T >::SelectValueFromD

Here is the call graph for this function:



Here is the caller graph for this function:



10.90.3.8 executeSelectQuery()

```
shared_ptr< sql::ResultSet > util::mysql::LocalMysqlConfiguration::executeSelectQuery (
            const string & what,
            const string & from,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [static], [inherited]
```

Execute an SQL select query and return a shared pointer to the ResultSet object.

Parameters

in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table–references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Exceptions

log::MessageException	if an error occurs while executing the query.

Returns

A shared pointer to the ResultSet object.

References CATCH_BLOCK, util::mysql::LocalMysqlConfiguration::executeQuery(), and util::mysql::MysqlUtils::GenerateSqlSelectStr().

Referenced by util::mysql::SqlTableDescription< T >::SelectObjectsFromDatabase().

Here is the call graph for this function:

Here is the caller graph for this function:

10.90.3.9 ExecuteUpdate()

```
static int util::mysql::MysqlUtils::ExecuteUpdate (
            Connection * con,
            const string & update)  [inline], [static], [inherited]
```

Execute an SQL update and return the status code.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*update*	The SQL update to execute. This must be a well-formatted SQL update string.

Exceptions

log::MessageException	if 'con' is null, 'update' is a malformed SQL string, or any other error occurs.

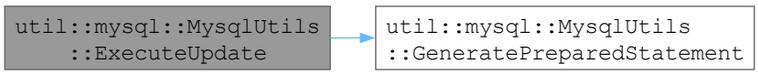
Returns

The update status code.

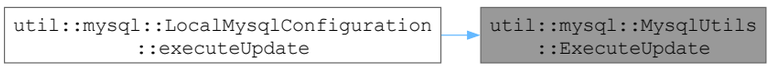
References CATCH_BLOCK, and util::mysql::MysqlUtils::GeneratePreparedStatement().

Referenced by util::mysql::LocalMysqlConfiguration::executeUpdate().

Here is the call graph for this function:



Here is the caller graph for this function:



10.90.3.10 executeUpdate()

```
int util::mysql::LocalMysqlConfiguration::executeUpdate (
            const string & update)  [static], [inherited]
```

Execute an SQL update and return the status code.

Parameters

in	*update*	The SQL update to execute. This must be a well-formatted SQL update string.

Exceptions

log::MessageException	if 'update' is a malformed SQL string, or any other error occurs while executing the update.

Returns

The update status code.

References util::mysql::MysqlUtils::ExecuteUpdate(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

Here is the call graph for this function:

10.90.3.11 FetchMailMessagesFromFileSystem()

```
size_t argo::iridium::xfloat::XFloatMailRetrievalService::FetchMailMessagesFromFileSystem ()  [private]
```

Fetch a batch of messages from the file system.

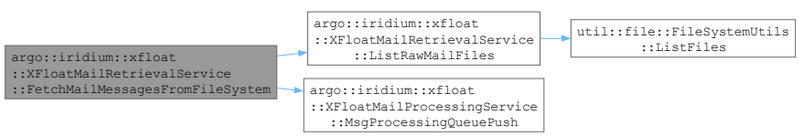
Returns

The number of messages fetched.

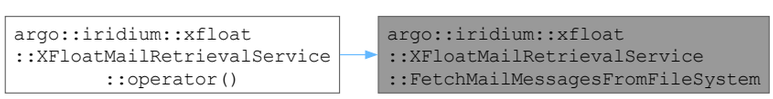
References CATCH_BLOCK, CATCH_NOTHROW, EXC_THROW, ldbg, ListRawMailFiles(), lwrn, max_num_msgs_to_fetch_, move_mail_messages_, and argo::iridium::xfloat::XFloatMailProcessingService::MsgProcessingQueuePush().

Referenced by operator()().

Here is the call graph for this function:



Here is the caller graph for this function:



10.90.3.12 FetchMailMessagesFromServer()

```
size_t argo::iridium::xfloat::XFloatMailRetrievalService::FetchMailMessagesFromServer ()  [private]
```

Fetch a batch of mail messages from the mail server.

Connects to the mail server and fetches a batch of mail messages. Fetched messages are pushed into the mail processing queue.

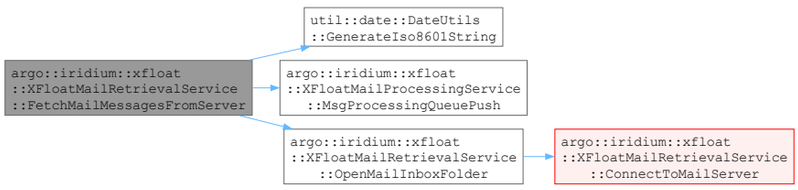
Returns

The number of messages fetched.

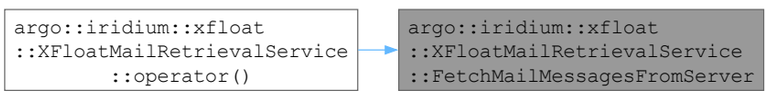
References CATCH_BLOCK, CATCH_NOTHROW, EXC_THROW, util::date::DateUtils::GenerateIso8601String(), ldbg, lout, max_num_msgs_to_fetch_, message_start_index_, move_mail_messages_, argo::iridium::xfloat::XFloatMailProcessingService::Msg and OpenMailInboxFolder().

Referenced by operator()().

Here is the call graph for this function:



Here is the caller graph for this function:



10.90.3.13 GenerateMailServerUrlString()

```
string argo::iridium::xfloat::XFloatMailRetrievalService::GenerateMailServerUrlString () const
[private]
```

Generate the mail server URL string.

The mail server URL string is generated from the static member fields that are set as a result of parsing the configuration file and/or command-line arguments during application initialization.

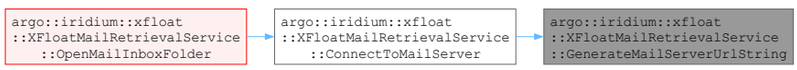
Returns

The generated mail server URL string.

References mail_server_host_, mail_server_password_, mail_server_protocol_, and mail_server_user_.

Referenced by ConnectToMailServer().

Here is the caller graph for this function:



10.90.3.14 GeneratePreparedStatement()

```
static shared_ptr< PreparedStatement > util::mysql::MysqlUtils::GeneratePreparedStatement (
            Connection * con,
            const string & statement)  [inline], [static], [inherited]
```

Generate a prepared SQL statement object for the given SQL statement.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*statement*	The SQL statement to prepare. This must be a well-formed SQL string.

Exceptions

log::MessageException	if 'con' is NULL, 'statement' is not a valid SQL string, or if an error occurs.

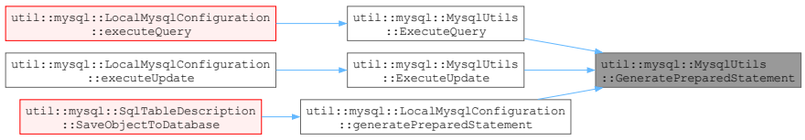
Returns

A prepared SQL statement object generated from the given SQL statement.

References CATCH_BLOCK, and EXC_THROW.

Referenced by util::mysql::MysqlUtils::ExecuteQuery(), util::mysql::MysqlUtils::ExecuteUpdate(), and util::mysql::LocalMysqlConfiguration:

Here is the caller graph for this function:



10.90.3.15 generatePreparedStatement()

```
std::shared_ptr< sql::PreparedStatement > util::mysql::LocalMysqlConfiguration::generatePrepared↩
Statement (
            const string & statement)  [static], [inherited]
```

Generate a prepared SQL statement object for the given SQL statement.

Parameters

in	*statement*	The SQL statement to prepare. This must be a well-formed SQL string.

Exceptions

log::MessageException	if 'statement' is not a valid SQL string or if an error occurs while generating the prepared statement object..

Returns

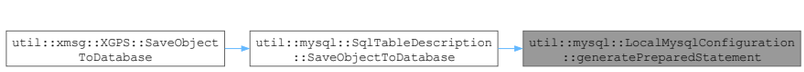
A prepared SQL statement object generated from the given SQL statement.

References util::mysql::MysqlUtils::GeneratePreparedStatement(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

Referenced by util::mysql::SqlTableDescription< T >::SaveObjectToDatabase().

Here is the call graph for this function:

Here is the caller graph for this function:



10.90.3.16 GenerateSqlDeleteStr()

```
static string util::mysql::MysqlUtils::GenerateSqlDeleteStr (
            const string & from,
            const string & where = "")  [inline], [static], [inherited]
```

Generate an SQL DELETE statement.

Warning

Without a `where` clause, the statement deletes every row in the table.

Parameters

in	*from*	The name of the table to delete from.
in	*where*	The SQL "where-condition" clause (empty = all rows).

Returns

The SQL statement.

10.90.3.17 GenerateSqlSelectStr()

```
static string util::mysql::MysqlUtils::GenerateSqlSelectStr (
            const string & what,
            const string & from,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [inline], [static], [inherited]
```

Generate an SQL select statement.

Parameters

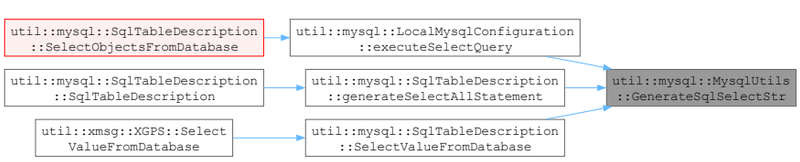
in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table-references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Returns

The SQL select statement.

Referenced by util::mysql::LocalMysqlConfiguration::executeSelectQuery(), util::mysql::SqlTableDescription< T >::generateSelectAllState
and util::mysql::SqlTableDescription< T >::SelectValueFromDatabase().

Here is the caller graph for this function:



10.90.3.18 GetDirectoryPath()

```
static const path & util::file::FileSystemUtils::GetDirectoryPath (
            const path & dir,
            bool create = false)  [inline], [static], [inherited]
```

Get a directory path.

Exceptions

MessageException	if create == FALSE and the directory specified by path does not exist.

Parameters

in	*dir*	Directory path.
in	*create*	If TRUE, the directory specified by path will be created if it does not already exists. If FALSE, an exception will be thrown if the directory does not exist.

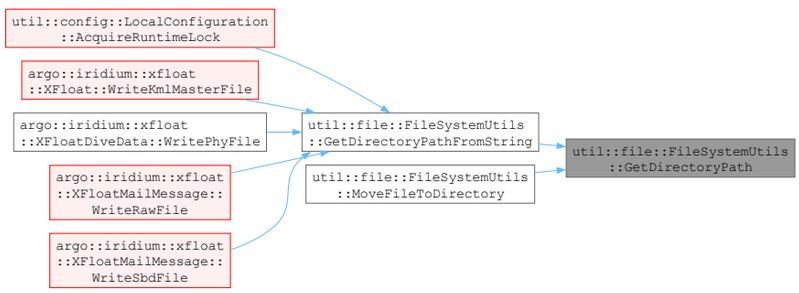
Returns

dir

References CATCH_BLOCK, EXC_THROW, and ldbg.

Referenced by util::file::FileSystemUtils::GetDirectoryPathFromString(), and util::file::FileSystemUtils::MoveFileToDirectory().

Here is the caller graph for this function:



10.90.3.19 GetDirectoryPathFromString()

```
static path util::file::FileSystemUtils::GetDirectoryPathFromString (
            const string & dir,
            bool create = false)  [inline], [static], [inherited]
```

Generate a boost::filesystem::path object from the directory path string.

Exceptions

MessageException	if create == FALSE and the directory specified by path does not exist.

Parameters

in	*dir*	Directory path string.
in	*create*	If TRUE, the directory specified by path will be created if it does not already exists. If FALSE, an exception will be thrown if the directory does not exist.

Returns

A boost::filesystem::path object from the directory path string.

References CATCH_BLOCK, and util::file::FileSystemUtils::GetDirectoryPath().

Referenced by util::config::LocalConfiguration::AcquireRuntimeLock(), argo::iridium::xfloat::XFloat::WriteKmlMasterFile(), argo::iridium::xfloat::XFloatDiveData::WritePhyFile(), argo::iridium::xfloat::XFloatMailMessage::WriteRawFile(), and argo::iridium::xfloat::XFloatMailMessage::WriteSbdFile().

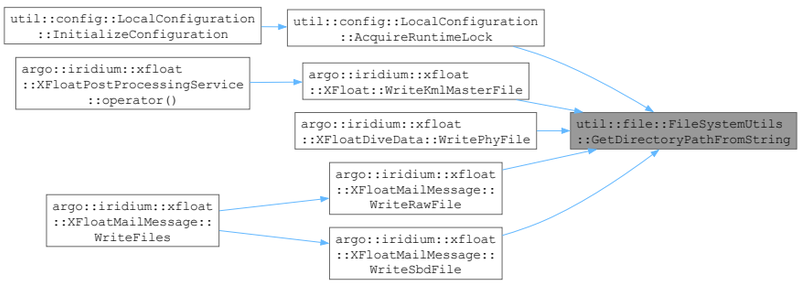
Here is the caller graph for this function:



10.90.3.20 GetSqlConnection()

```
static thread_specific_ptr< Connection > & util::mysql::MysqlUtils::GetSqlConnection (
            string url,
            string user,
            string password,
            string schema)  [inline], [static], [inherited]
```

Get a thread-specific instance of a MySQL connection object.

A new connection will be created, if necessary.

Parameters

in	*url*	The MySQL host server qualified address.
in	*user*	The MySQL account username.
in	*password*	The MySQL account password.
in	*schema*	The MySQL account schema name.

Exceptions

log::MessageException	if an error occurs while creating a new thread-specific instance of the SQL connection object

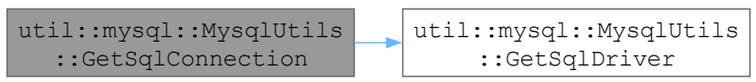
Returns

A thread-specific instance of a MySQL connection object.

References CATCH_BLOCK, util::mysql::MysqlUtils::GetSqlDriver(), and util::mysql::MysqlUtils::sql_connection_.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

Here is the call graph for this function:



Here is the caller graph for this function:

10.90.3.21 getSqlConnection()

`sql::Connection * util::mysql::LocalMysqlConfiguration::getSqlConnection () [static], [protected], [inherited]`

Generate a thread-specific instance of a MySQL connection object.

A new connection will be created, if necessary.

Exceptions

log::MessageException	if an error occurs while generating the SQL connection object.

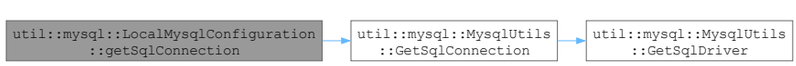
Returns

A thread-specific instance of a MySQL connection object.

References util::mysql::LocalMysqlConfiguration::address_, CATCH_BLOCK, util::mysql::MysqlUtils::GetSqlConnection(), util::mysql::LocalMysqlConfiguration::password_, util::mysql::LocalMysqlConfiguration::port_, util::mysql::LocalMysqlConfiguration::protoc util::mysql::LocalMysqlConfiguration::schema_, and util::mysql::LocalMysqlConfiguration::user_.

Referenced by util::mysql::LocalMysqlConfiguration::executeQuery(), util::mysql::LocalMysqlConfiguration::executeUpdate(), and util::mysql::LocalMysqlConfiguration::generatePreparedStatement().

Here is the call graph for this function:



Here is the caller graph for this function:

10.90.3.22 GetSqlDriver()

```
static thread_specific_ptr< MySQL_Driver > & util::mysql::MysqlUtils::GetSqlDriver ()  [inline],
[static], [inherited]
```

Get a thread-specific instance of a MySQL driver object.

A new driver will created, if necessary.

Exceptions

log::MessageException	if an error occurs while creating a new thread-specific instance of the SQL driver object

Returns

A thread-specific instance of a MySQL driver object.

References CATCH_BLOCK, and util::mysql::MysqlUtils::sql_driver_.

Referenced by util::mysql::MysqlUtils::GetSqlConnection().

Here is the caller graph for this function:

10.90.3.23 ListDirectories()

```
static vector< path > util::file::FileSystemUtils::ListDirectories (
            const path & dir)  [inline], [static], [inherited]
```

List all directories contained in the given directory.

Parameters

in	*dir*	The path to the directory of interest.

Exceptions

log::MessageException	if the directory does not exist, is not a directory, or an error occurs.

Returns

A vector of paths to all the directories contained in the given directory.

References CATCH_BLOCK, and EXC_THROW.

10.90.3.24 ListFiles()

```
static vector< path > util::file::FileSystemUtils::ListFiles (
            path dir,
            size_t n = 0)  [inline], [static], [inherited]
```

List all regular files contained in the given directory.

Parameters

in	*dir*	The path to the directory of interest.
in	*n*	If n>0, the maximum number of paths to return, else no effect.

Exceptions

log::MessageException	if the directory does not exist, is not a directory, or an error occurs.

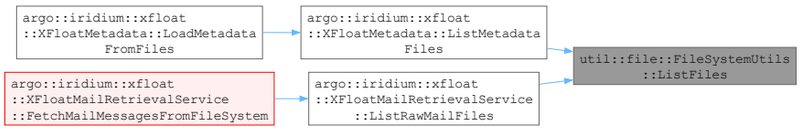
Returns

A vector of paths to all the regular files contained in the given directory.

References CATCH_BLOCK, and EXC_THROW.

Referenced by argo::iridium::xfloat::XFloatMetadata::ListMetadataFiles(), and ListRawMailFiles().

Here is the caller graph for this function:



10.90.3.25 ListRawMailFiles()

`vector< path > argo::iridium::xfloat::XFloatMailRetrievalService::ListRawMailFiles () [static], [private]`

List the paths raw mail files on the local filesystem.

Exceptions

util::log::MessageException	if an error occurs while listing the raw mail paths.

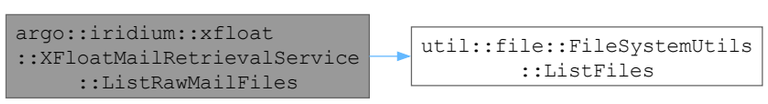
Returns

A vector containing the paths to the raw mail files on the local filesystem.

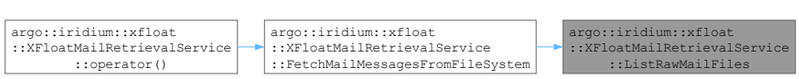
References CATCH_BLOCK, util::file::FileSystemUtils::ListFiles(), and max_num_msgs_to_fetch_.

Referenced by FetchMailMessagesFromFileSystem().

Here is the call graph for this function:



Here is the caller graph for this function:



10.90.3.26 mail_session()

```
const vmime::shared_ptr< vmime::net::session > & argo::iridium::xfloat::XFloatMailRetrieval↩
Service::mail_session ()  [private]
```

Get the mail session object.

If the mail session does not exist, a new one will be created.

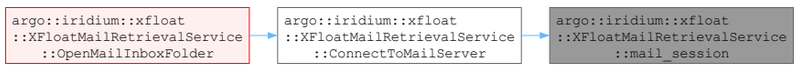
Returns

A shared reference to the VMime session object, mail_session_.

References mail_session_.

Referenced by ConnectToMailServer().

Here is the caller graph for this function:



10.90.3.27 MoveFileToDirectory()

```
static path util::file::FileSystemUtils::MoveFileToDirectory (
            const path & file,
            const path & dir_dst,
            bool create_dir = false)  [inline], [static], [inherited]
```

Copy a file into a directory.

Warning

Despite its name, this function copies the file and does not remove the source. If a file with the same name already exists in the destination directory, it is left unchanged. It is not currently called.

Parameters

in	*file*	The file to copy.
in	*dir_dst*	The destination directory.
in	*create_dir*	If TRUE, create the destination directory if it does not exist.

Exceptions

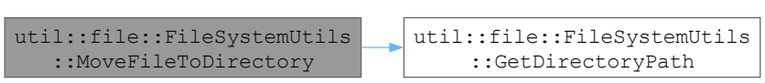
util::log::MessageException	if the file does not exist, is not a regular file, or cannot be copied.

Returns

The path of the file in the destination directory.

References CATCH_BLOCK, EXC_THROW, and util::file::FileSystemUtils::GetDirectoryPath().

Here is the call graph for this function:



10.90.3.28 OpenMailInboxFolder()

```
const vmime::shared_ptr< vmime::net::folder > & argo::iridium::xfloat::XFloatMailRetrieval↩
Service::OpenMailInboxFolder ()  [private]
```

Open the inbox folder on the remote mail server.

If the inbox folder is not already open, then this function will attempt to open it. The path to the inbox folder is specified by the static member string mail_server_inbox_folder_path_, which is set as a result of parsing the configuration file and/or command-line arguments during application initialization. If the string mail_server_inbox_folder_path_ is empty, then the default mail folder will be requested from the mail server.

Exceptions

util::log::MessageException	of an error occurs while attempting to open the inbox folder.

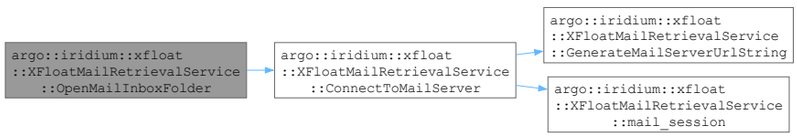
Returns

A shared reference to the VMime folder object, inbox_folder_.

References CATCH_BLOCK, ConnectToMailServer(), dbg1, inbox_folder_, and mail_server_inbox_folder_path_.

Referenced by FetchMailMessagesFromServer().

Here is the call graph for this function:



Here is the caller graph for this function:

10.90.3.29 operator()()

```
void argo::iridium::xfloat::XFloatMailRetrievalService::operator() ()
```

Functor operator overload function: the main entry point for the mail retrieval thread.

This function defines the behavior of the mail retrieval thread, which is responsible for retrieving messages from the mail server. After initialization, a single instance of this thread will be instantiated. The static configuration options for this thread are set as a result of parsing the command-line arguments and/or configuration file.

First, the scope thread attribute "ThreadName" is set to "mail-fetch". This attribute is used by the global logger object for filtering, etc. Next, the instruments whose messages are to be reprocessed are determined: all cached instruments if is_reprocess_all_ is TRUE; otherwise, those listed in reprocess_by_inst_ids_ and those with PHY generation enabled, plus, if `is_reprocess_active_` is TRUE, those that reported in the last 90 days.

For each instrument to reprocess, its existing dive data is deleted from the SQL database, its stored mail messages are fetched from the SQL database and passed on to the mail processing thread. Then, the thread will sleep for a short duration before proceeding to allow time for the daemon thread to signal termination if the application is configured to terminate after reprocessing.

Then the thread enters its primary loop, which depends on mail_fetch_mode_. In `MAIL_FETCH_SERVER` mode, FetchMailMessagesFromServer() fetches the next batch of messages from the mail server, by message index starting at message_start_index_. In `MAIL_FETCH_FILESYSTEM` mode, FetchMailMessagesFromFileSystem() reads RAW mail files from `mail_file_input_directory_`. The fetched messages are queued to be processed by the next thread in the pipeline, XFloatMailProcessingService. If no new messages are fetched, then the connections to the mail server and SQL database are closed and the thread sleeps for sleep_seconds_if_no_new_msgs_ seconds.

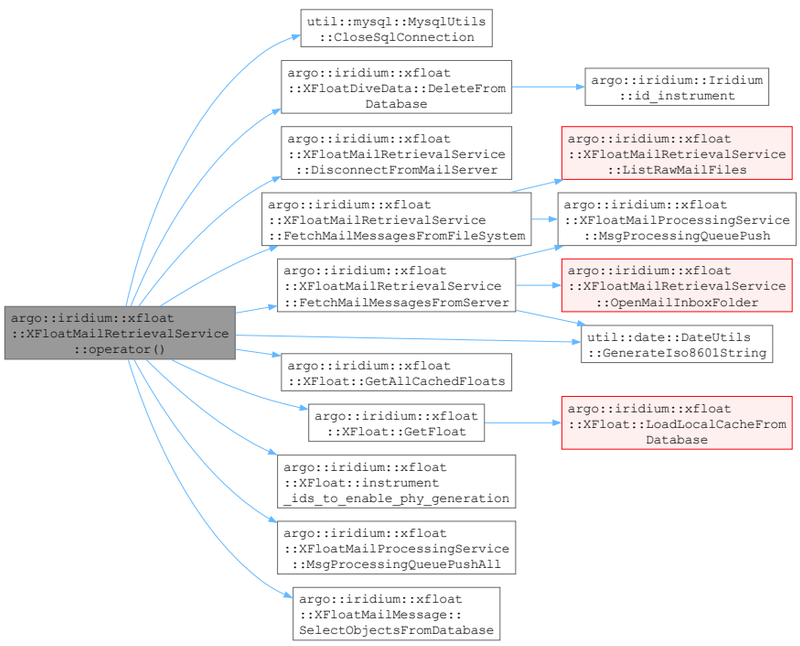
The primary loop terminates once termination is signaled (i.e. termination_signaled_ is TRUE) and the thread will disconnect from the mail server and then die. If termination is signaled before the thread begins its first iteration, then exactly zero iteration of the loop will be executed.

Exceptions

None.	Never throws.

References CATCH_NOTHROW, util::mysql::MysqlUtils::CloseSqlConnection(), argo::iridium::xfloat::XFloatDiveData::DeleteFromDatabas DisconnectFromMailServer(), FetchMailMessagesFromFileSystem(), FetchMailMessagesFromServer(), util::date::DateUtils::GenerateIso8 argo::iridium::xfloat::XFloat::GetAllCachedFloats(), argo::iridium::xfloat::XFloat::GetFloat(), argo::iridium::xfloat::XFloat::instrument_ids_to is_reprocess_all_, ldbg, linf, lout, mail_fetch_mode_, argo::iridium::xfloat::XFloatMailProcessingService::MsgProcessingQueuePushAll(), reprocess_by_inst_ids_, argo::iridium::xfloat::XFloatMailMessage::SelectObjectsFromDatabase(), sleep_seconds_if_no_new_msgs_, termination_signaled_, and XFLT_THREAD_SLEEP_MS.

Here is the call graph for this function:



10.90.3.30 set_termination_signaled()

```
void argo::iridium::xfloat::XFloatMailRetrievalService::set_termination_signaled (
            bool termination_signaled = true)  [static], [private]
```

Set the termination signaled flag.

This function is called by TerminateWorkerThreads() in order to cause all currently running instances of the mail retrieval thread to exit their primary loop and die.

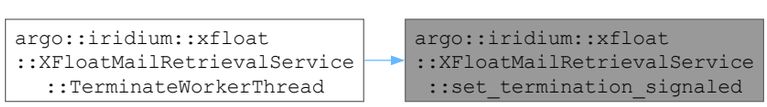
Parameters

in	*termination_signaled*	The termination signaled value to set.

References termination_signaled_.

Referenced by TerminateWorkerThread().

Here is the caller graph for this function:



10.90.3.31 StartWorkerThread()

```
void argo::iridium::xfloat::XFloatMailRetrievalService::StartWorkerThread ()  [static]
```

Instantiate the mail retrieval worker thread.

This function is invoked by the daemon thread after initialization to instantiate the mail retrieval thread. It creates a new instance of XFloatMailRetrievalService, and instantiates a new thread that invokes the functor operator of the object.

Exceptions

None.	Never throws.

References CATCH_BLOCK, ldbg, thread_, and thread_object_.

10.90.3.32 TerminateWorkerThread()

```
void argo::iridium::xfloat::XFloatMailRetrievalService::TerminateWorkerThread ()  [static]
```

Terminate the mail retrieval worker thread.

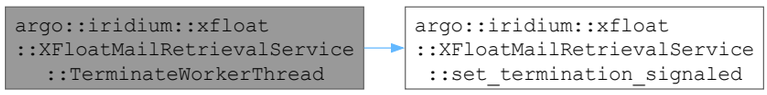
This function is used by the daemon thread to kill the worker thread upon application termination. The function signals termination, and then attempts to join the child thread. If the child thread does not join, then the function will timeout after XMTPS_THREAD_JOIN_SECONDS seconds, a warning will be issued, and the child thread will be abandoned.

Exceptions

None.	Never throws.

References CATCH_BLOCK, ldbg, lwrn, set_termination_signaled(), thread_, and XMTPS_THREAD_JOIN_SECONDS.

Here is the call graph for this function:



10.90.4 Friends And Related Symbol Documentation

10.90.4.1 util::config::LocalConfiguration::GenerateCommandLineOptionsDescription

```
options_description util::config::LocalConfiguration::GenerateCommandLineOptionsDescription ()
[friend]
```

Friend function for populating static members of this class from the command-line options.

10.90.4.2 util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription

```
options_description util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription
()  [friend]
```

Friend function for populating some of the static members of this class from the configuration file options.

10.90.5 Member Data Documentation

10.90.5.1 address_

```
std::string util::mysql::LocalMysqlConfiguration::address_  [static], [private], [inherited]
```

The SQL server qualified name or IP address string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.90.5.2 inbox_folder_

vmime::shared_ptr<vmime::net::folder> argo::iridium::xfloat::XFloatMailRetrievalService::inbox_folder_ [private]

The VMime inbox folder object reference.

This object represents the folder on the mail server that contains incoming messages. Typically, this folder is "INBOX".

Referenced by DisconnectFromMailServer(), and OpenMailInboxFolder().

10.90.5.3 is_reprocess_all_

bool argo::iridium::xfloat::XFloatMailRetrievalService::is_reprocess_all_ [static], [private]

The reprocess-all-mail-messages boolean flag.

The value of this field is set as a result of parsing the command-line options. If unspecified in the command-line arguments, this field defaults to a the value CFG_DEFAULT_REPROCESS_ALL.

The value of this boolean flag determines which messages are retrieved from the mail server upon startup of the application. If TRUE, then mail messages will be fetched from mail server starting with UID 0. Otherwise, if FALSE, the starting UID of mail messages to be fetched from the server will be determined by querying the maximum UID of the mail messages stored in the SQL database. Mail message will be fetched from the mail server, starting with the UID queried from the database plus one.

Referenced by operator()().

10.90.5.4 mail_fetch_mode_

int argo::iridium::xfloat::XFloatMailRetrievalService::mail_fetch_mode_ [static], [private]

The mail fetch mode flag.

- 0: Fetch mail from mail server.
- 1: Fetch mail from file system.

Referenced by operator()().

10.90.5.5 mail_server_host_

string argo::iridium::xfloat::XFloatMailRetrievalService::mail_server_host_ [static], [private]

The mail server host qualified name or IP address string.

The value of this field is set as a result of parsing the command-line options. If unspecified, it defaults to "maila.whoi.edu".

Referenced by ConnectToMailServer(), and GenerateMailServerUrlString().

10.90.5.6 mail_server_inbox_folder_path_

string argo::iridium::xfloat::XFloatMailRetrievalService::mail_server_inbox_folder_path_ [static], [private]

The mail server remote incoming mail message folder path string.

The value of this field is set as a result of parsing the command-line options. If unspecified, it defaults to "INBOX".

Referenced by OpenMailInboxFolder().

10.90.5.7 mail_server_password_

string argo::iridium::xfloat::XFloatMailRetrievalService::mail_server_password_ [static], [private]

The mail server account password string.

The value of this field is set as a result of parsing the command-line options.

Referenced by GenerateMailServerUrlString().

10.90.5.8 mail_server_protocol_

string argo::iridium::xfloat::XFloatMailRetrievalService::mail_server_protocol_ [static], [private]

The mail server protocol name string.

The value of this field is set as a result of parsing the command-line options. If unspecified, it defaults to "imap".

Referenced by GenerateMailServerUrlString().

10.90.5.9 mail_server_user_

string argo::iridium::xfloat::XFloatMailRetrievalService::mail_server_user_ [static], [private]

The mail server account username string.

The value of this field is set as a result of parsing the command-line options. If unspecified, it defaults to "imap".

Referenced by GenerateMailServerUrlString().

10.90.5.10 mail_session_

vmime::shared_ptr<vmime::net::session> argo::iridium::xfloat::XFloatMailRetrievalService::mail_↩session_ [private]

The VMime session object reference.

This object is used to connect to the mail server, and create the mail_store_ object. It is created when the thread connects to the mail server and released when the thread disconnects from the mail server.

Referenced by DisconnectFromMailServer(), and mail_session().

10.90.5.11 mail_store_

vmime::shared_ptr<vmime::net::store> argo::iridium::xfloat::XFloatMailRetrievalService::mail_↩store_ [private]

The VMime mail store object reference.

This object encapsulates the protocols that provide access to the mail drop. It is created when the thread connects to the mail server and released when the thread disconnects from the mail server.

Referenced by ConnectToMailServer(), and DisconnectFromMailServer().

10.90.5.12 max_num_msgs_to_fetch_

size_t argo::iridium::xfloat::XFloatMailRetrievalService::max_num_msgs_to_fetch_ [static], [private]

The maximum number of messages to simultaneously fetch from the mail server.

The value of this field is set as a result of parsing the command-line options. If unspecified, it defaults to CFG_DEFAULT_MAX_FETCH.

Referenced by FetchMailMessagesFromFileSystem(), FetchMailMessagesFromServer(), and ListRawMailFiles().

10.90.5.13 message_start_index_

```
unsigned int argo::iridium::xfloat::XFloatMailRetrievalService::message_start_index_ [static],
[private]
```

The starting index of the sequence of messages to fetch.

If messages are moved out of the INBOX folder after being processed, then the messages sequence start number will always be one. Otherwise, this field will contain the starting index of the first message not fetched from the mail server.

Referenced by FetchMailMessagesFromServer().

10.90.5.14 move_mail_messages_

```
bool argo::iridium::xfloat::XFloatMailRetrievalService::move_mail_messages_ [static], [private]
```

Move mail messages flag.

If set, then the mail messages will be moved out of the inbox folder after being processed.

Referenced by FetchMailMessagesFromFileSystem(), and FetchMailMessagesFromServer().

10.90.5.15 password_

```
std::string util::mysql::LocalMysqlConfiguration::password_ [static], [private], [inherited]
```

The SQL server account password string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.90.5.16 port_

```
unsigned int util::mysql::LocalMysqlConfiguration::port_ [static], [private], [inherited]
```

The SQL server port number.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.90.5.17 processing_thread_propagation_enabled_

```
bool argo::iridium::xfloat::XFloatMailRetrievalService::processing_thread_propagation_enabled_↩
[private]
```

Is propagation of mail messages to the mail processing thread enabled?

This field determines whether fetched messages are queued for consumption by the next thread in the processing pipeline, XFloatMailProcessingService. If no instances of that thread are running, then this field will be FALSE and message will be discarded rather than queued. Otherwise, this field will be TRUE and messages will be queued for consumption by XFloatMailProcessingService.

10.90.5.18 protocol_

```
std::string util::mysql::LocalMysqlConfiguration::protocol_ [static], [private], [inherited]
```

The protocol to use in the SQL server connection e.g.

"tcp".

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.90.5.19 reprocess_by_inst_ids_

```
vector< unsigned int > argo::iridium::xfloat::XFloatMailRetrievalService::reprocess_by_inst_ids↩
_ [static], [private]
```

A vector containing the unique instrument identifier of messages to reprocess from the SQL database.

If the user specifies one or more instruments to reprocess by specifying their unique instrument identifiers, then those identifiers will be contained in this vector. Otherwise, this vector will be empty.

After the thread is instantiated, it will check the size of this vector. If the vector size is non-zero, then the thread will query the SQL database for messages with instrument identifiers matching those contained in this vector. Those messages will then be passed on to the mail processing thread.

Regardless of the size of this vector, the mail retrieval thread will then continue on to enter its primary loop until termination is signaled.

Referenced by operator()().

10.90.5.20 schema_

```
std::string util::mysql::LocalMysqlConfiguration::schema_ [static], [private], [inherited]
```

The SQL server schema name.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.90.5.21 sleep_seconds_if_no_new_msgs_

```
unsigned int argo::iridium::xfloat::XFloatMailRetrievalService::sleep_seconds_if_no_new_msgs_↩
[static], [private]
```

The time to sleep if no new mail messages are fetched, in seconds.

If no new mail messages are fetched, the mail retrieval thread will sleep for this period of time, in increments of XFLT_THREAD_SLEEP_MS.

The value of this field is set as a result of parsing the command-line options. If unspecified, it defaults to CFG_DEFAULT_MAIL_CHK_DLY.

Referenced by operator()().

10.90.5.22 sql_connection_

```
thread_specific_ptr<Connection> util::mysql::MysqlUtils::sql_connection_ [static], [private],
[inherited]
```

Tthe thread-specific pointer to MySQL connection object.

Thread-specific MySQL connection, released by `MysqlUtils::CleanupSqlConnection()` when the thread exits.

Referenced by util::mysql::MysqlUtils::CloseSqlConnection(), and util::mysql::MysqlUtils::GetSqlConnection().

10.90.5.23 sql_driver_

```
thread_specific_ptr<MySQL_Driver> util::mysql::MysqlUtils::sql_driver_ [static], [private],
[inherited]
```

The thread-specific pointer to MySQL driver object.

Thread-specific reference to the MySQL driver.

Its cleanup function, `MysqlUtils::CleanupSqlDriver()`, does not delete the shared driver instance.

Referenced by util::mysql::MysqlUtils::GetSqlDriver().

10.90.5.24 termination_signaled_

```
std::atomic< bool > argo::iridium::xfloat::XFloatMailRetrievalService::termination_signaled_
[static], [private]
```

The termination signaled flag.

This flag is used to signal termination of the mail retrieval thread. During normal operation, the value of this field will be FALSE. Once termination is signaled, it will become TRUE causing all of the single instance of the mail retrieval to to exit its primary loop and die.

Referenced by operator()(), and set_termination_signaled().

10.90.5.25 thread_

```
thread argo::iridium::xfloat::XFloatMailRetrievalService::thread_ [static], [private]
```

The instance of the mail retrieval thread.

The thread operation is defined by the functor operator of the runnable object, thread_object_, which is invoked when this thread is instantiated.

Referenced by StartWorkerThread(), and TerminateWorkerThread().

10.90.5.26 thread_object_

```
shared_ptr< XFloatMailRetrievalService > argo::iridium::xfloat::XFloatMailRetrievalService
::thread_object_ [static], [private]
```

The mail retrieval thread object.

This is a reference to a runnable object whose functor operator is invoked during instantiation of the mail retrieval thread, thread_.

Referenced by StartWorkerThread().

10.90.5.27 user_

```
std::string util::mysql::LocalMysqlConfiguration::user_ [static], [private], [inherited]
```

The SQL server account username string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

The documentation for this class was generated from the following files:

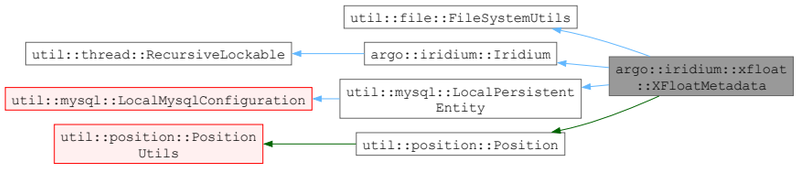
- stage1_MailRetrievalThread.h
- stage1_MailRetrievalThread.cpp

10.91 argo::iridium::xfloat::XFloatMetadata Class Reference

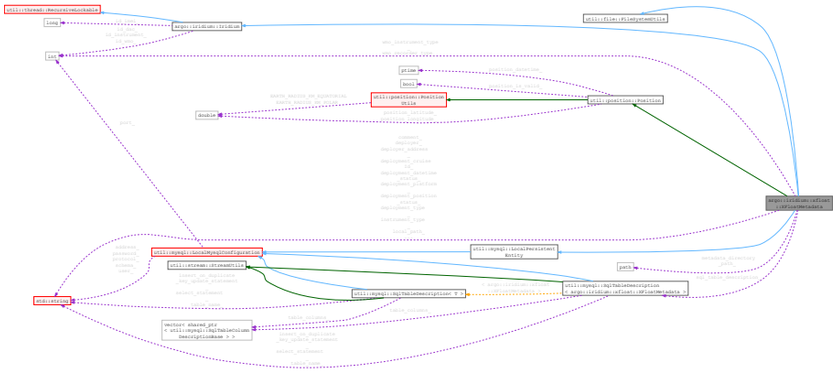
The instrument metadata class.

`#include <XFloatMetadata.h>`

Inheritance diagram for argo::iridium::xfloat::XFloatMetadata:



Collaboration diagram for argo::iridium::xfloat::XFloatMetadata:



Public Member Functions

- XFloatMetadata ()

  The default constructor.
- XFloatMetadata (const path &path)

  The file constructor.
- ~XFloatMetadata ()

  The destructor.
- string comment () const

  Get the instrument comment(s).
- string deployer () const

  Get the name of the instrument deployer(s).
- string deployer_address () const

  Get the address of the instrument deployer(s).
- string deployment_cruise_id () const

  Get the unique identifier of the deployment or launch cruise.
- ptime deployment_datetime () const

  Get the date/time of the deployment.
- string deployment_datetime_status () const

  Get the status of the accompanying date/time of the instrument deployment or launch.
- double deployment_latitude () const

  Get the latitude of the deployment position, in decimal degrees North.
- double deployment_longitude () const

  Get the longitude of the deployment position, in decimal degrees East.
- string deployment_platform () const

  Get the deployment or launch platform.
- string **deployment_position_as_iso6709_string** () const
- string deployment_position_status () const

  Get the status of the accompanying date/time of the instrument deployment or launch.
- string deployment_type () const

Get the deployment or launch type.

- int id_dac () const

  Get the unique Data Assembly Center (DAC) identifier.
- long id_imei () const

  Get the unique International Mobile Equipment Identifier (IMEI).
- int id_instrument () const

  Get the unique instrument identifier or instrument serial number.
- int id_wmo () const

  Get the unique World Meteorological Organization (WMO) identifier.
- const string & **instrument_type** () const
- bool **is_deployment_position_valid** () const
- string local_path () const

  Get the path to the metadata file on the local filesystem.
- bool LockObject (bool block)

  Lock the object.
- string manufacturer () const

  Get the instrument manufacturer.
- string principal_investigators () const

  Get the names of the principal investigator(s).
- string principal_investigators_address () const

  Get the address of the principal investigator(s).
- string principal_investigators_originating_country () const

  Get the originating country of the instrument.
- void SaveObjectToDatabase () const

  Save this object to the database.
- void UnlockObject ()

  Unlock the object.
- int wmo_instrument_type () const

  Get the WMO instrument type identifier.
- int wmo_recorder_type () const

  Get the WMO recorder type identifier.

Static Public Member Functions

- static void CloseSqlConnection ()

  Close the thread-specific MySQL connection if it is currently open.
- static shared_ptr< sql::ResultSet > **executeDeleteQuery** (const string &from, const string &where="")
- static shared_ptr< ResultSet > ExecuteQuery (Connection *con, const string &query)

  Execute an SQL query and return a shared pointer to the ResultSet object.
- static shared_ptr< sql::ResultSet > executeQuery (const string &query)

  Execute an SQL query and return a shared pointer to the ResultSet object.
- static shared_ptr< sql::ResultSet > executeSelectQuery (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)

  Execute an SQL select query and return a shared pointer to the ResultSet object.
- static int ExecuteUpdate (Connection *con, const string &update)

  Execute an SQL update and return the status code.
- static int executeUpdate (const string &update)

  Execute an SQL update and return the status code.
- static shared_ptr< PreparedStatement > GeneratePreparedStatement (Connection *con, const string &statement)

  Generate a prepared SQL statement object for the given SQL statement.
- static shared_ptr< sql::PreparedStatement > generatePreparedStatement (const string &statement)

  Generate a prepared SQL statement object for the given SQL statement.
- static string GenerateSqlDeleteStr (const string &from, const string &where="")

  Generate an SQL DELETE statement.
- static string GenerateSqlSelectStr (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)

  Generate an SQL select statement.
- static const path & GetDirectoryPath (const path &dir, bool create=false)

  Get a directory path.
- static path GetDirectoryPathFromString (const string &dir, bool create=false)

  Generate a boost::filesystem::path object from the directory path string.

- static thread_specific_ptr< Connection > & GetSqlConnection (string url, string user, string password, string schema)

  Get a thread-specific instance of a MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > & GetSqlDriver ()

  Get a thread-specific instance of a MySQL driver object.
- static vector< path > ListDirectories (const path &dir)

  List all directories contained in the given directory.
- static vector< path > ListFiles (path dir, size_t n=0)

  List all regular files contained in the given directory.
- static path MoveFileToDirectory (const path &file, const path &dir_dst, bool create_dir=false)

  Copy a file into a directory.

Protected Member Functions

- void LoadFile (const path &path)

  Read instrument metadata from a file on the local filesystem.
- ptime position_datetime () const

  Get the date/time of the position.
- string position_datetime_as_iso8601_string () const

  Get a formatted string representing the position date/time composed using the ISO 8601 standard.
- bool position_is_valid () const

  Is the position valid?
- double position_latitude () const

  Get the latitude of the position, in decimal degrees.
- double position_longitude () const

  Get the longitude of the position, in decimal degrees.
- string postition_as_iso6709_string () const

  Get a formatted string representing the position composed using the ISO 6709 standard.
- void set_comment (const string &comment)

  Set the instrument comment(s).
- void set_deployer (const string &deployer)

  Set the name of the instrument deployer(s).
- void set_deployer_address (const string &address)

  Set the address of the instrument deployer(s).
- void set_deployment_cruise_id (const string &id)

  Set the unique identifier of the deployment or launch cruise.
- void set_deployment_datetime (const ptime &dt)

  Set the date/time of the deployment.
- void set_deployment_datetime_status (const string &stat)

  Set the status of the accompanying date/time of the instrument deployment or launch.
- void set_deployment_latitude (double lat)

  Set the deployment position latitude, in decimal degrees North.
- void set_deployment_longitude (double lon)

  Set the deployment position longitude, in decimal degrees East.
- void set_deployment_platform (const string &platform)

  Set the deployment or launch platform.
- void set_deployment_position_status (const string &status)

  Set the status of the accompanying date/time of the instrument deployment or launch.
- void **set_deployment_position_valid** (bool valid)
- void set_deployment_type (const string &type)

  Set the deployment or launch type.
- void set_gps_position_datetime (unsigned int gpsWeek, unsigned int gpsDay, unsigned int gpsHour=0, unsigned int gpsMinute=0, unsigned int gpsSecond=0)

  Set the date and time of this position from the given GPS week, day, and time.
- void set_id_dac (int id_dac)

  Set the unique Data Assembly Center (DAC) identifier.
- void set_id_imei (long id_imei)

  Set the unique International Mobile Equipment Identifier (IMEI).
- void set_id_instrument (int id_instrument)

  Set the unique instrument identifier or instrument serial number.
- void set_id_wmo (int id_wmo)

  Set the unique World Meteorological Organization (WMO) identifier.

- void **set_instrument_type** (const string &instrument_type)
- void set_local_path (const string &local_path)

  Set the path to the metadata file on the local filesystem.
- void set_manufacturer (const string &man)

  Set the instrument manufacturer.
- void set_position_datetime (const ptime &datetime)

  Set the date/time of the position.
- void set_position_is_valid (bool is_valid=true)

  Set the position is valid flag.
- void set_position_latitude (double lat)

  Set the latitude of the position, in decimal degrees.
- void set_position_longitude (double lon)

  Set the longitude of the position, in decimal degrees.
- void set_principal_investigators (const string &pis)

  Set the names of the principal investigator(s).
- void set_principal_investigators_address (const string &addr)

  Set the address of the principal investigator(s).
- void set_principal_investigators_originating_country (const string &country)

  Set the originating country of the instrument.
- void set_wmo_instrument_type (int type)

  Set the WMO instrument type identifier.
- void set_wmo_recorder_type (int type)

  Set the WMO recorder type identifier.

Static Protected Member Functions

- static float **bitcastUint32ToFloat** (uint32_t u)
- template<typename T >
  static double CalculateEllipsoidHeight (T lat)

  Get the approximate surface altitude or height of earth for a given latitude, in kilometers.
- template<typename T >
  static double CalculateGeographicDistance (T lat1, T lon1, T lat0, T lon0)

  Get the geographical distance between two position, in kilometers, from the positions' locations, in decimal degrees.
- template<typename T >
  static double degToRad (T deg)

  Convert angular units from from degrees to decimal radians.
- static string GenerateCurrentUtcTimeIso8601String ()

  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- template<typename T >
  static std::string GenerateIso6709String (T lat, T lon)

  Generate an IS06709 string representation of the position given by (`lat`, `lon`).
- static string GenerateIso8601String (const ptime &p, bool extended=true)

  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)

  Convert a date/time to fractional days since a reference date/time.
- static ptime GetCurrentUtcTime ()

  Generate a POSIX time object representing the current date and time (rounded to the nearest second).
- static sql::Connection * getSqlConnection ()

  Generate a thread-specific instance of a MySQL connection object.
- template<typename T >
  static bool IsPositionValid (T lat, T lon)

  Check position validity.
- static vector< path > ListMetadataFiles ()

  List the paths to all metadata files on the local filesystem.
- static vector< shared_ptr< XFloatMetadata > > LoadMetadataFromFiles ()

  Load all metadata from the files on the local filesystem.

Protected Attributes

- recursive_mutex mutex_

  Recursive mutual exclusion lock for synchronizing operations.

Static Private Member Functions

- static void CleanupSqlConnection (Connection *con)

  Cleanup an SQL connection.
- static void CleanupSqlDriver (MySQL_Driver *driver)

  Function for memory cleanup of MySQL driver on destruct.

Private Attributes

- string comment_

  The instrument comment(s).
- string deployer_

  The name of the instrument deployer(s).
- string deployer_address_

  The address of the instrument deployer(s).
- string deployment_cruiseId_

  The unique identifier of the deployment or launch cruise.
- string deployment_datetime_status_

  The status of the accompanying date/time of the instrument deployment or launch.
- string deployment_platform_

  The deployment or launch platform.
- string deployment_position_status_

  The status of the accompanying date/time of the instrument deployment or launch.
- string deployment_type_

  The deployment or launch type.
- int id_dac_

  The unique Data Assembly Center (DAC) identifier.
- long id_imei_

  The unique International Mobile Equipment Identifier (IMEI).
- int id_instrument_

  The unique instrument identifier or instrument serial number.
- int id_wmo_

  The unique World Meteorological Organization (WMO) identifier.
- string **instrument_type_**
- string local_path_

  The path to the metadata file on the local filesystem.
- string manufacturer_

  The instrument manufacturer.
- ptime position_datetime_

  The date and time of the position.
- bool position_is_valid_

  The valid position indicator.
- double position_latitude_

  The latitude of the position, in decimal degrees.
- double position_longitude_

  The longitude of the position, in decimal degrees.
- string principal_investigators_

  The names of the principal investigator(s).
- string principal_investigators_address_

  The address of the principal investigator(s).
- string principal_investigators_originating_country_

  The originating country of the instrument.
- int wmo_instrument_type_

  The WMO instrument type identifier.
- int wmo_recorder_type_

  The WMO recorder type identifier.

Static Private Attributes

- static string address_
  The SQL server qualified name or IP address string.
- static const double EARTH_RADIUS_KM_EQUATORIAL = 6378.1
  The equatorial radius of the earth, in kilometers.
- static const double EARTH_RADIUS_KM_POLAR = 6356.1
  The polar radius of the earth, in kilometers.
- static path metadata_directory_path_
  The path to metadata directory on the local filesystem.
- static string password_
  The SQL server account password string.
- static unsigned int port_
  The SQL server port number.
- static string protocol_
  The protocol to use in the SQL server connection e.g.
- static string schema_
  The SQL server schema name.
- static thread_specific_ptr< Connection > sql_connection_
  Tthe thread-specific pointer to MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > sql_driver_
  The thread-specific pointer to MySQL driver object.
- static const util::mysql::SqlTableDescription< XFloatMetadata > sql_table_description_
  The SQL table description object.
- static string user_
  The SQL server account username string.

Friends

- istream & operator>> (istream &in, XFloatMetadata &metadata)
  Stream extraction operator overload function for the XFloatMetadata class.
- options_description util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription ()
  Friend function for setting the value of some of the static configuration options that are members of this class.
- class **XFloat**

10.91.1 Detailed Description

The instrument metadata class.

This class contains the metadata for a single instrument. The metadata object includes information about the instrument including details about deployment, principal investigators, and the instrument type. During application initialization, the metadata files are read from the local filesystem, and used to construct one metadata object per metadata file. Additionally, the metadata is persisted to the SQL database.

Todo Devise a method to actively check for (1) changes in the metadata files and (2) newly created metadata files. Load the metadata from the new or modified files and assign them to the corresponding float object. If necessary, retroactively process the mail messages for these instruments. Persist updates to the SQL database as necessary.

10.91.2 Constructor & Destructor Documentation

10.91.2.1 XFloatMetadata() [1/2]

```
argo::iridium::xfloat::XFloatMetadata::XFloatMetadata ()  [inline]
```

The default constructor.

10.91.2.2 XFloatMetadata() [2/2]

```
argo::iridium::xfloat::XFloatMetadata::XFloatMetadata (
            const path & path)  [inline]
```

The file constructor.

Reads instrument metadata from a file on the local filesystem.

Parameters

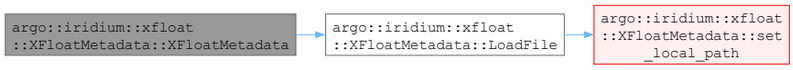
in	*path*	The path to the metadata file on the local filesystem.

Exceptions

util::log::MessageException	if the file does not exist or extraction of metadata from the file fails.

References CATCH_BLOCK, and LoadFile().

Here is the call graph for this function:



10.91.2.3 ~XFloatMetadata()

```
argo::iridium::xfloat::XFloatMetadata::~XFloatMetadata ()  [inline]
```

The destructor.

10.91.3 Member Function Documentation

10.91.3.1 CalculateEllipsoidHeight()

```
template<typename T >
static double util::position::PositionUtils::CalculateEllipsoidHeight (
            T lat)  [inline], [static], [inherited]
```

Get the approximate surface altitude or height of earth for a given latitude, in kilometers.

Warning

This method provides approximate surface height estimates only! This approximation is calculated from a reference ellipsoid – a mathematically-defined surface that approximates the geoid, the truer figure of the Earth.

Parameters

in	*lat*	The geographic latitude of interest, in decimal degrees.

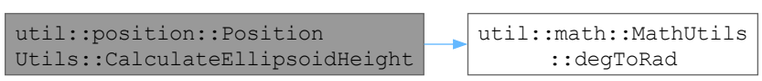
Returns

The approximate surface altitude or height of earth for the given latitude, in kilometers.

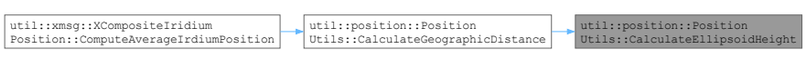
References util::math::MathUtils::degToRad(), util::position::PositionUtils::EARTH_RADIUS_KM_EQUATORIAL, and util::position::PositionUtils::EARTH_RADIUS_KM_POLAR.

Referenced by util::position::PositionUtils::CalculateGeographicDistance().

Here is the call graph for this function:



Here is the caller graph for this function:



10.91.3.2 CalculateGeographicDistance()

```
template<typename T >
static double util::position::PositionUtils::CalculateGeographicDistance (
            T lat1,
            T lon1,
            T lat0,
            T lon0)  [inline], [static], [inherited]
```

Get the geographical distance between two position, in kilometers, from the positions' locations, in decimal degrees.

Warning

This method provides approximate geographic estimates only! This approximation is calculated from a reference ellipsoid – a mathematically-defined surface that approximates the geoid, the truer figure of the Earth.

Note

This method uses the 'haversine' formula to calculate the great-circle distance between two points – that is, the shortest distance over the earth's surface – giving an 'as-the-crow-flies' distance between the points (ignoring any hills they fly over, of course!).

Parameters

in	*lat1*	The latitude of the geographic final position, in decimal degrees North.
in	*lon1*	The longitude of the geographic final position, in decimal degrees East.
in	*lat0*	The latitude of the geographic initial position, in decimal degrees North.
in	*lon0*	The longitude of the geographic initial position, in decimal degrees East.

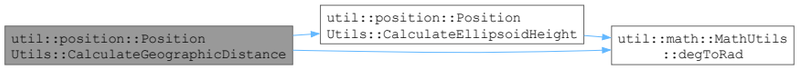
Returns

The geographical distance between the two given positions, in kilometers.

References util::position::PositionUtils::CalculateEllipsoidHeight(), and util::math::MathUtils::degToRad().

Referenced by util::xmsg::XCompositeIridiumPosition::ComputeAverageIrdiumPosition().

Here is the call graph for this function:



Here is the caller graph for this function:

10.91.3.3 CleanupSqlConnection()

```
static void util::mysql::MysqlUtils::CleanupSqlConnection (
            Connection * con)  [inline], [static], [private], [inherited]
```

Cleanup an SQL connection.

This function for memory cleanup of the SQL connection on destruction. The thread-specific SQL connection object will be deleted if it exists.

Parameters

in	*con*	The SQL connection to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL connection object.

References CATCH_BLOCK.

10.91.3.4 CleanupSqlDriver()

```
static void util::mysql::MysqlUtils::CleanupSqlDriver (
            MySQL_Driver * driver)  [inline], [static], [private], [inherited]
```

Function for memory cleanup of MySQL driver on destruct.

Signals the SQL driver to end operation, if it exists.

Parameters

in	*driver*	Driver to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL driver object.

References CATCH_BLOCK.

10.91.3.5 CloseSqlConnection()

```
static void util::mysql::MysqlUtils::CloseSqlConnection ()  [inline], [static], [inherited]
```

Close the thread-specific MySQL connection if it is currently open.

If the thread local MySQL connection is not currently open, then this function will have no effect.

Note

The MySQL connection should be closed when idle to prevent the connection from timing out and throwing exceptions.

Exceptions

log::MessageException	if an error occurs while attempting to close the MySQL connection.

References CATCH_BLOCK, and util::mysql::MysqlUtils::sql_connection_.

Referenced by argo::iridium::xfloat::XFloatMailProcessingService::operator()(), argo::iridium::xfloat::XFloatMailRetrievalService::operator(

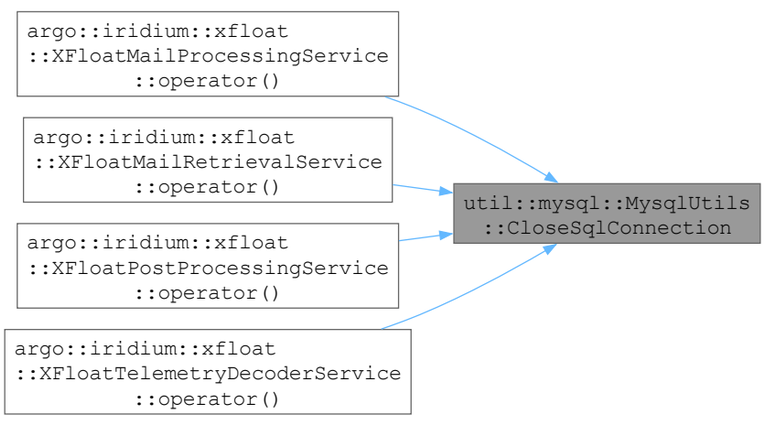
Here is the caller graph for this function:



10.91.3.6 comment()

```
string argo::iridium::xfloat::XFloatMetadata::comment () const  [inline]
```

Get the instrument comment(s).

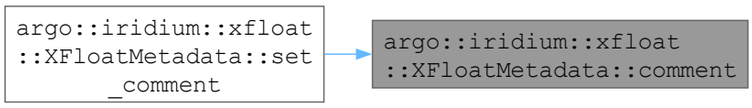
Returns

The instrument comment(s).

References comment_, and util::thread::RecursiveLockable::mutex_.

Referenced by set_comment().

Here is the caller graph for this function:



10.91.3.7 degToRad()

```
template<typename T >
static double util::math::MathUtils::degToRad (
            T deg)  [inline], [static], [inherited]
```

Convert angular units from from degrees to decimal radians.

Parameters

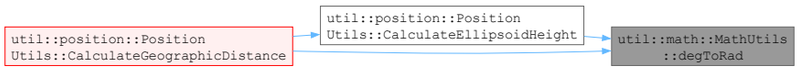
in	*deg*	Angle in integer or decimal degrees to convert to radians.

Returns

Angle in decimal radians.

Referenced by util::position::PositionUtils::CalculateEllipsoidHeight(), and util::position::PositionUtils::CalculateGeographicDistance().

Here is the caller graph for this function:



10.91.3.8 deployer()

```
string argo::iridium::xfloat::XFloatMetadata::deployer () const  [inline]
```

Get the name of the instrument deployer(s).

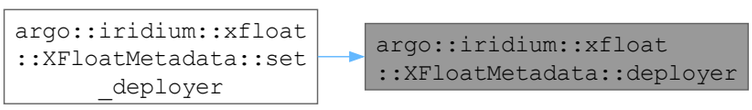
Returns

The name of the instrument deployer(s).

References deployer_, and util::thread::RecursiveLockable::mutex_.

Referenced by set_deployer().

Here is the caller graph for this function:



10.91.3.9 deployer_address()

```
string argo::iridium::xfloat::XFloatMetadata::deployer_address () const  [inline]
```

Get the address of the instrument deployer(s).

Returns

The address of the instrument deployer(s).

References deployer_address_, and util::thread::RecursiveLockable::mutex_.

10.91.3.10 deployment_cruise_id()

```
string argo::iridium::xfloat::XFloatMetadata::deployment_cruise_id () const  [inline]
```

Get the unique identifier of the deployment or launch cruise.

Returns

The unique identifier of the deployment or launch cruise.

References deployment_cruiseId_, and util::thread::RecursiveLockable::mutex_.

10.91.3.11 deployment_datetime()

```
ptime argo::iridium::xfloat::XFloatMetadata::deployment_datetime () const  [inline]
```

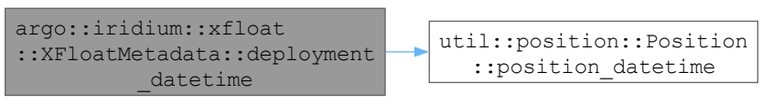
Get the date/time of the deployment.

Returns

The date/time of the deployment.

References util::thread::RecursiveLockable::mutex_, and util::position::Position::position_datetime().

Here is the call graph for this function:



10.91.3.12 deployment_datetime_status()

```
string argo::iridium::xfloat::XFloatMetadata::deployment_datetime_status () const  [inline]
```

Get the status of the accompanying date/time of the instrument deployment or launch.

Returns

The status of the accompanying date/time of the instrument deployment or launch.

References deployment_datetime_status_, and util::thread::RecursiveLockable::mutex_.

10.91.3.13 deployment_latitude()

```
double argo::iridium::xfloat::XFloatMetadata::deployment_latitude () const  [inline]
```

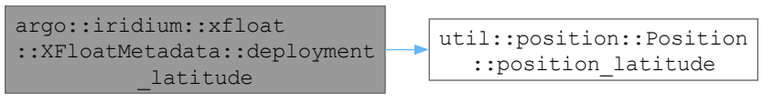
Get the latitude of the deployment position, in decimal degrees North.

Returns

The latitude of the deployment position, in decimal degrees North.

References util::thread::RecursiveLockable::mutex_, and util::position::Position::position_latitude().

Here is the call graph for this function:



10.91.3.14 deployment_longitude()

```
double argo::iridium::xfloat::XFloatMetadata::deployment_longitude () const  [inline]
```

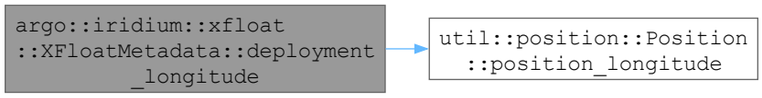
Get the longitude of the deployment position, in decimal degrees East.

Returns

The longitude of the deployment position, in decimal degrees East.

References util::thread::RecursiveLockable::mutex_, and util::position::Position::position_longitude().

Here is the call graph for this function:



10.91.3.15 deployment_platform()

```
string argo::iridium::xfloat::XFloatMetadata::deployment_platform () const  [inline]
```

Get the deployment or launch platform.

Returns

The deployment or launch platform.

References deployment_platform_, and util::thread::RecursiveLockable::mutex_.

10.91.3.16 deployment_position_status()

```
string argo::iridium::xfloat::XFloatMetadata::deployment_position_status () const  [inline]
```

Get the status of the accompanying date/time of the instrument deployment or launch.

Returns

The status of the accompanying date/time of the instrument deployment or launch.

References deployment_position_status_, and util::thread::RecursiveLockable::mutex_.

10.91.3.17 deployment_type()

```
string argo::iridium::xfloat::XFloatMetadata::deployment_type () const  [inline]
```

Get the deployment or launch type.

Returns

The deployment or launch type.

References deployment_type_, and util::thread::RecursiveLockable::mutex_.

10.91.3.18 ExecuteQuery()

```
static shared_ptr< ResultSet > util::mysql::MysqlUtils::ExecuteQuery (
            Connection * con,
            const string & query)  [inline], [static], [inherited]
```

Execute an SQL query and return a shared pointer to the ResultSet object.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*query*	The SQL query to execute. This must be a well-formatted SQL query string.

Exceptions

log::MessageException	if 'con' is null, 'query' is a malfored SQL string, or any other error occurs.

Returns

A shared pointer to the query ResultSet object.

References CATCH_BLOCK, and util::mysql::MysqlUtils::GeneratePreparedStatement().

Referenced by util::mysql::LocalMysqlConfiguration::executeQuery().

Here is the caller graph for this function:

10.91.3.19 executeQuery()

```
shared_ptr< sql::ResultSet > util::mysql::LocalMysqlConfiguration::executeQuery (
            const string & query)  [static], [inherited]
```

Execute an SQL query and return a shared pointer to the ResultSet object.

Parameters

in	*query*	The SQL query to execute. This must be a well-formatted SQL query string.

Exceptions

log::MessageException	'query' is a malfored SQL string or any other error occurs while executing the query.

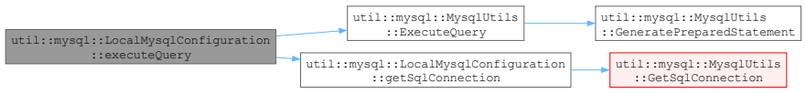
Returns

A shared pointer to the query ResultSet object.

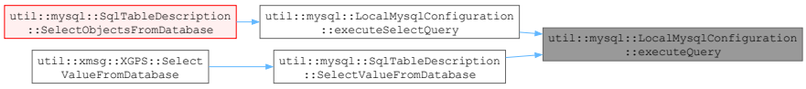
References util::mysql::MysqlUtils::ExecuteQuery(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

Referenced by util::mysql::LocalMysqlConfiguration::executeSelectQuery(), and util::mysql::SqlTableDescription< T >::SelectValueFromD

Here is the call graph for this function:



Here is the caller graph for this function:



10.91.3.20 executeSelectQuery()

```
shared_ptr< sql::ResultSet > util::mysql::LocalMysqlConfiguration::executeSelectQuery (
            const string & what,
            const string & from,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [static], [inherited]
```

Execute an SQL select query and return a shared pointer to the ResultSet object.

Parameters

in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table–references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Exceptions

log::MessageException	if an error occurs while executing the query.

Returns

A shared pointer to the ResultSet object.

References CATCH_BLOCK, util::mysql::LocalMysqlConfiguration::executeQuery(), and util::mysql::MysqlUtils::GenerateSqlSelectStr().

Referenced by util::mysql::SqlTableDescription< T >::SelectObjectsFromDatabase().

10.91.3.21 ExecuteUpdate()

```
static int util::mysql::MysqlUtils::ExecuteUpdate (
            Connection * con,
            const string & update)  [inline], [static], [inherited]
```

Execute an SQL update and return the status code.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*update*	The SQL update to execute. This must be a well-formatted SQL update string.

Exceptions

log::MessageException	if 'con' is null, 'update' is a malformed SQL string, or any other error occurs.

Returns

The update status code.

References CATCH_BLOCK, and util::mysql::MysqlUtils::GeneratePreparedStatement().

Referenced by util::mysql::LocalMysqlConfiguration::executeUpdate().

10.91.3.24 GenerateIso6709String()

```
template<typename T >
static std::string util::position::PositionUtils::GenerateIso6709String (
            T lat,
            T lon)  [inline], [static], [inherited]
```

Generate an IS06709 string representation of the position given by (`lat`, `lon`).

Parameters

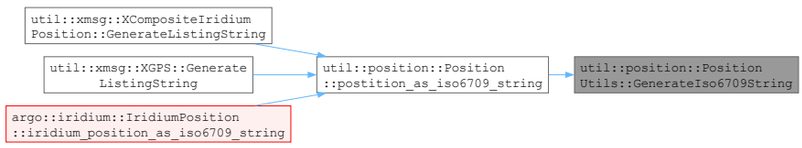
in	*lat*	The latitude of the position, in degrees North.
in	*lon*	The longitude of the position, in degrees East.

Returns

An IS06709 string representation of the position given by (`lat`, `lon`).

Referenced by util::position::Position::postition_as_iso6709_string().

Here is the caller graph for this function:



10.91.3.25 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

10.91.3.26 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref↩ _dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.91.3.27 GeneratePreparedStatement()

```
static shared_ptr< PreparedStatement > util::mysql::MysqlUtils::GeneratePreparedStatement (
            Connection * con,
            const string & statement)  [inline], [static], [inherited]
```

Generate a prepared SQL statement object for the given SQL statement.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*statement*	The SQL statement to prepare. This must be a well-formed SQL string.

Exceptions

log::MessageException	if 'con' is NULL, 'statement' is not a valid SQL string, or if an error occurs.

Returns

A prepared SQL statement object generated from the given SQL statement.

References CATCH_BLOCK, and EXC_THROW.

Referenced by util::mysql::MysqlUtils::ExecuteQuery(), util::mysql::MysqlUtils::ExecuteUpdate(), and util::mysql::LocalMysqlConfiguration:

10.91.3.29 GenerateSqlDeleteStr()

```
static string util::mysql::MysqlUtils::GenerateSqlDeleteStr (
            const string & from,
            const string & where = "")  [inline], [static], [inherited]
```

Generate an SQL DELETE statement.

Warning

Without a `where` clause, the statement deletes every row in the table.

Parameters

in	*from*	The name of the table to delete from.
in	*where*	The SQL "where-condition" clause (empty = all rows).

Returns

The SQL statement.

10.91.3.30 GenerateSqlSelectStr()

```
static string util::mysql::MysqlUtils::GenerateSqlSelectStr (
            const string & what,
            const string & from,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [inline], [static], [inherited]
```

Generate an SQL select statement.

Parameters

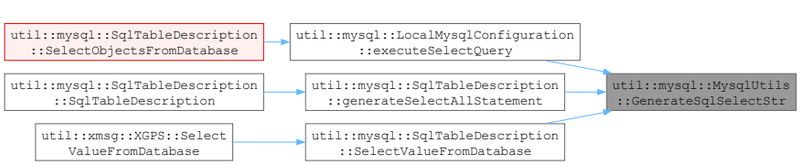
in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table-references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Returns

The SQL select statement.

Referenced by util::mysql::LocalMysqlConfiguration::executeSelectQuery(), util::mysql::SqlTableDescription< T >::generateSelectAllState
and util::mysql::SqlTableDescription< T >::SelectValueFromDatabase().

Here is the caller graph for this function:



10.91.3.31 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

```
static const path & util::file::FileSystemUtils::GetDirectoryPath (
            const path & dir,
            bool create = false)  [inline], [static], [inherited]
```

Get a directory path.

Exceptions

MessageException	if create == FALSE and the directory specified by path does not exist.

Parameters

in	*dir*	Directory path.
in	*create*	If TRUE, the directory specified by path will be created if it does not already exists. If FALSE, an exception will be thrown if the directory does not exist.

Returns

dir

References CATCH_BLOCK, EXC_THROW, and ldbg.

Referenced by util::file::FileSystemUtils::GetDirectoryPathFromString(), and util::file::FileSystemUtils::MoveFileToDirectory().

            string user,
            string password,
            string schema)  [inline], [static], [inherited]
```

Get a thread-specific instance of a MySQL connection object.

A new connection will be created, if necessary.

Parameters

in	*url*	The MySQL host server qualified address.
in	*user*	The MySQL account username.
in	*password*	The MySQL account password.
in	*schema*	The MySQL account schema name.

Exceptions

log::MessageException	if an error occurs while creating a new thread-specific instance of the SQL connection object

Returns

A thread-specific instance of a MySQL connection object.

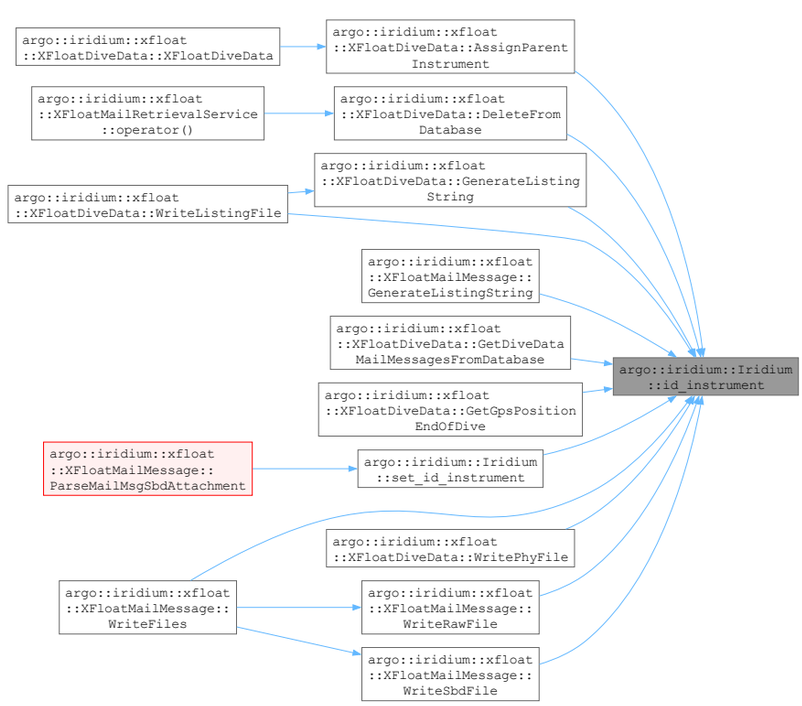
argo::iridium::xfloat::XFloatDiveData::WritePhyFile(), argo::iridium::xfloat::XFloatMailMessage::WriteRawFile(), and
argo::iridium::xfloat::XFloatMailMessage::WriteSbdFile().

Here is the caller graph for this function:



10.91.3.40 id_wmo()

```
int argo::iridium::Iridium::id_wmo () const  [inline], [inherited]
```

Get the unique World Meteorological Organization (WMO) identifier.

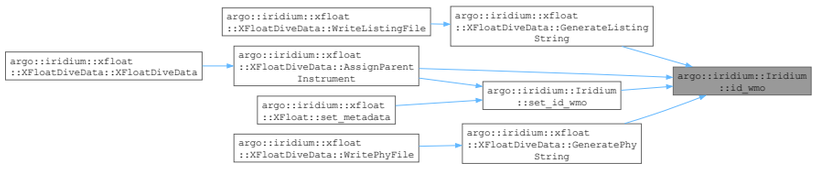
Returns

The unique World Meteorological Organization (WMO) identifier.

References argo::iridium::Iridium::id_wmo_, and util::thread::RecursiveLockable::mutex_.

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignParentInstrument(), argo::iridium::xfloat::XFloatDiveData::GenerateListingStrir
argo::iridium::xfloat::XFloatDiveData::GeneratePhyString(), and argo::iridium::Iridium::set_id_wmo().

Here is the caller graph for this function:



10.91.3.41 IsPositionValid()

```
template<typename T >
static bool util::position::PositionUtils::IsPositionValid (
            T lat,
            T lon)  [inline], [static], [inherited]
```

Check position validity.

Parameters

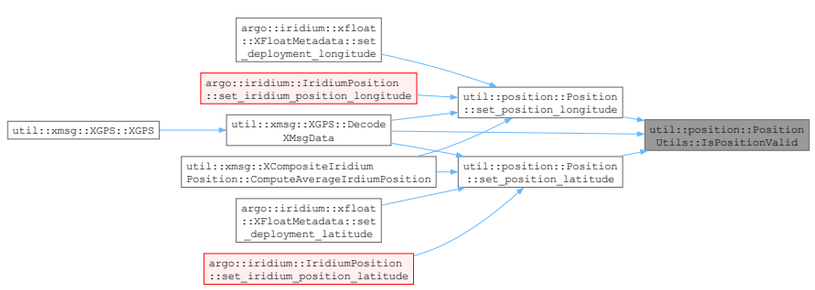
in	*lat*	Latitude of position.
in	*lon*	Longitude of position.

Returns

TRUE if (lat, lon) represents a valid geographical position, or FALSE otherwise.

Referenced by util::xmsg::XGPS::DecodeXMsgData(), util::position::Position::set_position_latitude(), and util::position::Position::set_positi

Here is the caller graph for this function:



10.91.3.42 ListDirectories()

```
static vector< path > util::file::FileSystemUtils::ListDirectories (
            const path & dir)  [inline], [static], [inherited]
```

List all directories contained in the given directory.

Parameters

in	*dir*	The path to the directory of interest.

Exceptions

log::MessageException	if the directory does not exist, is not a directory, or an error occurs.

Returns

A vector of paths to all the directories contained in the given directory.

References CATCH_BLOCK, and EXC_THROW.

10.91.3.43 ListFiles()

```
static vector< path > util::file::FileSystemUtils::ListFiles (
            path dir,
            size_t n = 0)  [inline], [static], [inherited]
```

List all regular files contained in the given directory.

Parameters

in	*dir*	The path to the directory of interest.
in	*n*	If n>0, the maximum number of paths to return, else no effect.

Exceptions

log::MessageException	if the directory does not exist, is not a directory, or an error occurs.

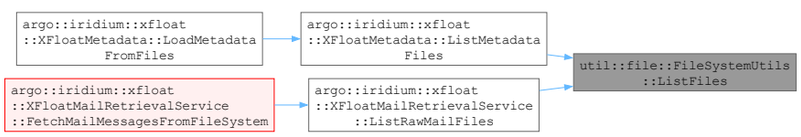
Returns

A vector of paths to all the regular files contained in the given directory.

References CATCH_BLOCK, and EXC_THROW.

Referenced by ListMetadataFiles(), and argo::iridium::xfloat::XFloatMailRetrievalService::ListRawMailFiles().

Here is the caller graph for this function:



10.91.3.44 ListMetadataFiles()

```
static vector< path > argo::iridium::xfloat::XFloatMetadata::ListMetadataFiles ()  [inline],
[static], [protected]
```

List the paths to all metadata files on the local filesystem.

Exceptions

util::log::MessageException	if an error occurs while listing the metadata paths.

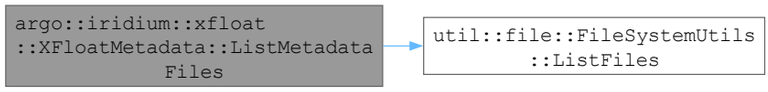
Returns

A vector containing the paths to the metadata files on the local filesystem.

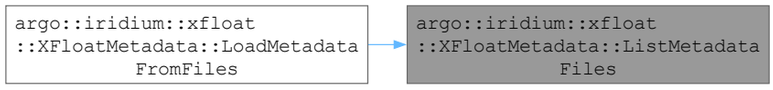
References CATCH_BLOCK, EXC_THROW, util::file::FileSystemUtils::ListFiles(), and metadata_directory_path_.

Referenced by LoadMetadataFromFiles().

Here is the call graph for this function:



Here is the caller graph for this function:



10.91.3.45 LoadFile()

```
void argo::iridium::xfloat::XFloatMetadata::LoadFile (
            const path & path)  [inline], [protected]
```

Read instrument metadata from a file on the local filesystem.

Parameters

in	*path*	The path to the metadata file on the local filesystem.

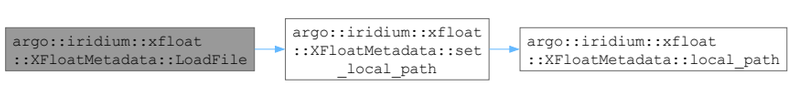
Exceptions

util::log::MessageException	if the file does not exist or extraction of metadata from the file fails.

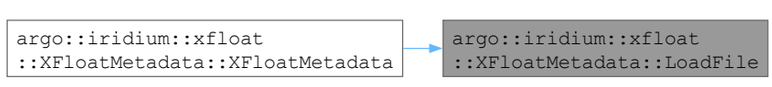
References CATCH_NOTHROW, EXC_THROW, ldbg, and set_local_path().

Referenced by XFloatMetadata().

Here is the call graph for this function:



Here is the caller graph for this function:



10.91.3.46 LoadMetadataFromFiles()

```
static vector< shared_ptr< XFloatMetadata > > argo::iridium::xfloat::XFloatMetadata::Load↩
MetadataFromFiles ()  [inline], [static], [protected]
```

Load all metadata from the files on the local filesystem.

Exceptions

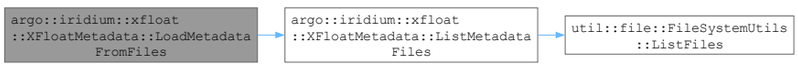
util::log::MessageException	if an error occurs while loading the metadata from the files on the local filesystem.

Returns

A vector of shared pointers to the metadata objects constructed from the metadata files on the local filesystem.

References CATCH_BLOCK, and ListMetadataFiles().

Here is the call graph for this function:



10.91.3.47 local_path()

```
string argo::iridium::xfloat::XFloatMetadata::local_path () const  [inline]
```

Get the path to the metadata file on the local filesystem.

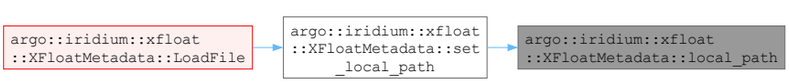
Returns

The path to the metadata file on the local filesystem.

References local_path_, and util::thread::RecursiveLockable::mutex_.

Referenced by set_local_path().

Here is the caller graph for this function:



10.91.3.48 LockObject()

```
bool util::thread::RecursiveLockable::LockObject (
            bool block)  [inline], [inherited]
```

Lock the object.

Parameters

in	*block*	If TRUE, then the calling thread will block until the lock becomes available.

Exceptions

util::log::MessageException	if an error occurs.

Returns

TRUE if the lock was successfully obtained, or FALSE if block is FALSE and another thread owns the lock on the mutex.

References CATCH_BLOCK, and util::thread::RecursiveLockable::mutex_.

10.91.3.49 manufacturer()

```
string argo::iridium::xfloat::XFloatMetadata::manufacturer () const  [inline]
```

Get the instrument manufacturer.

Returns

The instrument manufacturer.

References manufacturer_, and util::thread::RecursiveLockable::mutex_.

10.91.3.50 MoveFileToDirectory()

```
static path util::file::FileSystemUtils::MoveFileToDirectory (
            const path & file,
            const path & dir_dst,
            bool create_dir = false)  [inline], [static], [inherited]
```

Copy a file into a directory.

Warning

Despite its name, this function copies the file and does not remove the source. If a file with the same name already exists in the destination directory, it is left unchanged. It is not currently called.

Parameters

in	*file*	The file to copy.
in	*dir_dst*	The destination directory.
in	*create_dir*	If TRUE, create the destination directory if it does not exist.

Exceptions

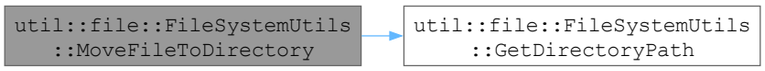
util::log::MessageException	if the file does not exist, is not a regular file, or cannot be copied.

Returns

The path of the file in the destination directory.

References CATCH_BLOCK, EXC_THROW, and util::file::FileSystemUtils::GetDirectoryPath().

Here is the call graph for this function:



10.91.3.51 position_datetime()

```
ptime util::position::Position::position_datetime () const  [inline], [inherited]
```

Get the date/time of the position.

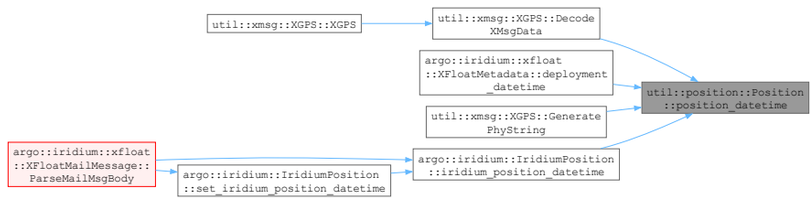
Returns

The date/time of the position.

References util::position::Position::position_datetime_.

Referenced by util::xmsg::XGPS::DecodeXMsgData(), deployment_datetime(), util::xmsg::XGPS::GeneratePhyString(), and argo::iridium::IridiumPosition::iridium_position_datetime().

Here is the caller graph for this function:



10.91.3.52 position_datetime_as_iso8601_string()

```
string util::position::Position::position_datetime_as_iso8601_string () const  [inline], [inherited]
```

Get a formatted string representing the position date/time composed using the ISO 8601 standard.

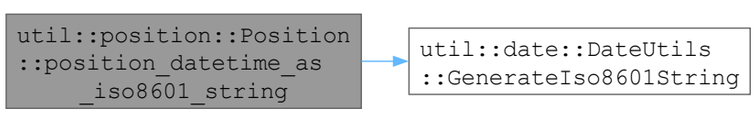
Returns

The formatted string representation of the position date/time.

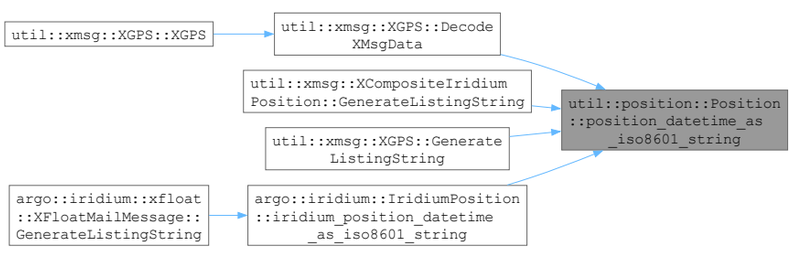
References util::date::DateUtils::GenerateIso8601String(), and util::position::Position::position_datetime_.

Referenced by util::xmsg::XGPS::DecodeXMsgData(), util::xmsg::XCompositeIridiumPosition::GenerateListingString(), util::xmsg::XGPS::GenerateListingString(), and argo::iridium::IridiumPosition::iridium_position_datetime_as_iso8601_string().

Here is the call graph for this function:



Here is the caller graph for this function:



10.91.3.53 position_is_valid()

```
bool util::position::Position::position_is_valid () const  [inline], [inherited]
```

Is the position valid?

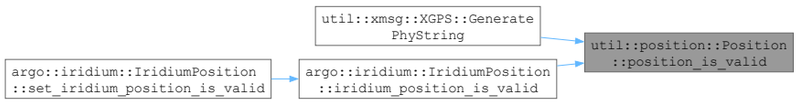
Returns

TRUE if the position is valid, or false otherwise.

References util::position::Position::position_is_valid_.

Referenced by util::xmsg::XGPS::GeneratePhyString(), and argo::iridium::IridiumPosition::iridium_position_is_valid().

Here is the caller graph for this function:



10.91.3.54 position_latitude()

```
double util::position::Position::position_latitude () const  [inline], [inherited]
```

Get the latitude of the position, in decimal degrees.

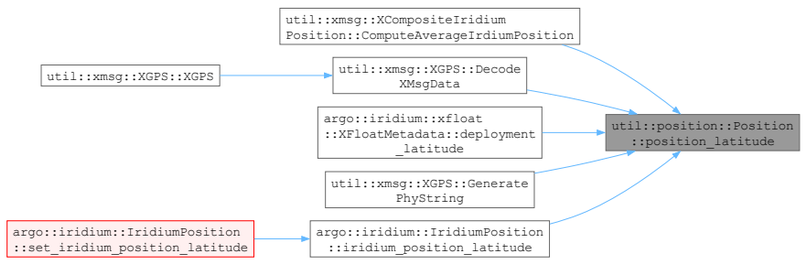
Returns

The latitude of the position, in decimal degrees.

References util::position::Position::position_latitude_.

Referenced by util::xmsg::XCompositeIridiumPosition::ComputeAverageIrdiumPosition(), util::xmsg::XGPS::DecodeXMsgData(), deployment_latitude(), util::xmsg::XGPS::GeneratePhyString(), and argo::iridium::IridiumPosition::iridium_position_latitude().

Here is the caller graph for this function:



10.91.3.55 position_longitude()

```
double util::position::Position::position_longitude () const  [inline], [inherited]
```

Get the longitude of the position, in decimal degrees.

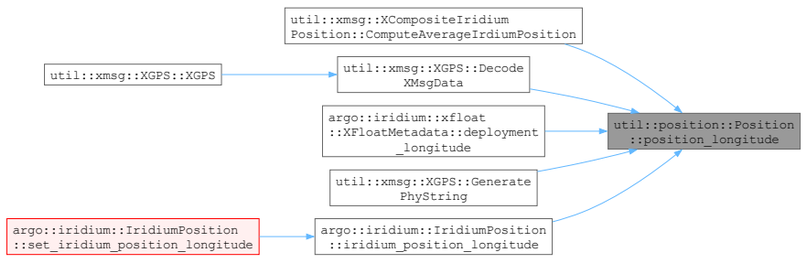
Returns

The longitude of the position, in decimal degrees.

References util::position::Position::position_longitude_.

Referenced by util::xmsg::XCompositeIridiumPosition::ComputeAverageIrdiumPosition(), util::xmsg::XGPS::DecodeXMsgData(), deployment_longitude(), util::xmsg::XGPS::GeneratePhyString(), and argo::iridium::IridiumPosition::iridium_position_longitude().

Here is the caller graph for this function:



10.91.3.56 postition_as_iso6709_string()

```
string util::position::Position::postition_as_iso6709_string () const  [inline], [inherited]
```

Get a formatted string representing the position composed using the ISO 6709 standard.

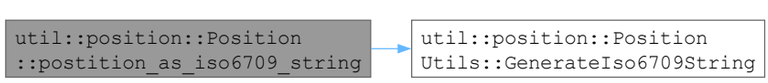
Returns

The formatted string representation of the position.

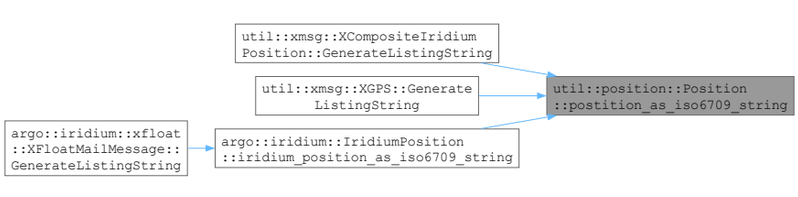
References util::position::PositionUtils::GenerateIso6709String(), util::position::Position::position_latitude_, and util::position::Position::position_longitude_.

Referenced by util::xmsg::XCompositeIridiumPosition::GenerateListingString(), util::xmsg::XGPS::GenerateListingString(), and argo::iridium::IridiumPosition::iridium_position_as_iso6709_string().

Here is the call graph for this function:



Here is the caller graph for this function:



10.91.3.57 principal_investigators()

```
string argo::iridium::xfloat::XFloatMetadata::principal_investigators () const  [inline]
```

Get the names of the principal investigator(s).

Returns

The names of the principal investigator(s).

References util::thread::RecursiveLockable::mutex_, and principal_investigators_.

10.91.3.58 principal_investigators_address()

```
string argo::iridium::xfloat::XFloatMetadata::principal_investigators_address () const  [inline]
```

Get the address of the principal investigator(s).

Returns

The address of the principal investigator(s).

References util::thread::RecursiveLockable::mutex_, and principal_investigators_address_.

10.91.3.59 principal_investigators_originating_country()

```
string argo::iridium::xfloat::XFloatMetadata::principal_investigators_originating_country () const
[inline]
```

Get the originating country of the instrument.

Returns

The originating country of the instrument.

References util::thread::RecursiveLockable::mutex_, and principal_investigators_originating_country_.

10.91.3.60 SaveObjectToDatabase()

```
void argo::iridium::xfloat::XFloatMetadata::SaveObjectToDatabase () const  [inline], [virtual]
```

Save this object to the database.

Exceptions

util::log::MessageException	if an error occurs while saving this object to the database.

Implements util::mysql::LocalPersistentEntity.

References CATCH_BLOCK, ldbg, util::thread::RecursiveLockable::mutex_, and sql_table_description_.

10.91.3.61 set_comment()

```
void argo::iridium::xfloat::XFloatMetadata::set_comment (
            const string & comment)  [inline], [protected]
```

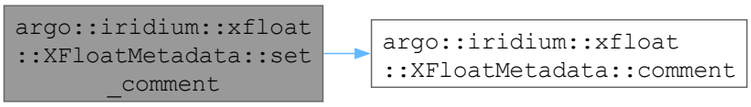
Set the instrument comment(s).

Parameters

in	*comment*	The instrument comment(s).

References comment(), comment_, and util::thread::RecursiveLockable::mutex_.

Here is the call graph for this function:



10.91.3.62 set_deployer()

```
void argo::iridium::xfloat::XFloatMetadata::set_deployer (
            const string & deployer)  [inline], [protected]
```

Set the name of the instrument deployer(s).

Parameters

in	*deployer*	The name of the instrument deployer(s).

References deployer(), deployer_, and util::thread::RecursiveLockable::mutex_.

Here is the call graph for this function:

10.91.3.63 set_deployer_address()

```
void argo::iridium::xfloat::XFloatMetadata::set_deployer_address (
            const string & address)  [inline], [protected]
```

Set the address of the instrument deployer(s).

Parameters

in	*address*	The address of the instrument deployer(s).

References deployer_address_, and util::thread::RecursiveLockable::mutex_.

10.91.3.64 set_deployment_cruise_id()

```
void argo::iridium::xfloat::XFloatMetadata::set_deployment_cruise_id (
            const string & id)  [inline], [protected]
```

Set the unique identifier of the deployment or launch cruise.

Parameters

in	*id*	The unique identifier of the deployment or launch cruise.

References deployment_cruiseId_, and util::thread::RecursiveLockable::mutex_.

10.91.3.65 set_deployment_datetime()

```
void argo::iridium::xfloat::XFloatMetadata::set_deployment_datetime (
            const ptime & dt)  [inline], [protected]
```

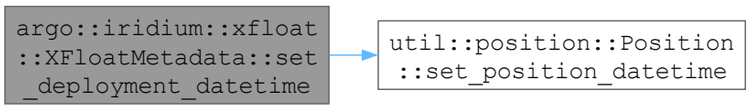
Set the date/time of the deployment.

Parameters

in	*dt*	The date/time of the deployment.

References util::thread::RecursiveLockable::mutex_, and util::position::Position::set_position_datetime().

Here is the call graph for this function:



10.91.3.66 set_deployment_datetime_status()

```
void argo::iridium::xfloat::XFloatMetadata::set_deployment_datetime_status (
            const string & stat)  [inline], [protected]
```

Set the status of the accompanying date/time of the instrument deployment or launch.

Parameters

in	*stat*	The status of the accompanying date/time of the instrument deployment or launch.

References deployment_datetime_status_, and util::thread::RecursiveLockable::mutex_.

10.91.3.67 set_deployment_latitude()

```
void argo::iridium::xfloat::XFloatMetadata::set_deployment_latitude (
            double lat)  [inline], [protected]
```

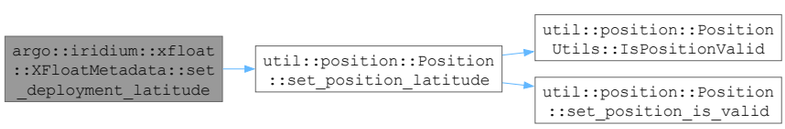
Set the deployment position latitude, in decimal degrees North.

Parameters

in	*lat*	The deployment position latitude, in decimal degrees North.

References util::thread::RecursiveLockable::mutex_, and util::position::Position::set_position_latitude().

Here is the call graph for this function:



10.91.3.68 set_deployment_longitude()

```
void argo::iridium::xfloat::XFloatMetadata::set_deployment_longitude (
            double lon)  [inline], [protected]
```

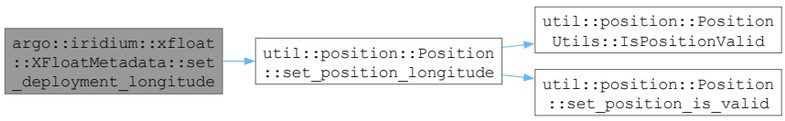
Set the deployment position longitude, in decimal degrees East.

Parameters

in	*lon*	The deployment position longitude, in decimal degrees East.

References util::thread::RecursiveLockable::mutex_, and util::position::Position::set_position_longitude().

Here is the call graph for this function:



10.91.3.69 set_deployment_platform()

```
void argo::iridium::xfloat::XFloatMetadata::set_deployment_platform (
            const string & platform)  [inline], [protected]
```

Set the deployment or launch platform.

Parameters

in	*platform*	The deployment or launch platform.

References deployment_platform_, and util::thread::RecursiveLockable::mutex_.

10.91.3.70 set_deployment_position_status()

```
void argo::iridium::xfloat::XFloatMetadata::set_deployment_position_status (
            const string & status)  [inline], [protected]
```

Set the status of the accompanying date/time of the instrument deployment or launch.

Parameters

in	*status*	The status of the accompanying date/time of the instrument deployment or launch.

References deployment_position_status_, and util::thread::RecursiveLockable::mutex_.

10.91.3.71 set_deployment_type()

```
void argo::iridium::xfloat::XFloatMetadata::set_deployment_type (
            const string & type)  [inline], [protected]
```

Set the deployment or launch type.

Parameters

in	*type*	The deployment or launch type.

References deployment_type_, and util::thread::RecursiveLockable::mutex_.

10.91.3.72 set_gps_position_datetime()

```
void util::position::Position::set_gps_position_datetime (
            unsigned int gpsWeek,
            unsigned int gpsDay,
            unsigned int gpsHour = 0,
            unsigned int gpsMinute = 0,
            unsigned int gpsSecond = 0)  [inline], [protected], [inherited]
```

Set the date and time of this position from the given GPS week, day, and time.

Parameters

in	*gpsWeek*	The GPS week, in weeks since midnight of January 6, 1980.
in	*gpsDay*	The GPS day of week (0 - 6).
in	*gpsHour*	The UTC hour of day (0 - 23).
in	*gpsMinute*	The UTC minute of hour (0 - 59)..
in	*gpsSecond*	The UTC second of minute (0 - 59).

References util::position::Position::set_position_datetime().

Referenced by util::xmsg::XGPS::DecodeXMsgData().

Here is the caller graph for this function:

10.91.3.73 set_id_dac()

```
void argo::iridium::Iridium::set_id_dac (
            int id_dac)  [inline], [protected], [inherited]
```

Set the unique Data Assembly Center (DAC) identifier.

Parameters

in	*id_dac*	The unique Data Assembly Center (DAC) identifier.

References argo::iridium::Iridium::id_dac(), argo::iridium::Iridium::id_dac_, and util::thread::RecursiveLockable::mutex_.

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignParentInstrument(), and argo::iridium::xfloat::XFloat::set_metadata().

```
void argo::iridium::Iridium::set_id_imei (
            long id_imei)  [inline], [protected], [inherited]
```

Set the unique International Mobile Equipment Identifier (IMEI).

Parameters

in	*id_imei*	The unique International Mobile Equipment Identifier (IMEI).

References argo::iridium::Iridium::id_imei(), argo::iridium::Iridium::id_imei_, and util::thread::RecursiveLockable::mutex_.

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignParentInstrument(), and argo::iridium::xfloat::XFloatMailMessage::ParseMailM

Here is the call graph for this function:

```
void argo::iridium::xfloat::XFloatMetadata::set_local_path (
            const string & local_path)  [inline], [protected]
```

Set the path to the metadata file on the local filesystem.

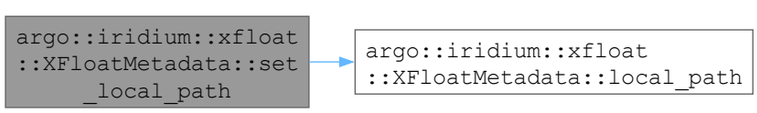
Parameters

in	*local_path*	The path to the metadata file on the local filesystem.

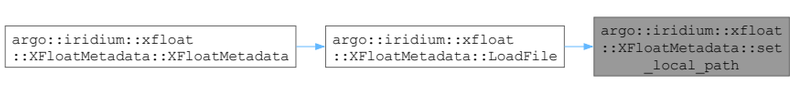
References local_path(), local_path_, and util::thread::RecursiveLockable::mutex_.

Referenced by LoadFile().

Here is the call graph for this function:



Here is the caller graph for this function:



10.91.3.78 set_manufacturer()

```
void argo::iridium::xfloat::XFloatMetadata::set_manufacturer (
            const string & man)  [inline], [protected]
```

Set the instrument manufacturer.

Parameters

in	*man*	The instrument manufacturer.

References manufacturer_, and util::thread::RecursiveLockable::mutex_.

10.91.3.79 set_position_datetime()

```
void util::position::Position::set_position_datetime (
            const ptime & datetime)  [inline], [protected], [inherited]
```

Set the date/time of the position.

Parameters

in	*datetime*	The date/time of the position to set.

References util::position::Position::position_datetime_.

Referenced by util::xmsg::XCompositeIridiumPosition::ComputeAverageIrdiumPosition(), util::xmsg::XGPS::DecodeXMsgData(), set_deployment_datetime(), util::position::Position::set_gps_position_datetime(), and argo::iridium::IridiumPosition::set_iridium_position_d

```
void argo::iridium::xfloat::XFloatMetadata::set_principal_investigators (
            const string & pis)  [inline], [protected]
```

Set the names of the principal investigator(s).

Parameters

in	*pis*	The names of the principal investigator(s).

References util::thread::RecursiveLockable::mutex_, and principal_investigators_.

10.91.3.84 set_principal_investigators_address()

```
void argo::iridium::xfloat::XFloatMetadata::set_principal_investigators_address (
            const string & addr)  [inline], [protected]
```

Set the address of the principal investigator(s).

Parameters

in	*addr*	The address of the principal investigator(s).

References util::thread::RecursiveLockable::mutex_, and principal_investigators_address_.

10.91.3.85 set_principal_investigators_originating_country()

```
void argo::iridium::xfloat::XFloatMetadata::set_principal_investigators_originating_country (
            const string & country)  [inline], [protected]
```

Set the originating country of the instrument.

Parameters

in	*country*	The originating country of the instrument.

References util::thread::RecursiveLockable::mutex_, and principal_investigators_originating_country_.

10.91.3.86 set_wmo_instrument_type()

```
void argo::iridium::xfloat::XFloatMetadata::set_wmo_instrument_type (
            int type)  [inline], [protected]
```

Set the WMO instrument type identifier.

Parameters

in	*type*	The WMO instrument type identifier.

References util::thread::RecursiveLockable::mutex_, and wmo_instrument_type_.

10.91.3.87 set_wmo_recorder_type()

```
void argo::iridium::xfloat::XFloatMetadata::set_wmo_recorder_type (
            int type)  [inline], [protected]
```

Set the WMO recorder type identifier.

Parameters

in	*type*	The WMO recorder type identifier.

References util::thread::RecursiveLockable::mutex_, and wmo_recorder_type_.

10.91.3.88 UnlockObject()

```
void util::thread::RecursiveLockable::UnlockObject ()  [inline], [inherited]
```

Unlock the object.

Exceptions

util::log::MessageException	if an error occurs.

References CATCH_BLOCK, and util::thread::RecursiveLockable::mutex_.

10.91.3.89 wmo_instrument_type()

```
int argo::iridium::xfloat::XFloatMetadata::wmo_instrument_type () const  [inline]
```

Get the WMO instrument type identifier.

Returns

The WMO instrument type identifier.

References util::thread::RecursiveLockable::mutex_, and wmo_instrument_type_.

10.91.3.90 wmo_recorder_type()

```
int argo::iridium::xfloat::XFloatMetadata::wmo_recorder_type () const  [inline]
```

Get the WMO recorder type identifier.

Returns

The WMO recorder type identifier.

References util::thread::RecursiveLockable::mutex_, and wmo_recorder_type_.

10.91.4 Friends And Related Symbol Documentation

10.91.4.1 operator>>

```
istream & operator>> (
            istream & in,
            XFloatMetadata & metadata)  [friend]
```

Stream extraction operator overload function for the XFloatMetadata class.

Parameters

in	*in*	The input stream.
in	*metadata*	The metadata object.

Exceptions

util::log::MessageException	if the stream extraction fails.

Returns

The reference to the input stream, `istream`.

Todo Implement the functionality for parsing additional metadata field from stream

10.91.4.2 util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription

```
options_description util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription
() [friend]
```

Friend function for setting the value of some of the static configuration options that are members of this class.

10.91.5 Member Data Documentation

10.91.5.1 address_

```
std::string util::mysql::LocalMysqlConfiguration::address_  [static], [private], [inherited]
```

The SQL server qualified name or IP address string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.91.5.2 comment_

```
string argo::iridium::xfloat::XFloatMetadata::comment_  [private]
```

The instrument comment(s).

Referenced by comment(), and set_comment().

10.91.5.3 deployer_

```
string argo::iridium::xfloat::XFloatMetadata::deployer_  [private]
```

The name of the instrument deployer(s).

Referenced by deployer(), and set_deployer().

10.91.5.4 deployer_address_

```
string argo::iridium::xfloat::XFloatMetadata::deployer_address_  [private]
```

The address of the instrument deployer(s).

Referenced by deployer_address(), and set_deployer_address().

10.91.5.5 deployment_cruiseId_

```
string argo::iridium::xfloat::XFloatMetadata::deployment_cruiseId_  [private]
```

The unique identifier of the deployment or launch cruise.

Referenced by deployment_cruise_id(), and set_deployment_cruise_id().

10.91.5.6 deployment_datetime_status_

```
string argo::iridium::xfloat::XFloatMetadata::deployment_datetime_status_  [private]
```

The status of the accompanying date/time of the instrument deployment or launch.

Referenced by deployment_datetime_status(), and set_deployment_datetime_status().

10.91.5.7 deployment_platform_

```
string argo::iridium::xfloat::XFloatMetadata::deployment_platform_  [private]
```

The deployment or launch platform.

Referenced by deployment_platform(), and set_deployment_platform().

10.91.5.8 deployment_position_status_

```
string argo::iridium::xfloat::XFloatMetadata::deployment_position_status_  [private]
```

The status of the accompanying date/time of the instrument deployment or launch.

Referenced by deployment_position_status(), and set_deployment_position_status().

10.91.5.9 deployment_type_

```
string argo::iridium::xfloat::XFloatMetadata::deployment_type_  [private]
```

The deployment or launch type.

Referenced by deployment_type(), and set_deployment_type().

10.91.5.10 EARTH_RADIUS_KM_EQUATORIAL

```
const double util::position::PositionUtils::EARTH_RADIUS_KM_EQUATORIAL = 6378.1  [static], [private],
[inherited]
```

The equatorial radius of the earth, in kilometers.

Referenced by util::position::PositionUtils::CalculateEllipsoidHeight().

10.91.5.11 EARTH_RADIUS_KM_POLAR

```
const double util::position::PositionUtils::EARTH_RADIUS_KM_POLAR = 6356.1  [static], [private],
[inherited]
```

The polar radius of the earth, in kilometers.

Referenced by util::position::PositionUtils::CalculateEllipsoidHeight().

10.91.5.12 id_dac_

```
int argo::iridium::Iridium::id_dac_  [private], [inherited]
```

The unique Data Assembly Center (DAC) identifier.

Referenced by argo::iridium::Iridium::id_dac(), and argo::iridium::Iridium::set_id_dac().

10.91.5.13 id_imei_

```
long argo::iridium::Iridium::id_imei_  [private], [inherited]
```

The unique International Mobile Equipment Identifier (IMEI).

Referenced by argo::iridium::Iridium::id_imei(), and argo::iridium::Iridium::set_id_imei().

10.91.5.14 id_instrument_

```
int argo::iridium::Iridium::id_instrument_  [private], [inherited]
```

The unique instrument identifier or instrument serial number.

Referenced by argo::iridium::Iridium::id_instrument(), and argo::iridium::Iridium::set_id_instrument().

10.91.5.15 id_wmo_

```
int argo::iridium::Iridium::id_wmo_  [private], [inherited]
```

The unique World Meteorological Organization (WMO) identifier.

Referenced by argo::iridium::Iridium::id_wmo(), and argo::iridium::Iridium::set_id_wmo().

10.91.5.16 local_path_

```
string argo::iridium::xfloat::XFloatMetadata::local_path_  [private]
```

The path to the metadata file on the local filesystem.

Referenced by local_path(), and set_local_path().

10.91.5.17 manufacturer_

```
string argo::iridium::xfloat::XFloatMetadata::manufacturer_  [private]
```

The instrument manufacturer.

Referenced by manufacturer(), and set_manufacturer().

10.91.5.18 metadata_directory_path_

```
path argo::iridium::xfloat::XFloatMetadata::metadata_directory_path_  [static], [private]
```

The path to metadata directory on the local filesystem.

This path indicates the directory containing the instrument metadata files. The value of this field is set during application initialization as a result of parsing the command-line arguments and configuration file arguments.

After the run-time configuration settings are parsed, but before the completion of application initialization, the metadata files are read from this directory and used to generate one instance of this class for each metadata file read. The resulting object are assigned to the corresponding instrument objects (XFloat), and are save to the SQL database.

Referenced by ListMetadataFiles().

10.91.5.19 mutex_

```
recursive_mutex util::thread::RecursiveLockable::mutex_  [mutable], [protected], [inherited]
```

Recursive mutual exclusion lock for synchronizing operations.

Referenced by util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AggregateS

10.91.5.20 password_

```
std::string util::mysql::LocalMysqlConfiguration::password_  [static], [private], [inherited]
```

The SQL server account password string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.91.5.21 port_

```
unsigned int util::mysql::LocalMysqlConfiguration::port_  [static], [private], [inherited]
```

The SQL server port number.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.91.5.22 position_datetime_

```
ptime util::position::Position::position_datetime_  [private], [inherited]
```

The date and time of the position.

Referenced by util::position::Position::position_datetime(), util::position::Position::position_datetime_as_iso8601_string(), and util::position::Position::set_position_datetime().

10.91.5.23 position_is_valid_

```
bool util::position::Position::position_is_valid_  [private], [inherited]
```

The valid position indicator.

Referenced by util::position::Position::position_is_valid(), and util::position::Position::set_position_is_valid().

10.91.5.24 position_latitude_

```
double util::position::Position::position_latitude_  [private], [inherited]
```

The latitude of the position, in decimal degrees.

Referenced by util::position::Position::position_latitude(), util::position::Position::postition_as_iso6709_string(), util::position::Position::set_position_latitude(), and util::position::Position::set_position_longitude().

10.91.5.25 position_longitude_

```
double util::position::Position::position_longitude_  [private], [inherited]
```

The longitude of the position, in decimal degrees.

Referenced by util::position::Position::position_longitude(), util::position::Position::postition_as_iso6709_string(), util::position::Position::set_position_latitude(), and util::position::Position::set_position_longitude().

10.91.5.26 principal_investigators_

```
string argo::iridium::xfloat::XFloatMetadata::principal_investigators_  [private]
```

The names of the principal investigator(s).

Referenced by principal_investigators(), and set_principal_investigators().

10.91.5.27 principal_investigators_address_

```
string argo::iridium::xfloat::XFloatMetadata::principal_investigators_address_  [private]
```

The address of the principal investigator(s).

Referenced by principal_investigators_address(), and set_principal_investigators_address().

10.91.5.28 principal_investigators_originating_country_

```
string argo::iridium::xfloat::XFloatMetadata::principal_investigators_originating_country_  [private]
```

The originating country of the instrument.

Referenced by principal_investigators_originating_country(), and set_principal_investigators_originating_country().

10.91.5.29 protocol_

```
std::string util::mysql::LocalMysqlConfiguration::protocol_  [static], [private], [inherited]
```

The protocol to use in the SQL server connection e.g.

"tcp".

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.91.5.30 schema_

```
std::string util::mysql::LocalMysqlConfiguration::schema_  [static], [private], [inherited]
```

The SQL server schema name.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.91.5.31 sql_connection_

```
thread_specific_ptr<Connection> util::mysql::MysqlUtils::sql_connection_  [static], [private],
[inherited]
```

Tthe thread-specific pointer to MySQL connection object.

Thread-specific MySQL connection, released by `MysqlUtils::CleanupSqlConnection()` when the thread exits.

Referenced by util::mysql::MysqlUtils::CloseSqlConnection(), and util::mysql::MysqlUtils::GetSqlConnection().

10.91.5.32 sql_driver_

```
thread_specific_ptr<MySQL_Driver> util::mysql::MysqlUtils::sql_driver_  [static], [private],
[inherited]
```

The thread-specific pointer to MySQL driver object.

Thread-specific reference to the MySQL driver.

Its cleanup function, `MysqlUtils::CleanupSqlDriver()`, does not delete the shared driver instance.

Referenced by util::mysql::MysqlUtils::GetSqlDriver().

10.91.5.33 sql_table_description_

```
const util::mysql::SqlTableDescription< XFloatMetadata > argo::iridium::xfloat::XFloatMetadata↩
::sql_table_description_  [static], [private]
```

The SQL table description object.

This SQL table description provides the details needed to map this object to a relational database table. It utilizes the accessor methods of the class and the details of the SQL table column to (1) create an SQL INSERT statement to save the object into the database, (2) populate one or more objects' fields as a result of an SQL SELECT query, or (3) query the SQL database to access one or more of the values that are stored the the SQL table corresponding to this object.

Referenced by SaveObjectToDatabase().

10.91.5.34 user_

`std::string util::mysql::LocalMysqlConfiguration::user_ [static], [private], [inherited]`

The SQL server account username string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.91.5.35 wmo_instrument_type_

`int argo::iridium::xfloat::XFloatMetadata::wmo_instrument_type_ [private]`

The WMO instrument type identifier.

Note

This value corresponds to the WMO reference table 1770.

Referenced by set_wmo_instrument_type(), and wmo_instrument_type().

10.91.5.36 wmo_recorder_type_

`int argo::iridium::xfloat::XFloatMetadata::wmo_recorder_type_ [private]`

The WMO recorder type identifier.

Note

This value corresponds to the WMO reference table 4770.

Referenced by set_wmo_recorder_type(), and wmo_recorder_type().

The documentation for this class was generated from the following files:

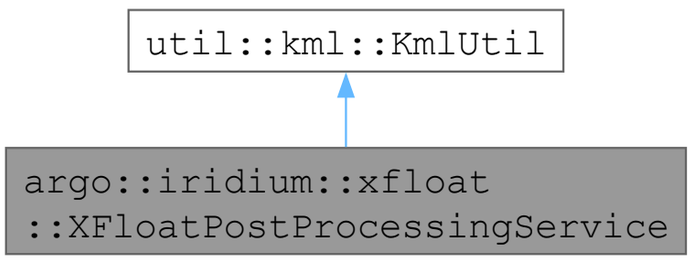
- data/XFloatMetadata.h
- data/XFloatMetadata.cpp

10.92 argo::iridium::xfloat::XFloatPostProcessingService Class Reference

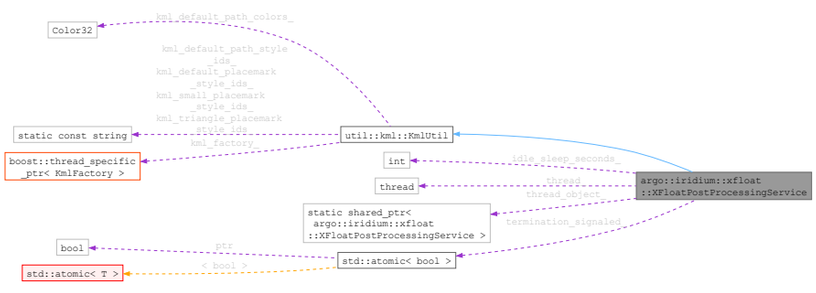
The post-processing analysis thread class.

`#include <stage4b_PostProcessingThread.h>`

Inheritance diagram for argo::iridium::xfloat::XFloatPostProcessingService:



Collaboration diagram for argo::iridium::xfloat::XFloatPostProcessingService:



Public Member Functions

- XFloatPostProcessingService ()

  The constructor.
- ~XFloatPostProcessingService ()

  The destructor.
- void operator() () ATTR_NO_EXCEPTIONS

  Functor operator overload function: the main entry point for the post-processing analysis thread.

Static Public Member Functions

- static void CloseKmlFactory ()

  Release this thread's KML factory pointer.
- static const Color32 & GetDefaltKmlPathColor (int id)

  Get the palette colour for an index (an instrument ID, for example), modulo the palette size.
- static const string & GetDefaltKmlPathStyleId (int id)

  Get the path (line) style ID for an index, modulo the palette size.
- static const string & GetDefaltKmlPlacemarkStyleId (int id)

  Get the large placemark style ID for an index, modulo the palette size.
- static thread_specific_ptr< KmlFactory > & GetKmlFactory ()

  Get the libkml factory, initializing it for this thread if necessary.
- static const string & GetSmallKmlPlacemarkStyleId (int id)

  Get the small placemark style ID for an index, modulo the palette size.
- static const string & GetTriangleKmlPlacemarkStyleId (int id)

  Get the triangle placemark style ID for an index, modulo the palette size.
- static void SetAllDefaultKmlSyles (const DocumentPtr &document)

  Add the default styles for every palette colour to a KML document.
- static void SetDefaultKmlStyle (const DocumentPtr &document, unsigned int style_idx)

  Add the four default styles for one palette colour to a KML document.
- static void StartWorkerThread () ATTR_NO_EXCEPTIONS

  Instantiate the post-processing analysis worker thread.
- static void TerminateWorkerThread () ATTR_NO_EXCEPTIONS

  Terminate the mail post-processing analysis thread.

Static Private Member Functions

- static void **set_termination_signaled** (bool termination_signaled=true)

Static Private Attributes

- static unsigned int idle_sleep_seconds_

  Duration to sleep when not performing post-processing, in seconds.
- static const Color32 kml_default_path_colors_ [KML_NUM_DFLT_PATH_COLORS]

  The colour palette for instrument paths and placemarks, indexed by style index.
- static const string kml_default_path_style_ids_ [KML_NUM_DFLT_PATH_COLORS]

  The KML style IDs of the path (line) styles, one per palette colour.
- static const string kml_default_placemark_style_ids_ [KML_NUM_DFLT_PATH_COLORS]

  The KML style IDs of the large placemark styles, one per palette colour.
- static thread_specific_ptr< KmlFactory > kml_factory_

  The libkml factory used to create KML elements, held per thread.
- static const string kml_small_placemark_style_ids_ [KML_NUM_DFLT_PATH_COLORS]

  The KML style IDs of the small placemark styles, one per palette colour.
- static const string kml_triangle_placemark_style_ids_ [KML_NUM_DFLT_PATH_COLORS]

  The KML style IDs of the triangle placemark styles, one per palette colour.
- static std::atomic< bool > termination_signaled_

  The termination signaled flag.
- static thread thread_

  The post-processing analysis thread group.
- static shared_ptr< XFloatPostProcessingService > thread_object_

  The post-processing analysis thread objects.

Friends

- options_description util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription ()

  Friend function for populating some of the static members of this class from the configuration file options.

10.92.1 Detailed Description

The post-processing analysis thread class.

This class is defines the operation of the post-processing analysis thread(s), which are the fourth stage of the processing pipeline. The post-processing analysis thread(s) are responsible for generating plots, Matlab, and NetCDF files as well as performing some analysis of the decoded telemetry fields in order to derive performance metrics of the instrument.

10.92.2 Constructor & Destructor Documentation

10.92.2.1 XFloatPostProcessingService()

```
argo::iridium::xfloat::XFloatPostProcessingService::XFloatPostProcessingService ()  [inline]
```

The constructor.

10.92.2.2 ~XFloatPostProcessingService()

```
argo::iridium::xfloat::XFloatPostProcessingService::~XFloatPostProcessingService ()  [inline]
```

The destructor.

10.92.3 Member Function Documentation

10.92.3.1 CloseKmlFactory()

```
static void util::kml::KmlUtil::CloseKmlFactory ()  [inline], [static], [inherited]
```

Release this thread's KML factory pointer.

Warning

This deletes libkml's shared factory (see kml_factory_). It is not currently called.

Exceptions

util::log::MessageException	if an error occurs.

References CATCH_BLOCK, and util::kml::KmlUtil::kml_factory_.

10.92.3.2 GetDefaltKmlPathColor()

```
static const Color32 & util::kml::KmlUtil::GetDefaltKmlPathColor (
            int id)  [inline], [static], [inherited]
```

Get the palette colour for an index (an instrument ID, for example), modulo the palette size.

Parameters

in	*id*	The index.

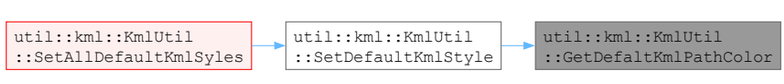
Returns

The colour.

References util::kml::KmlUtil::kml_default_path_colors_.

Referenced by util::kml::KmlUtil::SetDefaultKmlStyle().

Here is the caller graph for this function:



10.92.3.3 GetDefaltKmlPathStyleId()

```
static const string & util::kml::KmlUtil::GetDefaltKmlPathStyleId (
            int id)  [inline], [static], [inherited]
```

Get the path (line) style ID for an index, modulo the palette size.

Parameters

in	*id*	The index.

Returns

The KML style ID.

References util::kml::KmlUtil::kml_default_path_style_ids_.

Referenced by util::kml::KmlUtil::SetDefaultKmlStyle().

Here is the caller graph for this function:

10.92.3.4 GetDefaltKmlPlacemarkStyleId()

```
static const string & util::kml::KmlUtil::GetDefaltKmlPlacemarkStyleId (
            int id)  [inline], [static], [inherited]
```

Get the large placemark style ID for an index, modulo the palette size.

Parameters

in	*id*	The index.

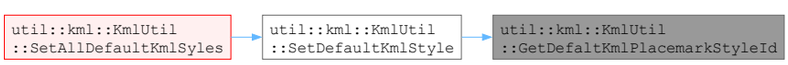
Returns

The KML style ID.

References util::kml::KmlUtil::kml_default_placemark_style_ids_.

Referenced by util::kml::KmlUtil::SetDefaultKmlStyle().

Here is the caller graph for this function:



10.92.3.5 GetKmlFactory()

```
static thread_specific_ptr< KmlFactory > & util::kml::KmlUtil::GetKmlFactory ()  [inline], [static],
[inherited]
```

Get the libkml factory, initializing it for this thread if necessary.

Exceptions

util::log::MessageException	if the factory cannot be obtained.

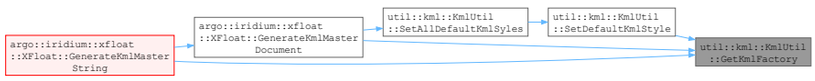
Returns

The thread's KML factory pointer (see kml_factory_).

References CATCH_BLOCK, and util::kml::KmlUtil::kml_factory_.

Referenced by argo::iridium::xfloat::XFloat::GenerateKmlMasterDocument(), argo::iridium::xfloat::XFloat::GenerateKmlMasterString(), and util::kml::KmlUtil::SetDefaultKmlStyle().

Here is the caller graph for this function:



10.92.3.6 GetSmallKmlPlacemarkStyleId()

```
static const string & util::kml::KmlUtil::GetSmallKmlPlacemarkStyleId (
            int id)  [inline], [static], [inherited]
```

Get the small placemark style ID for an index, modulo the palette size.

Parameters

in	*id*	The index.

Returns

The KML style ID.

References util::kml::KmlUtil::kml_small_placemark_style_ids_.

Referenced by util::kml::KmlUtil::SetDefaultKmlStyle().

Here is the caller graph for this function:

10.92.3.7 GetTriangleKmlPlacemarkStyleId()

```
static const string & util::kml::KmlUtil::GetTriangleKmlPlacemarkStyleId (
            int id)  [inline], [static], [inherited]
```

Get the triangle placemark style ID for an index, modulo the palette size.

Parameters

in	*id*	The index.

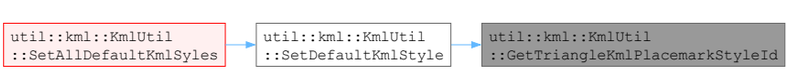
Returns

The KML style ID.

References util::kml::KmlUtil::kml_triangle_placemark_style_ids_.

Referenced by util::kml::KmlUtil::SetDefaultKmlStyle().

Here is the caller graph for this function:



10.92.3.8 operator()()

```
void argo::iridium::xfloat::XFloatPostProcessingService::operator() ()  [inline]
```

Functor operator overload function: the main entry point for the post-processing analysis thread.

This function defines the behavior of the post-processing analysis thread which is responsible for generating tertiary files (e.g. Google Earth KML and status files).

During execution the primary loop consists of the following. First, sleep for idle_sleep_seconds_. Then, iterate over all of the cached instrument objects and update files as needed. This loop continues until termination is signaled by the daemon/service thread.

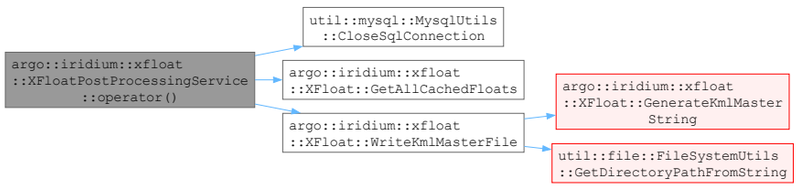
Once termination is signaled by the daemon process i.e. termination_signaled_ is TRUE, the thread will exit its primary loop and die.

Exceptions

None.	Never throws.

References CATCH_NOTHROW, util::mysql::MysqlUtils::CloseSqlConnection(), argo::iridium::xfloat::XFloat::GetAllCachedFloats(), idle_sleep_seconds_, ldbg, termination_signaled_, argo::iridium::xfloat::XFloat::WriteKmlMasterFile(), and XFLT_THREAD_SLEEP_MS.

Here is the call graph for this function:



10.92.3.9 SetAllDefaultKmlSyles()

```
static void util::kml::KmlUtil::SetAllDefaultKmlSyles (
             const DocumentPtr & document)  [inline], [static], [inherited]
```

Add the default styles for every palette colour to a KML document.

Parameters

in	*document*	The KML document to add the styles to.

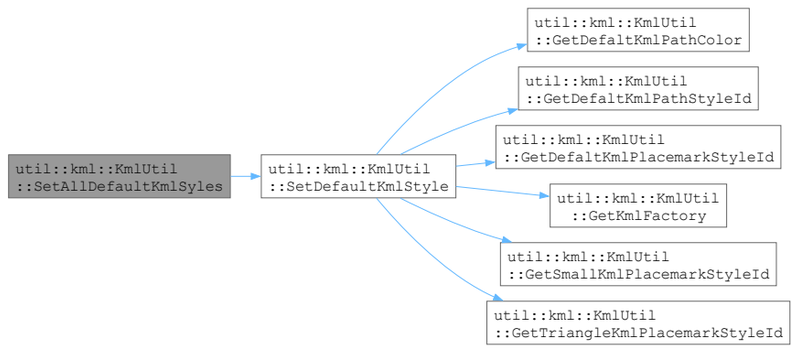
Exceptions

util::log::MessageException	if an error occurs.

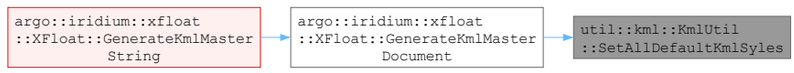
References CATCH_BLOCK, and util::kml::KmlUtil::SetDefaultKmlStyle().

Referenced by argo::iridium::xfloat::XFloat::GenerateKmlMasterDocument().

Here is the call graph for this function:



Here is the caller graph for this function:



10.92.3.10 SetDefaultKmlStyle()

```
static void util::kml::KmlUtil::SetDefaultKmlStyle (
            const DocumentPtr & document,
            unsigned int style_idx)  [inline], [static], [inherited]
```

Add the four default styles for one palette colour to a KML document.

Adds a 5-pixel path (line) style, a large dot placemark style, a small dot placemark style and a triangle placemark style, all in the colour `style_idx` (modulo the palette size). The icons are loaded from `http://argo.whoi.edu/kml/img/`. Errors are logged, not thrown.

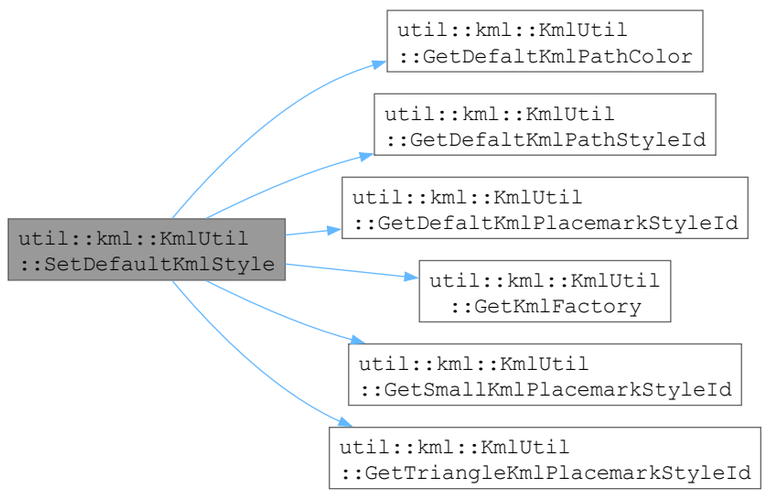
Parameters

in	*document*	The KML document to add the styles to.
in	*style_idx*	The palette index of the colour.

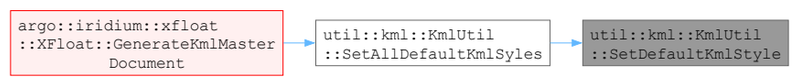
References CATCH_NOTHROW, util::kml::KmlUtil::GetDefaltKmlPathColor(), util::kml::KmlUtil::GetDefaltKmlPathStyleId(), util::kml::KmlUtil::GetDefaltKmlPlacemarkStyleId(), util::kml::KmlUtil::GetKmlFactory(), util::kml::KmlUtil::GetSmallKmlPlacemarkStyleId(), and util::kml::KmlUtil::GetTriangleKmlPlacemarkStyleId().

Referenced by util::kml::KmlUtil::SetAllDefaultKmlSyles().

Here is the call graph for this function:



Here is the caller graph for this function:



10.92.3.11 StartWorkerThread()

```
static void argo::iridium::xfloat::XFloatPostProcessingService::StartWorkerThread ()  [inline],
[static]
```

Instantiate the post-processing analysis worker thread.

This function is invoked by the daemon thread after initialization to instantiate the post-processing analysis thread. It creates a new instance of XFloatPostProcessingService, and instantiates a new thread that invokes the functor operator of the object.

Exceptions

None.	Never throws.

References CATCH_BLOCK, ldbg, thread_, and thread_object_.

10.92.3.12 TerminateWorkerThread()

```
static void argo::iridium::xfloat::XFloatPostProcessingService::TerminateWorkerThread ()  [inline],
[static]
```

Terminate the mail post-processing analysis thread.

This function is used by the daemon thread to kill the worker thread upon application termination. The function signals termination, and then attempts to join the child thread. If the child thread does not join, then the function will timeout after XMTPS_THREAD_JOIN_SECONDS seconds, a warning will be issued, and the child thread will be abandoned.

Exceptions

None.	Never throws.

References CATCH_BLOCK, ldbg, lwrn, thread_, and XMTPS_THREAD_JOIN_SECONDS.

10.92.4 Friends And Related Symbol Documentation

10.92.4.1 util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription

```
options_description util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription
()  [friend]
```

Friend function for populating some of the static members of this class from the configuration file options.

10.92.5 Member Data Documentation

10.92.5.1 idle_sleep_seconds_

```
unsigned int argo::iridium::xfloat::XFloatPostProcessingService::idle_sleep_seconds_  [static],
[private]
```

Duration to sleep when not performing post-processing, in seconds.

The thread sleeps for this duration between periodically iterating over all cached instrument data objects and performing post-processing as needed.

Referenced by operator()().

10.92.5.2 kml_default_path_colors_

```
const Color32 util::kml::KmlUtil::kml_default_path_colors_  [static], [private], [inherited]
```

Initial value:

```
= {
        Color32(0xB0, 0xFF, 0x00, 0x00),
        Color32(0xB0, 0xFF, 0x80, 0x00),
        Color32(0xB0, 0xFF, 0xFF, 0x00),
        Color32(0xB0, 0x80, 0xFF, 0x00),
        Color32(0xB0, 0x00, 0xFF, 0x00),
        Color32(0xB0, 0x00, 0xFF, 0x80),
        Color32(0xB0, 0x00, 0xFF, 0xFF),
        Color32(0xB0, 0x00, 0x80, 0xFF),
        Color32(0xB0, 0x00, 0x00, 0xFF),
        Color32(0xB0, 0x80, 0x00, 0xFF),
        Color32(0xB0, 0xFF, 0x00, 0xFF),
        Color32(0xB0, 0xFF, 0x00, 0x80),
        Color32(0xB0, 0x80, 0x80, 0x080),
 }
```

The colour palette for instrument paths and placemarks, indexed by style index.

Referenced by util::kml::KmlUtil::GetDefaltKmlPathColor().

10.92.5.3 kml_default_path_style_ids_

```
const string util::kml::KmlUtil::kml_default_path_style_ids_  [static], [private], [inherited]
```

Initial value:

```
= {
        "path1",
        "path2",
        "path3",
        "path4",
        "path5",
        "path6",
        "path7",
        "path8",
        "path9",
        "pathA",
        "pathB",
        "pathC",
        "pathD",}
```

The KML style IDs of the path (line) styles, one per palette colour.

Referenced by util::kml::KmlUtil::GetDefaltKmlPathStyleId().

10.92.5.4 kml_default_placemark_style_ids_

```
const string util::kml::KmlUtil::kml_default_placemark_style_ids_  [static], [private], [inherited]
```

Initial value:

```
= {
        "dot1_1",
        "dot1_2",
        "dot1_3",
        "dot1_4",
        "dot1_5",
        "dot1_6",
        "dot1_7",
        "dot1_8",
        "dot1_9",
        "dot1_A",
        "dot1_B",
        "dot1_C",
        "dot1_D", }
```

The KML style IDs of the large placemark styles, one per palette colour.

Referenced by util::kml::KmlUtil::GetDefaltKmlPlacemarkStyleId().

10.92.5.5 kml_factory_

```
thread_specific_ptr< KmlFactory > util::kml::KmlUtil::kml_factory_  [static], [private], [inherited]
```

The libkml factory used to create KML elements, held per thread.

Warning

> This holds libkml's process-wide factory (`KmlFactory::GetFactory()`), and the default cleanup deletes it when the owning thread exits or CloseKmlFactory() is called. Only the post-processing thread uses KML, so this currently happens only at shutdown.

Referenced by util::kml::KmlUtil::CloseKmlFactory(), and util::kml::KmlUtil::GetKmlFactory().

10.92.5.6 kml_small_placemark_style_ids_

```
const string util::kml::KmlUtil::kml_small_placemark_style_ids_  [static], [private], [inherited]
```

Initial value:

```
= {
        "dot1s_1",
        "dot1s_2",
        "dot1s_3",
        "dot1s_4",
        "dot1s_5",
        "dot1s_6",
        "dot1s_7",
        "dot1s_8",
        "dot1s_9",
        "dot1s_A",
        "dot1s_B",
        "dot1s_C",
        "dot1s_D", }
```

The KML style IDs of the small placemark styles, one per palette colour.

Referenced by util::kml::KmlUtil::GetSmallKmlPlacemarkStyleId().

10.92.5.7 kml_triangle_placemark_style_ids_

```
const string util::kml::KmlUtil::kml_triangle_placemark_style_ids_  [static], [private], [inherited]
```

Initial value:

```
= {
        "tri1_1",
        "tri1_2",
        "tri1_3",
        "tri1_4",
        "tri1_5",
        "tri1_6",
        "tri1_7",
        "tri1_8",
        "tri1_9",
        "tri1_A",
        "tri1_B",
        "tri1_C",
        "tri1_D", }
```

The KML style IDs of the triangle placemark styles, one per palette colour.

Referenced by util::kml::KmlUtil::GetTriangleKmlPlacemarkStyleId().

10.92.5.8 termination_signaled_

```
std::atomic< bool > argo::iridium::xfloat::XFloatPostProcessingService::termination_signaled_↩
[static], [private]
```

The termination signaled flag.

This flag is used to signal termination of the post-processing analysis thread. During normal operation, the value of this field will be FALSE. Once termination is signaled, it will become TRUE causing all of the single instance of the mail retrieval to to exit its primary loop and die.

Referenced by operator()().

10.92.5.9 thread_

```
thread argo::iridium::xfloat::XFloatPostProcessingService::thread_  [static], [private]
```

The post-processing analysis thread group.

This object represents the group of post-processing analysis threads that are instantiated after initialization. Each new thread that is instantiated is added to this group. Upon termination, the thread group is joined.

Referenced by StartWorkerThread(), and TerminateWorkerThread().

10.92.5.10 thread_object_

shared_ptr< XFloatPostProcessingService > argo::iridium::xfloat::XFloatPostProcessingService↩
::thread_object_ [static], [private]

The post-processing analysis thread objects.

Each instance of the post-processing analysis threads is created by invoking the functor of an instance of this runnable class. Each instance of this object that is created during instantiation of a new thread is stored in this vector.

Referenced by StartWorkerThread().

The documentation for this class was generated from the following files:

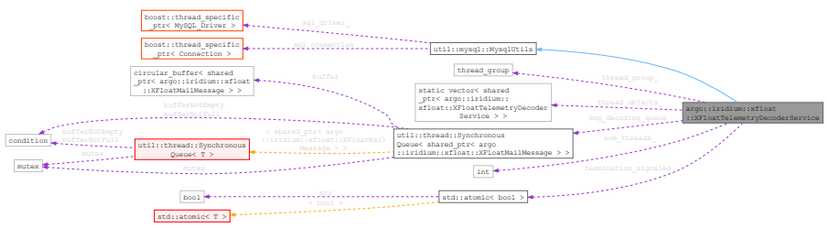
Collaboration diagram for argo::iridium::xfloat::XFloatTelemetryDecoderService:



Public Member Functions

- XFloatTelemetryDecoderService ()

  The constructor.
- ~XFloatTelemetryDecoderService ()

  The destructor.
- void DecodeMessage (shared_ptr< XFloatMailMessage > msg) const

  Decode the telemetry data from a processed mail message.
- void operator() () ATTR_NO_EXCEPTIONS

  Functor operator overload function: the main entry point for the telemetry decoder thread(s).
- void ProcessDiveData (shared_ptr< XFloatDiveData > &dive_data) const

  Process a dive data object.

Static Public Member Functions

- static void CloseSqlConnection ()

  Close the thread-specific MySQL connection if it is currently open.
- static shared_ptr< ResultSet > ExecuteQuery (Connection *con, const string &query)

  Execute an SQL query and return a shared pointer to the ResultSet object.
- static int ExecuteUpdate (Connection *con, const string &update)

  Execute an SQL update and return the status code.
- static shared_ptr< PreparedStatement > GeneratePreparedStatement (Connection *con, const string &statement)

  Generate a prepared SQL statement object for the given SQL statement.
- static string GenerateSqlDeleteStr (const string &from, const string &where="")

  Generate an SQL DELETE statement.
- static string GenerateSqlSelectStr (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)

  Generate an SQL select statement.
- static thread_specific_ptr< Connection > & GetSqlConnection (string url, string user, string password, string schema)

  Get a thread-specific instance of a MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > & GetSqlDriver ()

  Get a thread-specific instance of a MySQL driver object.
- static bool MsgDecodingQueuePush (const shared_ptr< XFloatMailMessage > &msg, bool block=true)

  Push a mail message into the telemetry decoder queue.
- static unsigned int num_threads ()

  Get the number of telemetry decoder threads.
- static void StartWorkerThreads () ATTR_NO_EXCEPTIONS

  Instantiate the telemetry decoder worker thread(s).
- static void TerminateWorkerThreads () ATTR_NO_EXCEPTIONS

  Terminate the telemetry decoder worker thread(s).

Static Private Member Functions

- static void CleanupSqlConnection (Connection *con)

  Cleanup an SQL connection.
- static void CleanupSqlDriver (MySQL_Driver *driver)

  Function for memory cleanup of MySQL driver on destruct.
- static bool MsgProcessingQueuePop (shared_ptr< XFloatMailMessage > &msg, bool block=false)

  Pop a mail message out of the telemetry decoder queue.
- static void set_termination_signaled (bool termination_signaled=true)

  Set the termination signaled flag.

Static Private Attributes

- static util::thread::SynchronousQueue< shared_ptr< XFloatMailMessage > > msg_decoding_queue_

  The telemetry decode queue.
- static unsigned int num_threads_

  The number of telemetry decoder threads.
- static thread_specific_ptr< Connection > sql_connection_

  Tthe thread-specific pointer to MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > sql_driver_

  The thread-specific pointer to MySQL driver object.
- static std::atomic< bool > termination_signaled_

  The termination signaled flag.
- static thread_group thread_group_

  The telemetry decoder thread group.
- static vector< shared_ptr< XFloatTelemetryDecoderService > > thread_objects_

  The telemetry decoder thread objects.

Friends

- options_description util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription ()

  Friend function for populating some of the static members of this class from the configuration file options.

10.93.1 Detailed Description

The telemetry decoder thread class.

This class defines the operation of the telemetry decoder thread(s), which are the third stage in the processing pipeline. The telemetry decoder thread(s) consumes processed mail messages that are produced by the previous stage of the processing pipeline, the mail processing thread, XFloatMailProcessingService.

For each message received from the mail processing thread, the corresponding instrument object, XFloat, is retrieved. Likewise, the dive data object, XFloatDiveData, corresponding to the dive or cycle number of the mail message is retrieved from the instrument object. The mail message is assigned to the dive data object. Finally, the SBD message data attached to the mail message is decoded into one of the util::xmsg::XMessage which is determined by the X-↩ Message type identifier contained in the binary message data. The resulting util::xmsg::XMessage object is assigned to the XFloatDiveData.

Zero or more instance of this thread may be instantiated after application initialization, depending on the configuration options. Each thread enters a primary loop in which messages are fetched from a common queue and processed. If the incoming queue is empty, then the thread will sleep for intervals of XFLT_THREAD_SLEEP_MS milliseconds.

The primary loop will continue until the daemon thread signals termination. When termination is signaled, the remaining messages in the incoming queue will be processed, then all instances of this thread will die. This ensures that processing pipeline will be thoroughly flushed before application termination, and that no messages will be partially or incompletely processed.

10.93.2 Constructor & Destructor Documentation

10.93.2.1 XFloatTelemetryDecoderService()

```
argo::iridium::xfloat::XFloatTelemetryDecoderService::XFloatTelemetryDecoderService ()  [inline]
```

The constructor.

10.93.2.2 ~XFloatTelemetryDecoderService()

```
argo::iridium::xfloat::XFloatTelemetryDecoderService::~XFloatTelemetryDecoderService ()  [inline]
```

The destructor.

10.93.3 Member Function Documentation

10.93.3.1 CleanupSqlConnection()

```
static void util::mysql::MysqlUtils::CleanupSqlConnection (
            Connection * con)  [inline], [static], [private], [inherited]
```

Cleanup an SQL connection.

This function for memory cleanup of the SQL connection on destruction. The thread-specific SQL connection object will be deleted if it exists.

Parameters

in	*con*	The SQL connection to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL connection object.

References CATCH_BLOCK.

10.93.3.2 CleanupSqlDriver()

```
static void util::mysql::MysqlUtils::CleanupSqlDriver (
            MySQL_Driver * driver)  [inline], [static], [private], [inherited]
```

Function for memory cleanup of MySQL driver on destruct.

Signals the SQL driver to end operation, if it exists.

Parameters

in	*driver*	Driver to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL driver object.

References CATCH_BLOCK.

10.93.3.3 CloseSqlConnection()

```
static void util::mysql::MysqlUtils::CloseSqlConnection ()  [inline], [static], [inherited]
```

Close the thread-specific MySQL connection if it is currently open.

If the thread local MySQL connection is not currently open, then this function will have no effect.

Note

The MySQL connection should be closed when idle to prevent the connection from timing out and throwing exceptions.

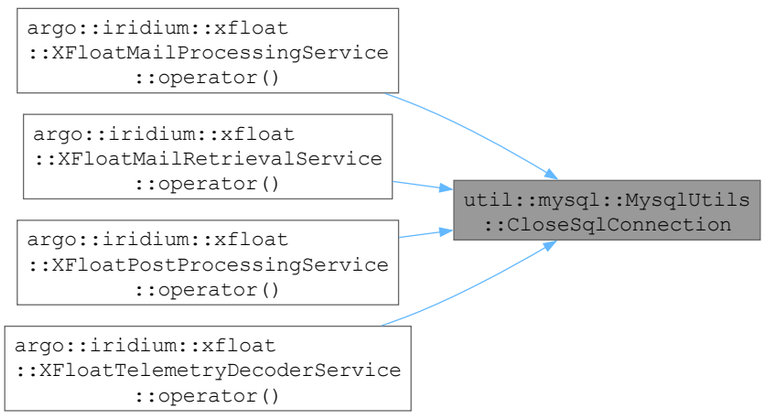
Exceptions

log::MessageException	if an error occurs while attempting to close the MySQL connection.

References CATCH_BLOCK, and util::mysql::MysqlUtils::sql_connection_.

Referenced by argo::iridium::xfloat::XFloatMailProcessingService::operator()(), argo::iridium::xfloat::XFloatMailRetrievalService::operator(
argo::iridium::xfloat::XFloatPostProcessingService::operator()(), and operator()().

Here is the caller graph for this function:



10.93.3.4 DecodeMessage()

```
void argo::iridium::xfloat::XFloatTelemetryDecoderService::DecodeMessage (
            shared_ptr< XFloatMailMessage > msg) const  [inline]
```

Decode the telemetry data from a processed mail message.

This function is used to decode the binary Iridium Short Burst Data (SBD) message that is supplied as an attachment to the email message. Mail messages that are received from the previous stage in the processing pipeline, the mail processing thread(s), XFloatMailProcessingService, are decoded using this function.

First, the function checks the message reference `msg`. If it is NULL, then the function throws an exception. Otherwise, it continues on to set the global logger attributes:

- DiveID,
- MsgUID,
- PcktID,
- MomsnID,
- WhoiID,
- DacID, and
- WmoID.

These attributes are used by the global logger object for filtering, etc. The values of the attributes are assumed to be known since, if any were unknown, then the mail processing threads would have queried them from the SQL database.

Next, the float object, `xfloat`, that corresponds to the instrument that transmitted this message is retrieved. If the float object does not already exist, it will be created. Also, the metadata object for this instrument is retrieved, which contains information about the start-of-mission and deployment date/times. The time of flight of the message is examined to ensure that the message is valid. Messages that were transmitted after the start-of-mission or deployment date/times are discarded.

Then, the dive data object, `xdive`, which contains all the data received for a single instrument and single dive/cycle is retrieved from the float object. If the dive data object for this dive/cycle does not already exist, it will be created. The mail message, `msg`, is then assigned to the dive data object.

The SBD message is passed to the ProcessDiveData() function to be decoded.

Parameters

in	*msg*	A shared reference to the mail message to decode.

References CATCH_BLOCK, EXC_THROW, argo::iridium::xfloat::XFloat::GetFloat(), ldbg, ProcessDiveData(), XFLT_DIVE_UNKNOWN, util::xmsg::XMSG_TYPE_ID_ARGO_DATA, util::xmsg::XMSG_TYPE_ID_GPS_ENDOFDIVE, util::xmsg::XMSG_TYPE_ID_GPS_STARTOFDIVE, util::xmsg::XMSG_TYPE_ID_PRES_SURF0, util::xmsg::XMSG_TYPE_ID_PRES_SU util::xmsg::XMSG_TYPE_ID_PRES_SURF2, util::xmsg::XMSG_TYPE_ID_PRES_SURF3, util::xmsg::XMSG_TYPE_ID_PRES_SURF4, util::xmsg::XMSG_TYPE_ID_PRES_SURF5, util::xmsg::XMSG_TYPE_ID_PRES_SURF6, util::xmsg::XMSG_TYPE_ID_PRES_SURF7, util::xmsg::XMSG_TYPE_ID_PRES_SURF8, util::xmsg::XMSG_TYPE_ID_PRES_SURF9, util::xmsg::XMSG_TYPE_ID_PRES_SURFA, util::xmsg::XMSG_TYPE_ID_PRES_SURFB, util::xmsg::XMSG_TYPE_ID_PRES_SURFC, util::xmsg::XMSG_TYPE_ID_PRES_SURFD, util::xmsg::XMSG_TYPE_ID_PRES_SURFE, and util::xmsg::XMSG_TYPE_ID_PRES_SURFF.

10.93.3.5 ExecuteQuery()

```
static shared_ptr< ResultSet > util::mysql::MysqlUtils::ExecuteQuery (
            Connection * con,
            const string & query)  [inline], [static], [inherited]
```

Execute an SQL query and return a shared pointer to the ResultSet object.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*query*	The SQL query to execute. This must be a well-formatted SQL query string.

Exceptions

log::MessageException	if 'con' is null, 'query' is a malfored SQL string, or any other error occurs.

Returns

A shared pointer to the query ResultSet object.

References CATCH_BLOCK, and util::mysql::MysqlUtils::GeneratePreparedStatement().

Referenced by util::mysql::LocalMysqlConfiguration::executeQuery().

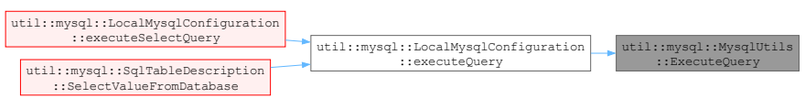
Here is the caller graph for this function:



10.93.3.6 ExecuteUpdate()

```
static int util::mysql::MysqlUtils::ExecuteUpdate (
            Connection * con,
            const string & update)  [inline], [static], [inherited]
```

Execute an SQL update and return the status code.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*update*	The SQL update to execute. This must be a well-formatted SQL update string.

Exceptions

log::MessageException	if 'con' is null, 'update' is a malformed SQL string, or any other error occurs.

Returns

The update status code.

References CATCH_BLOCK, and util::mysql::MysqlUtils::GeneratePreparedStatement().

Referenced by util::mysql::LocalMysqlConfiguration::executeUpdate().

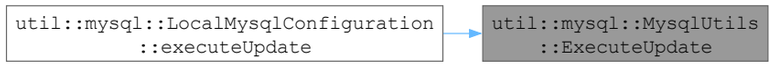
Here is the caller graph for this function:



10.93.3.7 GeneratePreparedStatement()

```
static shared_ptr< PreparedStatement > util::mysql::MysqlUtils::GeneratePreparedStatement (
            Connection * con,
            const string & statement)  [inline], [static], [inherited]
```

Generate a prepared SQL statement object for the given SQL statement.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*statement*	The SQL statement to prepare. This must be a well-formed SQL string.

Exceptions

log::MessageException	if 'con' is NULL, 'statement' is not a valid SQL string, or if an error occurs.

Returns

A prepared SQL statement object generated from the given SQL statement.

References CATCH_BLOCK, and EXC_THROW.

10.93.3.8 GenerateSqlDeleteStr()

```
static string util::mysql::MysqlUtils::GenerateSqlDeleteStr (
            const string & from,
            const string & where = "")  [inline], [static], [inherited]
```

Generate an SQL DELETE statement.

Warning

Without a `where` clause, the statement deletes every row in the table.

Parameters

in	*from*	The name of the table to delete from.
in	*where*	The SQL "where-condition" clause (empty = all rows).

Returns

The SQL statement.

10.93.3.9 GenerateSqlSelectStr()

```
static string util::mysql::MysqlUtils::GenerateSqlSelectStr (
            const string & what,
            const string & from,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [inline], [static], [inherited]
```

Generate an SQL select statement.

Parameters

in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table-references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Returns

The SQL select statement.

Referenced by util::mysql::LocalMysqlConfiguration::executeSelectQuery(), util::mysql::SqlTableDescription< T >::generateSelectAllState
and util::mysql::SqlTableDescription< T >::SelectValueFromDatabase().

10.93.3.10 GetSqlConnection()

```
static thread_specific_ptr< Connection > & util::mysql::MysqlUtils::GetSqlConnection (
            string url,
            string user,
            string password,
            string schema)  [inline], [static], [inherited]
```

Get a thread-specific instance of a MySQL connection object.

A new connection will be created, if necessary.

Parameters

in	*url*	The MySQL host server qualified address.
in	*user*	The MySQL account username.
in	*password*	The MySQL account password.
in	*schema*	The MySQL account schema name.

Exceptions

log::MessageException	if an error occurs while creating a new thread-specific instance of the SQL connection object

Returns

A thread-specific instance of a MySQL connection object.

References CATCH_BLOCK, util::mysql::MysqlUtils::GetSqlDriver(), and util::mysql::MysqlUtils::sql_connection_.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.93.3.11 GetSqlDriver()

```
static thread_specific_ptr< MySQL_Driver > & util::mysql::MysqlUtils::GetSqlDriver ()  [inline],
[static], [inherited]
```

Get a thread-specific instance of a MySQL driver object.

A new driver will created, if necessary.

Exceptions

log::MessageException	if an error occurs while creating a new thread-specific instance of the SQL driver object

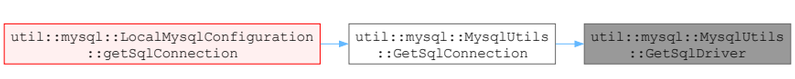
Returns

A thread-specific instance of a MySQL driver object.

References CATCH_BLOCK, and util::mysql::MysqlUtils::sql_driver_.

Referenced by util::mysql::MysqlUtils::GetSqlConnection().

Here is the caller graph for this function:



10.93.3.12 MsgDecodingQueuePush()

```
static bool argo::iridium::xfloat::XFloatTelemetryDecoderService::MsgDecodingQueuePush (
            const shared_ptr< XFloatMailMessage > & msg,
            bool block = true)  [inline], [static]
```

Push a mail message into the telemetry decoder queue.

This function is used by the previous stage in the processing pipeline, the mail processing thread, XFloatMailProcessingService, to pass a mail message to the telemetry decoder thread(s). The mail message processing queue is synchronous, so the underlying push function is atomic.

Parameters

in	*msg*	The mail message to push into the queue.
in	*block*	If TRUE, this function will block until the queue is not full. If FALSE, this function will return FALSE if the queue is full (and the element will not be pushed into the queue).

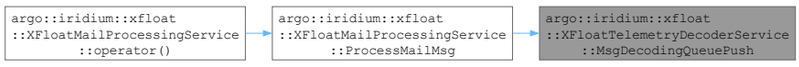
Returns

TRUE if the element was successfully pushed into the queue, or FALSE otherwise.

References msg_decoding_queue_.

Referenced by argo::iridium::xfloat::XFloatMailProcessingService::ProcessMailMsg().

Here is the caller graph for this function:



10.93.3.13 MsgProcessingQueuePop()

```
static bool argo::iridium::xfloat::XFloatTelemetryDecoderService::MsgProcessingQueuePop (
            shared_ptr< XFloatMailMessage > & msg,
            bool block = false)  [inline], [static], [private]
```

Pop a mail message out of the telemetry decoder queue.

This function is used by the telemetry decoder thread(s) to receive mail messages produced by the previous stage in the processing pipeline, the mail processing thread, XFloatMailProcessingService. The queue is synchronous, so the underlying pop function is atomic.

Parameters

out	*msg*	The destination of the mail message to pop out of the queue.
in	*block*	If TRUE, this function will block until the queue is not empty. If FALSE, this function will return FALSE if the queue is empty (and no element will be popped out of the queue).

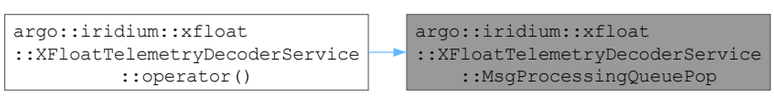
Returns

TRUE if the element was successfully popped out of the queue, or FALSE otherwise.

References msg_decoding_queue_.

Referenced by operator()().

Here is the caller graph for this function:



10.93.3.14 num_threads()

```
static unsigned int argo::iridium::xfloat::XFloatTelemetryDecoderService::num_threads () [inline],
[static]
```

Get the number of telemetry decoder threads.

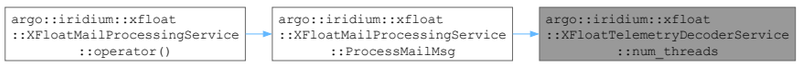
Returns

The number of telemetry decoder threads.

References num_threads_.

Referenced by argo::iridium::xfloat::XFloatMailProcessingService::ProcessMailMsg().

Here is the caller graph for this function:



10.93.3.15 operator()()

```
void argo::iridium::xfloat::XFloatTelemetryDecoderService::operator() () [inline]
```

Functor operator overload function: the main entry point for the telemetry decoder thread(s).

This function defines the behavior of the telemetry decoder thread(s), which are responsible for decoding the binary data from the processed mail messages that are produced by the mail processing thread, XFloatMailProcessingService. After initialization, zero or more instances of this thread are instantiated. The static configuration options for this thread are set as a result of parsing the command-line arguments and/or configuration file.

First, the scope thread attribute "ThreadName" is set to "sbd-decode". This attribute is used by the global logger object for filtering, etc. Then the thread enters its primary loop, in which it pops mail messages from the incoming queue one at a time and decodes the messages before passing them to the next stage in the processing pipeline, the post-processing analysis thread(s), XFloatPostProcessingService. If the incoming message queue is empty, then the connection o the SQL database is closed, and the thread sleeps for XFLT_THREAD_SLEEP_MS milliseconds.

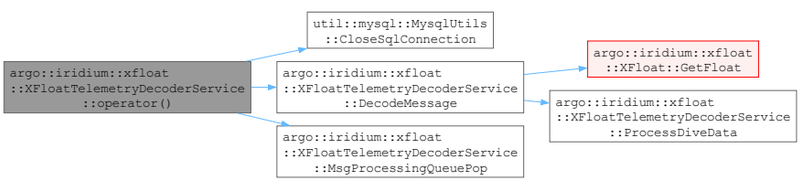
Once termination is signaled by the daemon process i.e. termination_signaled_ is TRUE, the thread will exit its primary loop and die.

Exceptions

None.	Never throws.

References CATCH_NOTHROW, util::mysql::MysqlUtils::CloseSqlConnection(), DecodeMessage(), ldbg, MsgProcessingQueuePop(), termination_signaled_, and XFLT_THREAD_SLEEP_MS.

Here is the call graph for this function:



10.93.3.16 ProcessDiveData()

```
void argo::iridium::xfloat::XFloatTelemetryDecoderService::ProcessDiveData (
            shared_ptr< XFloatDiveData > & dive_data) const [inline]
```

Process a dive data object.

Parameters

in	*dive_data*	The dive data object to process.

This function is invoked each time a new message for this dive is decoded. The function first checks if the dive data object is complete and proceeds accordingly.

If the dive data object is complete, then PHY and listing files are written, the object is saved to the database, the KML-document-is-updated flag is set to false, the dive data object is pushed into the NetCDF file writing queue, and the parent instrument object is pushed into the float processing queue.

If the dive data object is incomplete, then the listing file is written, the dive data object is saved to the database, and the parent instrument is pushed into the float processing queue.

References CATCH_BLOCK, EXC_THROW, ldbg, and lout.

Referenced by DecodeMessage().

Here is the caller graph for this function:

10.93.3.17 set_termination_signaled()

```
static void argo::iridium::xfloat::XFloatTelemetryDecoderService::set_termination_signaled (
            bool termination_signaled = true)  [inline], [static], [private]
```

Set the termination signaled flag.

This function is called by TerminateWorkerThreads() in order to cause all currently running instances of the telemetry decoder thread to exit their primary loop and die.

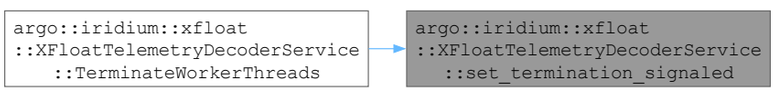
Parameters

in	*termination_signaled*	The termination signaled value to set.

References termination_signaled_.

Referenced by TerminateWorkerThreads().

Here is the caller graph for this function:



10.93.3.18 StartWorkerThreads()

```
static void argo::iridium::xfloat::XFloatTelemetryDecoderService::StartWorkerThreads ()  [inline],
[static]
```

Instantiate the telemetry decoder worker thread(s).

This function is used by the daemon thread to instantiate zero or more telemetry decoder threads after initialization. The number of threads that are instantiated by this function is determined by the value of num_threads_, which is set as a result of parsing the command-line argument and/or configuration file during initialization.

Each thread is instantiated by creating an instance of this class, which is pushed into the thread_objects_ vector, and invoking the functor of each object. Each thread that is created is added to the thread_group_ object.

Exceptions

None.	Never throws.

References CATCH_BLOCK, ldbg, num_threads_, thread_group_, and thread_objects_.

10.93.3.19 TerminateWorkerThreads()

```
static void argo::iridium::xfloat::XFloatTelemetryDecoderService::TerminateWorkerThreads () [inline],
[static]
```

Terminate the telemetry decoder worker thread(s).

This function is used by the daemon thread to kill the telemetry decoder worker thread(s) upon application termination. The function signals termination, and then attempts to join the thread group.

Warning

> If any of telemetry decoder threads fails to terminate properly, then the `join_all()` function could block indefinitely. Precautions have been take to ensure that this does not happen, but it may still be possible.

Exceptions

None.	Never throws.

References CATCH_BLOCK, ldbg, num_threads_, set_termination_signaled(), and thread_group_.

Here is the call graph for this function:

10.93.4 Friends And Related Symbol Documentation

10.93.4.1 util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription

```
options_description util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription
() [friend]
```

Friend function for populating some of the static members of this class from the configuration file options.

10.93.5 Member Data Documentation

10.93.5.1 msg_decoding_queue_

```
util::thread::SynchronousQueue< shared_ptr< XFloatMailMessage > > argo::iridium::xfloat::↩
XFloatTelemetryDecoderService::msg_decoding_queue_ [static], [private]
```

The telemetry decode queue.

This synchronous FIFO queue is used to pass messages produced by the previous stage of the processing pipeline, the mail processing thread(s), XFloatMailRetrievalService, to the telemetry decoder thread(s). All the operations performed by on the queue are atomic. Depending on the number of telemetry decoder threads, this queue may function as a one-to-one queue or one-to-many queue.

Referenced by MsgDecodingQueuePush(), and MsgProcessingQueuePop().

10.93.5.2 num_threads_

```
unsigned int argo::iridium::xfloat::XFloatTelemetryDecoderService::num_threads_ [static], [private]
```

The number of telemetry decoder threads.

The value of this field determines the number of telemetry decoder threads that are instantiated after initialization. Its value is set as a result of parsing the configuration file and/or command-line arguments during initialization. If the value is unspecified, then it defaults to a value of CFG_DEFAULT_NDECO.

Referenced by num_threads(), StartWorkerThreads(), and TerminateWorkerThreads().

10.93.5.3 sql_connection_

```
thread_specific_ptr<Connection> util::mysql::MysqlUtils::sql_connection_ [static], [private],
[inherited]
```

Tthe thread-specific pointer to MySQL connection object.

Thread-specific MySQL connection, released by `MysqlUtils::CleanupSqlConnection()` when the thread exits.

Referenced by util::mysql::MysqlUtils::CloseSqlConnection(), and util::mysql::MysqlUtils::GetSqlConnection().

10.93.5.4 sql_driver_

```
thread_specific_ptr<MySQL_Driver> util::mysql::MysqlUtils::sql_driver_ [static], [private],
[inherited]
```

The thread-specific pointer to MySQL driver object.

Thread-specific reference to the MySQL driver.

Its cleanup function, `MysqlUtils::CleanupSqlDriver()`, does not delete the shared driver instance.

Referenced by util::mysql::MysqlUtils::GetSqlDriver().

10.93.5.5 termination_signaled_

```
std::atomic< bool > argo::iridium::xfloat::XFloatTelemetryDecoderService::termination_signaled_
[static], [private]
```

The termination signaled flag.

This flag is used to signal termination of the telemetry decoder thread(s). During normal operation, the value of this field will be FALSE. Once termination is signaled, it will become TRUE causing all of the instances of the telemetry decoder thread to process the remaining messages in the incoming queue, exiting their primary loop, and then die.

Referenced by operator()(), and set_termination_signaled().

10.93.5.6 thread_group_

```
thread_group argo::iridium::xfloat::XFloatTelemetryDecoderService::thread_group_ [static], [private]
```

The telemetry decoder thread group.

This object represents the group of telemetry decoder threads that are instantiated after initialization. Each new thread that is instantiated is added to this group. Upon termination, the thread group is joined.

Referenced by StartWorkerThreads(), and TerminateWorkerThreads().

10.93.5.7 thread_objects_

vector< shared_ptr< XFloatTelemetryDecoderService > > argo::iridium::xfloat::XFloatTelemetry↩
DecoderService::thread_objects_ [static], [private]

The telemetry decoder thread objects.

Each instance of the telemetry decoder threads is created by invoking the functor of an instance of this runnable class. Each instance of this object that is created during instantiation of a new thread is stored in this vector.

Referenced by StartWorkerThreads().

The documentation for this class was generated from the following files:

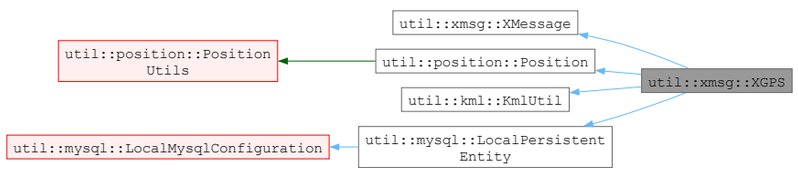
- stage3_TelemetryDecoderThread.h
- stage3_TelemetryDecoderThread.cpp

10.94 util::xmsg::XGPS Class Reference

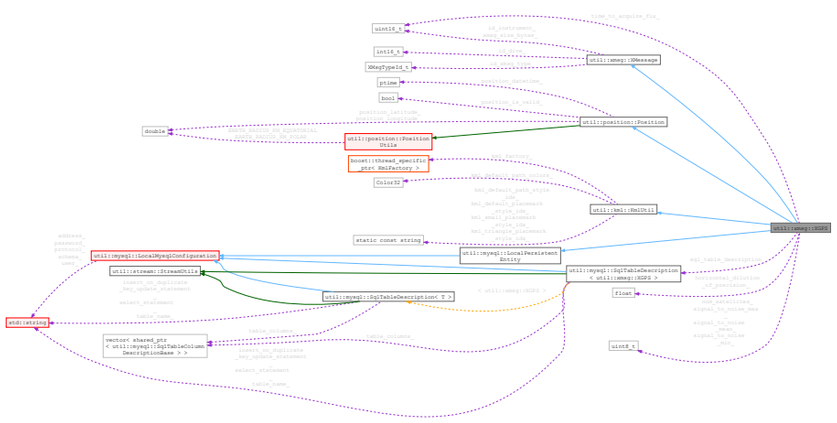
Class representing a GPS type X-Message.

#include <XGPS.h>

Inheritance diagram for util::xmsg::XGPS:



Collaboration diagram for util::xmsg::XGPS:



Public Member Functions

- XGPS (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)

  The parameterized, binary data constructor.
- XGPS (int16_t dive, uint16_t whoi, XMsgTypeId_t type) ATTR_NO_EXCEPTIONS

  The parameterized, blank constructor.
- ~XGPS ()

  The destructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)

  Check the X-message for the correct ID, minimum size, and message terminator.
- void DecodeXMsgData (const vector< uint8_t > &data)

  Decode the GPS X-message from binary data.

- const string GenerateListingString () const

  Return a string representation of this GPS message.
- const string GeneratePhyString (size_t xmits) const

  Generate a phy file entry string representation of this GPS position message object.
- float **horizontal_dilution_of_precision** () const
- int16_t id_dive () const

  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const

  Get the unique instrument identifier of this X-Message.
- uint8_t **id_type** () const
- XMsgTypeId_t id_xmsg_type () const

  Get the enumerated X-Message type identifier.
- uint8_t **num_satellites** () const
- ptime position_datetime () const

  Get the date/time of the position.
- string position_datetime_as_iso8601_string () const

  Get a formatted string representing the position date/time composed using the ISO 8601 standard.
- bool position_is_valid () const

  Is the position valid?
- double position_latitude () const

  Get the latitude of the position, in decimal degrees.
- double position_longitude () const

  Get the longitude of the position, in decimal degrees.
- string postition_as_iso6709_string () const

  Get a formatted string representing the position composed using the ISO 6709 standard.
- void SaveObjectToDatabase () const

  Save this GPS message object to the SQL database.
- uint8_t **signal_to_noise_max** () const
- uint8_t **signal_to_noise_mean** () const
- uint8_t **signal_to_noise_min** () const
- uint16_t **time_to_acquire_fix** () const
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Static Public Member Functions

- static void CloseKmlFactory ()

  Release this thread's KML factory pointer.
- static void CloseSqlConnection ()

  Close the thread-specific MySQL connection if it is currently open.
- static void DeleteObjectsFromDatabase (const string &where)

  Delete GPS message rows from the SQL database table.
- static shared_ptr< sql::ResultSet > **executeDeleteQuery** (const string &from, const string &where="")
- static shared_ptr< ResultSet > ExecuteQuery (Connection *con, const string &query)

  Execute an SQL query and return a shared pointer to the ResultSet object.
- static shared_ptr< sql::ResultSet > executeQuery (const string &query)

  Execute an SQL query and return a shared pointer to the ResultSet object.
- static shared_ptr< sql::ResultSet > executeSelectQuery (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)

  Execute an SQL select query and return a shared pointer to the ResultSet object.
- static int ExecuteUpdate (Connection *con, const string &update)

  Execute an SQL update and return the status code.
- static int executeUpdate (const string &update)

  Execute an SQL update and return the status code.
- static string GenerateListingComment ()

  Get the listing entry comment string.
- static shared_ptr< PreparedStatement > GeneratePreparedStatement (Connection *con, const string &statement)

  Generate a prepared SQL statement object for the given SQL statement.
- static shared_ptr< sql::PreparedStatement > generatePreparedStatement (const string &statement)

  Generate a prepared SQL statement object for the given SQL statement.
- static string GenerateSqlDeleteStr (const string &from, const string &where="")

  Generate an SQL DELETE statement.

- static string GenerateSqlSelectStr (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)

  Generate an SQL select statement.
- static const Color32 & GetDefaltKmlPathColor (int id)

  Get the palette colour for an index (an instrument ID, for example), modulo the palette size.
- static const string & GetDefaltKmlPathStyleId (int id)

  Get the path (line) style ID for an index, modulo the palette size.
- static const string & GetDefaltKmlPlacemarkStyleId (int id)

  Get the large placemark style ID for an index, modulo the palette size.
- static thread_specific_ptr< KmlFactory > & GetKmlFactory ()

  Get the libkml factory, initializing it for this thread if necessary.
- static const string & GetSmallKmlPlacemarkStyleId (int id)

  Get the small placemark style ID for an index, modulo the palette size.
- static thread_specific_ptr< Connection > & GetSqlConnection (string url, string user, string password, string schema)

  Get a thread-specific instance of a MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > & GetSqlDriver ()

  Get a thread-specific instance of a MySQL driver object.
- static const string & GetTriangleKmlPlacemarkStyleId (int id)

  Get the triangle placemark style ID for an index, modulo the palette size.
- static vector< shared_ptr< XGPS > > SelectAllObjectsFromDatabase (const string &groupBy="", const string &orderBy="", const unsigned int &limit=0, const unsigned int &offset=0)

  Select all GPS message objects from the SQL database table.
- static shared_ptr< XGPS > SelectObjectFromDatabase (const string &where="", const string &groupBy="", const string &orderBy="", const unsigned int &offset=0)

  Select a single GPS message object from the SQL database table.
- static vector< shared_ptr< XGPS > > SelectObjectsFromDatabase (const string &where="", const string &groupBy="", const string &orderBy="", const unsigned int &limit=0, const unsigned int &offset=0)

  Select GPS message objects from the SQL database table.
- template<typename TT >
  static TT SelectValueFromDatabase (const string &what, const string &where="", const string &groupBy="", const string &orderBy="", const unsigned int &offset=0)

  Select a single value from the GPS message SQL database table.
- static void SetAllDefaultKmlSyles (const DocumentPtr &document)

  Add the default styles for every palette colour to a KML document.
- static void SetDefaultKmlStyle (const DocumentPtr &document, unsigned int style_idx)

  Add the four default styles for one palette colour to a KML document.

Protected Member Functions

- void set_gps_position_datetime (unsigned int gpsWeek, unsigned int gpsDay, unsigned int gpsHour=0, unsigned int gpsMinute=0, unsigned int gpsSecond=0)

  Set the date and time of this position from the given GPS week, day, and time.
- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_position_datetime (const ptime &datetime)

  Set the date/time of the position.
- void set_position_is_valid (bool is_valid=true)

  Set the position is valid flag.
- void set_position_latitude (double lat)

  Set the latitude of the position, in decimal degrees.
- void set_position_longitude (double lon)

  Set the longitude of the position, in decimal degrees.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.

Static Protected Member Functions

- static float **bitcastUint32ToFloat** (uint32_t u)
- template<typename T >
  static double CalculateEllipsoidHeight (T lat)

  Get the approximate surface altitude or height of earth for a given latitude, in kilometers.
- template<typename T >
  static double CalculateGeographicDistance (T lat1, T lon1, T lat0, T lon0)

  Get the geographical distance between two position, in kilometers, from the positions' locations, in decimal degrees.
- template<typename T >
  static double degToRad (T deg)

  Convert angular units from from degrees to decimal radians.
- static string GenerateCurrentUtcTimeIso8601String ()

  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- template<typename T >
  static std::string GenerateIso6709String (T lat, T lon)

  Generate an IS06709 string representation of the position given by `(lat, lon)`.
- static string GenerateIso8601String (const ptime &p, bool extended=true)

  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)

  Convert a date/time to fractional days since a reference date/time.
- static ptime GetCurrentUtcTime ()

  Generate a POSIX time object representing the current date and time (rounded to the nearest second).
- static sql::Connection * getSqlConnection ()

  Generate a thread-specific instance of a MySQL connection object.
- template<typename T >
  static bool IsPositionValid (T lat, T lon)

  Check position validity.

Private Member Functions

- void **set_horizontal_dilution_of_precision** (float horizontal_dilution_of_precision)
- void **set_id_type** (uint8_t type)
- void **set_num_satellites** (uint8_t num_satellites)
- void **set_signal_to_noise_max** (uint8_t signal_to_noise_max)
- void **set_signal_to_noise_mean** (uint8_t signal_to_noise_mean)
- void **set_signal_to_noise_min** (uint8_t signal_to_noise_min)
- void **set_time_to_acquire_fix** (uint16_t time_to_acquire_fix)

Static Private Member Functions

- static void CleanupSqlConnection (Connection *con)

  Cleanup an SQL connection.
- static void CleanupSqlDriver (MySQL_Driver *driver)

  Function for memory cleanup of MySQL driver on destruct.
- static void DeleteFromDatabase (int id_inst)

  Delete all GPS message rows for an instrument from the SQL database.
- static void DeleteFromDatabase (int id_inst, int id_dive)

  Delete the GPS message rows for one dive of an instrument from the SQL database.

Private Attributes

- float horizontal_dilution_of_precision_

  The horizontal Dilution of Precision (HDOP) of the GPS fix.
- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint8_t num_satellites_

  The number of satellites used in GPS fix.
- ptime position_datetime_

The date and time of the position.

- bool position_is_valid_

  The valid position indicator.
- double position_latitude_

  The latitude of the position, in decimal degrees.
- double position_longitude_

  The longitude of the position, in decimal degrees.
- uint8_t signal_to_noise_max_

  The maximum Signal-to-Noise Ratio (SNR) for this GPS fix.
- uint8_t signal_to_noise_mean_

  The mean Signal-to-Noise Ratio (SNR) for this GPS fix.
- uint8_t signal_to_noise_min_

  The minimum Signal-to-Noise Ratio (SNR) for this GPS fix.
- uint16_t time_to_acquire_fix_

  The time to acquire this GPS fix, in seconds.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

Static Private Attributes

- static string address_

  The SQL server qualified name or IP address string.
- static const double EARTH_RADIUS_KM_EQUATORIAL = 6378.1

  The equatorial radius of the earth, in kilometers.
- static const double EARTH_RADIUS_KM_POLAR = 6356.1

  The polar radius of the earth, in kilometers.
- static const Color32 kml_default_path_colors_ [KML_NUM_DFLT_PATH_COLORS]

  The colour palette for instrument paths and placemarks, indexed by style index.
- static const string kml_default_path_style_ids_ [KML_NUM_DFLT_PATH_COLORS]

  The KML style IDs of the path (line) styles, one per palette colour.
- static const string kml_default_placemark_style_ids_ [KML_NUM_DFLT_PATH_COLORS]

  The KML style IDs of the large placemark styles, one per palette colour.
- static thread_specific_ptr< KmlFactory > kml_factory_

  The libkml factory used to create KML elements, held per thread.
- static const string kml_small_placemark_style_ids_ [KML_NUM_DFLT_PATH_COLORS]

  The KML style IDs of the small placemark styles, one per palette colour.
- static const string kml_triangle_placemark_style_ids_ [KML_NUM_DFLT_PATH_COLORS]

  The KML style IDs of the triangle placemark styles, one per palette colour.
- static string password_

  The SQL server account password string.
- static unsigned int port_

  The SQL server port number.
- static string protocol_

  The protocol to use in the SQL server connection e.g.
- static string schema_

  The SQL server schema name.
- static thread_specific_ptr< Connection > sql_connection_

  Tthe thread-specific pointer to MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > sql_driver_

  The thread-specific pointer to MySQL driver object.
- static const util::mysql::SqlTableDescription< XGPS > **sql_table_description_**
- static string user_

  The SQL server account username string.

Friends

- class **argo::iridium::xfloat::XFloatDiveData**
- shared_ptr< XGPS > std::make_shared ()

  Friend function for creating an X-Float object using the private constructor and a shared pointer to that object.

10.94.1 Detailed Description

Class representing a GPS type X-Message.

10.94.2 Constructor & Destructor Documentation

10.94.2.1 XGPS() [1/2]

```
util::xmsg::XGPS::XGPS (
            int16_t dive,
            uint16_t whoi,
            XMsgTypeId_t type)  [inline]
```

The parameterized, blank constructor.

Parameters

in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*type*	The X-Message type identifier.

Exceptions

None.	Never throws.

10.94.2.2 XGPS() [2/2]

```
util::xmsg::XGPS::XGPS (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

The parameterized, binary data constructor.

Parameters

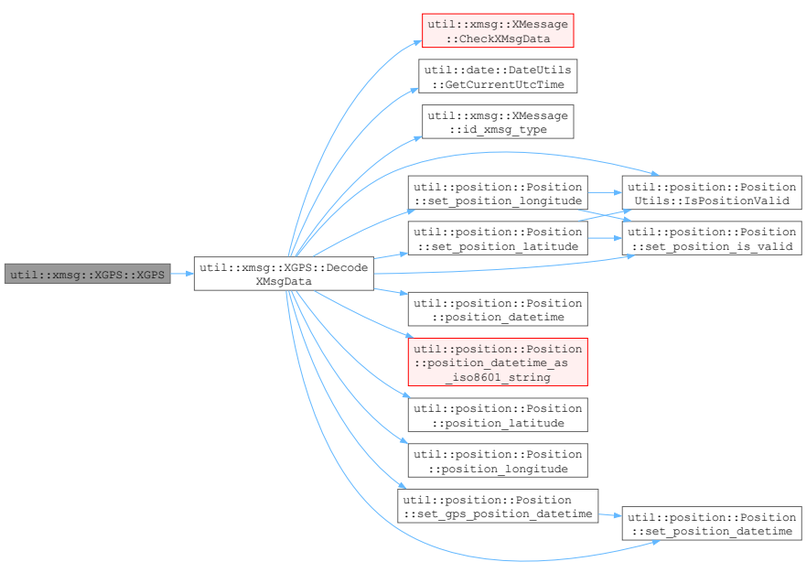
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.94.2.3 ~XGPS()

```
util::xmsg::XGPS::~XGPS ()  [inline]
```

The destructor.

10.94.3 Member Function Documentation

10.94.3.1 CalculateEllipsoidHeight()

```
template<typename T >
static double util::position::PositionUtils::CalculateEllipsoidHeight (
            T lat)  [inline], [static], [inherited]
```

Get the approximate surface altitude or height of earth for a given latitude, in kilometers.

Warning

This method provides approximate surface height estimates only! This approximation is calculated from a reference ellipsoid – a mathematically-defined surface that approximates the geoid, the truer figure of the Earth.

Parameters

in	*lat*	The geographic latitude of interest, in decimal degrees.

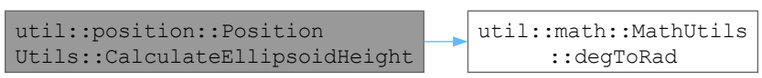
Returns

The approximate surface altitude or height of earth for the given latitude, in kilometers.

References util::math::MathUtils::degToRad(), util::position::PositionUtils::EARTH_RADIUS_KM_EQUATORIAL, and util::position::PositionUtils::EARTH_RADIUS_KM_POLAR.

Referenced by util::position::PositionUtils::CalculateGeographicDistance().

Here is the call graph for this function:



Here is the caller graph for this function:

10.94.3.2 CalculateGeographicDistance()

```
template<typename T >
static double util::position::PositionUtils::CalculateGeographicDistance (
            T lat1,
            T lon1,
            T lat0,
            T lon0)  [inline], [static], [inherited]
```

Get the geographical distance between two position, in kilometers, from the positions' locations, in decimal degrees.

Warning

This method provides approximate geographic estimates only! This approximation is calculated from a reference ellipsoid – a mathematically-defined surface that approximates the geoid, the truer figure of the Earth.

Note

This method uses the 'haversine' formula to calculate the great-circle distance between two points – that is, the shortest distance over the earth's surface – giving an 'as-the-crow-flies' distance between the points (ignoring any hills they fly over, of course!).

Parameters

in	*lat1*	The latitude of the geographic final position, in decimal degrees North.
in	*lon1*	The longitude of the geographic final position, in decimal degrees East.
in	*lat0*	The latitude of the geographic initial position, in decimal degrees North.
in	*lon0*	The longitude of the geographic initial position, in decimal degrees East.

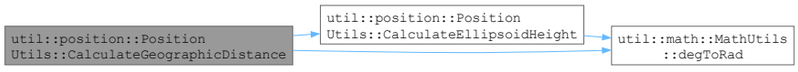
Returns

The geographical distance between the two given positions, in kilometers.

References util::position::PositionUtils::CalculateEllipsoidHeight(), and util::math::MathUtils::degToRad().

Referenced by util::xmsg::XCompositeIridiumPosition::ComputeAverageIrdiumPosition().

Here is the call graph for this function:



Here is the caller graph for this function:

10.94.3.3 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::XMessage::set_xmsg_size_byte
u16, and util::xmsg::XMessage::xmsg_size_bytes().

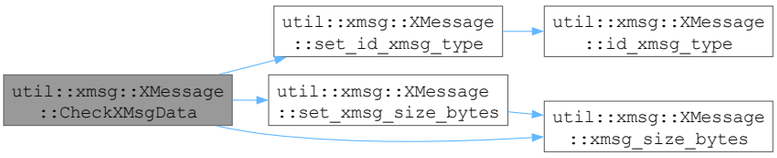
util::xmsg::XValve::DecodeXMsgData(), util::xmsg::XWave::DecodeXMsgData(), and util::xmsg::AbstractXFallRise::UnpackData().

Here is the call graph for this function:



10.94.3.4 CleanupSqlConnection()

```
static void util::mysql::MysqlUtils::CleanupSqlConnection (
            Connection * con)  [inline], [static], [private], [inherited]
```

Cleanup an SQL connection.

This function for memory cleanup of the SQL connection on destruction. The thread-specific SQL connection object will be deleted if it exists.

Parameters

in	*con*	The SQL connection to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL connection object.

References CATCH_BLOCK.

10.94.3.5 CleanupSqlDriver()

```
static void util::mysql::MysqlUtils::CleanupSqlDriver (
            MySQL_Driver * driver)  [inline], [static], [private], [inherited]
```

Function for memory cleanup of MySQL driver on destruct.

Signals the SQL driver to end operation, if it exists.

Parameters

in	*driver*	Driver to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL driver object.

References CATCH_BLOCK.

10.94.3.6 CloseKmlFactory()

```
static void util::kml::KmlUtil::CloseKmlFactory ()  [inline], [static], [inherited]
```

Release this thread's KML factory pointer.

Warning

This deletes libkml's shared factory (see kml_factory_). It is not currently called.

Exceptions

util::log::MessageException	if an error occurs.

References CATCH_BLOCK, and util::kml::KmlUtil::kml_factory_.

10.94.3.7 CloseSqlConnection()

```
static void util::mysql::MysqlUtils::CloseSqlConnection ()  [inline], [static], [inherited]
```

Close the thread-specific MySQL connection if it is currently open.

If the thread local MySQL connection is not currently open, then this function will have no effect.

Note

The MySQL connection should be closed when idle to prevent the connection from timing out and throwing exceptions.

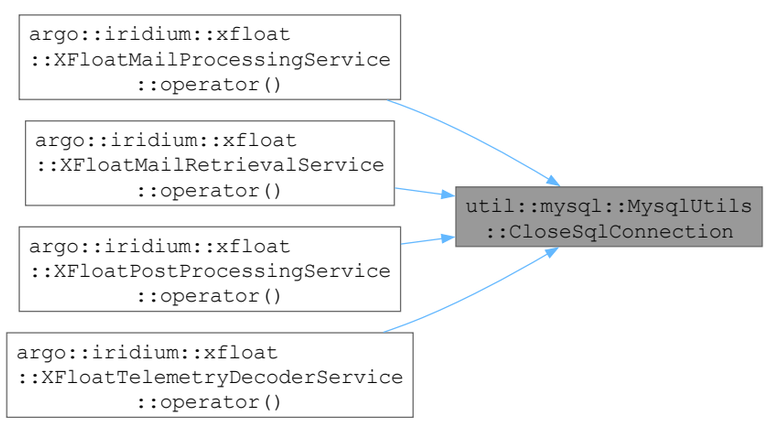
Exceptions

log::MessageException	if an error occurs while attempting to close the MySQL connection.

References CATCH_BLOCK, and util::mysql::MysqlUtils::sql_connection_.

Referenced by argo::iridium::xfloat::XFloatMailProcessingService::operator()(), argo::iridium::xfloat::XFloatMailRetrievalService::operator(
argo::iridium::xfloat::XFloatPostProcessingService::operator()(), and argo::iridium::xfloat::XFloatTelemetryDecoderService::operator()().

Here is the caller graph for this function:



10.94.3.8 DecodeXMsgData()

```
void util::xmsg::XGPS::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode the GPS X-message from binary data.

Parameters

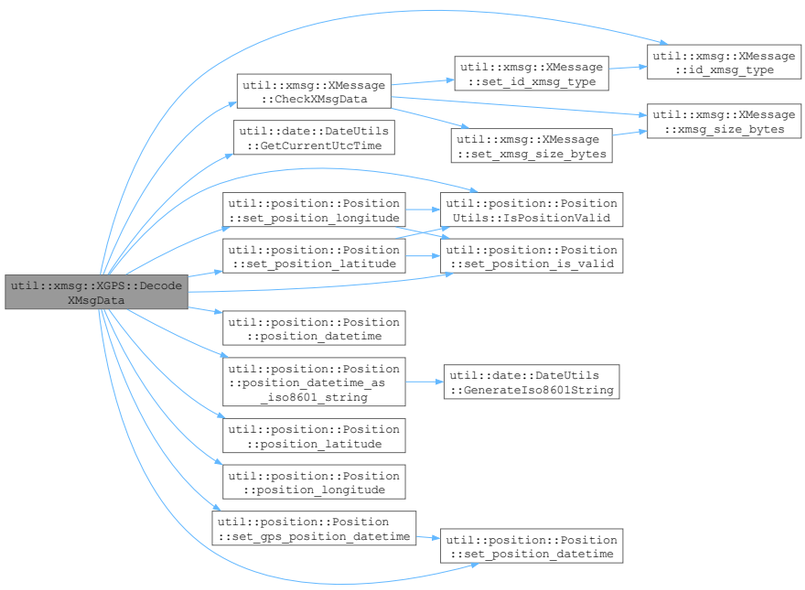
in	*data*	The binary GPS X-message data to decode.

Implements util::xmsg::XMessage.

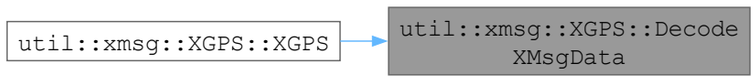
References CATCH_BLOCK, util::xmsg::XMessage::CheckXMsgData(), EXC_THROW, util::date::DateUtils::GetCurrentUtcTime(), horizontal_dilution_of_precision_, i08, i32, util::xmsg::XMessage::id_xmsg_type(), util::position::PositionUtils::IsPositionValid(), ldbg, num_satellites_, util::position::Position::position_datetime(), util::position::Position::position_datetime_as_iso8601_string(), util::position::Position::position_latitude(), util::position::Position::position_longitude(), util::position::Position::set_gps_position_datetime(), util::position::Position::set_position_datetime(), util::position::Position::set_position_is_valid(), util::position::Position::set_position_latitude(util::position::Position::set_position_longitude(), signal_to_noise_max_, signal_to_noise_mean_, signal_to_noise_min_, time_to_acquire_fix_, u08, u16, UTIL_POS_INVALID_LAT, and UTIL_POS_INVALID_LON.

Referenced by XGPS().

Here is the call graph for this function:



Here is the caller graph for this function:



10.94.3.9 degToRad()

```
template<typename T >
static double util::math::MathUtils::degToRad (
            T deg)  [inline], [static], [inherited]
```

Convert angular units from from degrees to decimal radians.

Parameters

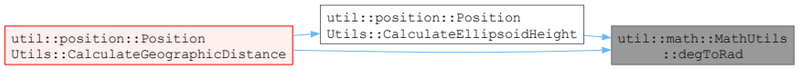
in	*deg*	Angle in integer or decimal degrees to convert to radians.

Returns

Angle in decimal radians.

Referenced by util::position::PositionUtils::CalculateEllipsoidHeight(), and util::position::PositionUtils::CalculateGeographicDistance().

Here is the caller graph for this function:



10.94.3.10 DeleteFromDatabase() [1/2]

```
static void util::xmsg::XGPS::DeleteFromDatabase (
            int id_inst)  [inline], [static], [private]
```

Delete all GPS message rows for an instrument from the SQL database.

Parameters

in	*id_inst*	The unique instrument identifier.

Exceptions

util::log::MessageException	if the delete query fails.

References CATCH_BLOCK.

10.94.3.11 DeleteFromDatabase() [2/2]

```
static void util::xmsg::XGPS::DeleteFromDatabase (
            int id_inst,
            int id_dive)  [inline], [static], [private]
```

Delete the GPS message rows for one dive of an instrument from the SQL database.

Warning

The generated condition uses == , which MySQL does not accept, so this query would fail. It is not currently called.

Parameters

in	*id_inst*	The unique instrument identifier.
in	*id_dive*	The dive or cycle number.

Exceptions

util::log::MessageException	if the delete query fails.

References CATCH_BLOCK, and util::xmsg::XMessage::id_dive().

Here is the call graph for this function:

10.94.3.12 DeleteObjectsFromDatabase()

```
static void util::xmsg::XGPS::DeleteObjectsFromDatabase (
            const string & where)  [inline], [static]
```

Delete GPS message rows from the SQL database table.

Parameters

in	*where*	The SQL "where-condition" clause selecting the rows to delete.

Exceptions

util::log::MessageException	if the delete query fails.

References CATCH_BLOCK.

10.94.3.13 ExecuteQuery()

```
static shared_ptr< ResultSet > util::mysql::MysqlUtils::ExecuteQuery (
            Connection * con,
            const string & query)  [inline], [static], [inherited]
```

Execute an SQL query and return a shared pointer to the ResultSet object.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*query*	The SQL query to execute. This must be a well-formatted SQL query string.

Exceptions

log::MessageException	if 'con' is null, 'query' is a malfored SQL string, or any other error occurs.

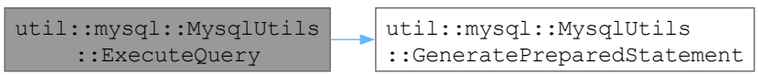
Returns

A shared pointer to the query ResultSet object.

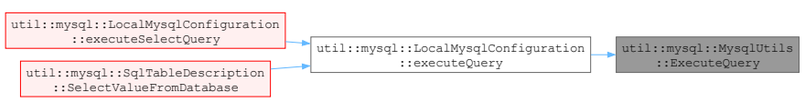
References CATCH_BLOCK, and util::mysql::MysqlUtils::GeneratePreparedStatement().

Referenced by util::mysql::LocalMysqlConfiguration::executeQuery().

Here is the call graph for this function:



Here is the caller graph for this function:



10.94.3.14 executeQuery()

```
shared_ptr< sql::ResultSet > util::mysql::LocalMysqlConfiguration::executeQuery (
            const string & query)  [static], [inherited]
```

Execute an SQL query and return a shared pointer to the ResultSet object.

Parameters

in	*query*	The SQL query to execute. This must be a well-formatted SQL query string.

Exceptions

log::MessageException	'query' is a malfored SQL string or any other error occurs while executing the query.

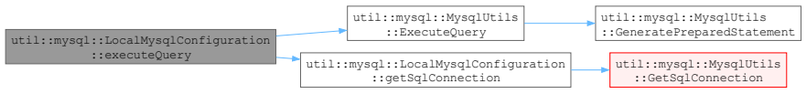
Returns

A shared pointer to the query ResultSet object.

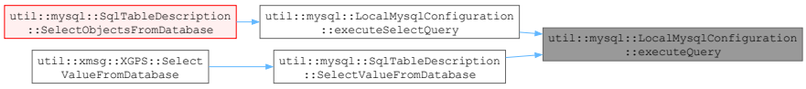
References util::mysql::MysqlUtils::ExecuteQuery(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

Referenced by util::mysql::LocalMysqlConfiguration::executeSelectQuery(), and util::mysql::SqlTableDescription< T >::SelectValueFromD

Here is the call graph for this function:



Here is the caller graph for this function:



10.94.3.15 executeSelectQuery()

```
shared_ptr< sql::ResultSet > util::mysql::LocalMysqlConfiguration::executeSelectQuery (
            const string & what,
            const string & from,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [static], [inherited]
```

Execute an SQL select query and return a shared pointer to the ResultSet object.

Parameters

in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table–references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Exceptions

log::MessageException	if an error occurs while executing the query.

Returns

A shared pointer to the ResultSet object.

References CATCH_BLOCK, util::mysql::LocalMysqlConfiguration::executeQuery(), and util::mysql::MysqlUtils::GenerateSqlSelectStr().

Referenced by util::mysql::SqlTableDescription< T >::SelectObjectsFromDatabase().

10.94.3.16 ExecuteUpdate()

```
static int util::mysql::MysqlUtils::ExecuteUpdate (
            Connection * con,
            const string & update)  [inline], [static], [inherited]
```

Execute an SQL update and return the status code.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*update*	The SQL update to execute. This must be a well-formatted SQL update string.

Exceptions

log::MessageException	if 'con' is null, 'update' is a malformed SQL string, or any other error occurs.

Returns

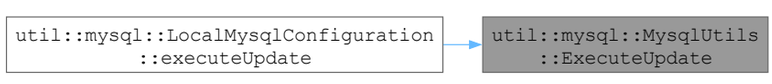
The update status code.

References CATCH_BLOCK, and util::mysql::MysqlUtils::GeneratePreparedStatement().

Referenced by util::mysql::LocalMysqlConfiguration::executeUpdate().

Here is the call graph for this function:

Here is the caller graph for this function:



10.94.3.17 executeUpdate()

```
int util::mysql::LocalMysqlConfiguration::executeUpdate (
            const string & update)  [static], [inherited]
```

Execute an SQL update and return the status code.

Parameters

in	*update*	The SQL update to execute. This must be a well-formatted SQL update string.

Exceptions

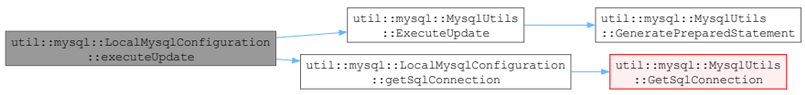
log::MessageException	if 'update' is a malformed SQL string, or any other error occurs while executing the update.

Returns

The update status code.

References util::mysql::MysqlUtils::ExecuteUpdate(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

Here is the call graph for this function:



10.94.3.18 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

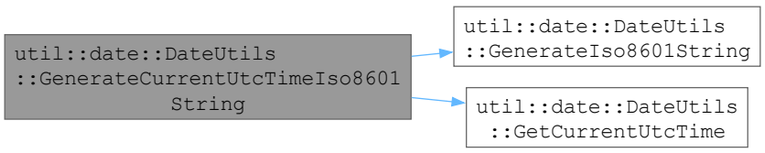
Returns

An ISO8601 format date/time string representation of the current time.

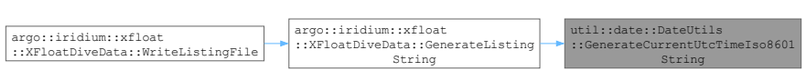
References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:



10.94.3.19 GenerateIso6709String()

```
template<typename T >
static std::string util::position::PositionUtils::GenerateIso6709String (
            T lat,
            T lon)  [inline], [static], [inherited]
```

Generate an IS06709 string representation of the position given by (`lat`, `lon`).

Parameters

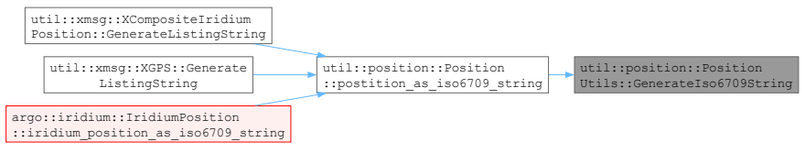
in	*lat*	The latitude of the position, in degrees North.
in	*lon*	The longitude of the position, in degrees East.

Returns

An IS06709 string representation of the position given by (`lat`, `lon`).

Referenced by util::position::Position::postition_as_iso6709_string().

Here is the caller graph for this function:



10.94.3.20 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), util::xmsg::XEngIce::XEngIce

10.94.3.21 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref↩ _dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.94.3.22 GenerateListingComment()

```
static string util::xmsg::XGPS::GenerateListingComment ()  [inline], [static]
```

Get the listing entry comment string.

Returns

The listing entry comment string.

References CATCH_BLOCK.

10.94.3.23 GenerateListingString()

```
const string util::xmsg::XGPS::GenerateListingString () const  [inline]
```

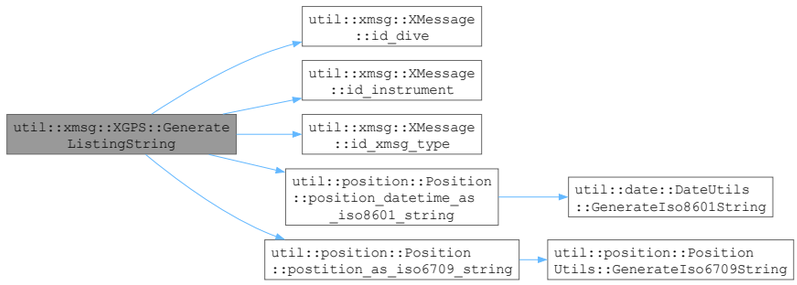
Return a string representation of this GPS message.

Returns

A string representation of this GPS message.

References CATCH_BLOCK, util::xmsg::XMessage::id_dive(), util::xmsg::XMessage::id_instrument(), util::xmsg::XMessage::id_xmsg_typ
util::position::Position::position_datetime_as_iso8601_string(), and util::position::Position::postition_as_iso6709_string().

Here is the call graph for this function:



10.94.3.24 GeneratePhyString()

```
const string util::xmsg::XGPS::GeneratePhyString (
            size_t xmits) const  [inline]
```

Generate a phy file entry string representation of this GPS position message object.

Parameters

in	*xmits*	The number of transmissions for this dive data.

Exceptions

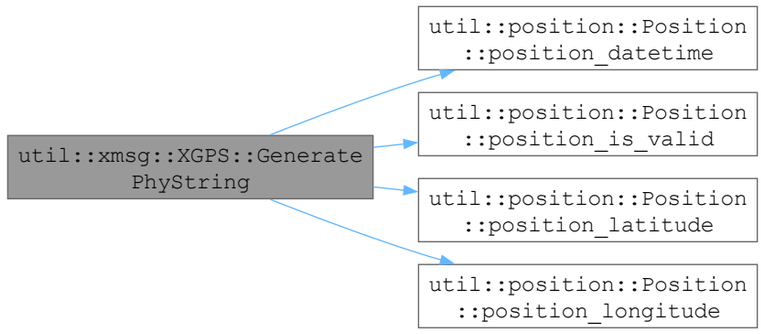
log::MessageException	if an error occurs

Returns

A phy file entry string representation of this GPS position message object.

References CATCH_BLOCK, num_satellites_, util::position::Position::position_datetime(), util::position::Position::position_is_valid(), util::position::Position::position_latitude(), and util::position::Position::position_longitude().

Here is the call graph for this function:



10.94.3.25 GeneratePreparedStatement()

```
static shared_ptr< PreparedStatement > util::mysql::MysqlUtils::GeneratePreparedStatement (
            Connection * con,
            const string & statement)  [inline], [static], [inherited]
```

Generate a prepared SQL statement object for the given SQL statement.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*statement*	The SQL statement to prepare. This must be a well-formed SQL string.

Exceptions

log::MessageException	if 'con' is NULL, 'statement' is not a valid SQL string, or if an error occurs.

Returns

A prepared SQL statement object generated from the given SQL statement.

References CATCH_BLOCK, and EXC_THROW.

Referenced by util::mysql::MysqlUtils::ExecuteQuery(), util::mysql::MysqlUtils::ExecuteUpdate(), and util::mysql::LocalMysqlConfiguration:

Here is the caller graph for this function:

std::shared_ptr< sql::PreparedStatement > util::mysql::LocalMysqlConfiguration::generatePrepared↩
Statement (
            const string & statement)  [static], [inherited]
```

Generate a prepared SQL statement object for the given SQL statement.

Parameters

in	*statement*	The SQL statement to prepare. This must be a well-formed SQL string.

Exceptions

log::MessageException	if 'statement' is not a valid SQL string or if an error occurs while generating the prepared statement object..

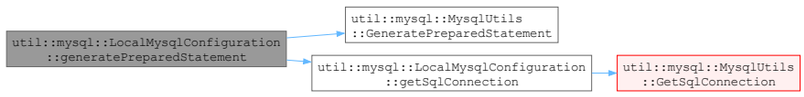
Returns

A prepared SQL statement object generated from the given SQL statement.

References util::mysql::MysqlUtils::GeneratePreparedStatement(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

Referenced by util::mysql::SqlTableDescription< T >::SaveObjectToDatabase().

Here is the call graph for this function:



Here is the caller graph for this function:

10.94.3.27 GenerateSqlDeleteStr()

```
static string util::mysql::MysqlUtils::GenerateSqlDeleteStr (
            const string & from,
            const string & where = "")  [inline], [static], [inherited]
```

Generate an SQL DELETE statement.

Warning

Without a `where` clause, the statement deletes every row in the table.

Parameters

in	*from*	The name of the table to delete from.
in	*where*	The SQL "where-condition" clause (empty = all rows).

Returns

The SQL statement.

10.94.3.28 GenerateSqlSelectStr()

```
static string util::mysql::MysqlUtils::GenerateSqlSelectStr (
            const string & what,
            const string & from,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [inline], [static], [inherited]
```

Generate an SQL select statement.

Parameters

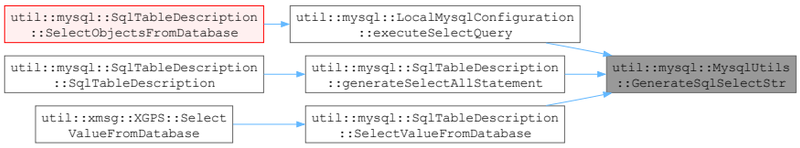
in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table-references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Returns

The SQL select statement.

Referenced by util::mysql::LocalMysqlConfiguration::executeSelectQuery(), util::mysql::SqlTableDescription< T >::generateSelectAllState and util::mysql::SqlTableDescription< T >::SelectValueFromDatabase().

Here is the caller graph for this function:



10.94.3.29 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

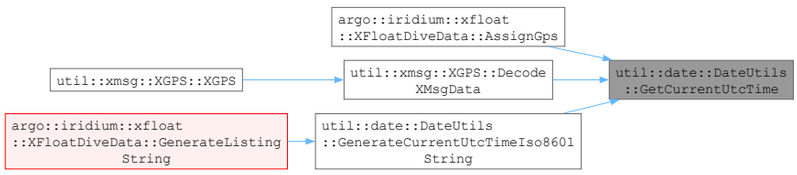
Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTime

Here is the caller graph for this function:



10.94.3.30 GetDefaltKmlPathColor()

```
static const Color32 & util::kml::KmlUtil::GetDefaltKmlPathColor (
            int id)  [inline], [static], [inherited]
```

Get the palette colour for an index (an instrument ID, for example), modulo the palette size.

Parameters

in	*id*	The index.

Returns

The colour.

References util::kml::KmlUtil::kml_default_path_colors_.

Referenced by util::kml::KmlUtil::SetDefaultKmlStyle().

Here is the caller graph for this function:

10.94.3.31 GetDefaltKmlPathStyleId()

```
static const string & util::kml::KmlUtil::GetDefaltKmlPathStyleId (
            int id)  [inline], [static], [inherited]
```

Get the path (line) style ID for an index, modulo the palette size.

Parameters

in	*id*	The index.

Returns

The KML style ID.

References util::kml::KmlUtil::kml_default_path_style_ids_.

Referenced by util::kml::KmlUtil::SetDefaultKmlStyle().

Here is the caller graph for this function:

10.94.3.32 GetDefaltKmlPlacemarkStyleId()

```
static const string & util::kml::KmlUtil::GetDefaltKmlPlacemarkStyleId (
            int id)  [inline], [static], [inherited]
```

Get the large placemark style ID for an index, modulo the palette size.

Parameters

in	*id*	The index.

Returns

The KML style ID.

References util::kml::KmlUtil::kml_default_placemark_style_ids_.

Referenced by util::kml::KmlUtil::SetDefaultKmlStyle().

Here is the caller graph for this function:

10.94.3.33 GetKmlFactory()

```
static thread_specific_ptr< KmlFactory > & util::kml::KmlUtil::GetKmlFactory ()  [inline], [static],
[inherited]
```

Get the libkml factory, initializing it for this thread if necessary.

Exceptions

util::log::MessageException	if the factory cannot be obtained.

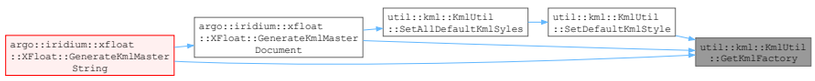
Returns

The thread's KML factory pointer (see kml_factory_).

References CATCH_BLOCK, and util::kml::KmlUtil::kml_factory_.

Referenced by argo::iridium::xfloat::XFloat::GenerateKmlMasterDocument(), argo::iridium::xfloat::XFloat::GenerateKmlMasterString(), and util::kml::KmlUtil::SetDefaultKmlStyle().

Here is the caller graph for this function:



10.94.3.34 GetSmallKmlPlacemarkStyleId()

```
static const string & util::kml::KmlUtil::GetSmallKmlPlacemarkStyleId (
            int id)  [inline], [static], [inherited]
```

Get the small placemark style ID for an index, modulo the palette size.

Parameters

in	*id*	The index.

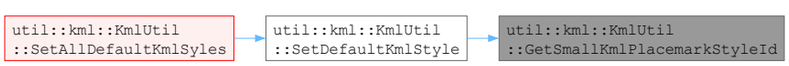
Returns

The KML style ID.

References util::kml::KmlUtil::kml_small_placemark_style_ids_.

Referenced by util::kml::KmlUtil::SetDefaultKmlStyle().

Here is the caller graph for this function:



10.94.3.35 GetSqlConnection()

```
static thread_specific_ptr< Connection > & util::mysql::MysqlUtils::GetSqlConnection (
            string url,
            string user,
            string password,
            string schema)  [inline], [static], [inherited]
```

Get a thread-specific instance of a MySQL connection object.

A new connection will be created, if necessary.

Parameters

in	*url*	The MySQL host server qualified address.
in	*user*	The MySQL account username.
in	*password*	The MySQL account password.
in	*schema*	The MySQL account schema name.

Exceptions

log::MessageException	if an error occurs while creating a new thread-specific instance of the SQL connection object

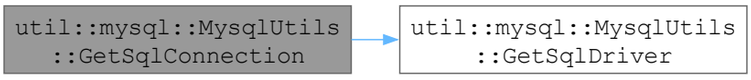
Returns

A thread-specific instance of a MySQL connection object.

References CATCH_BLOCK, util::mysql::MysqlUtils::GetSqlDriver(), and util::mysql::MysqlUtils::sql_connection_.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

Here is the call graph for this function:



Here is the caller graph for this function:

10.94.3.36 getSqlConnection()

`sql::Connection * util::mysql::LocalMysqlConfiguration::getSqlConnection () [static], [protected], [inherited]`

Generate a thread-specific instance of a MySQL connection object.

A new connection will be created, if necessary.

Exceptions

log::MessageException	if an error occurs while generating the SQL connection object.

Returns

A thread-specific instance of a MySQL connection object.

References util::mysql::LocalMysqlConfiguration::address_, CATCH_BLOCK, util::mysql::MysqlUtils::GetSqlConnection(), util::mysql::LocalMysqlConfiguration::password_, util::mysql::LocalMysqlConfiguration::port_, util::mysql::LocalMysqlConfiguration::protoc util::mysql::LocalMysqlConfiguration::schema_, and util::mysql::LocalMysqlConfiguration::user_.

10.94.3.37 GetSqlDriver()

```
static thread_specific_ptr< MySQL_Driver > & util::mysql::MysqlUtils::GetSqlDriver ()  [inline],
[static], [inherited]
```

Get a thread-specific instance of a MySQL driver object.

A new driver will created, if necessary.

Exceptions

log::MessageException	if an error occurs while creating a new thread-specific instance of the SQL driver object

Returns

A thread-specific instance of a MySQL driver object.

References CATCH_BLOCK, and util::mysql::MysqlUtils::sql_driver_.

Referenced by util::mysql::MysqlUtils::GetSqlConnection().

Here is the caller graph for this function:

10.94.3.38 GetTriangleKmlPlacemarkStyleId()

```
static const string & util::kml::KmlUtil::GetTriangleKmlPlacemarkStyleId (
            int id)  [inline], [static], [inherited]
```

Get the triangle placemark style ID for an index, modulo the palette size.

Parameters

in	*id*	The index.

Returns

The KML style ID.

References util::kml::KmlUtil::kml_triangle_placemark_style_ids_.

Referenced by util::kml::KmlUtil::SetDefaultKmlStyle().

Here is the caller graph for this function:

10.94.3.39 id_dive()

```
int16_t util::xmsg::XMessage::id_dive () const  [inline], [inherited]
```

Get the dive or cycle number of this X-Message.

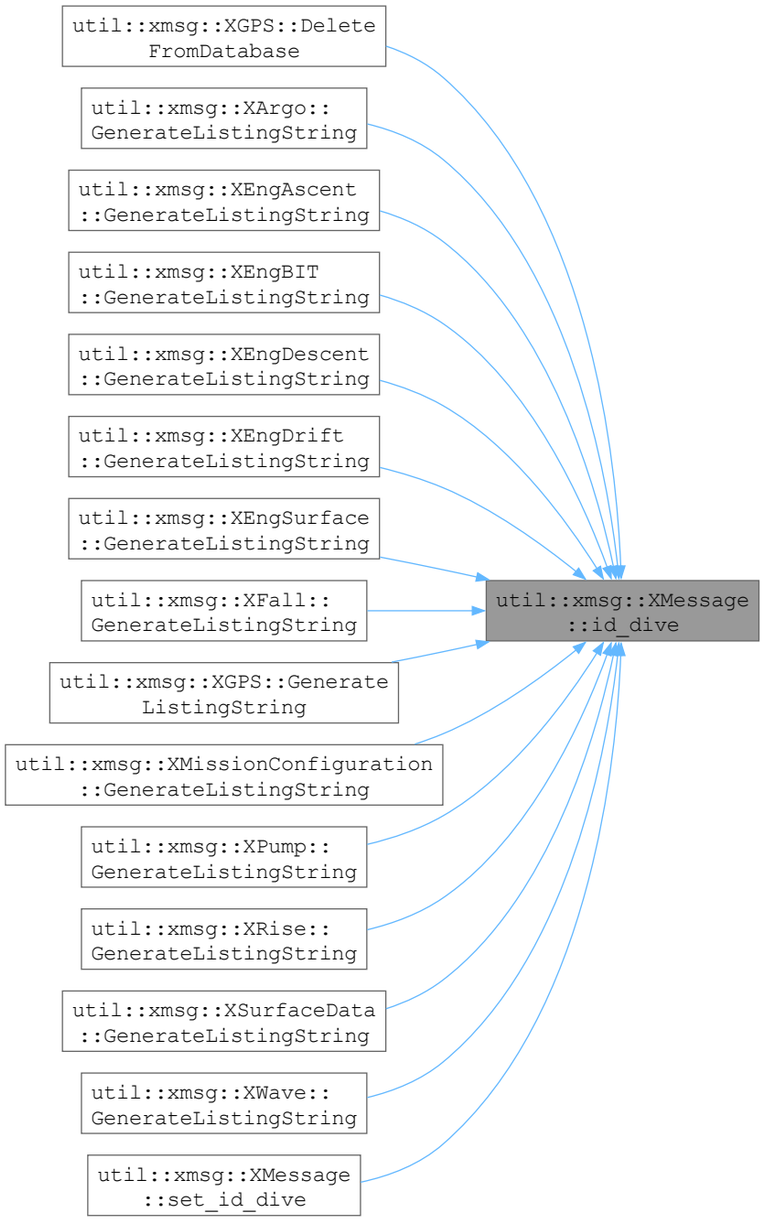
Returns

The dive or cycle number of this X-Message.

References util::xmsg::XMessage::id_dive_.

Referenced by DeleteFromDatabase(), util::xmsg::XArgo::GenerateListingString(), util::xmsg::XEngAscent::GenerateListingString(), util::xmsg::XEngBIT::GenerateListingString(), util::xmsg::XEngDescent::GenerateListingString(), util::xmsg::XEngDrift::GenerateListingStr util::xmsg::XEngSurface::GenerateListingString(), util::xmsg::XFall::GenerateListingString(), GenerateListingString(), util::xmsg::XMissionConfiguration::GenerateListingString(), util::xmsg::XPump::GenerateListingString(), util::xmsg::XRise::GenerateListing util::xmsg::XSurfaceData::GenerateListingString(), util::xmsg::XWave::GenerateListingString(), and util::xmsg::XMessage::set_id_dive().

Here is the caller graph for this function:



10.94.3.40 id_instrument()

```
uint16_t util::xmsg::XMessage::id_instrument () const  [inline], [inherited]
```

Get the unique instrument identifier of this X-Message.

Returns

The unique instrument identifier of this X-Message.

References util::xmsg::XMessage::id_instrument_.

Referenced by util::xmsg::XArgo::GenerateListingString(), util::xmsg::XEngAscent::GenerateListingString(), util::xmsg::XEngBIT::Generate

10.94.3.41 id_xmsg_type()

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type () const  [inline], [inherited]
```

Get the enumerated X-Message type identifier.

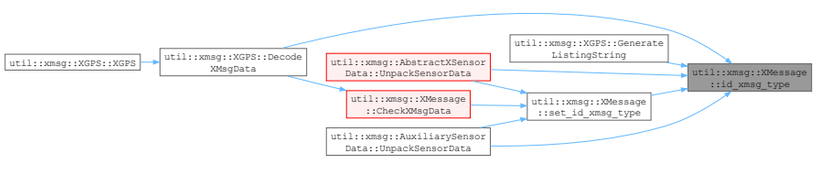
Returns

The enumerated X-Message type identifier.

References util::xmsg::XMessage::id_xmsg_type_.

Referenced by DecodeXMsgData(), GenerateListingString(), util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::AbstractXSensorData and util::xmsg::AuxiliarySensorData::UnpackSensorData().

Here is the caller graph for this function:



10.94.3.42 IsPositionValid()

```
template<typename T >
static bool util::position::PositionUtils::IsPositionValid (
            T lat,
            T lon)  [inline], [static], [inherited]
```

Check position validity.

Parameters

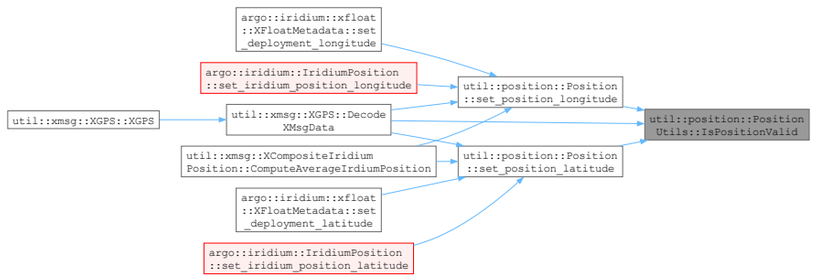
in	*lat*	Latitude of position.
in	*lon*	Longitude of position.

Returns

TRUE if (lat, lon) represents a valid geographical position, or FALSE otherwise.

Referenced by DecodeXMsgData(), util::position::Position::set_position_latitude(), and util::position::Position::set_position_longitude().

Here is the caller graph for this function:



10.94.3.43 position_datetime()

```
ptime util::position::Position::position_datetime () const  [inline], [inherited]
```

Get the date/time of the position.

Returns

The date/time of the position.

References util::position::Position::position_datetime_.

Referenced by DecodeXMsgData(), argo::iridium::xfloat::XFloatMetadata::deployment_datetime(), GeneratePhyString(), and argo::iridium::IridiumPosition::iridium_position_datetime().

Here is the caller graph for this function:

10.94.3.49 SaveObjectToDatabase()

```
void util::xmsg::XGPS::SaveObjectToDatabase () const  [inline], [virtual]
```

Save this GPS message object to the SQL database.

Exceptions

util::log::MessageException	if an error occurs.

Implements util::mysql::LocalPersistentEntity.

References CATCH_BLOCK, and util::mysql::SqlTableDescription< T >::SaveObjectToDatabase().

Here is the call graph for this function:

10.94.3.50 SelectAllObjectsFromDatabase()

```
static vector< shared_ptr< XGPS > > util::xmsg::XGPS::SelectAllObjectsFromDatabase (
            const string & groupBy = "",
            const string & orderBy = "",
            const unsigned int & limit = 0,
            const unsigned int & offset = 0)  [inline], [static]
```

Select all GPS message objects from the SQL database table.

Parameters

in	*groupBy*	The SQL select statement "group-by expression" clause.
in	*orderBy*	The SQL select statement "order-by expression" clause.
in	*limit*	The SQL select statement result set row limit value (0 = no limit).
in	*offset*	The SQL select statement result set row offset value.

Exceptions

util::log::MessageException	if the query fails.

Returns

The GPS message objects.

References CATCH_BLOCK, and util::mysql::SqlTableDescription< T >::SelectAllObjectsFromDatabase().

Here is the call graph for this function:

10.94.3.51 SelectObjectFromDatabase()

```
static shared_ptr< XGPS > util::xmsg::XGPS::SelectObjectFromDatabase (
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            const unsigned int & offset = 0)  [inline], [static]
```

Select a single GPS message object from the SQL database table.

Parameters

in	*where*	The SQL select statement "where-condition" clause.
in	*groupBy*	The SQL select statement "group-by expression" clause.
in	*orderBy*	The SQL select statement "order-by expression" clause.
in	*offset*	The SQL select statement result set row offset value.

Exceptions

util::log::MessageException	if the query fails.

Returns

The first GPS message object matching the query.

References CATCH_BLOCK, util::mysql::SqlTableDescription< T >::SelectObjectFromDatabase(), and std::make_shared.

Here is the call graph for this function:

10.94.3.52 SelectObjectsFromDatabase()

```
static vector< shared_ptr< XGPS > > util::xmsg::XGPS::SelectObjectsFromDatabase (
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            const unsigned int & limit = 0,
            const unsigned int & offset = 0)  [inline], [static]
```

Select GPS message objects from the SQL database table.

Exceptions

util::log::MessageException	if an error occurs while querying the database or constructing the GPS message objects from the result of the query.

Parameters

in	*where*	The SQL select statement "where-condition" clause.
in	*groupBy*	The SQL select statement "group-by expression" clause.
in	*orderBy*	The SQL select statement "order-by expression" clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset value.

Returns

A vector of shared references to the GPS message objects constructed from the results of the SQL query.

References CATCH_BLOCK, and util::mysql::SqlTableDescription< T >::SelectObjectsFromDatabase().

Here is the call graph for this function:

10.94.3.53 SelectValueFromDatabase()

```
template<typename TT >
static TT util::xmsg::XGPS::SelectValueFromDatabase (
            const string & what,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            const unsigned int & offset = 0)  [inline], [static]
```

Select a single value from the GPS message SQL database table.

Exceptions

util::log::MessageException	if the SQL database query fails or if an error occurs while attempting to interpret the result of the query.

Note

The result set of this query is always limited to a single result. That is, the result set row limit value is automatically set to one. If more than one row in the database table satisfy the "where condition" clause of the select statement, then only the value of the first result will be returned.

Parameters

in	*what*	The SQL select statement "what" clause. This clause may only contain a singular result e.g. the name of the SQL database table column of interest.
in	*where*	The SQL select statement "where condition" clause.
in	*groupBy*	The SQL select statement "group-by expression" clause.
in	*orderBy*	The SQL select statement "order-by expression" clause.
in	*offset*	The SQL select statement result set row offset value.

Returns

The selected value from the SQL database table.

References util::mysql::SqlTableDescription< T >::SelectValueFromDatabase().

Here is the call graph for this function:

10.94.3.54 set_gps_position_datetime()

```
void util::position::Position::set_gps_position_datetime (
            unsigned int gpsWeek,
            unsigned int gpsDay,

            unsigned int gpsMinute = 0,
            unsigned int gpsSecond = 0)  [inline], [protected], [inherited]
```

Set the date and time of this position from the given GPS week, day, and time.

Parameters

in	*gpsWeek*	The GPS week, in weeks since midnight of January 6, 1980.
in	*gpsDay*	The GPS day of week (0 - 6).
in	*gpsHour*	The UTC hour of day (0 - 23).
in	*gpsMinute*	The UTC minute of hour (0 - 59)..
in	*gpsSecond*	The UTC second of minute (0 - 59).

```
static void util::kml::KmlUtil::SetAllDefaultKmlSyles (
            const DocumentPtr & document)  [inline], [static], [inherited]
```

Add the default styles for every palette colour to a KML document.

Parameters

in	*document*	The KML document to add the styles to.

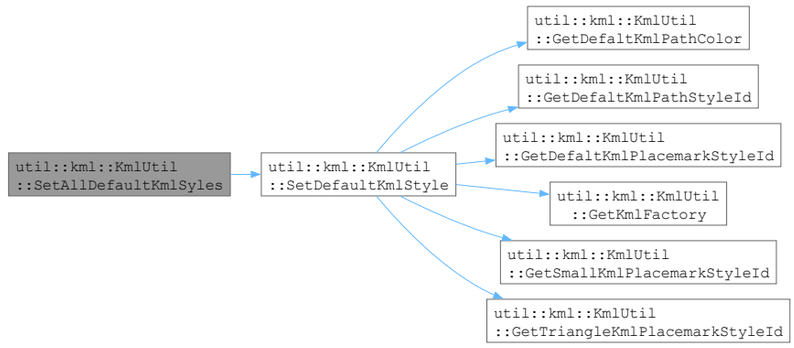
Exceptions

util::log::MessageException	if an error occurs.

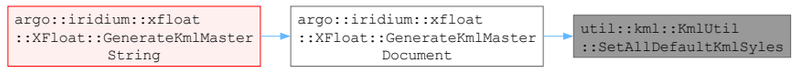
References CATCH_BLOCK, and util::kml::KmlUtil::SetDefaultKmlStyle().

Referenced by argo::iridium::xfloat::XFloat::GenerateKmlMasterDocument().

Here is the call graph for this function:



Here is the caller graph for this function:



10.94.3.64 SetDefaultKmlStyle()

```
static void util::kml::KmlUtil::SetDefaultKmlStyle (
            const DocumentPtr & document,
            unsigned int style_idx)  [inline], [static], [inherited]
```

Add the four default styles for one palette colour to a KML document.

Adds a 5-pixel path (line) style, a large dot placemark style, a small dot placemark style and a triangle placemark style, all in the colour `style_idx` (modulo the palette size). The icons are loaded from http://argo.whoi.↩edu/kml/img/. Errors are logged, not thrown.

Parameters

in	*document*	The KML document to add the styles to.
in	*style_idx*	The palette index of the colour.

References CATCH_NOTHROW, util::kml::KmlUtil::GetDefaltKmlPathColor(), util::kml::KmlUtil::GetDefaltKmlPathStyleId(), util::kml::KmlUtil::GetDefaltKmlPlacemarkStyleId(), util::kml::KmlUtil::GetKmlFactory(), util::kml::KmlUtil::GetSmallKmlPlacemarkStyleId(), and util::kml::KmlUtil::GetTriangleKmlPlacemarkStyleId().

10.94.4 Friends And Related Symbol Documentation

10.94.4.1 std::make_shared

```
shared_ptr< XGPS > std::make_shared ()  [friend]
```

Friend function for creating an X-Float object using the private constructor and a shared pointer to that object.

Referenced by SelectObjectFromDatabase().

10.94.5 Member Data Documentation

10.94.5.1 address_

```
std::string util::mysql::LocalMysqlConfiguration::address_  [static], [private], [inherited]
```

The SQL server qualified name or IP address string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.94.5.2 EARTH_RADIUS_KM_EQUATORIAL

```
const double util::position::PositionUtils::EARTH_RADIUS_KM_EQUATORIAL = 6378.1  [static], [private],
[inherited]
```

The equatorial radius of the earth, in kilometers.

Referenced by util::position::PositionUtils::CalculateEllipsoidHeight().

10.94.5.3 EARTH_RADIUS_KM_POLAR

```
const double util::position::PositionUtils::EARTH_RADIUS_KM_POLAR = 6356.1  [static], [private],
[inherited]
```

The polar radius of the earth, in kilometers.

Referenced by util::position::PositionUtils::CalculateEllipsoidHeight().

10.94.5.4 horizontal_dilution_of_precision_

```
float util::xmsg::XGPS::horizontal_dilution_of_precision_  [private]
```

The horizontal Dilution of Precision (HDOP) of the GPS fix.

Referenced by DecodeXMsgData().

10.94.5.5 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.94.5.6 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.94.5.7 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.94.5.8 kml_default_path_colors_

```
const Color32 util::kml::KmlUtil::kml_default_path_colors_  [static], [private], [inherited]
```

Initial value:

```
= {
        Color32(0xB0, 0xFF, 0x00, 0x00),
        Color32(0xB0, 0xFF, 0x80, 0x00),
        Color32(0xB0, 0xFF, 0xFF, 0x00),
        Color32(0xB0, 0x80, 0xFF, 0x00),
        Color32(0xB0, 0x00, 0xFF, 0x00),
        Color32(0xB0, 0x00, 0xFF, 0x80),
        Color32(0xB0, 0x00, 0xFF, 0xFF),
        Color32(0xB0, 0x00, 0x80, 0xFF),
        Color32(0xB0, 0x00, 0x00, 0xFF),
        Color32(0xB0, 0x80, 0x00, 0xFF),
        Color32(0xB0, 0xFF, 0x00, 0xFF),
        Color32(0xB0, 0xFF, 0x00, 0x80),
        Color32(0xB0, 0x80, 0x80, 0x080),
 }
```

The colour palette for instrument paths and placemarks, indexed by style index.

Referenced by util::kml::KmlUtil::GetDefaltKmlPathColor().

10.94.5.9 kml_default_path_style_ids_

```
const string util::kml::KmlUtil::kml_default_path_style_ids_  [static], [private], [inherited]
```

Initial value:

```
= {
        "path1",
        "path2",
        "path3",
        "path4",
        "path5",
        "path6",
        "path7",
        "path8",
        "path9",
        "pathA",
        "pathB",
        "pathC",
        "pathD",}
```

The KML style IDs of the path (line) styles, one per palette colour.

Referenced by util::kml::KmlUtil::GetDefaltKmlPathStyleId().

10.94.5.10 kml_default_placemark_style_ids_

```
const string util::kml::KmlUtil::kml_default_placemark_style_ids_  [static], [private], [inherited]
```

Initial value:

```
= {
        "dot1_1",
        "dot1_2",
        "dot1_3",
        "dot1_4",
        "dot1_5",
        "dot1_6",
        "dot1_7",
        "dot1_8",
        "dot1_9",
        "dot1_A",
        "dot1_B",
        "dot1_C",
        "dot1_D", }
```

The KML style IDs of the large placemark styles, one per palette colour.

Referenced by util::kml::KmlUtil::GetDefaltKmlPlacemarkStyleId().

10.94.5.11 kml_factory_

```
thread_specific_ptr< KmlFactory > util::kml::KmlUtil::kml_factory_  [static], [private], [inherited]
```

The libkml factory used to create KML elements, held per thread.

Warning

This holds libkml's process-wide factory (`KmlFactory::GetFactory()`), and the default cleanup deletes it when the owning thread exits or CloseKmlFactory() is called. Only the post-processing thread uses KML, so this currently happens only at shutdown.

Referenced by util::kml::KmlUtil::CloseKmlFactory(), and util::kml::KmlUtil::GetKmlFactory().

10.94.5.12 kml_small_placemark_style_ids_

```
const string util::kml::KmlUtil::kml_small_placemark_style_ids_  [static], [private], [inherited]
```

Initial value:

```
= {
        "dot1s_1",
        "dot1s_2",
        "dot1s_3",
        "dot1s_4",
        "dot1s_5",
        "dot1s_6",
        "dot1s_7",
        "dot1s_8",
        "dot1s_9",
        "dot1s_A",
        "dot1s_B",
        "dot1s_C",
        "dot1s_D", }
```

The KML style IDs of the small placemark styles, one per palette colour.

Referenced by util::kml::KmlUtil::GetSmallKmlPlacemarkStyleId().

10.94.5.13 kml_triangle_placemark_style_ids_

```
const string util::kml::KmlUtil::kml_triangle_placemark_style_ids_  [static], [private], [inherited]
```

Initial value:

```
= {
        "tri1_1",
        "tri1_2",
        "tri1_3",
        "tri1_4",
        "tri1_5",
        "tri1_6",
        "tri1_7",
        "tri1_8",
        "tri1_9",
        "tri1_A",
        "tri1_B",
        "tri1_C",
        "tri1_D", }
```

The KML style IDs of the triangle placemark styles, one per palette colour.

Referenced by util::kml::KmlUtil::GetTriangleKmlPlacemarkStyleId().

10.94.5.14 num_satellites_

```
uint8_t util::xmsg::XGPS::num_satellites_  [private]
```

The number of satellites used in GPS fix.

Referenced by DecodeXMsgData(), and GeneratePhyString().

10.94.5.15 password_

`std::string util::mysql::LocalMysqlConfiguration::password_ [static], [private], [inherited]`

The SQL server account password string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.94.5.16 port_

`unsigned int util::mysql::LocalMysqlConfiguration::port_ [static], [private], [inherited]`

The SQL server port number.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.94.5.17 position_datetime_

`ptime util::position::Position::position_datetime_ [private], [inherited]`

The date and time of the position.

Referenced by util::position::Position::position_datetime(), util::position::Position::position_datetime_as_iso8601_string(), and util::position::Position::set_position_datetime().

10.94.5.18 position_is_valid_

`bool util::position::Position::position_is_valid_ [private], [inherited]`

The valid position indicator.

Referenced by util::position::Position::position_is_valid(), and util::position::Position::set_position_is_valid().

10.94.5.19 position_latitude_

`double util::position::Position::position_latitude_ [private], [inherited]`

The latitude of the position, in decimal degrees.

Referenced by util::position::Position::position_latitude(), util::position::Position::postition_as_iso6709_string(), util::position::Position::set_position_latitude(), and util::position::Position::set_position_longitude().

10.94.5.20 position_longitude_

`double util::position::Position::position_longitude_ [private], [inherited]`

The longitude of the position, in decimal degrees.

Referenced by util::position::Position::position_longitude(), util::position::Position::postition_as_iso6709_string(), util::position::Position::set_position_latitude(), and util::position::Position::set_position_longitude().

10.94.5.21 protocol_

`std::string util::mysql::LocalMysqlConfiguration::protocol_ [static], [private], [inherited]`

The protocol to use in the SQL server connection e.g.

"tcp".

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.94.5.22 schema_

```
std::string util::mysql::LocalMysqlConfiguration::schema_  [static], [private], [inherited]
```

The SQL server schema name.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.94.5.23 signal_to_noise_max_

```
uint8_t util::xmsg::XGPS::signal_to_noise_max_  [private]
```

The maximum Signal-to-Noise Ratio (SNR) for this GPS fix.

Referenced by DecodeXMsgData().

10.94.5.24 signal_to_noise_mean_

```
uint8_t util::xmsg::XGPS::signal_to_noise_mean_  [private]
```

The mean Signal-to-Noise Ratio (SNR) for this GPS fix.

Referenced by DecodeXMsgData().

10.94.5.25 signal_to_noise_min_

```
uint8_t util::xmsg::XGPS::signal_to_noise_min_  [private]
```

The minimum Signal-to-Noise Ratio (SNR) for this GPS fix.

Referenced by DecodeXMsgData().

10.94.5.26 sql_connection_

```
thread_specific_ptr<Connection> util::mysql::MysqlUtils::sql_connection_  [static], [private],
[inherited]
```

Tthe thread-specific pointer to MySQL connection object.

Thread-specific MySQL connection, released by `MysqlUtils::CleanupSqlConnection()` when the thread exits.

Referenced by util::mysql::MysqlUtils::CloseSqlConnection(), and util::mysql::MysqlUtils::GetSqlConnection().

10.94.5.27 sql_driver_

```
thread_specific_ptr<MySQL_Driver> util::mysql::MysqlUtils::sql_driver_  [static], [private],
[inherited]
```

The thread-specific pointer to MySQL driver object.

Thread-specific reference to the MySQL driver.

Its cleanup function, `MysqlUtils::CleanupSqlDriver()`, does not delete the shared driver instance.

Referenced by util::mysql::MysqlUtils::GetSqlDriver().

10.94.5.28 time_to_acquire_fix_

```
uint16_t util::xmsg::XGPS::time_to_acquire_fix_  [private]
```

The time to acquire this GPS fix, in seconds.

Referenced by DecodeXMsgData().

10.94.5.29 user_

```
std::string util::mysql::LocalMysqlConfiguration::user_  [static], [private], [inherited]
```

The SQL server account username string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.94.5.30 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following files:

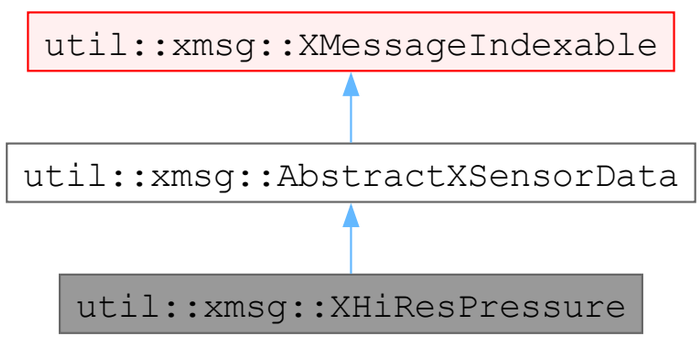
- data/xmsg/XGPS.h
- data/xmsg/XGPS.cpp

10.95 util::xmsg::XHiResPressure Class Reference

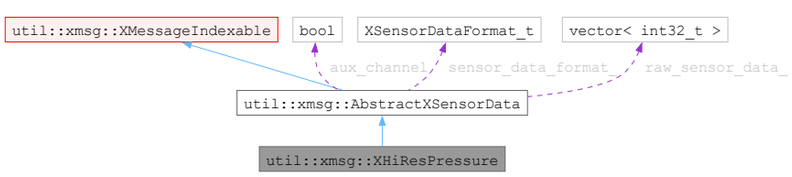
Class representing high-resolution/raw/unbinned profile pressure X-Message.

```
#include <XHiResPressure.h>
```

Inheritance diagram for util::xmsg::XHiResPressure:



Collaboration diagram for util::xmsg::XHiResPressure:



Public Member Functions

- XHiResPressure (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)

  The parameterized constructor.
- ~XHiResPressure ()

  The destructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)

  Check the X-message for the correct ID, minimum size, and message terminator.
- void DecodeXMsgData (const vector< uint8_t > &data)

  Decode the high-resolution/raw/unbinned profile pressure X-Message from the binary message data.
- int16_t id_dive () const

  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const

  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const

  Get the enumerated X-Message type identifier.
- bool **is_aux_channel** () const
- size_t num_samples () const

  Get the number of samples in this message.
- const vector< int32_t > & raw_sensor_data () const

  Get the raw sensor data vector.
- int32_t Sample (size_t i) const

  Get the raw integer value of the i^{th} sample.
- template<typename T = double>
  T SampleValue (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} sensor value in scientific units.
- template<typename T = double>
  T SampleValueAsPressure (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} pressure sensor value, in dBar.
- template<typename T = double>
  T SampleValueAsSalinity (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} salinity sensor value, in PSU.
- template<typename T = double>
  T SampleValueAsTemperature (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} temperature sensor value, in degC.
- XSensorDataFormat_t sensor_data_format () const

  Get the enumerated sensor data format value.
- uint8_t xmsg_index () const

  Get the index of this X-Message.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Protected Member Functions

- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_raw_sensor_data (const vector< int32_t > &raw_sensor_data)

  Set raw integer counts of the measured sensor data.
- void set_sensor_data_format (XSensorDataFormat_t sensor_data_format)

  Set the sensor data format.
- void set_xmsg_index (uint8_t xmsg_index)

  Set the index of this X-Message.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.
- virtual vector< int32_t > UnpackSensorData (const vector< uint8_t > &data)

  Unpack the sensor data from the binary message.

Protected Attributes

- bool **aux_channel**
- vector< int32_t > raw_sensor_data_

  The raw integer counts of the measured sensor data.
- XSensorDataFormat_t sensor_data_format_

  The enumerated sensor data packing format.

Private Attributes

- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint8_t xmsg_index_

  The index of this X-Message.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.95.1 Detailed Description

Class representing high-resolution/raw/unbinned profile pressure X-Message.

10.95.2 Constructor & Destructor Documentation

10.95.2.1 XHiResPressure()

```
util::xmsg::XHiResPressure::XHiResPressure (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

The parameterized constructor.

Parameters

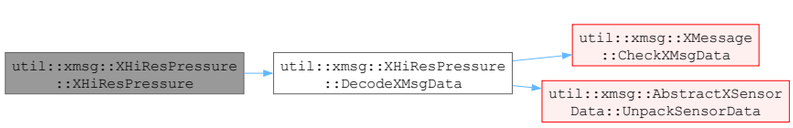
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.95.2.2 ~XHiResPressure()

```
util::xmsg::XHiResPressure::~XHiResPressure ()  [inline]
```

The destructor.

10.95.3 Member Function Documentation

10.95.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::XMessage::set_xmsg_size_byte
u16, and util::xmsg::XMessage::xmsg_size_bytes().

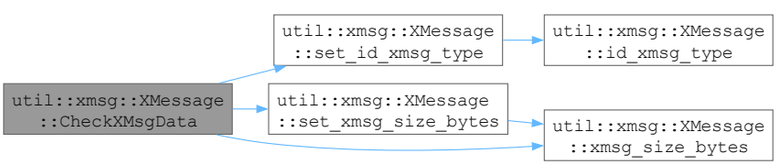
util::xmsg::XValve::DecodeXMsgData(), util::xmsg::XWave::DecodeXMsgData(), and util::xmsg::AbstractXFallRise::UnpackData().

Here is the call graph for this function:



10.95.3.2 DecodeXMsgData()

```
void util::xmsg::XHiResPressure::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode the high-resolution/raw/unbinned profile pressure X-Message from the binary message data.

Parameters

in	*data*	The binary message data to decode.

Exceptions

util::log::MessageException	if the message is invalid or an error occurs during decoding.

Implements util::xmsg::AbstractXSensorData.

References CATCH_BLOCK, util::xmsg::XMessage::CheckXMsgData(), EXC_THROW, util::xmsg::AbstractXSensorData::UnpackSensorD
and util::xmsg::XMSG_TYPE_ID_PRES_HI_RES0.

10.95.3.5 id_xmsg_type()

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type () const  [inline], [inherited]
```

Get the enumerated X-Message type identifier.

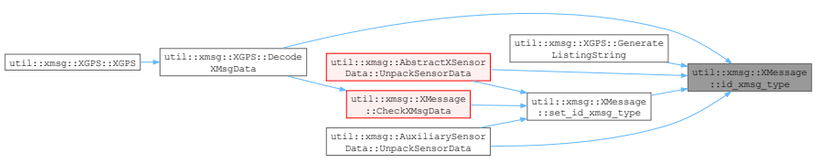
Returns

The enumerated X-Message type identifier.

References util::xmsg::XMessage::id_xmsg_type_.

Referenced by util::xmsg::XGPS::DecodeXMsgData(), util::xmsg::XGPS::GenerateListingString(), util::xmsg::XMessage::set_id_xmsg_typ
util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

Here is the caller graph for this function:



10.95.3.6 num_samples()

```
size_t util::xmsg::AbstractXSensorData::num_samples () const  [inline], [inherited]
```

Get the number of samples in this message.

Returns

The number of samples in this message.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

10.95.3.7 raw_sensor_data()

```
const vector< int32_t > & util::xmsg::AbstractXSensorData::raw_sensor_data () const  [inline],
[inherited]
```

Get the raw sensor data vector.

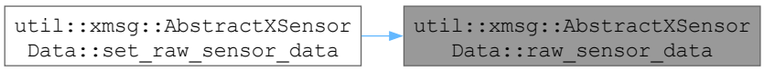
Returns

The raw sensor data vector.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

Referenced by util::xmsg::AbstractXSensorData::set_raw_sensor_data().

Here is the caller graph for this function:



10.95.3.8 Sample()

```
int32_t util::xmsg::AbstractXSensorData::Sample (
            size_t i) const  [inline], [inherited]
```

Get the raw integer value of the i^{th} sample.

Parameters

in	*i*	The index of the sensor value.

Returns

The raw integer value of the i^{th} ith sample.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

10.95.3.9 SampleValue()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValue (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} sensor value in scientific units.

Parameters

in	*i*	The index of the sensor value.
in	*gain*	The sensor sensitivity scale factor.
in	*offs*	The sensor offset.

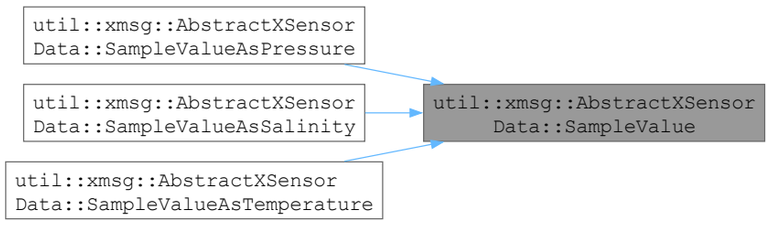
Returns

The i^{th} sensor value in scientific units.

References CATCH_BLOCK, and util::xmsg::AbstractXSensorData::raw_sensor_data_.

Referenced by util::xmsg::AbstractXSensorData::SampleValueAsPressure(), util::xmsg::AbstractXSensorData::SampleValueAsSalinity(), and util::xmsg::AbstractXSensorData::SampleValueAsTemperature().

Here is the caller graph for this function:



10.95.3.10 SampleValueAsPressure()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValueAsPressure (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} pressure sensor value, in dBar.

Parameters

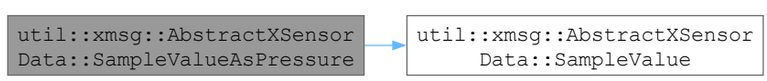
in	*i*	The index of the sensor value.
in	*gain*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*offs*	The pressure sensor offset, in dBar.

Returns

The i^{th} pressure sensor value, in dBar.

References util::xmsg::AbstractXSensorData::SampleValue(), XMSG_SENS_BAD_PRES, and XMSG_SENS_MAX_PRES.

Here is the call graph for this function:



10.95.3.11 SampleValueAsSalinity()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValueAsSalinity (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} salinity sensor value, in PSU.

Parameters

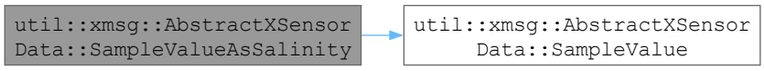
in	*i*	The index of the sensor value.
in	*gain*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*offs*	The salinity sensor offset, in PSU.

Returns

The i^{th} salinity sensor value, in PSU.

References util::xmsg::AbstractXSensorData::SampleValue(), XMSG_SENS_BAD_SALN, and XMSG_SENS_MAX_SALN.

Here is the call graph for this function:



10.95.3.12 SampleValueAsTemperature()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValueAsTemperature (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} temperature sensor value, in degC.

Parameters

in	*i*	The index of the sensor value.
in	*gain*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*offs*	The temperature sensor offset, in degC.

Returns

The i^{th} temperature sensor value, in degC.

Here is the caller graph for this function:

10.95.3.21 UnpackSensorData()

```
virtual vector< int32_t > util::xmsg::AbstractXSensorData::UnpackSensorData (
            const vector< uint8_t > & data)  [inline], [protected], [virtual], [inherited]
```

Unpack the sensor data from the binary message.

This field unpacks the encoded sensor data from the message and stores the decoded sensor values in raw_sensor_data_. First the function checks the size of the message, and the data packing format. The message data is decoded according to the packing format type. Both first-difference and curvature encoding are supported. The encoding method is determined from the value of the high nibble of byte `data`[1].

Once this function completes successfully, then the data may be recovered in scientific units from the raw sensor values by applying the appropriate sensor gain and offset values.

Parameters

in	*data*	The binary message to unpack, in a vector of unsigned bytes.

Warning

The function assumes the message data is valid. Message validity should be ensured before this function is called.

Exceptions

util::log::MessageException	if • an error occurs while decoding the message, • the message is of insufficient length, or • an invalid packing format is encountered.

Returns

The sensor data raw counts, in a vector of signed integers.

Reimplemented in util::xmsg::AuxiliarySensorData.

10.95.4 Member Data Documentation

10.95.4.1 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.95.4.2 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.95.4.3 id_xmsg_type_

XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_ [private], [inherited]

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.95.4.4 raw_sensor_data_

vector<int32_t> util::xmsg::AbstractXSensorData::raw_sensor_data_ [protected], [inherited]

The raw integer counts of the measured sensor data.

This vector of integers represents the "raw" sample values of the message. That is, by applying the appropriate gain and offset corrections, the sensor values may be recovered in scientific units. This data may represent pressure, temperature, salinity, or any other data that is recorded during the drift or profile phases of the dive cycle.

Referenced by util::xmsg::AbstractXSensorData::num_samples(), util::xmsg::AbstractXSensorData::raw_sensor_data(), util::xmsg::AbstractXSensorData::Sample(), util::xmsg::AbstractXSensorData::SampleValue(), util::xmsg::AbstractXSensorData::set_raw_ util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

10.95.4.5 sensor_data_format_

XSensorDataFormat_t util::xmsg::AbstractXSensorData::sensor_data_format_ [protected], [inherited]

The enumerated sensor data packing format.

This field indicates the format of encoded sensor data. The manner in which the sensor data is decoded is determined by the format of this field.

Referenced by util::xmsg::AbstractXSensorData::sensor_data_format(), and util::xmsg::AbstractXSensorData::set_sensor_data_format().

10.95.4.6 xmsg_index_

uint8_t util::xmsg::XMessageIndexable::xmsg_index_ [private], [inherited]

The index of this X-Message.

Referenced by util::xmsg::XMessageIndexable::set_xmsg_index(), and util::xmsg::XMessageIndexable::xmsg_index().

10.95.4.7 xmsg_size_bytes_

uint16_t util::xmsg::XMessage::xmsg_size_bytes_ [private], [inherited]

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

- data/xmsg/XHiResPressure.h

10.96 util::xmsg::XHiResSalinity Class Reference

Class representing high-resolution/raw/unbinned profile salinity X-Message.

`#include <XHiResSalinity.h>`

Get the i^{th} pressure sensor value, in dBar.

- template<typename T = double>
  T SampleValueAsSalinity (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} salinity sensor value, in PSU.
- template<typename T = double>
  T SampleValueAsTemperature (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} temperature sensor value, in degC.
- XSensorDataFormat_t sensor_data_format () const

  Get the enumerated sensor data format value.
- uint8_t xmsg_index () const

  Get the index of this X-Message.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Protected Member Functions

- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_raw_sensor_data (const vector< int32_t > &raw_sensor_data)

  Set raw integer counts of the measured sensor data.
- void set_sensor_data_format (XSensorDataFormat_t sensor_data_format)

  Set the sensor data format.
- void set_xmsg_index (uint8_t xmsg_index)

  Set the index of this X-Message.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.
- virtual vector< int32_t > UnpackSensorData (const vector< uint8_t > &data)

  Unpack the sensor data from the binary message.

Protected Attributes

- bool **aux_channel**
- vector< int32_t > raw_sensor_data_

  The raw integer counts of the measured sensor data.
- XSensorDataFormat_t sensor_data_format_

  The enumerated sensor data packing format.

Private Attributes

- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint8_t xmsg_index_

  The index of this X-Message.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.96.1 Detailed Description

Class representing high-resolution/raw/unbinned profile salinity X-Message.

10.96.2 Constructor & Destructor Documentation

10.96.2.1 XHiResSalinity()

```
util::xmsg::XHiResSalinity::XHiResSalinity (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

Parameterized constructor.

Parameters

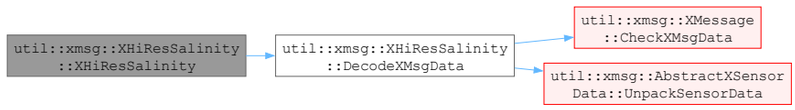
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.96.2.2 ~XHiResSalinity()

```
util::xmsg::XHiResSalinity::~XHiResSalinity ()  [inline]
```

Destructor.

10.96.3 Member Function Documentation

10.96.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::XMessage::set_xmsg_size_byte
u16, and util::xmsg::XMessage::xmsg_size_bytes().

```
void util::xmsg::XHiResSalinity::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode the high-resolution/raw/unbinned profile salinity X-Message from the binary message data.

Parameters

in	*data*	The binary message data to decode.

Exceptions

util::log::MessageException	if the message is invalid or an error occurs during decoding.

Implements util::xmsg::AbstractXSensorData.

Here is the caller graph for this function:

10.96.3.6 num_samples()

```
size_t util::xmsg::AbstractXSensorData::num_samples () const  [inline], [inherited]
```

Get the number of samples in this message.

Returns

The number of samples in this message.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

10.96.3.7 raw_sensor_data()

```
const vector< int32_t > & util::xmsg::AbstractXSensorData::raw_sensor_data () const  [inline],
[inherited]
```

Get the raw sensor data vector.

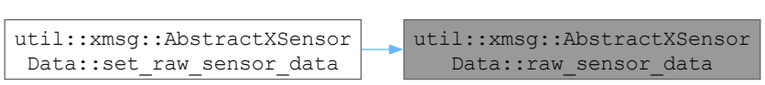
Returns

The raw sensor data vector.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

Referenced by util::xmsg::AbstractXSensorData::set_raw_sensor_data().

Here is the caller graph for this function:



10.96.3.8 Sample()

```
int32_t util::xmsg::AbstractXSensorData::Sample (
            size_t i) const  [inline], [inherited]
```

Get the raw integer value of the i^{th} sample.

Parameters

in	*i*	The index of the sensor value.

Returns

The raw integer value of the i^{th} ith sample.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

10.96.3.9 SampleValue()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValue (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} sensor value in scientific units.

Parameters

in	*i*	The index of the sensor value.
in	*gain*	The sensor sensitivity scale factor.
in	*offs*	The sensor offset.

Returns

The i^{th} sensor value in scientific units.

References CATCH_BLOCK, and util::xmsg::AbstractXSensorData::raw_sensor_data_.

Referenced by util::xmsg::AbstractXSensorData::SampleValueAsPressure(), util::xmsg::AbstractXSensorData::SampleValueAsSalinity(), and util::xmsg::AbstractXSensorData::SampleValueAsTemperature().

10.96.3.10 SampleValueAsPressure()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValueAsPressure (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} pressure sensor value, in dBar.

Parameters

in	*i*	The index of the sensor value.
in	*gain*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*offs*	The pressure sensor offset, in dBar.

Returns

The i^{th} pressure sensor value, in dBar.

References util::xmsg::AbstractXSensorData::SampleValue(), XMSG_SENS_BAD_PRES, and XMSG_SENS_MAX_PRES.

Here is the caller graph for this function:

10.96.3.21 UnpackSensorData()

```
virtual vector< int32_t > util::xmsg::AbstractXSensorData::UnpackSensorData (
            const vector< uint8_t > & data)  [inline], [protected], [virtual], [inherited]
```

Unpack the sensor data from the binary message.

This field unpacks the encoded sensor data from the message and stores the decoded sensor values in raw_sensor_data_. First the function checks the size of the message, and the data packing format. The message data is decoded according to the packing format type. Both first-difference and curvature encoding are supported. The encoding method is determined from the value of the high nibble of byte `data`[1].

Once this function completes successfully, then the data may be recovered in scientific units from the raw sensor values by applying the appropriate sensor gain and offset values.

Parameters

in	*data*	The binary message to unpack, in a vector of unsigned bytes.

Warning

The function assumes the message data is valid. Message validity should be ensured before this function is called.

Exceptions

util::log::MessageException	if • an error occurs while decoding the message, • the message is of insufficient length, or • an invalid packing format is encountered.

Returns

The sensor data raw counts, in a vector of signed integers.

Reimplemented in util::xmsg::AuxiliarySensorData.

10.96.4 Member Data Documentation

10.96.4.1 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.96.4.2 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.96.4.3 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.96.4.4 raw_sensor_data_

```
vector<int32_t> util::xmsg::AbstractXSensorData::raw_sensor_data_  [protected], [inherited]
```

The raw integer counts of the measured sensor data.

This vector of integers represents the "raw" sample values of the message. That is, by applying the appropriate gain and offset corrections, the sensor values may be recovered in scientific units. This data may represent pressure, temperature, salinity, or any other data that is recorded during the drift or profile phases of the dive cycle.

Referenced by util::xmsg::AbstractXSensorData::num_samples(), util::xmsg::AbstractXSensorData::raw_sensor_data(), util::xmsg::AbstractXSensorData::Sample(), util::xmsg::AbstractXSensorData::SampleValue(), util::xmsg::AbstractXSensorData::set_raw_ util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

10.96.4.5 sensor_data_format_

```
XSensorDataFormat_t util::xmsg::AbstractXSensorData::sensor_data_format_  [protected], [inherited]
```

The enumerated sensor data packing format.

This field indicates the format of encoded sensor data. The manner in which the sensor data is decoded is determined by the format of this field.

Referenced by util::xmsg::AbstractXSensorData::sensor_data_format(), and util::xmsg::AbstractXSensorData::set_sensor_data_format().

10.96.4.6 xmsg_index_

```
uint8_t util::xmsg::XMessageIndexable::xmsg_index_  [private], [inherited]
```

The index of this X-Message.

Referenced by util::xmsg::XMessageIndexable::set_xmsg_index(), and util::xmsg::XMessageIndexable::xmsg_index().

10.96.4.7 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

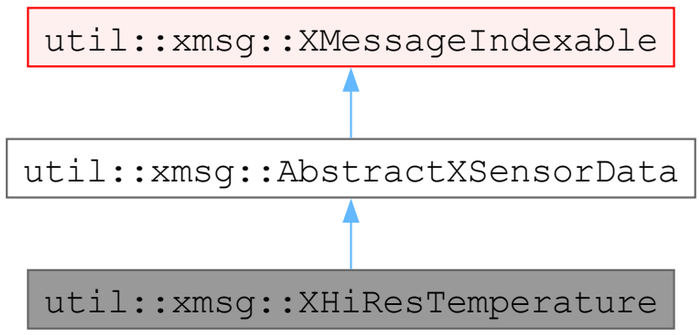
- data/xmsg/XHiResSalinity.h

10.97 util::xmsg::XHiResTemperature Class Reference

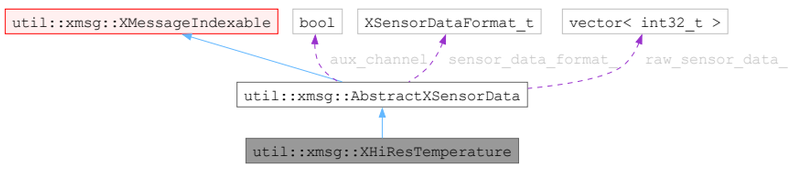
Class representing high-resolution/raw/unbinned profile temperature X-Message.

`#include <XHiResTemperature.h>`

Inheritance diagram for util::xmsg::XHiResTemperature:



Collaboration diagram for util::xmsg::XHiResTemperature:



Public Member Functions

- XHiResTemperature (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)
  Parameterized constructor.
- ~XHiResTemperature ()
  Destructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)
  Check the X-message for the correct ID, minimum size, and message terminator.
- void DecodeXMsgData (const vector< uint8_t > &data)
  Decode the high-resolution/raw/unbinned profile temperature X-Message from the binary message data.
- int16_t id_dive () const
  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const
  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const
  Get the enumerated X-Message type identifier.
- bool **is_aux_channel** () const
- size_t num_samples () const
  Get the number of samples in this message.
- const vector< int32_t > & raw_sensor_data () const
  Get the raw sensor data vector.
- int32_t Sample (size_t i) const
  Get the raw integer value of the i^{th} sample.
- template<typename T = double>
  T SampleValue (size_t i, int16_t gain, int16_t offs) const
  Get the i^{th} sensor value in scientific units.
- template<typename T = double>
  T SampleValueAsPressure (size_t i, int16_t gain, int16_t offs) const

Get the i^{th} pressure sensor value, in dBar.

- template<typename T = double>
  T SampleValueAsSalinity (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} salinity sensor value, in PSU.
- template<typename T = double>
  T SampleValueAsTemperature (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} temperature sensor value, in degC.
- XSensorDataFormat_t sensor_data_format () const

  Get the enumerated sensor data format value.
- uint8_t xmsg_index () const

  Get the index of this X-Message.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Protected Member Functions

- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_raw_sensor_data (const vector< int32_t > &raw_sensor_data)

  Set raw integer counts of the measured sensor data.
- void set_sensor_data_format (XSensorDataFormat_t sensor_data_format)

  Set the sensor data format.
- void set_xmsg_index (uint8_t xmsg_index)

  Set the index of this X-Message.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.
- virtual vector< int32_t > UnpackSensorData (const vector< uint8_t > &data)

  Unpack the sensor data from the binary message.

Protected Attributes

- bool **aux_channel**
- vector< int32_t > raw_sensor_data_

  The raw integer counts of the measured sensor data.
- XSensorDataFormat_t sensor_data_format_

  The enumerated sensor data packing format.

Private Attributes

- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint8_t xmsg_index_

  The index of this X-Message.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.97.1 Detailed Description

Class representing high-resolution/raw/unbinned profile temperature X-Message.

10.97.2 Constructor & Destructor Documentation

10.97.2.1 XHiResTemperature()

```
util::xmsg::XHiResTemperature::XHiResTemperature (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

Parameterized constructor.

Parameters

in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:

10.97.2.2 ~XHiResTemperature()

```
util::xmsg::XHiResTemperature::~XHiResTemperature ()  [inline]
```

Destructor.

10.97.3 Member Function Documentation

10.97.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::XMessage::set_xmsg_size_byte

10.97.3.2 DecodeXMsgData()

```
void util::xmsg::XHiResTemperature::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode the high-resolution/raw/unbinned profile temperature X-Message from the binary message data.

Parameters

in	*data*	The binary message data to decode.

Exceptions

util::log::MessageException	if the message is invalid or an error occurs during decoding.

Implements util::xmsg::AbstractXSensorData.

10.97.3.8 Sample()

```
int32_t util::xmsg::AbstractXSensorData::Sample (
            size_t i) const  [inline], [inherited]
```

Get the raw integer value of the i^{th} sample.

Parameters

in	*i*	The index of the sensor value.

Returns

The raw integer value of the i^{th} ith sample.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

10.97.3.9 SampleValue()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValue (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} sensor value in scientific units.

Parameters

in	*i*	The index of the sensor value.
in	*gain*	The sensor sensitivity scale factor.
in	*offs*	The sensor offset.

Returns

The i^{th} sensor value in scientific units.

References CATCH_BLOCK, and util::xmsg::AbstractXSensorData::raw_sensor_data_.

            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} pressure sensor value, in dBar.

Parameters

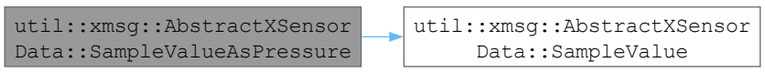
in	*i*	The index of the sensor value.
in	*gain*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*offs*	The pressure sensor offset, in dBar.

Returns

The i^{th} pressure sensor value, in dBar.

References util::xmsg::AbstractXSensorData::SampleValue(), XMSG_SENS_BAD_PRES, and XMSG_SENS_MAX_PRES.

Here is the call graph for this function:



10.97.3.11 SampleValueAsSalinity()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValueAsSalinity (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} salinity sensor value, in PSU.

Parameters

in	*i*	The index of the sensor value.
in	*gain*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*offs*	The salinity sensor offset, in PSU.

Returns

The i^{th} salinity sensor value, in PSU.

10.97.3.21 UnpackSensorData()

```
virtual vector< int32_t > util::xmsg::AbstractXSensorData::UnpackSensorData (
            const vector< uint8_t > & data)  [inline], [protected], [virtual], [inherited]
```

Unpack the sensor data from the binary message.

This field unpacks the encoded sensor data from the message and stores the decoded sensor values in raw_sensor_data_. First the function checks the size of the message, and the data packing format. The message data is decoded according to the packing format type. Both first-difference and curvature encoding are supported. The encoding method is determined from the value of the high nibble of byte `data`[1].

Once this function completes successfully, then the data may be recovered in scientific units from the raw sensor values by applying the appropriate sensor gain and offset values.

Parameters

`in`	*data*	The binary message to unpack, in a vector of unsigned bytes.

Warning

The function assumes the message data is valid. Message validity should be ensured before this function is called.

Exceptions

util::log::MessageException	if • an error occurs while decoding the message, • the message is of insufficient length, or • an invalid packing format is encountered.

Returns

The sensor data raw counts, in a vector of signed integers.

Reimplemented in util::xmsg::AuxiliarySensorData.

10.97.4 Member Data Documentation

10.97.4.1 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.97.4.2 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.97.4.3 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.97.4.4 raw_sensor_data_

```
vector<int32_t> util::xmsg::AbstractXSensorData::raw_sensor_data_  [protected], [inherited]
```

The raw integer counts of the measured sensor data.

This vector of integers represents the "raw" sample values of the message. That is, by applying the appropriate gain and offset corrections, the sensor values may be recovered in scientific units. This data may represent pressure, temperature, salinity, or any other data that is recorded during the drift or profile phases of the dive cycle.

Referenced by util::xmsg::AbstractXSensorData::num_samples(), util::xmsg::AbstractXSensorData::raw_sensor_data(), util::xmsg::AbstractXSensorData::Sample(), util::xmsg::AbstractXSensorData::SampleValue(), util::xmsg::AbstractXSensorData::set_raw_ util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

10.97.4.5 sensor_data_format_

```
XSensorDataFormat_t util::xmsg::AbstractXSensorData::sensor_data_format_  [protected], [inherited]
```

The enumerated sensor data packing format.

This field indicates the format of encoded sensor data. The manner in which the sensor data is decoded is determined by the format of this field.

Referenced by util::xmsg::AbstractXSensorData::sensor_data_format(), and util::xmsg::AbstractXSensorData::set_sensor_data_format().

10.97.4.6 xmsg_index_

```
uint8_t util::xmsg::XMessageIndexable::xmsg_index_  [private], [inherited]
```

The index of this X-Message.

Referenced by util::xmsg::XMessageIndexable::set_xmsg_index(), and util::xmsg::XMessageIndexable::xmsg_index().

10.97.4.7 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

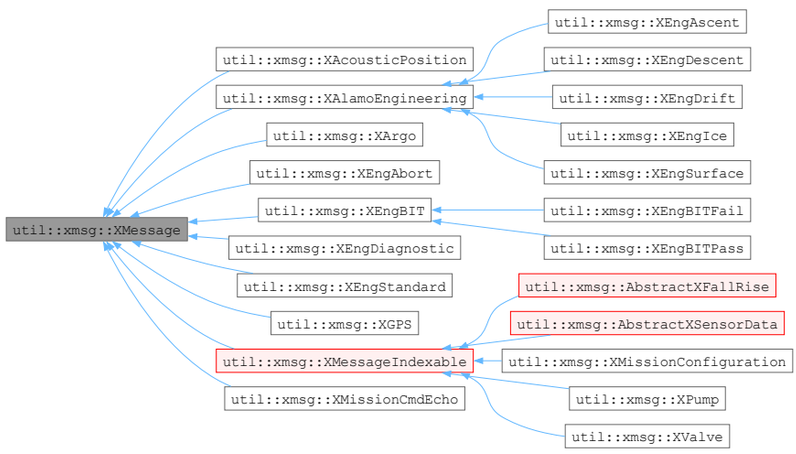
- data/xmsg/XHiResTemperature.h

10.98 util::xmsg::XMessage Class Reference

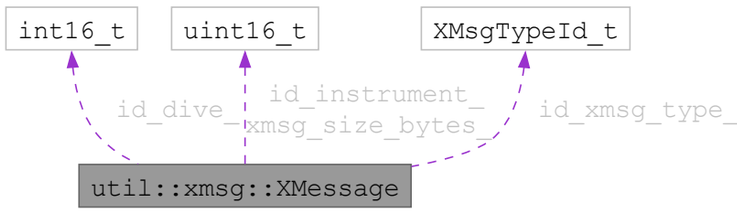
Class representing a message following the X format specification.

`#include <XMessage.h>`

Inheritance diagram for util::xmsg::XMessage:



Collaboration diagram for util::xmsg::XMessage:



Public Member Functions

- XMessage (int16_t dive, uint16_t whoi, const vector< uint8_t > &data) ATTR_NO_EXCEPTIONS

  The Parameterized constructor.
- virtual ~XMessage ()

  The destructor.

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.

Private Attributes

- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.98.1 Detailed Description

Class representing a message following the X format specification.

10.98.2 Constructor & Destructor Documentation

10.98.2.1 XMessage() [1/2]

```
util::xmsg::XMessage::XMessage (
            int16_t dive = XMSG_DIVE_UNKNOWN,
            uint16_t whoi = XMSG_ID_UNKNOWN,
            XMsgTypeId_t type = XMSG_TYPE_ID_UNKNOWN)  [inline], [protected]
```

The default constructor.

Parameters

in	*dive*	The dive number of this X-Message object.
in	*whoi*	The unique instrument identifier.
in	*type*	The X-Message type identifier.

Exceptions

None.	Never throws.

10.98.2.2 XMessage() [2/2]

```
util::xmsg::XMessage::XMessage (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

The Parameterized constructor.

Parameters

in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

None.	Never throws.

10.98.2.3 ~XMessage()

```
virtual util::xmsg::XMessage::~XMessage ()  [inline], [virtual]
```

The destructor.

10.98.3 Member Function Documentation

10.98.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, set_id_xmsg_type(), set_xmsg_size_bytes(), u16, and xmsg_size_bytes().

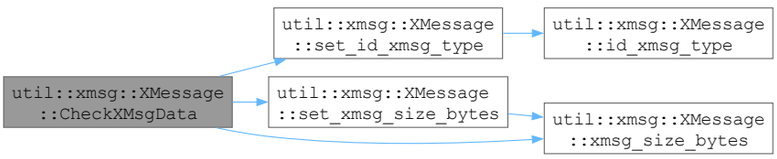
Here is the call graph for this function:



10.98.3.2 DecodeXMsgData()

```
virtual void util::xmsg::XMessage::DecodeXMsgData (
            const vector< uint8_t > & data)  [pure virtual]
```

Decode the X-Message data.

Parameters

in	*data*	The encoded X message to decode.

Implemented in util::xmsg::AbstractXFallRise, util::xmsg::AbstractXSensorData, util::xmsg::XAcousticPosition, util::xmsg::XArgo, util::xmsg::XDriftPressure, util::xmsg::XDriftSalinity, util::xmsg::XDriftTemperature, util::xmsg::XEngAbort, util::xmsg::XEngAscent, util::xmsg::XEngBIT, util::xmsg::XEngDescent, util::xmsg::XEngDiagnostic, util::xmsg::XEngDrift, util::xmsg::XEngIce, util::xmsg::XEngSurface, util::xmsg::XFall, util::xmsg::XGPS, util::xmsg::XHiResPressure, util::xmsg::XHiResSalinity, util::xmsg::XHiResTemperature, util::xmsg::XMessageIndexable, util::xmsg::XMissionCmdEcho, util::xmsg::XMissionConfiguration, util::xmsg::XProfilePressure, util::xmsg::XProfileSalinity, util::xmsg::XProfileTemperature, util::xmsg::XPump, util::xmsg::XRise, util::xmsg::XSurfaceData, util::xmsg::XValve, and util::xmsg::XWave.

10.98.3.3 id_dive()

```
int16_t util::xmsg::XMessage::id_dive () const  [inline]
```

Get the dive or cycle number of this X-Message.

Returns

The dive or cycle number of this X-Message.

Here is the caller graph for this function:

10.98.3.5 id_xmsg_type()

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type () const  [inline]
```

Get the enumerated X-Message type identifier.

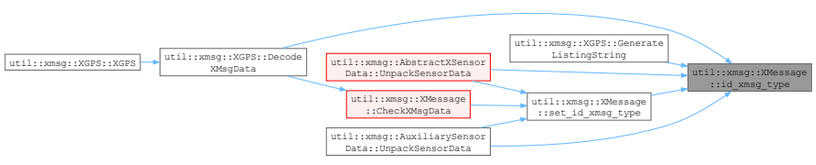
Returns

The enumerated X-Message type identifier.

References id_xmsg_type_.

Referenced by util::xmsg::XGPS::DecodeXMsgData(), util::xmsg::XGPS::GenerateListingString(), set_id_xmsg_type(), util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

Here is the caller graph for this function:



10.98.3.6 set_id_dive()

```
void util::xmsg::XMessage::set_id_dive (
            int16_t id_dive)  [inline], [protected]
```

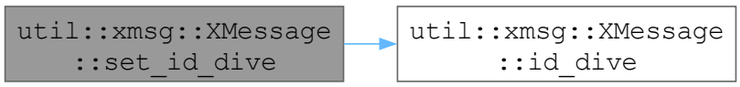
Set the dive or cycle number of this message.

Parameters

in	*id_dive*	The dive or cycle number of this message to set.

References id_dive(), and id_dive_.

Here is the call graph for this function:



10.98.3.7 set_id_instrument()

```
void util::xmsg::XMessage::set_id_instrument (
            uint16_t id_instrument)  [inline], [protected]
```

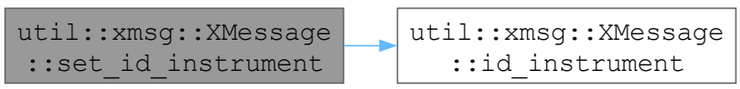
Set the unique instrument identifier.

Parameters

in	*id_instrument*	The unique instrument identifier to set.

References id_instrument(), and id_instrument_.

Here is the call graph for this function:



10.98.3.8 set_id_xmsg_type()

```
void util::xmsg::XMessage::set_id_xmsg_type (
            XMsgTypeId_t id_xmsg_type)  [inline], [protected]
```

Set the X-Message type identifier.

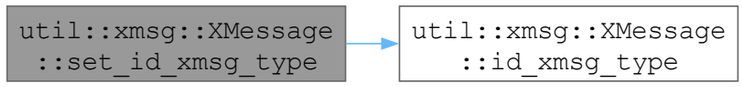
Parameters

in	*id_xmsg_type*	The X-Message type identifier to set.

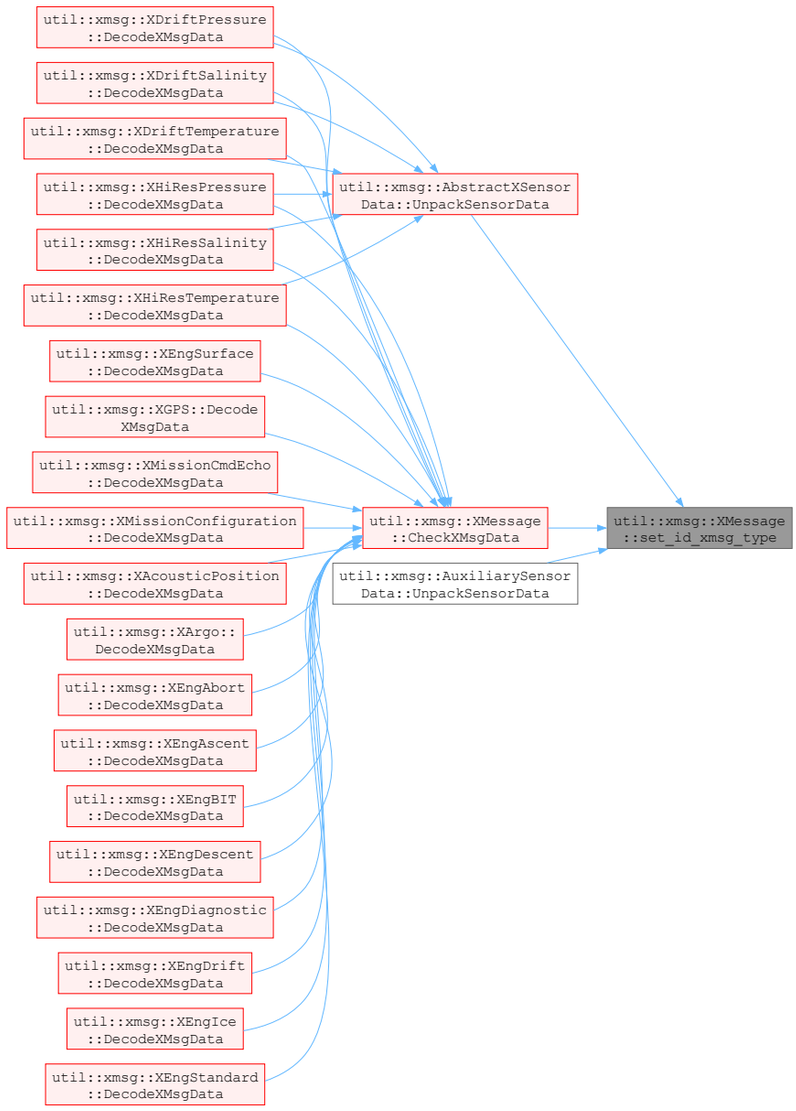
References id_xmsg_type(), and id_xmsg_type_.

Referenced by CheckXMsgData(), util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackS

Here is the call graph for this function:



Here is the caller graph for this function:



10.98.3.9 set_xmsg_size_bytes()

```
void util::xmsg::XMessage::set_xmsg_size_bytes (
            uint16_t xmsg_size_bytes)  [inline], [protected]
```

Set the size of the X-Message, in bytes.

Parameters

in	*xmsg_size_bytes*	The size of the X-Message to set, in bytes.

References xmsg_size_bytes(), and xmsg_size_bytes_.

Referenced by CheckXMsgData(), util::xmsg::XPump::DecodeXMsgData(), and util::xmsg::AbstractXFallRise::UnpackData().

10.98.4 Member Data Documentation

10.98.4.1 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private]
```

The dive or cycle number of this message.

Referenced by id_dive(), and set_id_dive().

10.98.4.2 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private]
```

The unique WHOI identifier of this instrument.

Referenced by id_instrument(), and set_id_instrument().

10.98.4.3 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private]
```

The X-message type identifier.

Referenced by id_xmsg_type(), and set_id_xmsg_type().

10.98.4.4 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private]
```

The size of the X message, in bytes.

Referenced by set_xmsg_size_bytes(), and xmsg_size_bytes().

The documentation for this class was generated from the following file:

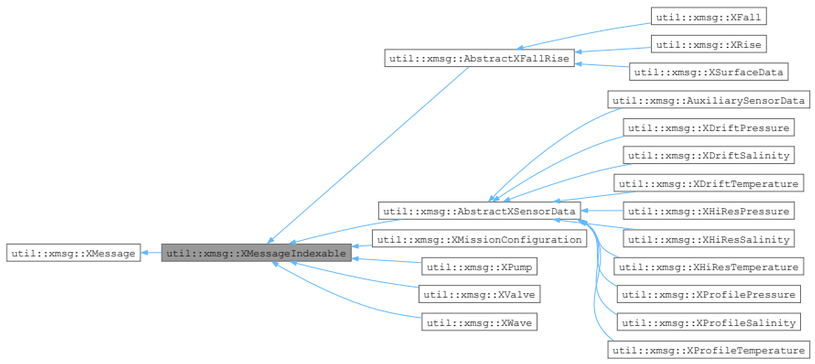
- data/xmsg/XMessage.h

10.99 util::xmsg::XMessageIndexable Class Reference

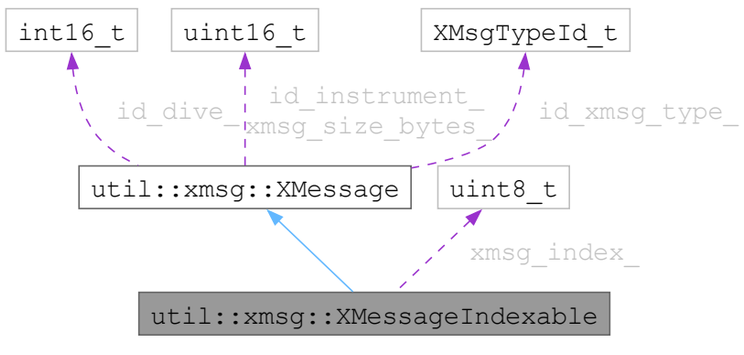
Class representing an indexable X-Message.

`#include <XMessageIndexable.h>`

Inheritance diagram for util::xmsg::XMessageIndexable:



Collaboration diagram for util::xmsg::XMessageIndexable:



Public Member Functions

- XMessageIndexable (int16_t dive, uint16_t whoi, const vector< uint8_t > &data) ATTR_NO_EXCEPTIONS
  The parameterized constructor.
- ~XMessageIndexable ()
  The destructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)
  Check the X-message for the correct ID, minimum size, and message terminator.
- virtual void DecodeXMsgData (const vector< uint8_t > &data)=0
  Decode the X-Message data.
- int16_t id_dive () const
  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const
  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const
  Get the enumerated X-Message type identifier.
- uint8_t xmsg_index () const
  Get the index of this X-Message.
- uint16_t xmsg_size_bytes () const
  Get the size of the X-Message, in bytes.

Protected Member Functions

- XMessageIndexable () ATTR_NO_EXCEPTIONS
  The default constructor.
- void set_id_dive (int16_t id_dive)
  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)
  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)
  Set the X-Message type identifier.
- void set_xmsg_index (uint8_t xmsg_index)
  Set the index of this X-Message.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)
  Set the size of the X-Message, in bytes.

Private Attributes

- int16_t id_dive_
  The dive or cycle number of this message.
- uint16_t id_instrument_
  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_
  The X-message type identifier.
- uint8_t xmsg_index_
  The index of this X-Message.
- uint16_t xmsg_size_bytes_
  The size of the X message, in bytes.

10.99.1 Detailed Description

Class representing an indexable X-Message.

10.99.2 Constructor & Destructor Documentation

10.99.2.1 XMessageIndexable() [1/2]

```
util::xmsg::XMessageIndexable::XMessageIndexable ()  [inline], [protected]
```

The default constructor.

Exceptions

None.	Never throws.

10.99.2.2 XMessageIndexable() [2/2]

```
util::xmsg::XMessageIndexable::XMessageIndexable (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

The parameterized constructor.

Parameters

in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

None.	Never throws.

10.99.2.3 ~XMessageIndexable()

```
util::xmsg::XMessageIndexable::~XMessageIndexable ()  [inline]
```

The destructor.

10.99.3 Member Function Documentation

10.99.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::XMessage::set_xmsg_size_byte
u16, and util::xmsg::XMessage::xmsg_size_bytes().

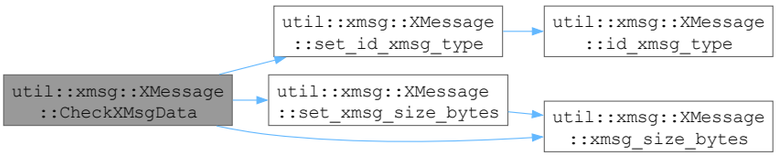
util::xmsg::XValve::DecodeXMsgData(), util::xmsg::XWave::DecodeXMsgData(), and util::xmsg::AbstractXFallRise::UnpackData().

Here is the call graph for this function:



10.99.3.2 DecodeXMsgData()

```
virtual void util::xmsg::XMessageIndexable::DecodeXMsgData (
            const vector< uint8_t > & data)  [pure virtual]
```

Decode the X-Message data.

Parameters

in	*data*	The encoded X message to decode.

Implements util::xmsg::XMessage.

Implemented in util::xmsg::AbstractXFallRise, util::xmsg::AbstractXSensorData, util::xmsg::XDriftPressure, util::xmsg::XDriftSalinity,
util::xmsg::XDriftTemperature, util::xmsg::XFall, util::xmsg::XHiResPressure, util::xmsg::XHiResSalinity, util::xmsg::XHiResTemperature,
util::xmsg::XMissionConfiguration, util::xmsg::XProfilePressure, util::xmsg::XProfileSalinity, util::xmsg::XProfileTemperature,
util::xmsg::XPump, util::xmsg::XRise, util::xmsg::XSurfaceData, util::xmsg::XValve, and util::xmsg::XWave.

10.99.3.3 id_dive()

```
int16_t util::xmsg::XMessage::id_dive () const  [inline], [inherited]
```

Get the dive or cycle number of this X-Message.

Returns

The dive or cycle number of this X-Message.

References util::xmsg::XMessage::id_dive_.

Referenced by util::xmsg::XGPS::DeleteFromDatabase(), util::xmsg::XArgo::GenerateListingString(), util::xmsg::XEngAscent::GenerateLis

10.99.3.6 set_id_dive()

```
void util::xmsg::XMessage::set_id_dive (
            int16_t id_dive)  [inline], [protected], [inherited]
```

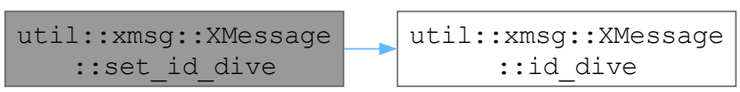
Set the dive or cycle number of this message.

Parameters

in	*id_dive*	The dive or cycle number of this message to set.

References util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::id_dive_.

Here is the call graph for this function:



10.99.3.7 set_id_instrument()

```
void util::xmsg::XMessage::set_id_instrument (
            uint16_t id_instrument)  [inline], [protected], [inherited]
```

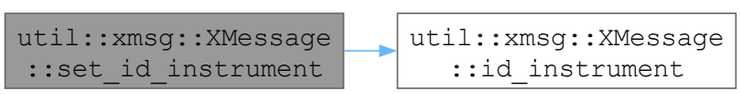
Set the unique instrument identifier.

Parameters

in	*id_instrument*	The unique instrument identifier to set.

References util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::id_instrument_.

Here is the call graph for this function:



10.99.3.8 set_id_xmsg_type()

```
void util::xmsg::XMessage::set_id_xmsg_type (
            XMsgTypeId_t id_xmsg_type)  [inline], [protected], [inherited]
```

Set the X-Message type identifier.

Parameters

in	*id_xmsg_type*	The X-Message type identifier to set.

References util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::id_xmsg_type_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

10.99.4 Member Data Documentation

10.99.4.1 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.99.4.2 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.99.4.3 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.99.4.4 xmsg_index_

`uint8_t util::xmsg::XMessageIndexable::xmsg_index_ [private]`

The index of this X-Message.

Referenced by set_xmsg_index(), and xmsg_index().

10.99.4.5 xmsg_size_bytes_

`uint16_t util::xmsg::XMessage::xmsg_size_bytes_ [private], [inherited]`

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

- data/xmsg/XMessageIndexable.h

10.100 util::xmsg::XMfaMissionCfg Class Reference

The ALAMO mission configuration (mission parameters) message class.

Static Public Member Functions

- static string GenerateCurrentUtcTimeIso8601String ()

  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- static string GenerateIso8601String (const ptime &p, bool extended=true)

  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)

  Convert a date/time to fractional days since a reference date/time.
- static ptime GetCurrentUtcTime ()

  Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Private Attributes

- uint16_t aca_

  The motion processing unit (MPU) accelerometer sensitivity scale factor identifier.
- uint16_t acg_

  The motion processing unit (MPU) gyroscope sensitivity scale factor identifier.
- uint16_t acr_

  The motion processing unit (MPU) sample rate, in Hz.
- uint16_t add_

  The ascent state data storage pressure interval, in dBar.
- uint16_t adt_

  The ascent state data storage interval timeout, in seconds.
- uint16_t **ahd_**
- uint16_t **ahr_**
- uint16_t apf_

  The ascent state pump off duration/interval/timeout, in seconds.
- uint16_t **apm_**
- uint16_t apn_

  The ascent state pump on duration/interval/timeout, in seconds.
- uint16_t **aps_**
- uint8_t apt_

  The auto-transmit mission configuration message flag.
- uint16_t **arc_**
- uint16_t arr_

  The ascent state rise rate, in centimeters per second.
- ptime ascent_start_time_

  The start time of the ascent state of the dive cycle.
- uint16_t asd_

  The ascent state surface threshold pressure, in dBar.
- uint32_t asi_

  The ascent state sampling interval/timeout, in milliseconds.
- uint16_t asn_

  The ascent number.
- uint8_t btm_

  The bluetooth mode.
- uint8_t cms_

  The CTD profiling mode.
- uint16_t cpb_ [3]

  The CTD sampling period pressure boundaries, in dBar.
- uint16_t cpn_ [3]

  The CTD sampling period bin sizes, in 0.1 dBar.

- uint16_t cpp_ [3]

  The CTD sampling period interval, in milliseconds.
- uint8_t cps_

  The CTD profiling mode.
- uint16_t crd_

  The CTD raw sampling threshold, in dBar.
- uint16_t crs_

  The maximum number of raw samples to collect above the raw sampling threshold.
- uint32_t csp_

  The CTD continuous sampling period, in milliseconds.
- uint8_t cst_

  The CTD sampling type.
- uint8_t ctc_

  The auxiliary temperature channel mode.
- uint16_t ctf_

  The profile cutoff pressure.
- uint16_t ctl_

  The pressure sensor offset reset lower pressure limit.
- uint16_t ctu_

  The pressure sensor offset reset lower pressure limit.
- uint8_t **dal_**
- uint8_t **dca_**
- uint16_t **dcd_**
- uint16_t **dcf_**
- uint8_t **dcm_**
- uint16_t **dcp_**
- uint16_t **dcr_**
- uint16_t **dct_** [3]
- uint16_t **dcx_**
- uint8_t ddb_

  Diagnostic dive bypass mode.
- uint16_t **ddc_**
- uint16_t ddd_

  The descent state data storage pressure interval, in dBar.
- uint16_t **ddf_**
- uint16_t **ddp_**
- uint16_t **dds_**
- uint16_t ddt_

  The descent state data storage interval, in seconds.
- ptime descend_start_time_

  The start time of the descend state of the dive cycle.
- uint16_t dft_ [3]

  The descent state fall timeout, in seconds.
- uint16_t dns_

  The descent number.
- uint16_t **dpd_**
- uint16_t **dpt_**
- uint8_t **dra_**
- uint16_t **drc_**
- uint16_t **drt_**
- uint16_t dsd_ [3]

  The descent state start pressure, in dBar.
- uint32_t dsi_

  The descent state sampling interval, in milliseconds.
- uint16_t dst_ [3]

  The descent state start timeout, in seconds.
- uint16_t **dsw_**
- uint16_t dtd_ [3]

  The target descent/drift/park pressure, in dBar.
- uint16_t **duc_**
- uint16_t **dut_**
- uint16_t **dvd_**
- uint16_t **dvt_**
- uint16_t **dvw_**

- uint16_t **fos_**
- uint8_t **fta_**
- uint8_t **ftm_**
- uint16_t **fto_**
- uint32_t fw_version_

  The software version identifier.
- uint16_t iat_

  Ice-detection – .
- uint16_t ica_ [2]

  Ice-detection – surface attempts.
- uint16_t icb_ [2]

  Ice-detection – cycles between surface attempts.
- uint16_t icd_ [2]

  Ice-detection – hold pressure, in dBar.
- uint32_t icf_

  Ice-detection – ice-free month mask.
- uint8_t icg_ [2]

  Ice-detection – seek mode.
- uint8_t icm_

  Ice-detection mode.
- uint16_t icn_

  Ice-detection – temperature threshold test upper pressure boundary, in dBar.
- uint16_t ico_ [2]

  Ice-detection – ice-detection hold-pressure duration, in minutes.
- uint32_t icr_ [2]

  Ice-detection – .
- uint16_t ics_

  Ice-detection – temperature threshold test sample interval, in seconds.
- int16_t ict_

  Ice-detection – temperature threshold test temperature, in 1/100 degC.
- uint32_t icw_

  Ice-detection – iced-over month mask.
- uint16_t icx_

  Ice-detection – temperature threshold test lower pressure boundary, in dBar.
- uint16_t ilt_ [2]

  Ice-detection – duration since last successful comms urgency criteria, in days.
- uint16_t imm_

  Ice-detection – month mask.
- uint16_t imt_ [2]

  Ice-detection – percentage used storage urgency criteria.
- uint8_t isa_

  Ice-detection – .
- uint16_t isd_

  Ice-detection – .
- uint8_t ism_

  Ice-detection – surfacing achieved criteria mode.
- uint16_t iso_

  Ice-detection – duration between multiple surfacing attempts, in seconds.
- uint8_t isp_

  Ice-detection – multiple surfacing profile mode.
- uint8_t iss_ [2]

  Ice-detection – multiple surface attempts mode.
- uint16_t ist_

  Ice-detection – surface achieved salinity threshold, in 1/10 PSU.
- uint16_t isv_

  Ice-detection – .
- uint16_t isw_

  Ice-detection – .
- uint8_t iue_ [2]

  Ice-detection – urgency mode exit criteria.
- uint8_t mam_

  The motion processing unit (MPU) data acquisition mode mask.
- uint16_t **map_**

- uint16_t mat_ [2]

  The motion processing unit (MPU) sampling duration, in seconds.
- uint16_t mds_

  The maximum descent/fall/profile pressure, in dBar.
- uint16_t mnm_ [3]

  Number of cycles for mission phase.
- uint8_t mns_ [3]

  Next mission phase.
- uint16_t mpc_

  Cycle count for current mission phase.
- uint8_t mps_

  Current mission phase.
- static_vector< vector< uint8_t >, XMSG_MAX_MFA_MISS > msg_data_

  The mission configuration messages' raw data.
- uint8_t msg_version_

  The message version identifier.
- int16_t msn_

  The mission, dive, or cycle number for this mission configuration.
- uint16_t mtd_

  The initial trigger depth, in dBar.
- uint32_t **mts_**
- uint32_t mtt_

  The initial trigger timeout/interval, in milliseconds.
- ptime park_start_time_

  The start time of the park/drift state of the dive cycle.
- uint16_t **pbh_**
- uint16_t **pbl_**
- uint16_t **pc0_**
- uint16_t **pc1_**
- uint16_t pdt_

  The park/drift state data storage interval/timeout, in seconds.
- uint16_t **pfc_**
- uint16_t pfd_ [3]

  The park/drift state fall depth (i.e.
- uint8_t pfm_ [3]

  The park/drift state fall mode.
- uint16_t **pfr_**
- uint16_t **pft_** [3]
- uint16_t **pfv_** [3]
- uint16_t **pnb_**
- uint16_t **pnc_**
- uint16_t pns_

  The park/drift number.
- uint16_t **pp0_**
- uint16_t **pp1_**
- float **ppc_alpha_**
- float **ppc_ctccoeff_**
- float **ppc_tau_**
- float **ppc_tdelay_**
- uint8_t **ppe_**
- uint8_t psa_

  The park/drift state sampling mode.
- uint16_t **psd_**
- uint32_t psi_

  The park/drift state sample interval/timeout, in milliseconds.
- uint8_t **psm_**
- uint8_t **pss_**
- uint16_t **pst_**
- uint16_t **psv_**
- uint16_t **psw_**
- uint32_t **ptd_**
- uint32_t pth_ [3]

  The bit-encoded park/drift state hour timeout trigger(s).
- uint32_t pto_ [3]

The park/drift state timeout, in seconds.

- uint16_t **pv0_**
- uint16_t **pv5_**
- uint16_t **pvh_**
- uint16_t **pvl_**
- uint16_t **pxc_**
- uint8_t **sam_**
- uint16_t **san_**
- uint16_t **sao_**
- uint16_t **sap_**
- uint16_t **sax_**
- uint8_t sbm_

  The surface state beacon mode flag.
- uint16_t sbt_

  The surface state beacon interval timeout, in seconds.
- int16_t sdc_

  The surface state sensor depth compensation offset, in dBar.
- uint16_t sds_

  The surface state sampling storage duration/interval/timeout, in seconds.
- uint32_t **sdt_**
- uint8_t sensor_type_

  The sensor type identifier.
- uint16_t set_

  The surface state Iridium session timeout, in minutes.
- uint16_t sfn_

  The surface number.
- uint16_t sgt_

  The surface state GPS timeout, in minutes.
- uint16_t **spt_**
- uint16_t **ssa_**
- uint32_t ssi_

  The surface state sampling interval timeout, in milliseconds.
- uint16_t **ssp_**
- ptime surface_start_time_

  The start time of the surface state of the dive cycle.
- uint16_t wmt_

  WIMS timeout during surface state, in seconds.
- uint8_t xas_

  The profile data encode method.

10.100.1 Detailed Description

The ALAMO mission configuration (mission parameters) message class.

An instance of this class assembles the mission configuration X-messages transmitted by an instrument and decodes the mission parameters according to the instrument's firmware version.

10.100.2 Constructor & Destructor Documentation

10.100.2.1 XMfaMissionCfg()

```
util::xmsg::XMfaMissionCfg::XMfaMissionCfg ()
```

The default constructor.

References msg_data_, and XMSG_MAX_MFA_MISS.

10.100.2.2 ~XMfaMissionCfg()

```
util::xmsg::XMfaMissionCfg::~XMfaMissionCfg ()
```

The destructor.

10.100.3 Member Function Documentation

10.100.3.1 AssignMessage()

```
void util::xmsg::XMfaMissionCfg::AssignMessage (
            const vector< uint8_t > & data)
```

Assign a mission configuration message.

Parameters

in	*data*	The message.

References CATCH_BLOCK, DecodeXMsgData(), EXC_THROW, msg_data_, u32, and XMSG_MAX_MFA_MISS.

Here is the call graph for this function:

10.100.3.2 DecodeXMsgData()

```
void util::xmsg::XMfaMissionCfg::DecodeXMsgData (
            uint32_t fw_ver,
            uint8_t msg_idx,
            const vector< uint8_t > & data)
```

Decode the mission configuration message data.

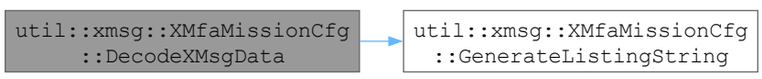
Parameters

in	*fw_ver*	The firmware version.
in	*msg_idx*	The message index.
in	*data*	The message data.

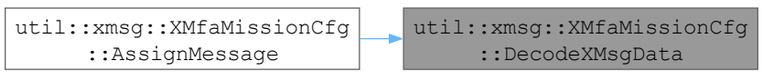
References CATCH_BLOCK, cpb_, cpn_, cpp_, EXC_THROW, GenerateListingString(), i16, ldbg, lwrn, s2000, u08, u16, u32, and XMSG_BAD_U16.

Referenced by AssignMessage().

Here is the call graph for this function:



Here is the caller graph for this function:



10.100.3.3 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

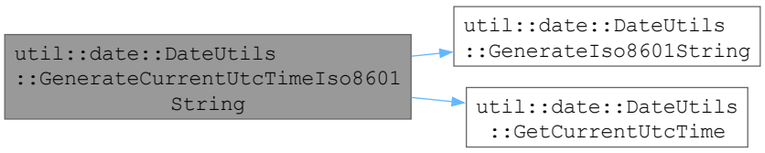
Returns

An ISO8601 format date/time string representation of the current time.

References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:

10.100.3.4 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

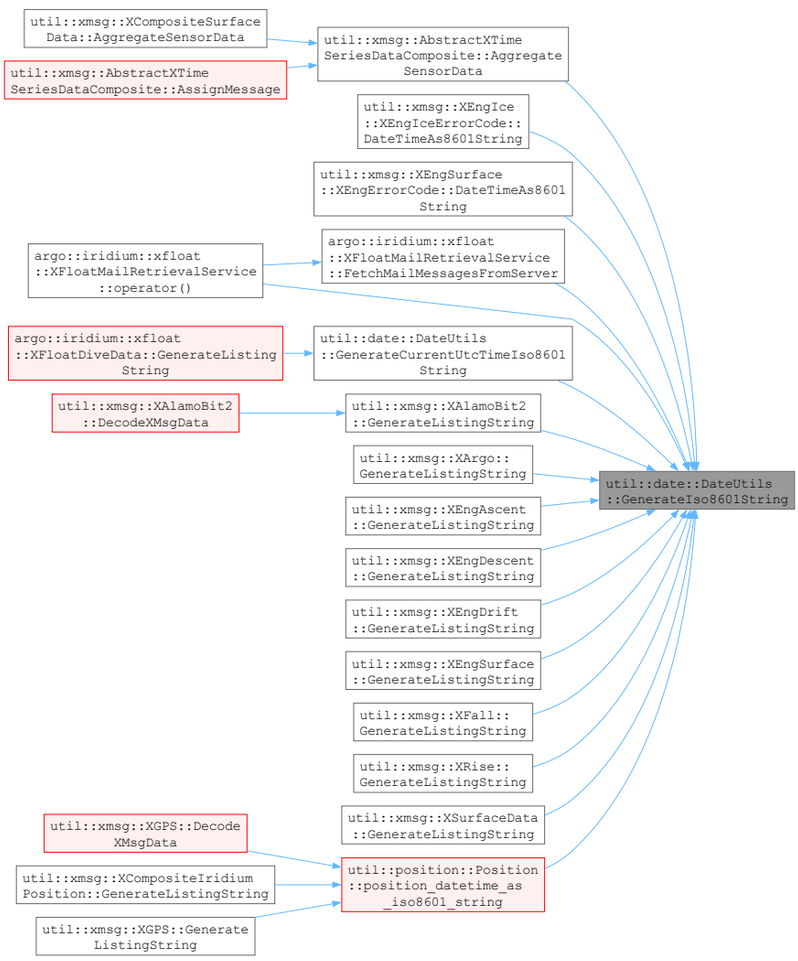
in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), util::xmsg::XEngIce::XEngIce
util::xmsg::XEngSurface::XEngErrorCode::DateTimeAs8601String(), argo::iridium::xfloat::XFloatMailRetrievalService::FetchMailMessages
util::date::DateUtils::GenerateCurrentUtcTimeIso8601String(), util::xmsg::XAlamoBit2::GenerateListingString(), util::xmsg::XArgo::Genera
util::xmsg::XEngAscent::GenerateListingString(), util::xmsg::XEngDescent::GenerateListingString(), util::xmsg::XEngDrift::GenerateListing
util::xmsg::XEngSurface::GenerateListingString(), util::xmsg::XFall::GenerateListingString(), util::xmsg::XRise::GenerateListingString(),
util::xmsg::XSurfaceData::GenerateListingString(), argo::iridium::xfloat::XFloatMailRetrievalService::operator()(), and
util::position::Position::position_datetime_as_iso8601_string().

Here is the caller graph for this function:



10.100.3.5 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref↩ _dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.100.3.6 GenerateListingString()

```
const string util::xmsg::XMfaMissionCfg::GenerateListingString (
            int whoi,
            int dive,
            int idx) const
```

Generate the mission configuration message listing string.

Parameters

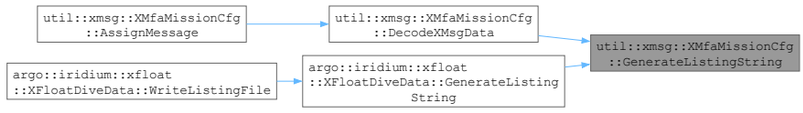
in	*whoi*	The instrument identifier.
in	*dive*	The dive cycle number
in	*idx*	

Returns

References CATCH_BLOCK, EXC_THROW, and lwrn.

Referenced by DecodeXMsgData(), and argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the caller graph for this function:



10.100.3.7 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

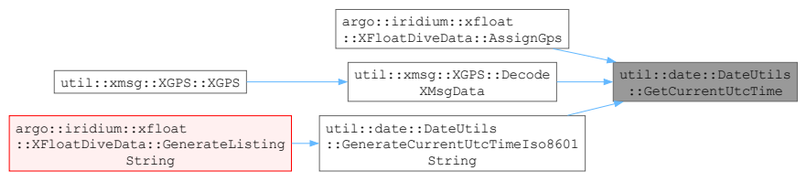
Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

Here is the caller graph for this function:



10.100.4 Member Data Documentation

10.100.4.1 aca_

```
uint16_t util::xmsg::XMfaMissionCfg::aca_  [private]
```

The motion processing unit (MPU) accelerometer sensitivity scale factor identifier.

10.100.4.2 acg_

```
uint16_t util::xmsg::XMfaMissionCfg::acg_  [private]
```

The motion processing unit (MPU) gyroscope sensitivity scale factor identifier.

10.100.4.3 acr_

```
uint16_t util::xmsg::XMfaMissionCfg::acr_  [private]
```

The motion processing unit (MPU) sample rate, in Hz.

10.100.4.4 add_

```
uint16_t util::xmsg::XMfaMissionCfg::add_  [private]
```

The ascent state data storage pressure interval, in dBar.

10.100.4.5 adt_

```
uint16_t util::xmsg::XMfaMissionCfg::adt_  [private]
```

The ascent state data storage interval timeout, in seconds.

10.100.4.6 apf_

```
uint16_t util::xmsg::XMfaMissionCfg::apf_  [private]
```

The ascent state pump off duration/interval/timeout, in seconds.

10.100.4.7 apn_

```
uint16_t util::xmsg::XMfaMissionCfg::apn_  [private]
```

The ascent state pump on duration/interval/timeout, in seconds.

10.100.4.8 apt_

```
uint8_t util::xmsg::XMfaMissionCfg::apt_  [private]
```

The auto-transmit mission configuration message flag.

10.100.4.9 arr_

```
uint16_t util::xmsg::XMfaMissionCfg::arr_  [private]
```

The ascent state rise rate, in centimeters per second.

10.100.4.10 ascent_start_time_

```
ptime util::xmsg::XMfaMissionCfg::ascent_start_time_  [private]
```

The start time of the ascent state of the dive cycle.

10.100.4.11 asd_

```
uint16_t util::xmsg::XMfaMissionCfg::asd_  [private]
```

The ascent state surface threshold pressure, in dBar.

10.100.4.12 asi_

```
uint32_t util::xmsg::XMfaMissionCfg::asi_  [private]
```

The ascent state sampling interval/timeout, in milliseconds.

10.100.4.13 asn_

```
uint16_t util::xmsg::XMfaMissionCfg::asn_  [private]
```

The ascent number.

10.100.4.14 btm_

```
uint8_t util::xmsg::XMfaMissionCfg::btm_  [private]
```

The bluetooth mode.

10.100.4.15 cms_

```
uint8_t util::xmsg::XMfaMissionCfg::cms_  [private]
```

The CTD profiling mode.

10.100.4.16 cpb_

```
uint16_t util::xmsg::XMfaMissionCfg::cpb_[3]  [private]
```

The CTD sampling period pressure boundaries, in dBar.

Referenced by DecodeXMsgData().

10.100.4.17 cpn_

```
uint16_t util::xmsg::XMfaMissionCfg::cpn_[3]  [private]
```

The CTD sampling period bin sizes, in 0.1 dBar.

Referenced by DecodeXMsgData().

10.100.4.18 cpp_

```
uint16_t util::xmsg::XMfaMissionCfg::cpp_[3]  [private]
```

The CTD sampling period interval, in milliseconds.

Referenced by DecodeXMsgData().

10.100.4.19 cps_

```
uint8_t util::xmsg::XMfaMissionCfg::cps_  [private]
```

The CTD profiling mode.

10.100.4.20 crd_

```
uint16_t util::xmsg::XMfaMissionCfg::crd_  [private]
```

The CTD raw sampling threshold, in dBar.

10.100.4.21 crs_

```
uint16_t util::xmsg::XMfaMissionCfg::crs_  [private]
```

The maximum number of raw samples to collect above the raw sampling threshold.

10.100.4.22 csp_

```
uint32_t util::xmsg::XMfaMissionCfg::csp_  [private]
```

The CTD continuous sampling period, in milliseconds.

10.100.4.23 cst_

```
uint8_t util::xmsg::XMfaMissionCfg::cst_  [private]
```

The CTD sampling type.

10.100.4.24 ctc_

```
uint8_t util::xmsg::XMfaMissionCfg::ctc_  [private]
```

The auxiliary temperature channel mode.

Note

Applies to RBR CTDs only.

10.100.4.25 ctf_

```
uint16_t util::xmsg::XMfaMissionCfg::ctf_  [private]
```

The profile cutoff pressure.

Todo Determine gain for profile cutoff pressure field.

Note

This field was added in firmware version 0x02006900.

10.100.4.26 ctl_

```
uint16_t util::xmsg::XMfaMissionCfg::ctl_  [private]
```

The pressure sensor offset reset lower pressure limit.

Todo Determine gain for pressure sensor offset reset lower pressure limit field.

Note

This field was added in firmware version 0x02006900.

10.100.4.27 ctu_

```
uint16_t util::xmsg::XMfaMissionCfg::ctu_  [private]
```

The pressure sensor offset reset lower pressure limit.

Todo Determine gain for pressure sensor offset reset lower pressure limit field.

Note

This field was added in firmware version 0x02006900.

10.100.4.28 ddb_

```
uint8_t util::xmsg::XMfaMissionCfg::ddb_  [private]
```

Diagnostic dive bypass mode.

10.100.4.29 ddd_

```
uint16_t util::xmsg::XMfaMissionCfg::ddd_  [private]
```

The descent state data storage pressure interval, in dBar.

10.100.4.30 ddt_

```
uint16_t util::xmsg::XMfaMissionCfg::ddt_  [private]
```

The descent state data storage interval, in seconds.

10.100.4.31 descend_start_time_

```
ptime util::xmsg::XMfaMissionCfg::descend_start_time_  [private]
```

The start time of the descend state of the dive cycle.

10.100.4.32 dft_

```
uint16_t util::xmsg::XMfaMissionCfg::dft_[3]  [private]
```

The descent state fall timeout, in seconds.

10.100.4.33 dns_

```
uint16_t util::xmsg::XMfaMissionCfg::dns_  [private]
```

The descent number.

10.100.4.34 dsd_

```
uint16_t util::xmsg::XMfaMissionCfg::dsd_[3]  [private]
```

The descent state start pressure, in dBar.

10.100.4.35 dsi_

```
uint32_t util::xmsg::XMfaMissionCfg::dsi_  [private]
```

The descent state sampling interval, in milliseconds.

10.100.4.36 dst_

```
uint16_t util::xmsg::XMfaMissionCfg::dst_[3]  [private]
```

The descent state start timeout, in seconds.

10.100.4.37 dtd_

```
uint16_t util::xmsg::XMfaMissionCfg::dtd_[3]  [private]
```

The target descent/drift/park pressure, in dBar.

10.100.4.38 fw_version_

```
uint32_t util::xmsg::XMfaMissionCfg::fw_version_  [private]
```

The software version identifier.

10.100.4.39 iat_

```
uint16_t util::xmsg::XMfaMissionCfg::iat_  [private]
```

Ice-detection – .

10.100.4.40 ica_

```
uint16_t util::xmsg::XMfaMissionCfg::ica_[2]  [private]
```

Ice-detection – surface attempts.

10.100.4.41 icb_

```
uint16_t util::xmsg::XMfaMissionCfg::icb_[2]  [private]
```

Ice-detection – cycles between surface attempts.

10.100.4.42 icd_

```
uint16_t util::xmsg::XMfaMissionCfg::icd_[2]  [private]
```

Ice-detection – hold pressure, in dBar.

10.100.4.43 icf_

```
uint32_t util::xmsg::XMfaMissionCfg::icf_  [private]
```

Ice-detection – ice-free month mask.

10.100.4.44 icg_

```
uint8_t util::xmsg::XMfaMissionCfg::icg_[2]  [private]
```

Ice-detection – seek mode.

10.100.4.45 icm_

```
uint8_t util::xmsg::XMfaMissionCfg::icm_  [private]
```

Ice-detection mode.

10.100.4.46 icn_

```
uint16_t util::xmsg::XMfaMissionCfg::icn_  [private]
```

Ice-detection – temperature threshold test upper pressure boundary, in dBar.

10.100.4.47 ico_

```
uint16_t util::xmsg::XMfaMissionCfg::ico_[2]  [private]
```

Ice-detection – ice-detection hold-pressure duration, in minutes.

10.100.4.48 icr_

```
uint32_t util::xmsg::XMfaMissionCfg::icr_[2]  [private]
```

Ice-detection – .

10.100.4.49 ics_

```
uint16_t util::xmsg::XMfaMissionCfg::ics_  [private]
```

Ice-detection – temperature threshold test sample interval, in seconds.

10.100.4.50 ict_

```
int16_t util::xmsg::XMfaMissionCfg::ict_  [private]
```

Ice-detection – temperature threshold test temperature, in 1/100 degC.

10.100.4.51 icw_

```
uint32_t util::xmsg::XMfaMissionCfg::icw_  [private]
```

Ice-detection – iced-over month mask.

10.100.4.52 icx_

```
uint16_t util::xmsg::XMfaMissionCfg::icx_  [private]
```

Ice-detection – temperature threshold test lower pressure boundary, in dBar.

10.100.4.53 ilt_

```
uint16_t util::xmsg::XMfaMissionCfg::ilt_[2]  [private]
```

Ice-detection – duration since last successful comms urgency criteria, in days.

10.100.4.54 imm_

```
uint16_t util::xmsg::XMfaMissionCfg::imm_  [private]
```

Ice-detection – month mask.

10.100.4.55 imt_

```
uint16_t util::xmsg::XMfaMissionCfg::imt_[2]  [private]
```

Ice-detection – percentage used storage urgency criteria.

10.100.4.56 isa_

```
uint8_t util::xmsg::XMfaMissionCfg::isa_  [private]
```

Ice-detection – .

10.100.4.57 isd_

```
uint16_t util::xmsg::XMfaMissionCfg::isd_  [private]
```

Ice-detection – .

10.100.4.58 ism_

```
uint8_t util::xmsg::XMfaMissionCfg::ism_  [private]
```

Ice-detection – surfacing achieved criteria mode.

10.100.4.59 iso_

```
uint16_t util::xmsg::XMfaMissionCfg::iso_  [private]
```

Ice-detection – duration between multiple surfacing attempts, in seconds.

10.100.4.60 isp_

```
uint8_t util::xmsg::XMfaMissionCfg::isp_  [private]
```

Ice-detection – multiple surfacing profile mode.

10.100.4.61 iss_

```
uint8_t util::xmsg::XMfaMissionCfg::iss_[2]  [private]
```

Ice-detection – multiple surface attempts mode.

10.100.4.62 ist_

```
uint16_t util::xmsg::XMfaMissionCfg::ist_  [private]
```

Ice-detection – surface achieved salinity threshold, in 1/10 PSU.

10.100.4.63 isv_

```
uint16_t util::xmsg::XMfaMissionCfg::isv_  [private]
```

Ice-detection – .

10.100.4.64 isw_

```
uint16_t util::xmsg::XMfaMissionCfg::isw_  [private]
```

Ice-detection – .

10.100.4.65 iue_

```
uint8_t util::xmsg::XMfaMissionCfg::iue_[2]  [private]
```

Ice-detection – urgency mode exit criteria.

10.100.4.66 mam_

```
uint8_t util::xmsg::XMfaMissionCfg::mam_  [private]
```

The motion processing unit (MPU) data acquisition mode mask.

10.100.4.67 mat_

```
uint16_t util::xmsg::XMfaMissionCfg::mat_[2]  [private]
```

The motion processing unit (MPU) sampling duration, in seconds.

10.100.4.68 mds_

```
uint16_t util::xmsg::XMfaMissionCfg::mds_  [private]
```

The maximum descent/fall/profile pressure, in dBar.

10.100.4.69 mnm_

```
uint16_t util::xmsg::XMfaMissionCfg::mnm_[3]  [private]
```

Number of cycles for mission phase.

10.100.4.70 mns_

```
uint8_t util::xmsg::XMfaMissionCfg::mns_[3]  [private]
```

Next mission phase.

10.100.4.71 mpc_

```
uint16_t util::xmsg::XMfaMissionCfg::mpc_  [private]
```

Cycle count for current mission phase.

e

10.100.4.72 mps_

```
uint8_t util::xmsg::XMfaMissionCfg::mps_  [private]
```

Current mission phase.

10.100.4.73 msg_data_

```
static_vector<vector<uint8_t>, XMSG_MAX_MFA_MISS> util::xmsg::XMfaMissionCfg::msg_data_  [private]
```

The mission configuration messages' raw data.

Referenced by XMfaMissionCfg(), and AssignMessage().

10.100.4.74 msg_version_

```
uint8_t util::xmsg::XMfaMissionCfg::msg_version_  [private]
```

The message version identifier.

10.100.4.75 msn_

```
int16_t util::xmsg::XMfaMissionCfg::msn_  [private]
```

The mission, dive, or cycle number for this mission configuration.

10.100.4.76 mtd_

```
uint16_t util::xmsg::XMfaMissionCfg::mtd_  [private]
```

The initial trigger depth, in dBar.

10.100.4.77 mtt_

```
uint32_t util::xmsg::XMfaMissionCfg::mtt_  [private]
```

The initial trigger timeout/interval, in milliseconds.

10.100.4.78 park_start_time_

```
ptime util::xmsg::XMfaMissionCfg::park_start_time_  [private]
```

The start time of the park/drift state of the dive cycle.

10.100.4.79 pdt_

```
uint16_t util::xmsg::XMfaMissionCfg::pdt_  [private]
```

The park/drift state data storage interval/timeout, in seconds.

10.100.4.80 pfd_

```
uint16_t util::xmsg::XMfaMissionCfg::pfd_[3]  [private]
```

The park/drift state fall depth (i.e.

profile depth), in dBar.

10.100.4.81 pfm_

```
uint8_t util::xmsg::XMfaMissionCfg::pfm_[3]  [private]
```

The park/drift state fall mode.

10.100.4.82 pns_

```
uint16_t util::xmsg::XMfaMissionCfg::pns_  [private]
```

The park/drift number.

10.100.4.83 psa_

```
uint8_t util::xmsg::XMfaMissionCfg::psa_  [private]
```

The park/drift state sampling mode.

10.100.4.84 psi_

```
uint32_t util::xmsg::XMfaMissionCfg::psi_  [private]
```

The park/drift state sample interval/timeout, in milliseconds.

10.100.4.85 pth_

```
uint32_t util::xmsg::XMfaMissionCfg::pth_[3]  [private]
```

The bit-encoded park/drift state hour timeout trigger(s).

10.100.4.86 pto_

```
uint32_t util::xmsg::XMfaMissionCfg::pto_[3]  [private]
```

The park/drift state timeout, in seconds.

10.100.4.87 sbm_

```
uint8_t util::xmsg::XMfaMissionCfg::sbm_  [private]
```

The surface state beacon mode flag.

10.100.4.88 sbt_

```
uint16_t util::xmsg::XMfaMissionCfg::sbt_  [private]
```

The surface state beacon interval timeout, in seconds.

10.100.4.89 sdc_

```
int16_t util::xmsg::XMfaMissionCfg::sdc_  [private]
```

The surface state sensor depth compensation offset, in dBar.

10.100.4.90 sds_

```
uint16_t util::xmsg::XMfaMissionCfg::sds_  [private]
```

The surface state sampling storage duration/interval/timeout, in seconds.

10.100.4.91 sensor_type_

```
uint8_t util::xmsg::XMfaMissionCfg::sensor_type_  [private]
```

The sensor type identifier.

10.100.4.92 set_

```
uint16_t util::xmsg::XMfaMissionCfg::set_  [private]
```

The surface state Iridium session timeout, in minutes.

10.100.4.93 sfn_

```
uint16_t util::xmsg::XMfaMissionCfg::sfn_  [private]
```

The surface number.

10.100.4.94 sgt_

```
uint16_t util::xmsg::XMfaMissionCfg::sgt_  [private]
```

The surface state GPS timeout, in minutes.

10.100.4.95 ssi_

```
uint32_t util::xmsg::XMfaMissionCfg::ssi_  [private]
```

The surface state sampling interval timeout, in milliseconds.

10.100.4.96 surface_start_time_

```
ptime util::xmsg::XMfaMissionCfg::surface_start_time_  [private]
```

The start time of the surface state of the dive cycle.

10.100.4.97 wmt_

```
uint16_t util::xmsg::XMfaMissionCfg::wmt_  [private]
```

WIMS timeout during surface state, in seconds.

10.100.4.98 xas_

```
uint8_t util::xmsg::XMfaMissionCfg::xas_  [private]
```

The profile data encode method.

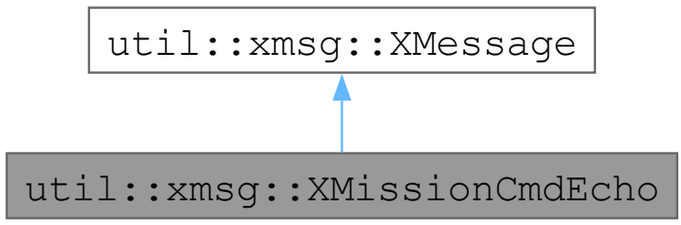
10.101 util::xmsg::XMissionCmdEcho Class Reference

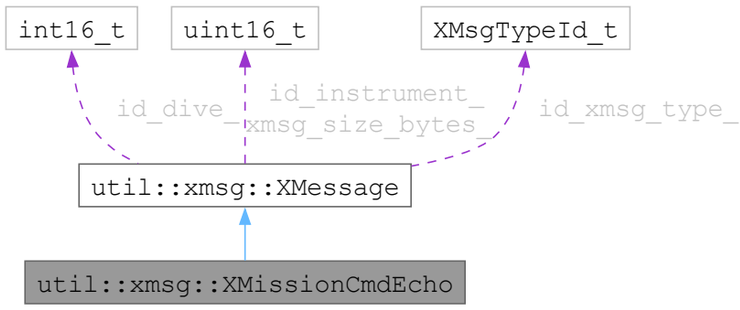
Class representing a ground station command echo-back X-Message.

```
#include <XMissionCmdEcho.h>
```

Inheritance diagram for util::xmsg::XMissionCmdEcho:



Collaboration diagram for util::xmsg::XMissionCmdEcho:



Public Member Functions

- XMissionCmdEcho (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)

  The parameterized constructor.
- ~XMissionCmdEcho ()

  The destructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)

  Check the X-message for the correct ID, minimum size, and message terminator.
- void DecodeXMsgData (const vector< uint8_t > &data)

  Decode the ground station command echo-back X-Message from the binary message data.
- const string GenerateListingString () const

  Generate a listing string representation of the ground station command echo-back message.

- int16_t id_dive () const

  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const

  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const

  Get the enumerated X-Message type identifier.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Protected Member Functions

- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.

Private Attributes

- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.101.1 Detailed Description

Class representing a ground station command echo-back X-Message.

10.101.2 Constructor & Destructor Documentation

10.101.2.1 XMissionCmdEcho()

```
util::xmsg::XMissionCmdEcho::XMissionCmdEcho (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

The parameterized constructor.

Parameters

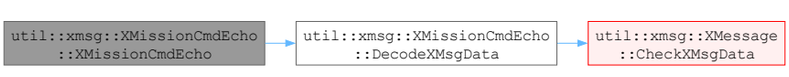
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.101.2.2 ~XMissionCmdEcho()

```
util::xmsg::XMissionCmdEcho::~XMissionCmdEcho ()  [inline]
```

The destructor.

10.101.3 Member Function Documentation

10.101.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::XMessage::set_xmsg_size_byte
u16, and util::xmsg::XMessage::xmsg_size_bytes().

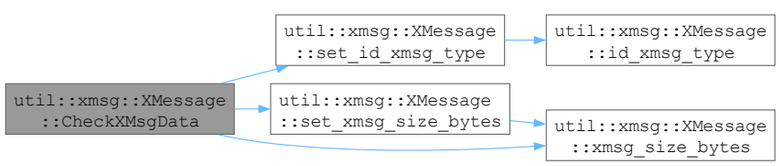
Here is the call graph for this function:



10.101.3.2 DecodeXMsgData()

```
void util::xmsg::XMissionCmdEcho::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode the ground station command echo-back X-Message from the binary message data.

Parameters

in	*data*	The binary message data to decode.

Exceptions

util::log::MessageException	if the message is invalid or an error occurs during decoding.

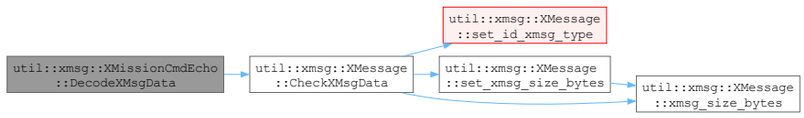
Todo Implement the functionality to decode the ground station command echo-back X-Message from the binary message data.

Implements util::xmsg::XMessage.

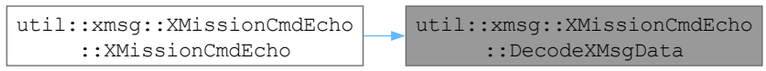
References CATCH_BLOCK, util::xmsg::XMessage::CheckXMsgData(), and util::xmsg::XMSG_TYPE_ID_MISS_CMD_ECHO.

Referenced by XMissionCmdEcho().

Here is the call graph for this function:



Here is the caller graph for this function:



10.101.3.3 GenerateListingString()

```
const string util::xmsg::XMissionCmdEcho::GenerateListingString () const  [inline]
```

Generate a listing string representation of the ground station command echo-back message.

Returns

A listing string representation of the ground station command echo-back message.

Todo Implement the functionality for generating a listing string for the ground station upload command echo-back message.

References CATCH_BLOCK.

10.101.3.4 id_dive()

```
int16_t util::xmsg::XMessage::id_dive () const  [inline], [inherited]
```

Get the dive or cycle number of this X-Message.

Returns

The dive or cycle number of this X-Message.

References util::xmsg::XMessage::id_dive_.

Referenced by util::xmsg::XGPS::DeleteFromDatabase(), util::xmsg::XArgo::GenerateListingString(), util::xmsg::XEngAscent::GenerateLis

10.101.4 Member Data Documentation

10.101.4.1 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.101.4.2 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.101.4.3 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.101.4.4 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

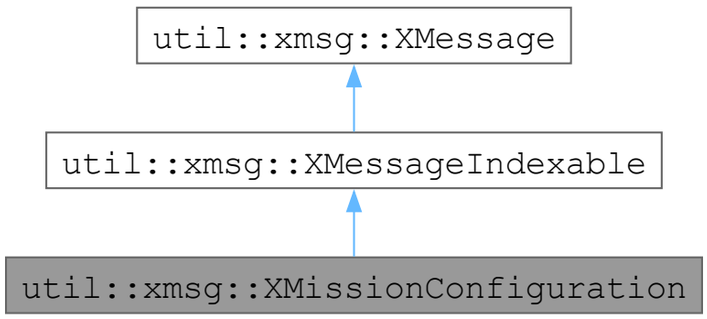
- data/xmsg/XMissionCmdEcho.h

10.102 util::xmsg::XMissionConfiguration Class Reference

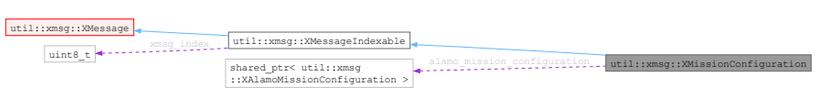
Class representing a mission configuration X-Message.

```
#include <XMissionConfiguration.h>
```

Inheritance diagram for util::xmsg::XMissionConfiguration:



Collaboration diagram for util::xmsg::XMissionConfiguration:



Public Member Functions

- XMissionConfiguration (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)
  The parameterized constructor.
- ~XMissionConfiguration ()
  The destructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)
  Check the X-message for the correct ID, minimum size, and message terminator.
- void DecodeXMsgData (const vector< uint8_t > &data)
  Decode the mission configuration message from the binary data.
- const string GenerateListingString () const
  Get the listing entry string for this mission configuration X-Message.
- int16_t id_dive () const
  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const
  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const
  Get the enumerated X-Message type identifier.
- uint8_t xmsg_index () const
  Get the index of this X-Message.
- uint16_t xmsg_size_bytes () const
  Get the size of the X-Message, in bytes.

Protected Member Functions

- void set_id_dive (int16_t id_dive)
  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)
  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)
  Set the X-Message type identifier.
- void set_xmsg_index (uint8_t xmsg_index)
  Set the index of this X-Message.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)
  Set the size of the X-Message, in bytes.

Private Attributes

- shared_ptr< XAlamoMissionConfiguration > alamo_mission_configuration_
  A shared pointer to the ALAMO mission configuration object.
- int16_t id_dive_
  The dive or cycle number of this message.
- uint16_t id_instrument_
  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_
  The X-message type identifier.
- uint8_t xmsg_index_
  The index of this X-Message.
- uint16_t xmsg_size_bytes_
  The size of the X message, in bytes.

10.102.1 Detailed Description

Class representing a mission configuration X-Message.

Note

This object supports both ALAMO and Solo-II mission configurations.

10.102.2 Constructor & Destructor Documentation

10.102.2.1 XMissionConfiguration()

```
util::xmsg::XMissionConfiguration::XMissionConfiguration (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

The parameterized constructor.

Parameters

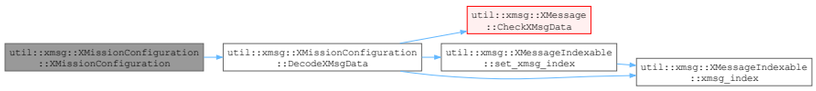
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary mission configuration X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.102.2.2 ~XMissionConfiguration()

```
util::xmsg::XMissionConfiguration::~XMissionConfiguration ()  [inline]
```

The destructor.

10.102.3 Member Function Documentation

10.102.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::XMessage::set_xmsg_size_byte
u16, and util::xmsg::XMessage::xmsg_size_bytes().

```
void util::xmsg::XMessage::set_id_dive (
            int16_t id_dive)  [inline], [protected], [inherited]
```

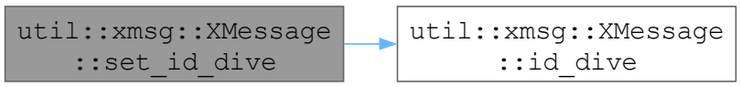
Set the dive or cycle number of this message.

Parameters

in	*id_dive*	The dive or cycle number of this message to set.

References util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::id_dive_.

Here is the call graph for this function:



10.102.3.8 set_id_instrument()

```
void util::xmsg::XMessage::set_id_instrument (
            uint16_t id_instrument)  [inline], [protected], [inherited]
```

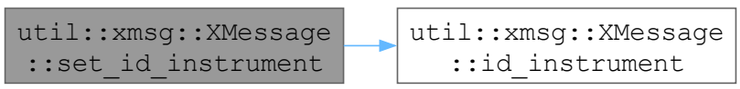
Set the unique instrument identifier.

Parameters

in	*id_instrument*	The unique instrument identifier to set.

References util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::id_instrument_.

Here is the call graph for this function:



10.102.3.9 set_id_xmsg_type()

```
void util::xmsg::XMessage::set_id_xmsg_type (
            XMsgTypeId_t id_xmsg_type)  [inline], [protected], [inherited]
```

Set the X-Message type identifier.

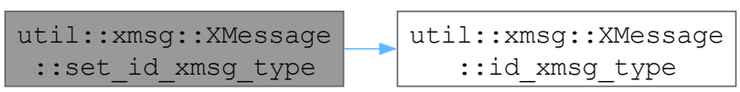
Parameters

in	*id_xmsg_type*	The X-Message type identifier to set.

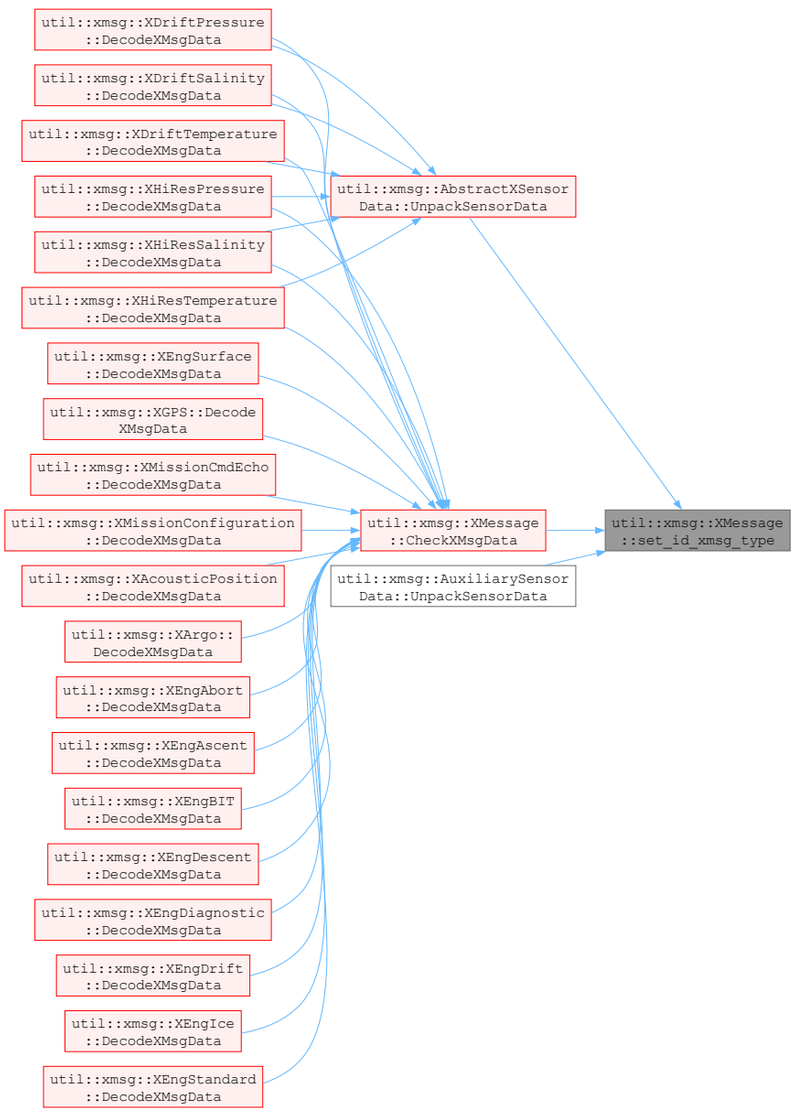
References util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::id_xmsg_type_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

Here is the call graph for this function:



Here is the caller graph for this function:



10.102.3.10 set_xmsg_index()

```
void util::xmsg::XMessageIndexable::set_xmsg_index (
            uint8_t xmsg_index)  [inline], [protected], [inherited]
```

Set the index of this X-Message.

Parameters

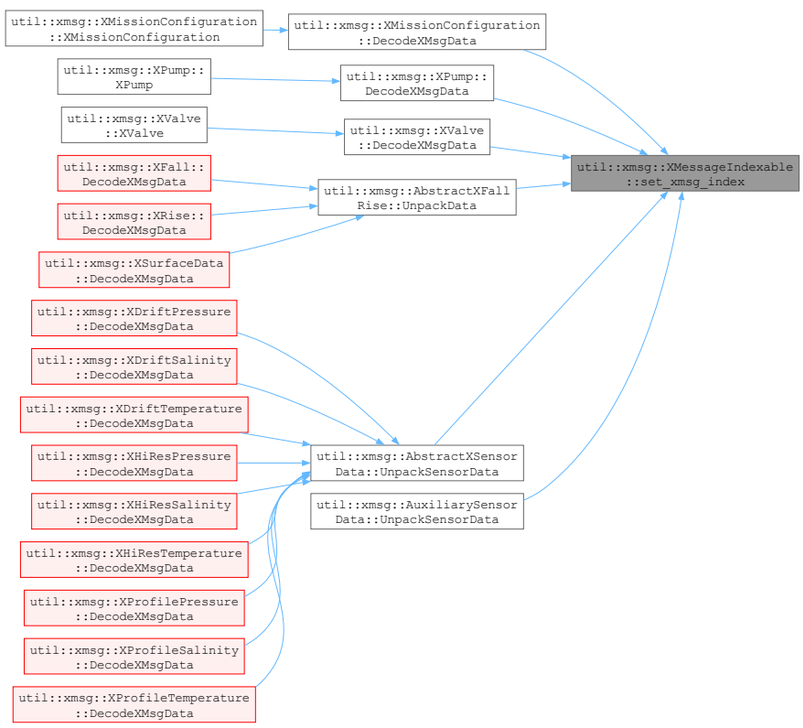
in	*xmsg_index*	The index of this X-Message.

References util::xmsg::XMessageIndexable::xmsg_index(), and util::xmsg::XMessageIndexable::xmsg_index_.

Referenced by DecodeXMsgData(), util::xmsg::XPump::DecodeXMsgData(), util::xmsg::XValve::DecodeXMsgData(), util::xmsg::AbstractXFallRise::UnpackData(), util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData

Here is the call graph for this function:

Here is the caller graph for this function:



10.102.3.11 set_xmsg_size_bytes()

```
void util::xmsg::XMessage::set_xmsg_size_bytes (
            uint16_t xmsg_size_bytes)  [inline], [protected], [inherited]
```

Set the size of the X-Message, in bytes.

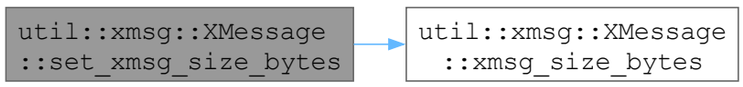
Parameters

in	*xmsg_size_bytes*	The size of the X-Message to set, in bytes.

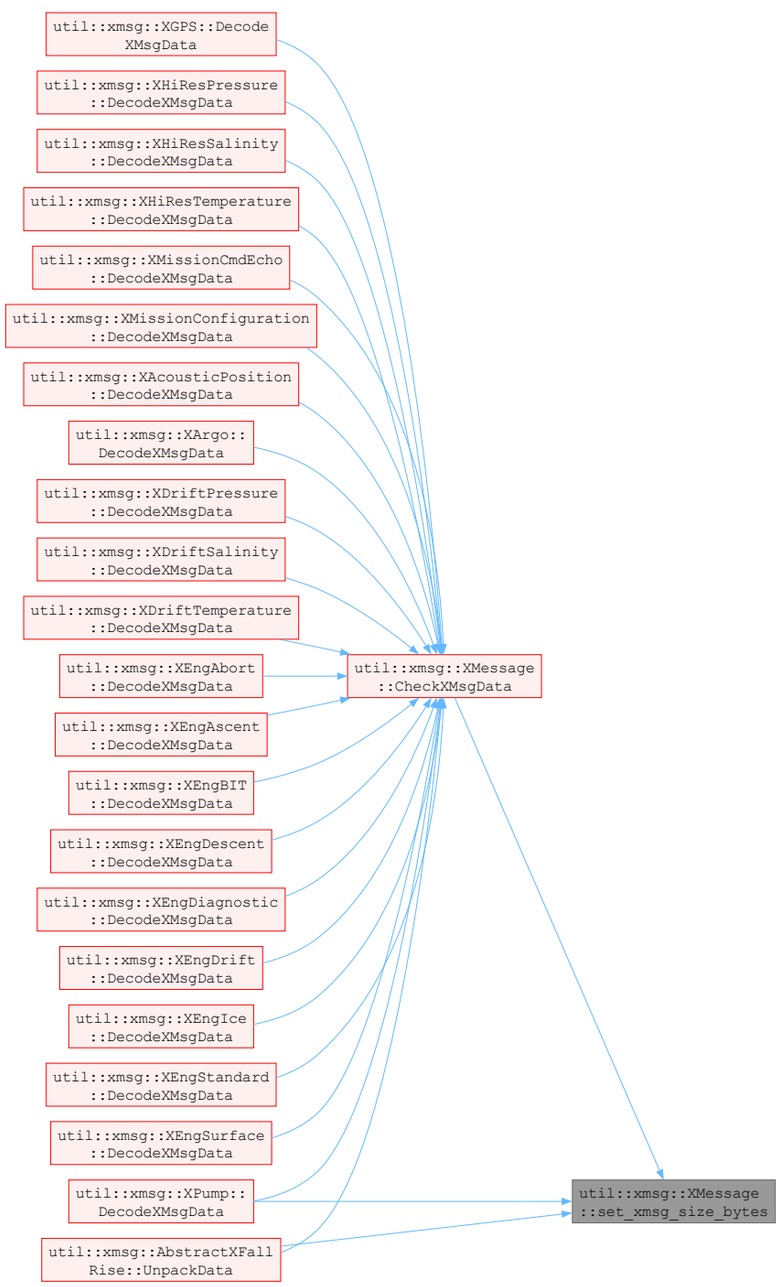
References util::xmsg::XMessage::xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), util::xmsg::XPump::DecodeXMsgData(), and util::xmsg::AbstractXFallRise::Unpa

Here is the call graph for this function:



Here is the caller graph for this function:



10.102.3.12 xmsg_index()

```
uint8_t util::xmsg::XMessageIndexable::xmsg_index () const  [inline], [inherited]
```

Get the index of this X-Message.

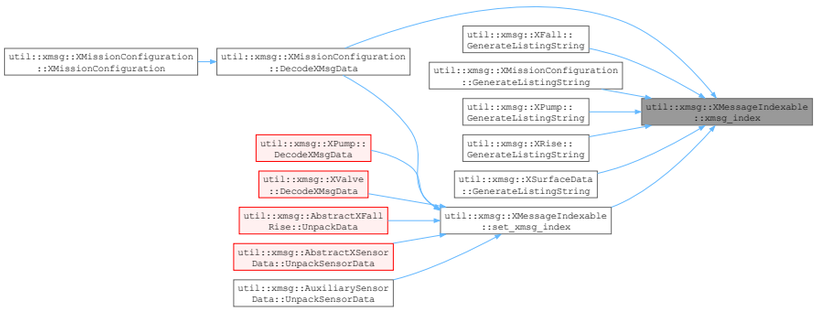
Returns

The index of this X-Message.

References util::xmsg::XMessageIndexable::xmsg_index_.

Referenced by DecodeXMsgData(), util::xmsg::XFall::GenerateListingString(), GenerateListingString(), util::xmsg::XPump::GenerateListing
util::xmsg::XRise::GenerateListingString(), util::xmsg::XSurfaceData::GenerateListingString(), and util::xmsg::XMessageIndexable::set_xm

Here is the caller graph for this function:



10.102.3.13 xmsg_size_bytes()

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes () const  [inline], [inherited]
```

Get the size of the X-Message, in bytes.

Returns

The size of the X-Message, in bytes.

References util::xmsg::XMessage::xmsg_size_bytes_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), util::xmsg::XArgo::DecodeXMsgData(), util::xmsg::XEngDescent::DecodeXMsgI
util::xmsg::XEngIce::DecodeXMsgData(), util::xmsg::XEngSurface::DecodeXMsgData(), util::xmsg::XPump::DecodeXMsgData(),

10.102.4 Member Data Documentation

10.102.4.1 alamo_mission_configuration_

```
shared_ptr<XAlamoMissionConfiguration> util::xmsg::XMissionConfiguration::alamo_mission_configuration↩
_  [private]
```

A shared pointer to the ALAMO mission configuration object.

Note

This pointer is only used for ALAMO-type mission configuration messages. If this is not an ALAMO-type message, then this pointer will be null.

Referenced by DecodeXMsgData(), and GenerateListingString().

10.102.4.2 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.102.4.3 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.102.4.4 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.102.4.5 xmsg_index_

```
uint8_t util::xmsg::XMessageIndexable::xmsg_index_  [private], [inherited]
```

The index of this X-Message.

Referenced by util::xmsg::XMessageIndexable::set_xmsg_index(), and util::xmsg::XMessageIndexable::xmsg_index().

10.102.4.6 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

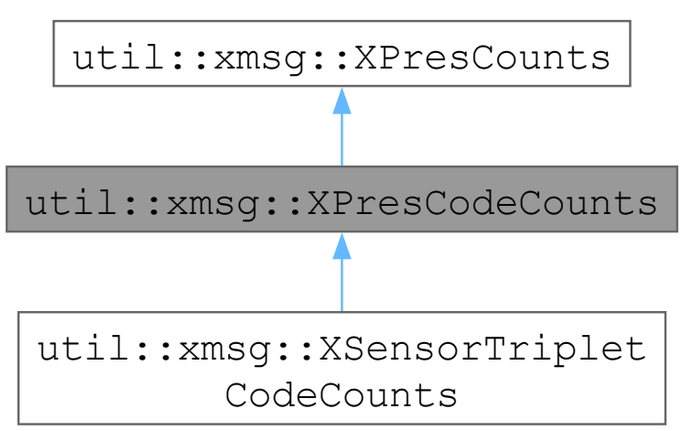
- data/xmsg/XMissionConfiguration.h

10.103 util::xmsg::XPresCodeCounts Class Reference

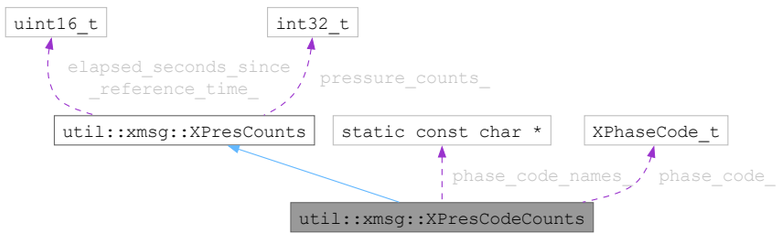
Class representing a raw pressure measurement and phase code for a rise or fall data X-Message.

```
#include <XPresCodeCounts.h>
```

Inheritance diagram for util::xmsg::XPresCodeCounts:



Collaboration diagram for util::xmsg::XPresCodeCounts:



Public Member Functions

- XPresCodeCounts (uint16_t sec, XPhaseCode_t code, int32_t counts)
  The constructor.
- ~XPresCodeCounts ()
  The destructor.
- uint16_t elapsed_seconds_since_reference_time () const
  Get the elapsed time since the reference time, in seconds.
- const string GenerateListingString (uint16_t pg, uint16_t po, float pc) const
  Generate a listing entry string from this pressure measurement object.
- XPhaseCode_t phase_code () const
  Get the phase code.
- const char * phase_code_name () const
  Get the phase code name C-sting.
- int32_t **pressure_counts** () const
- template<typename T = float>
  T PressureValue (uint16_t pg, uint16_t po, float pres_corr) const
  Get the measured pressure value, in dBar.

Static Public Member Functions

- static const char * GetPhaseCodeName (XPhaseCode_t code)
  Get the phase code name C-string for a given phase code value.

Private Attributes

- uint16_t elapsed_seconds_since_reference_time_
  The elapsed time since the reference time, in seconds.
- XPhaseCode_t phase_code_
  The phase code of this pressure measurement.
- int32_t pressure_counts_
  The pressure measurement, in raw sensor counts.

Static Private Attributes

- static const char * phase_code_names_ [ ]
  The phase code names.

10.103.1 Detailed Description

Class representing a raw pressure measurement and phase code for a rise or fall data X-Message.

10.103.2 Constructor & Destructor Documentation

10.103.2.1 XPresCodeCounts()

```
util::xmsg::XPresCodeCounts::XPresCodeCounts (
            uint16_t sec,
            XPhaseCode_t code,
            int32_t counts)  [inline]
```

The constructor.

Parameters

in	*sec*	The elapsed time since the reference time, in seconds.
in	*code*	The phase code of this pressure measurement.
in	*counts*	The pressure measurement, in raw sensor counts.

10.103.2.2 ~XPresCodeCounts()

```
util::xmsg::XPresCodeCounts::~XPresCodeCounts ()  [inline]
```

The destructor.

10.103.3 Member Function Documentation

10.103.3.1 elapsed_seconds_since_reference_time()

```
uint16_t util::xmsg::XPresCounts::elapsed_seconds_since_reference_time () const  [inline], [inherited]
```

Get the elapsed time since the reference time, in seconds.

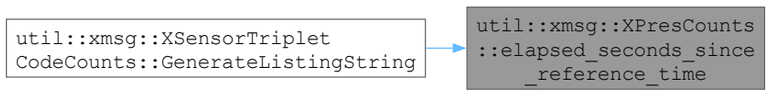
Returns

The elapsed time since the reference time, in seconds.

References util::xmsg::XPresCounts::elapsed_seconds_since_reference_time_.

Referenced by util::xmsg::XSensorTripletCodeCounts::GenerateListingString().

Here is the caller graph for this function:



10.103.3.2 GenerateListingString()

```
const string util::xmsg::XPresCodeCounts::GenerateListingString (
            uint16_t pg,
            uint16_t po,
            float pc) const  [inline]
```

Generate a listing entry string from this pressure measurement object.

Parameters

in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Exceptions

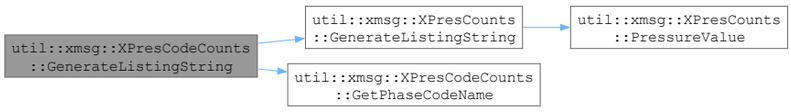
log::MessageException	if an error occurs while generating the listing string.

Returns

A listing entry string representation of this pressure measurement object.

References CATCH_BLOCK, util::xmsg::XPresCounts::GenerateListingString(), GetPhaseCodeName(), and phase_code_.

Here is the call graph for this function:



10.103.3.3 GetPhaseCodeName()

```
static const char * util::xmsg::XPresCodeCounts::GetPhaseCodeName (
            XPhaseCode_t code)  [inline], [static]
```

Get the phase code name C-string for a given phase code value.

Parameters

in	*code*	The phase code.

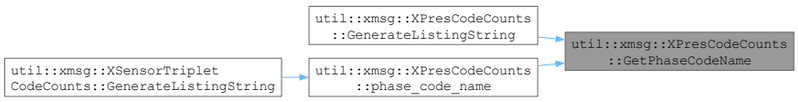
Returns

The phase code name C-string for the given phase code value.

References CATCH_BLOCK, EXC_THROW, and phase_code_names_.

Referenced by GenerateListingString(), and phase_code_name().

Here is the caller graph for this function:



10.103.3.4 phase_code()

```
XPhaseCode_t util::xmsg::XPresCodeCounts::phase_code () const  [inline]
```

Get the phase code.

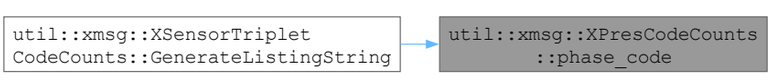
Returns

The phase code.

References phase_code_.

Referenced by util::xmsg::XSensorTripletCodeCounts::GenerateListingString().

Here is the caller graph for this function:



10.103.3.5 phase_code_name()

```
const char * util::xmsg::XPresCodeCounts::phase_code_name () const  [inline]
```

Get the phase code name C-sting.

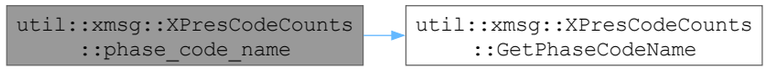
Returns

The phase code name C-sting.

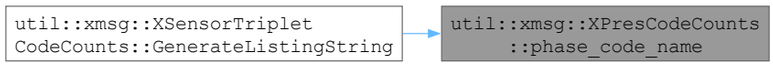
References GetPhaseCodeName(), and phase_code_.

Referenced by util::xmsg::XSensorTripletCodeCounts::GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:



10.103.3.6 PressureValue()

```
template<typename T = float>
T util::xmsg::XPresCounts::PressureValue (
            uint16_t pg,
            uint16_t po,
            float pres_corr) const  [inline], [inherited]
```

Get the measured pressure value, in dBar.

Parameters

in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*pres_corr*	The pressure correction, in dBar, to be subtracted computed pressure value.

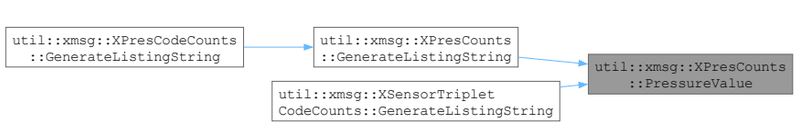
Returns

The measured pressure value, in dBar.

References util::xmsg::XPresCounts::pressure_counts_, XMSG_SENS_BAD_PRES, and XMSG_SENS_MAX_PRES.

Referenced by util::xmsg::XPresCounts::GenerateListingString(), and util::xmsg::XSensorTripletCodeCounts::GenerateListingString().

Here is the caller graph for this function:



10.103.4 Member Data Documentation

10.103.4.1 elapsed_seconds_since_reference_time_

```
uint16_t util::xmsg::XPresCounts::elapsed_seconds_since_reference_time_  [private], [inherited]
```

The elapsed time since the reference time, in seconds.

Referenced by util::xmsg::XPresCounts::elapsed_seconds_since_reference_time(), and util::xmsg::XPresCounts::GenerateListingString()

10.103.4.2 phase_code_

```
XPhaseCode_t util::xmsg::XPresCodeCounts::phase_code_  [private]
```

The phase code of this pressure measurement.

Referenced by GenerateListingString(), phase_code(), and phase_code_name().

10.103.4.3 phase_code_names_

```
const char * util::xmsg::XPresCodeCounts::phase_code_names_  [static], [private]
```

Initial value:

```
= {
        "unknown",
        "start of descent",
        "first descent pump",
        "seek to drift pres",
        "start of drift",
        "seek during drift",
        "start of descent to profile",
        "start of ascent",
        "end of ascent",
        "ice turn-around",
        "descending",
        "drift/park",
        "descending to profile",
        "ascending",
        "surface",
        "invalid phase code"
        }
```

The phase code names.

Referenced by GetPhaseCodeName().

10.103.4.4 pressure_counts_

```
int32_t util::xmsg::XPresCounts::pressure_counts_  [private], [inherited]
```

The pressure measurement, in raw sensor counts.

Referenced by util::xmsg::XPresCounts::PressureValue().

The documentation for this class was generated from the following files:

- data/xmsg/common/XPresCodeCounts.h
- data/xmsg/common/XPresCodeCounts.cpp

10.104 util::xmsg::XPresCounts Class Reference

Class representing a raw pressure measurement for a rise or fall data X-Message.

`#include <XPresCounts.h>`

10.104.1 Detailed Description

Class representing a raw pressure measurement for a rise or fall data X-Message.

10.104.2 Constructor & Destructor Documentation

10.104.2.1 XPresCounts()

```
util::xmsg::XPresCounts::XPresCounts (
            uint16_t sec,
            int32_t counts)  [inline]
```

The parameterized constructor.

Parameters

in	*sec*	The elapsed time since the reference time, in seconds.
in	*counts*	The pressure measurement, in raw counts.

10.104.2.2 ~XPresCounts()

```
util::xmsg::XPresCounts::~XPresCounts ()  [inline]
```

The destructor.

10.104.3 Member Function Documentation

10.104.3.1 elapsed_seconds_since_reference_time()

```
uint16_t util::xmsg::XPresCounts::elapsed_seconds_since_reference_time () const  [inline]
```

Get the elapsed time since the reference time, in seconds.

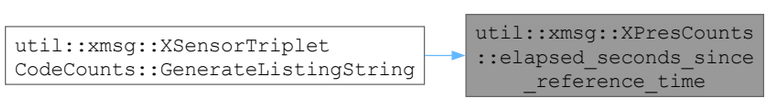
Returns

The elapsed time since the reference time, in seconds.

References elapsed_seconds_since_reference_time_.

Referenced by util::xmsg::XSensorTripletCodeCounts::GenerateListingString().

Here is the caller graph for this function:



10.104.3.2 GenerateListingString()

```
const string util::xmsg::XPresCounts::GenerateListingString (
            uint16_t pg,
            uint16_t po,
            float pc) const  [inline]
```

Generate a listing entry string from this pressure measurement object.

Parameters

in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Exceptions

log::MessageException	if an error occurs while generating the listing string.

Returns

A listing entry string representation of this pressure measurement object.

References CATCH_BLOCK, elapsed_seconds_since_reference_time_, and PressureValue().

Referenced by util::xmsg::XPresCodeCounts::GenerateListingString().

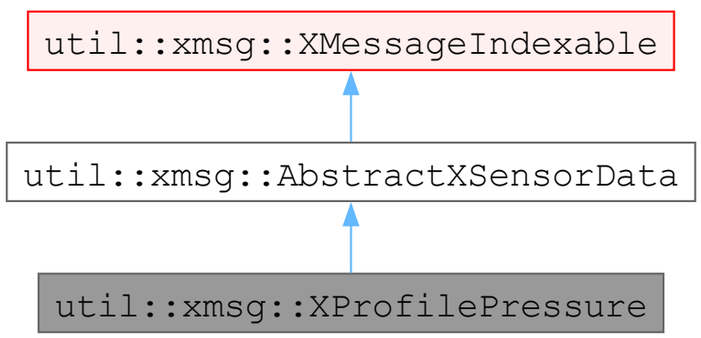
10.105 util::xmsg::XProfilePressure Class Reference

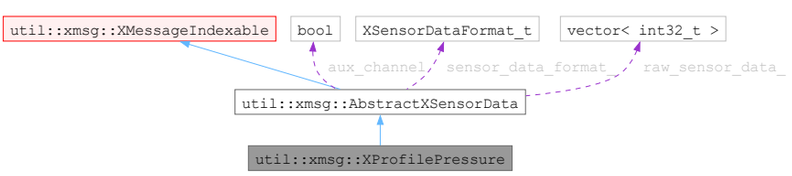
Class representing a profile pressure data X-Message.

```
#include <XProfilePressure.h>
```

Inheritance diagram for util::xmsg::XProfilePressure:



Collaboration diagram for util::xmsg::XProfilePressure:



Public Member Functions

- XProfilePressure (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)

  Parameterized constructor.
- ~XProfilePressure ()

  Destructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)

  Check the X-message for the correct ID, minimum size, and message terminator.
- void DecodeXMsgData (const vector< uint8_t > &data)

  Decode the bin-averaged profile pressure X-Message from the binary message data.
- int16_t id_dive () const

  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const

  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const

  Get the enumerated X-Message type identifier.
- bool **is_aux_channel** () const
- size_t num_samples () const

  Get the number of samples in this message.
- const vector< int32_t > & raw_sensor_data () const

  Get the raw sensor data vector.
- int32_t Sample (size_t i) const

  Get the raw integer value of the i^{th} sample.
- template<typename T = double>
  T SampleValue (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} sensor value in scientific units.
- template<typename T = double>
  T SampleValueAsPressure (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} pressure sensor value, in dBar.
- template<typename T = double>
  T SampleValueAsSalinity (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} salinity sensor value, in PSU.
- template<typename T = double>
  T SampleValueAsTemperature (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} temperature sensor value, in degC.
- XSensorDataFormat_t sensor_data_format () const

  Get the enumerated sensor data format value.
- uint8_t xmsg_index () const

  Get the index of this X-Message.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Protected Member Functions

- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_raw_sensor_data (const vector< int32_t > &raw_sensor_data)

  Set raw integer counts of the measured sensor data.
- void set_sensor_data_format (XSensorDataFormat_t sensor_data_format)

  Set the sensor data format.
- void set_xmsg_index (uint8_t xmsg_index)

  Set the index of this X-Message.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.
- virtual vector< int32_t > UnpackSensorData (const vector< uint8_t > &data)

  Unpack the sensor data from the binary message.

Protected Attributes

- bool **aux_channel**
- vector< int32_t > raw_sensor_data_

  The raw integer counts of the measured sensor data.
- XSensorDataFormat_t sensor_data_format_

  The enumerated sensor data packing format.

Private Attributes

- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint8_t xmsg_index_

  The index of this X-Message.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.105.1 Detailed Description

Class representing a profile pressure data X-Message.

10.105.2 Constructor & Destructor Documentation

10.105.2.1 XProfilePressure()

```
util::xmsg::XProfilePressure::XProfilePressure (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

Parameterized constructor.

Parameters

in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary profile pressure data X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:

10.105.2.2 ~XProfilePressure()

```
util::xmsg::XProfilePressure::~XProfilePressure ()  [inline]
```

Destructor.

10.105.3 Member Function Documentation

10.105.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::XMessage::set_xmsg_size_byte
u16, and util::xmsg::XMessage::xmsg_size_bytes().

```
void util::xmsg::XProfilePressure::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode the bin-averaged profile pressure X-Message from the binary message data.

Parameters

in	*data*	The binary message data to decode.

Exceptions

util::log::MessageException	if the message is invalid or an error occurs during decoding.

Implements util::xmsg::AbstractXSensorData.

References CATCH_BLOCK, util::xmsg::XMessage::CheckXMsgData(), EXC_THROW, util::xmsg::AbstractXSensorData::UnpackSensorD and util::xmsg::XMSG_TYPE_ID_PRES0.

10.105.3.6 num_samples()

```
size_t util::xmsg::AbstractXSensorData::num_samples () const  [inline], [inherited]
```

Get the number of samples in this message.

Returns

The number of samples in this message.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

10.105.3.7 raw_sensor_data()

```
const vector< int32_t > & util::xmsg::AbstractXSensorData::raw_sensor_data () const  [inline],
[inherited]
```

Get the raw sensor data vector.

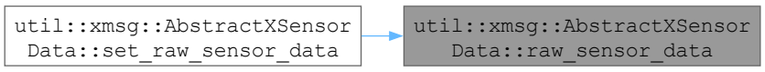
Returns

The raw sensor data vector.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

Referenced by util::xmsg::AbstractXSensorData::set_raw_sensor_data().

Here is the caller graph for this function:



10.105.3.8 Sample()

```
int32_t util::xmsg::AbstractXSensorData::Sample (
            size_t i) const  [inline], [inherited]
```

Get the raw integer value of the i^{th} sample.

Parameters

in	*i*	The index of the sensor value.

Returns

The raw integer value of the i^{th} ith sample.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

10.105.3.9 SampleValue()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValue (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} sensor value in scientific units.

Parameters

in	*i*	The index of the sensor value.
in	*gain*	The sensor sensitivity scale factor.
in	*offs*	The sensor offset.

Returns

The i^{th} sensor value in scientific units.

References CATCH_BLOCK, and util::xmsg::AbstractXSensorData::raw_sensor_data_.

10.105.3.21 UnpackSensorData()

```
virtual vector< int32_t > util::xmsg::AbstractXSensorData::UnpackSensorData (
            const vector< uint8_t > & data)  [inline], [protected], [virtual], [inherited]
```

Unpack the sensor data from the binary message.

This field unpacks the encoded sensor data from the message and stores the decoded sensor values in raw_sensor_data_. First the function checks the size of the message, and the data packing format. The message data is decoded according to the packing format type. Both first-difference and curvature encoding are supported. The encoding method is determined from the value of the high nibble of byte `data`[1].

Once this function completes successfully, then the data may be recovered in scientific units from the raw sensor values by applying the appropriate sensor gain and offset values.

Parameters

in	*data*	The binary message to unpack, in a vector of unsigned bytes.

Warning

The function assumes the message data is valid. Message validity should be ensured before this function is called.

Exceptions

util::log::MessageException	if • an error occurs while decoding the message, • the message is of insufficient length, or • an invalid packing format is encountered.

Returns

The sensor data raw counts, in a vector of signed integers.

Reimplemented in util::xmsg::AuxiliarySensorData.

10.105.4 Member Data Documentation

10.105.4.1 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.105.4.2 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.105.4.3 id_xmsg_type_

XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_ [private], [inherited]

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.105.4.4 raw_sensor_data_

vector<int32_t> util::xmsg::AbstractXSensorData::raw_sensor_data_ [protected], [inherited]

The raw integer counts of the measured sensor data.

This vector of integers represents the "raw" sample values of the message. That is, by applying the appropriate gain and offset corrections, the sensor values may be recovered in scientific units. This data may represent pressure, temperature, salinity, or any other data that is recorded during the drift or profile phases of the dive cycle.

Referenced by util::xmsg::AbstractXSensorData::num_samples(), util::xmsg::AbstractXSensorData::raw_sensor_data(), util::xmsg::AbstractXSensorData::Sample(), util::xmsg::AbstractXSensorData::SampleValue(), util::xmsg::AbstractXSensorData::set_raw_ util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

10.105.4.5 sensor_data_format_

XSensorDataFormat_t util::xmsg::AbstractXSensorData::sensor_data_format_ [protected], [inherited]

The enumerated sensor data packing format.

This field indicates the format of encoded sensor data. The manner in which the sensor data is decoded is determined by the format of this field.

Referenced by util::xmsg::AbstractXSensorData::sensor_data_format(), and util::xmsg::AbstractXSensorData::set_sensor_data_format().

10.105.4.6 xmsg_index_

uint8_t util::xmsg::XMessageIndexable::xmsg_index_ [private], [inherited]

The index of this X-Message.

Referenced by util::xmsg::XMessageIndexable::set_xmsg_index(), and util::xmsg::XMessageIndexable::xmsg_index().

10.105.4.7 xmsg_size_bytes_

uint16_t util::xmsg::XMessage::xmsg_size_bytes_ [private], [inherited]

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

- data/xmsg/XProfilePressure.h

10.106 util::xmsg::XProfileSalinity Class Reference

Class representing a profile salinity X-Message.

`#include <XProfileSalinity.h>`

Get the i^{th} pressure sensor value, in dBar.

- template<typename T = double>
  T SampleValueAsSalinity (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} salinity sensor value, in PSU.
- template<typename T = double>
  T SampleValueAsTemperature (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} temperature sensor value, in degC.
- XSensorDataFormat_t sensor_data_format () const

  Get the enumerated sensor data format value.
- uint8_t xmsg_index () const

  Get the index of this X-Message.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Protected Member Functions

- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_raw_sensor_data (const vector< int32_t > &raw_sensor_data)

  Set raw integer counts of the measured sensor data.
- void set_sensor_data_format (XSensorDataFormat_t sensor_data_format)

  Set the sensor data format.
- void set_xmsg_index (uint8_t xmsg_index)

  Set the index of this X-Message.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.
- virtual vector< int32_t > UnpackSensorData (const vector< uint8_t > &data)

  Unpack the sensor data from the binary message.

Protected Attributes

- bool **aux_channel**
- vector< int32_t > raw_sensor_data_

  The raw integer counts of the measured sensor data.
- XSensorDataFormat_t sensor_data_format_

  The enumerated sensor data packing format.

Private Attributes

- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint8_t xmsg_index_

  The index of this X-Message.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.106.1 Detailed Description

Class representing a profile salinity X-Message.

10.106.2 Constructor & Destructor Documentation

10.106.2.1 XProfileSalinity()

```
util::xmsg::XProfileSalinity::XProfileSalinity (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

The parameterized constructor.

Parameters

in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary profile salinity X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:

10.106.2.2 ~XProfileSalinity()

```
util::xmsg::XProfileSalinity::~XProfileSalinity ()  [inline]
```

The destructor.

10.106.3 Member Function Documentation

10.106.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::XMessage::set_xmsg_size_byte
u16, and util::xmsg::XMessage::xmsg_size_bytes().

10.106.3.2 DecodeXMsgData()

```
void util::xmsg::XProfileSalinity::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode the bin-averaged profile salinity X-Message from the binary message data.

Parameters

in	*data*	The binary message data to decode.

Exceptions

util::log::MessageException	if the message is invalid or an error occurs during decoding.

Implements util::xmsg::AbstractXSensorData.

References CATCH_BLOCK, util::xmsg::XMessage::CheckXMsgData(), EXC_THROW, util::xmsg::AbstractXSensorData::UnpackSensorD
and util::xmsg::XMSG_TYPE_ID_SALN0.

10.106.3.8 Sample()

```
int32_t util::xmsg::AbstractXSensorData::Sample (
            size_t i) const  [inline], [inherited]
```

Get the raw integer value of the i^{th} sample.

Parameters

in	*i*	The index of the sensor value.

Returns

The raw integer value of the i^{th} ith sample.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

10.106.3.9 SampleValue()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValue (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} sensor value in scientific units.

Parameters

in	*i*	The index of the sensor value.
in	*gain*	The sensor sensitivity scale factor.
in	*offs*	The sensor offset.

Returns

The i^{th} sensor value in scientific units.

References CATCH_BLOCK, and util::xmsg::AbstractXSensorData::raw_sensor_data_.

Here is the caller graph for this function:

10.106.3.21 UnpackSensorData()

```
virtual vector< int32_t > util::xmsg::AbstractXSensorData::UnpackSensorData (
            const vector< uint8_t > & data)  [inline], [protected], [virtual], [inherited]
```

Unpack the sensor data from the binary message.

This field unpacks the encoded sensor data from the message and stores the decoded sensor values in raw_sensor_data_. First the function checks the size of the message, and the data packing format. The message data is decoded according to the packing format type. Both first-difference and curvature encoding are supported. The encoding method is determined from the value of the high nibble of byte `data`[1].

Once this function completes successfully, then the data may be recovered in scientific units from the raw sensor values by applying the appropriate sensor gain and offset values.

Parameters

in	*data*	The binary message to unpack, in a vector of unsigned bytes.

Warning

The function assumes the message data is valid. Message validity should be ensured before this function is called.

Exceptions

util::log::MessageException	if • an error occurs while decoding the message, • the message is of insufficient length, or • an invalid packing format is encountered.

Returns

The sensor data raw counts, in a vector of signed integers.

Reimplemented in util::xmsg::AuxiliarySensorData.

10.106.4 Member Data Documentation

10.106.4.1 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.106.4.2 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.106.4.3 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.106.4.4 raw_sensor_data_

```
vector<int32_t> util::xmsg::AbstractXSensorData::raw_sensor_data_  [protected], [inherited]
```

The raw integer counts of the measured sensor data.

This vector of integers represents the "raw" sample values of the message. That is, by applying the appropriate gain and offset corrections, the sensor values may be recovered in scientific units. This data may represent pressure, temperature, salinity, or any other data that is recorded during the drift or profile phases of the dive cycle.

Referenced by util::xmsg::AbstractXSensorData::num_samples(), util::xmsg::AbstractXSensorData::raw_sensor_data(), util::xmsg::AbstractXSensorData::Sample(), util::xmsg::AbstractXSensorData::SampleValue(), util::xmsg::AbstractXSensorData::set_raw_ util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

10.106.4.5 sensor_data_format_

```
XSensorDataFormat_t util::xmsg::AbstractXSensorData::sensor_data_format_  [protected], [inherited]
```

The enumerated sensor data packing format.

This field indicates the format of encoded sensor data. The manner in which the sensor data is decoded is determined by the format of this field.

Referenced by util::xmsg::AbstractXSensorData::sensor_data_format(), and util::xmsg::AbstractXSensorData::set_sensor_data_format().

10.106.4.6 xmsg_index_

```
uint8_t util::xmsg::XMessageIndexable::xmsg_index_  [private], [inherited]
```

The index of this X-Message.

Referenced by util::xmsg::XMessageIndexable::set_xmsg_index(), and util::xmsg::XMessageIndexable::xmsg_index().

10.106.4.7 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

- data/xmsg/XProfileSalinity.h

10.107 util::xmsg::XProfileTemperature Class Reference

Class representing a profile temperature X-Message.

`#include <XProfileTemperature.h>`

Get the i^{th} pressure sensor value, in dBar.

- template<typename T = double>
  T SampleValueAsSalinity (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} salinity sensor value, in PSU.
- template<typename T = double>
  T SampleValueAsTemperature (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} temperature sensor value, in degC.
- XSensorDataFormat_t sensor_data_format () const

  Get the enumerated sensor data format value.
- uint8_t xmsg_index () const

  Get the index of this X-Message.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Protected Member Functions

- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_raw_sensor_data (const vector< int32_t > &raw_sensor_data)

  Set raw integer counts of the measured sensor data.
- void set_sensor_data_format (XSensorDataFormat_t sensor_data_format)

  Set the sensor data format.
- void set_xmsg_index (uint8_t xmsg_index)

  Set the index of this X-Message.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.
- virtual vector< int32_t > UnpackSensorData (const vector< uint8_t > &data)

  Unpack the sensor data from the binary message.

Protected Attributes

- bool **aux_channel**
- vector< int32_t > raw_sensor_data_

  The raw integer counts of the measured sensor data.
- XSensorDataFormat_t sensor_data_format_

  The enumerated sensor data packing format.

Private Attributes

- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint8_t xmsg_index_

  The index of this X-Message.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.107.1 Detailed Description

Class representing a profile temperature X-Message.

10.107.2 Constructor & Destructor Documentation

10.107.2.1 XProfileTemperature()

```
util::xmsg::XProfileTemperature::XProfileTemperature (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

Parameterized constructor.

Parameters

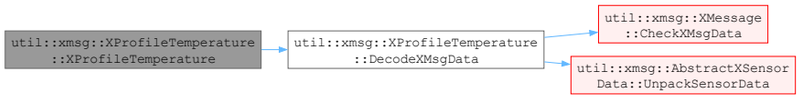
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary profile temperature X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.107.2.2 ~XProfileTemperature()

```
util::xmsg::XProfileTemperature::~XProfileTemperature ()  [inline]
```

Destructor.

10.107.3 Member Function Documentation

10.107.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

10.107.3.2 DecodeXMsgData()

```
void util::xmsg::XProfileTemperature::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode the bin-averaged profile temperature X-Message from the binary message data.

Parameters

in	*data*	The binary message data to decode.

Exceptions

util::log::MessageException	if the message is invalid or an error occurs during decoding.

Implements util::xmsg::AbstractXSensorData.

References CATCH_BLOCK, util::xmsg::XMessage::CheckXMsgData(), EXC_THROW, util::xmsg::AbstractXSensorData::UnpackSensorD
and util::xmsg::XMSG_TYPE_ID_TEMP0.

10.107.3.6 num_samples()

```
size_t util::xmsg::AbstractXSensorData::num_samples () const  [inline], [inherited]
```

Get the number of samples in this message.

Returns

The number of samples in this message.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

10.107.3.7 raw_sensor_data()

```
const vector< int32_t > & util::xmsg::AbstractXSensorData::raw_sensor_data () const  [inline],
[inherited]
```

Get the raw sensor data vector.

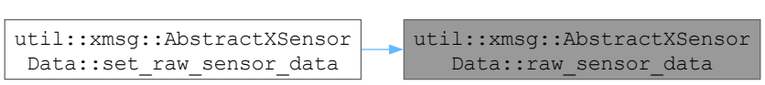
Returns

The raw sensor data vector.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

Referenced by util::xmsg::AbstractXSensorData::set_raw_sensor_data().

Here is the caller graph for this function:



10.107.3.8 Sample()

```
int32_t util::xmsg::AbstractXSensorData::Sample (
            size_t i) const  [inline], [inherited]
```

Get the raw integer value of the i^{th} sample.

Parameters

in	*i*	The index of the sensor value.

Returns

The raw integer value of the i^{th} ith sample.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

10.107.3.9 SampleValue()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValue (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} sensor value in scientific units.

Parameters

in	*i*	The index of the sensor value.
in	*gain*	The sensor sensitivity scale factor.
in	*offs*	The sensor offset.

Returns

The i^{th} sensor value in scientific units.

References CATCH_BLOCK, and util::xmsg::AbstractXSensorData::raw_sensor_data_.

Referenced by util::xmsg::AbstractXSensorData::SampleValueAsPressure(), util::xmsg::AbstractXSensorData::SampleValueAsSalinity(), and util::xmsg::AbstractXSensorData::SampleValueAsTemperature().

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValueAsPressure (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} pressure sensor value, in dBar.

Parameters

in	*i*	The index of the sensor value.
in	*gain*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*offs*	The pressure sensor offset, in dBar.

Returns

The i^{th} pressure sensor value, in dBar.

References util::xmsg::AbstractXSensorData::SampleValue(), XMSG_SENS_BAD_PRES, and XMSG_SENS_MAX_PRES.

10.107.3.11 SampleValueAsSalinity()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValueAsSalinity (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} salinity sensor value, in PSU.

Parameters

in	*i*	The index of the sensor value.
in	*gain*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*offs*	The salinity sensor offset, in PSU.

Returns

The i^{th} salinity sensor value, in PSU.

References util::xmsg::AbstractXSensorData::SampleValue(), XMSG_SENS_BAD_SALN, and XMSG_SENS_MAX_SALN.

Here is the caller graph for this function:

10.107.3.21 UnpackSensorData()

```
virtual vector< int32_t > util::xmsg::AbstractXSensorData::UnpackSensorData (
            const vector< uint8_t > & data)  [inline], [protected], [virtual], [inherited]
```

Unpack the sensor data from the binary message.

This field unpacks the encoded sensor data from the message and stores the decoded sensor values in raw_sensor_data_. First the function checks the size of the message, and the data packing format. The message data is decoded according to the packing format type. Both first-difference and curvature encoding are supported. The encoding method is determined from the value of the high nibble of byte `data`[1].

Once this function completes successfully, then the data may be recovered in scientific units from the raw sensor values by applying the appropriate sensor gain and offset values.

Parameters

`in`	*data*	The binary message to unpack, in a vector of unsigned bytes.

Warning

The function assumes the message data is valid. Message validity should be ensured before this function is called.

Exceptions

util::log::MessageException	if • an error occurs while decoding the message, • the message is of insufficient length, or • an invalid packing format is encountered.

Returns

The sensor data raw counts, in a vector of signed integers.

Reimplemented in util::xmsg::AuxiliarySensorData.

10.107.4 Member Data Documentation

10.107.4.1 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.107.4.2 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.107.4.3 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.107.4.4 raw_sensor_data_

```
vector<int32_t> util::xmsg::AbstractXSensorData::raw_sensor_data_  [protected], [inherited]
```

The raw integer counts of the measured sensor data.

This vector of integers represents the "raw" sample values of the message. That is, by applying the appropriate gain and offset corrections, the sensor values may be recovered in scientific units. This data may represent pressure, temperature, salinity, or any other data that is recorded during the drift or profile phases of the dive cycle.

Referenced by util::xmsg::AbstractXSensorData::num_samples(), util::xmsg::AbstractXSensorData::raw_sensor_data(), util::xmsg::AbstractXSensorData::Sample(), util::xmsg::AbstractXSensorData::SampleValue(), util::xmsg::AbstractXSensorData::set_raw_ util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

10.107.4.5 sensor_data_format_

```
XSensorDataFormat_t util::xmsg::AbstractXSensorData::sensor_data_format_  [protected], [inherited]
```

The enumerated sensor data packing format.

This field indicates the format of encoded sensor data. The manner in which the sensor data is decoded is determined by the format of this field.

Referenced by util::xmsg::AbstractXSensorData::sensor_data_format(), and util::xmsg::AbstractXSensorData::set_sensor_data_format().

10.107.4.6 xmsg_index_

```
uint8_t util::xmsg::XMessageIndexable::xmsg_index_  [private], [inherited]
```

The index of this X-Message.

Referenced by util::xmsg::XMessageIndexable::set_xmsg_index(), and util::xmsg::XMessageIndexable::xmsg_index().

10.107.4.7 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

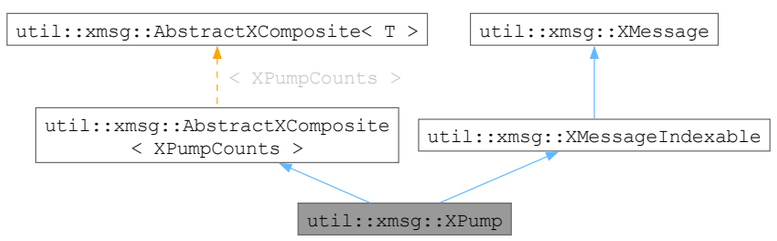
- data/xmsg/XProfileTemperature.h

10.108 util::xmsg::XPump Class Reference

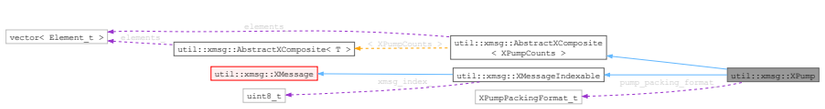
Class representing a pump data X-Message.

`#include <XPump.h>`

Inheritance diagram for util::xmsg::XPump:



Collaboration diagram for util::xmsg::XPump:



Public Member Functions

- XPump (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)

  The parameterized constructor.
- ~XPump ()

  The destructor.
- void AppendAllElements (const static_vector< Element_t, I > &elements)

  Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.
- virtual void AssignElement (const Element_t &element)

  Assign an element to this composite object.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)

  Check the X-message for the correct ID, minimum size, and message terminator.
- void DecodeXMsgData (const vector< uint8_t > &data)

  Decode the pump data message from the binary data to decode.
- const vector< Element_t > & elements () const

  Get the vector of individual X-Messages elements that compose this composite object.
- const string GenerateListingString (uint16_t pg, uint16_t po, float pc) const

  Generate the listing file entry string for this pump data message.
- int16_t id_dive () const

  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const

  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const

  Get the enumerated X-Message type identifier.
- virtual bool **IsEmpty** () const
- virtual size_t num_elements () const

  Get the number of individual elements that compose this composite object.
- XPumpPackingFormat_t pump_packing_format () const

  Get the enumerated pump packing format identifier.
- uint8_t xmsg_index () const

  Get the index of this X-Message.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Static Public Member Functions

- static const string GenerateListingComment ()

  The the listing file comment string.

Protected Member Functions

- void AppendAllElements (const vector< Element_t > &elements)

  Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.
- void AppendElement (const Element_t &element)

  Append one element to the vector of individual X-Messages elements that compose this composite object.
- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_xmsg_index (uint8_t xmsg_index)

  Set the index of this X-Message.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.

Private Types

- typedef XPumpCounts Element_t

  Type definition for the element aggregated by this object.
- typedef ElementVec_t::const_iterator **ElementConstIter_t**
- typedef ElementVec_t::iterator **ElementIter_t**
- typedef vector< Element_t > **ElementVec_t**

Private Attributes

- ElementVec_t elements_

  The vector of individual X-Messages elements that compose this composite object.
- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- XPumpPackingFormat_t pump_packing_format_

  The packing format of this pump data message.
- uint8_t xmsg_index_

  The index of this X-Message.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.108.1 Detailed Description

Class representing a pump data X-Message.

10.108.2 Member Typedef Documentation

10.108.2.1 Element_t

```
typedef XPumpCounts util::xmsg::AbstractXComposite< XPumpCounts >::Element_t  [private], [inherited]
```

Type definition for the element aggregated by this object.

10.108.3 Constructor & Destructor Documentation

10.108.3.1 XPump()

```
util::xmsg::XPump::XPump (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

The parameterized constructor.

Parameters

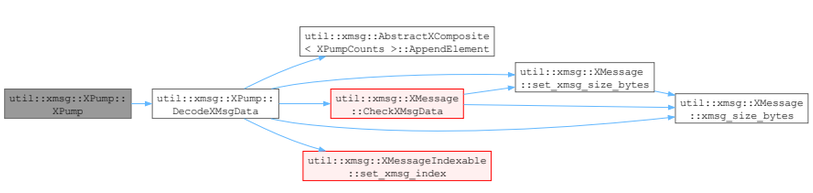
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.108.3.2 ~XPump()

```
util::xmsg::XPump::~XPump ()  [inline]
```

The destructor.

10.108.4 Member Function Documentation

10.108.4.1 AppendAllElements() [1/2]

```
void util::xmsg::AbstractXComposite< XPumpCounts >::AppendAllElements (
            const static_vector< Element_t, I > & elements)  [inline], [inherited]
```

Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*elements*	The vector of elements to append.

10.108.4.2 AppendAllElements() [2/2]

```
void util::xmsg::AbstractXComposite< XPumpCounts >::AppendAllElements (
            const vector< Element_t > & elements)  [inline], [protected], [inherited]
```

Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*elements*	The vector of elements to append.

10.108.4.3 AppendElement()

```
void util::xmsg::AbstractXComposite< XPumpCounts >::AppendElement (
            const Element_t & element)  [inline], [protected], [inherited]
```

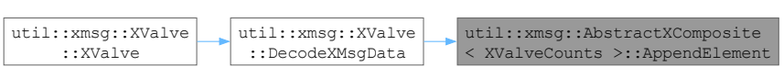
Append one element to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*element*	The element to append.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.108.4.4 AssignElement()

```
virtual void util::xmsg::AbstractXComposite< XPumpCounts >::AssignElement (
            const Element_t & element)  [inline], [virtual], [inherited]
```

Assign an element to this composite object.

The default implementation appends the element; derived classes may override it to insert elements in order or reject duplicates.

Parameters

in	*element*	The element to assign.

10.108.4.5 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

10.108.4.6 DecodeXMsgData()

```
void util::xmsg::XPump::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode the pump data message from the binary data to decode.

Parameters

in	*data*	The binary data to decode.

Implements util::xmsg::XMessageIndexable.

References util::xmsg::AbstractXComposite< XPumpCounts >::AppendElement(), CATCH_BLOCK, util::xmsg::XMessage::CheckXMsgD

            uint16_t pg,
            uint16_t po,
            float pc) const  [inline]
```

Generate the listing file entry string for this pump data message.

Parameters

in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Exceptions

log::MessageException	if an error occurs while generating the listing string.

Returns

The listing file entry string for this pump data message.

References CATCH_BLOCK, util::xmsg::AbstractXComposite< XPumpCounts >::elements(), util::xmsg::XMessage::id_dive(), util::xmsg::XMessage::id_instrument(), util::xmsg::AbstractXComposite< XPumpCounts >::num_elements(), and util::xmsg::XMessageIndexable::xmsg_index().

10.108.4.13 num_elements()

```
virtual size_t util::xmsg::AbstractXComposite< XPumpCounts >::num_elements () const  [inline],
[virtual], [inherited]
```

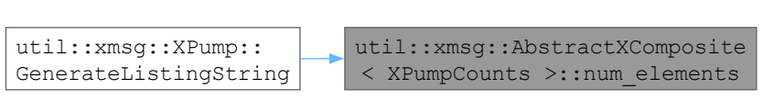
Get the number of individual elements that compose this composite object.

Returns

The number of individual elements that compose this composite object.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.108.4.14 pump_packing_format()

```
XPumpPackingFormat_t util::xmsg::XPump::pump_packing_format () const  [inline]
```

Get the enumerated pump packing format identifier.

Returns

The enumerated pump packing format identifier.

References pump_packing_format_.

10.108.4.15 set_id_dive()

```
void util::xmsg::XMessage::set_id_dive (
            int16_t id_dive)  [inline], [protected], [inherited]
```

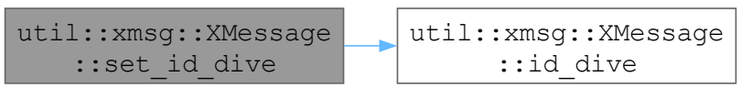
Set the dive or cycle number of this message.

Parameters

in	*id_dive*	The dive or cycle number of this message to set.

References util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::id_dive_.

Here is the call graph for this function:



10.108.4.16 set_id_instrument()

```
void util::xmsg::XMessage::set_id_instrument (
            uint16_t id_instrument)  [inline], [protected], [inherited]
```

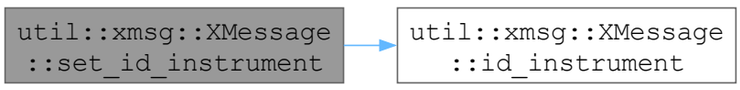
Set the unique instrument identifier.

Parameters

in	*id_instrument*	The unique instrument identifier to set.

References util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::id_instrument_.

Here is the call graph for this function:



10.108.4.17 set_id_xmsg_type()

```
void util::xmsg::XMessage::set_id_xmsg_type (
            XMsgTypeId_t id_xmsg_type)  [inline], [protected], [inherited]
```

Set the X-Message type identifier.

Parameters

in	*id_xmsg_type*	The X-Message type identifier to set.

References util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::id_xmsg_type_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

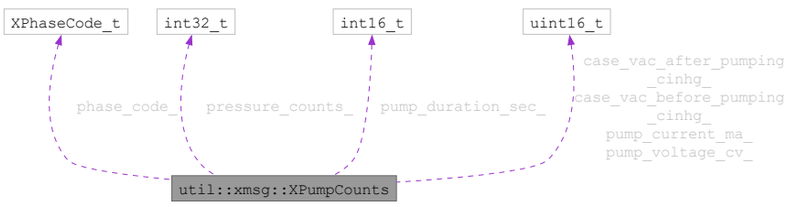
10.109 util::xmsg::XPumpCounts Class Reference

Class representing a single pump data measurement for a pump data time-series X-Message.

`#include <XPumpCounts.h>`

Collaboration diagram for util::xmsg::XPumpCounts:



Public Member Functions

- XPumpCounts (XPhaseCode_t code, int32_t count, int16_t sec, uint16_t v, uint16_t i, uint16_t vac0, uint16_t vac1) ATTR_NO_EXCEPTIONS

  Parameterized constructor.
- ~XPumpCounts ()

  Destructor.
- uint16_t case_vac_after_pumping_cinhg () const

  Get the measured vacuum after pumping, in 0.01inHg.
- template<typename T = float>
  T case_vac_after_pumping_inhg () const

  Get the measured vacuum after pumping, in inHg.
- uint16_t case_vac_before_pumping_cinhg () const

  Get the measured vacuum before pumping, in 0.01inHg.
- template<typename T = float>
  T case_vac_before_pumping_inhg () const

  Get the measured vacuum before pumping, in inHg.
- const string GenerateListingString (uint16_t pg, uint16_t po, float pres_corr) const

  Generate a listing entry string representation of this pump counts object.

Protected Member Functions

- template<typename T = double>
  T PressureValue (uint16_t pg, uint16_t po, float pres_corr) const

  Get the measured pressure value, in dBar.
- template<typename T = double>
  T pump_current_a () const

  Get the measured pump current, in amperes.
- template<typename T = double>
  T pump_voltage_v () const

  Get the measured pump voltage, in volts.

Private Attributes

- uint16_t case_vac_after_pumping_cinhg_

  The measured vacuum after pumping, in 0.01inHg.
- uint16_t case_vac_before_pumping_cinhg_

  The measured vacuum before pumping, in 0.01inHg.
- XPhaseCode_t phase_code_

  The phase code of this pump data measurement.
- int32_t pressure_counts_

  The raw pressure counts of the measured pressure during pumping.
- uint16_t pump_current_ma_

  The measured current of the pump supply during pumping, in milliamps.
- int16_t pump_duration_sec_

  The duration that the pump ran, in seconds.
- uint16_t pump_voltage_cv_

  The measured voltage of the pump supply during pumping, in 0.01 volts.

10.109.1 Detailed Description

Class representing a single pump data measurement for a pump data time-series X-Message.

10.109.2 Constructor & Destructor Documentation

10.109.2.1 XPumpCounts()

```
util::xmsg::XPumpCounts::XPumpCounts (
            XPhaseCode_t code,
            int32_t count,
            int16_t sec,
            uint16_t v,
            uint16_t i,
            uint16_t vac0,
            uint16_t vac1)  [inline]
```

Parameterized constructor.

Parameters

in	*code*	The phase code of this pump data measurement.
in	*count*	The raw pressure counts of the measured pressure during pumping.
in	*sec*	The duration that the pump ran, in seconds.
in	*v*	The measured voltage of the pump supply during pumping, in 0.01 volts.
in	*i*	The measured current of the pump supply during pumping, in milliamps.
in	*vac0*	The measured vacuum counts before pumping.
in	*vac1*	The measured vacuum counts after pumping.

10.109.2.2 ~XPumpCounts()

```
util::xmsg::XPumpCounts::~XPumpCounts ()  [inline]
```

Destructor.

10.109.3 Member Function Documentation

10.109.3.1 case_vac_after_pumping_cinhg()

```
uint16_t util::xmsg::XPumpCounts::case_vac_after_pumping_cinhg () const  [inline]
```

Get the measured vacuum after pumping, in 0.01inHg.

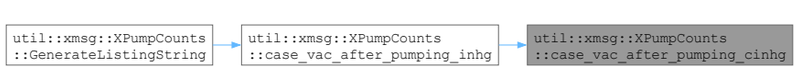
Returns

The measured vacuum after pumping, in 0.01inHg.

References case_vac_after_pumping_cinhg_.

Referenced by case_vac_after_pumping_inhg().

Here is the caller graph for this function:



10.109.3.2 case_vac_after_pumping_inhg()

```
template<typename T = float>
T util::xmsg::XPumpCounts::case_vac_after_pumping_inhg () const  [inline]
```

Get the measured vacuum after pumping, in inHg.

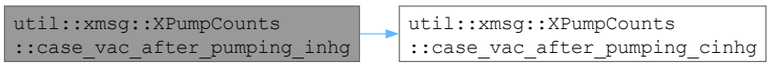
Returns

The measured vacuum after pumping, in inHg.

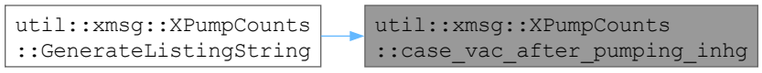
References case_vac_after_pumping_cinhg().

Referenced by GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:



10.109.3.3 case_vac_before_pumping_cinhg()

```
uint16_t util::xmsg::XPumpCounts::case_vac_before_pumping_cinhg () const  [inline]
```

Get the measured vacuum before pumping, in 0.01inHg.

Returns

The measured vacuum before pumping, in 0.01inHg.

References case_vac_before_pumping_cinhg_.

Referenced by case_vac_before_pumping_inhg().

Here is the caller graph for this function:

10.109.3.4 case_vac_before_pumping_inhg()

```
template<typename T = float>
T util::xmsg::XPumpCounts::case_vac_before_pumping_inhg () const  [inline]
```

Get the measured vacuum before pumping, in inHg.

Returns

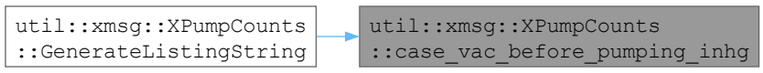
The measured vacuum before pumping, in inHg.

References case_vac_before_pumping_cinhg().

Referenced by GenerateListingString().

Here is the call graph for this function:

Here is the caller graph for this function:



10.109.3.5 GenerateListingString()

```
const string util::xmsg::XPumpCounts::GenerateListingString (
            uint16_t pg,
            uint16_t po,
            float pres_corr) const  [inline]
```

Generate a listing entry string representation of this pump counts object.

Parameters

in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*pres_corr*	The pressure correction, in dBar, to be subtracted computed pressure value.

Exceptions

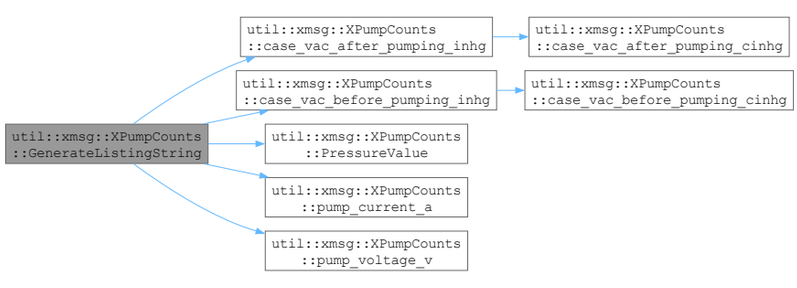
log::MessageException	if an error occurs while generating the listing string.

Returns

A listing entry string representation of this pump counts object.

References case_vac_after_pumping_inhg(), case_vac_before_pumping_inhg(), CATCH_BLOCK, PressureValue(), pump_current_a(), pump_duration_sec_, and pump_voltage_v().

Here is the call graph for this function:



10.109.3.6 PressureValue()

```
template<typename T = double>
T util::xmsg::XPumpCounts::PressureValue (
            uint16_t pg,
            uint16_t po,
            float pres_corr) const  [inline], [protected]
```

Get the measured pressure value, in dBar.

Parameters

in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*pres_corr*	The pressure correction, in dBar, to be subtracted computed pressure value.

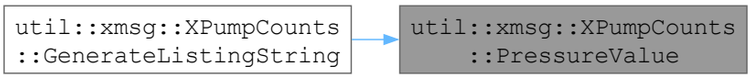
Returns

The measured pressure value, in dBar.

References pressure_counts_, XMSG_SENS_BAD_PRES, and XMSG_SENS_MAX_PRES.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.109.3.7 pump_current_a()

```
template<typename T = double>
T util::xmsg::XPumpCounts::pump_current_a () const  [inline], [protected]
```

Get the measured pump current, in amperes.

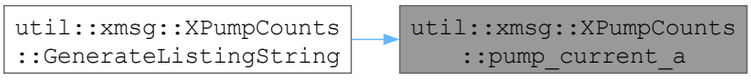
Returns

The measured pump current, in amperes.

References pump_current_ma_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.109.3.8 pump_voltage_v()

```
template<typename T = double>
T util::xmsg::XPumpCounts::pump_voltage_v () const  [inline], [protected]
```

Get the measured pump voltage, in volts.

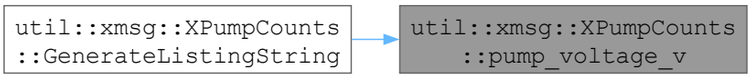
Returns

The measured pump voltage, in volts.

References pump_voltage_cv_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.109.4 Member Data Documentation

10.109.4.1 case_vac_after_pumping_cinhg_

```
uint16_t util::xmsg::XPumpCounts::case_vac_after_pumping_cinhg_  [private]
```

The measured vacuum after pumping, in 0.01inHg.

Referenced by case_vac_after_pumping_cinhg().

10.109.4.2 case_vac_before_pumping_cinhg_

```
uint16_t util::xmsg::XPumpCounts::case_vac_before_pumping_cinhg_  [private]
```

The measured vacuum before pumping, in 0.01inHg.

Referenced by case_vac_before_pumping_cinhg().

10.109.4.3 phase_code_

```
XPhaseCode_t util::xmsg::XPumpCounts::phase_code_  [private]
```

The phase code of this pump data measurement.

10.109.4.4 pressure_counts_

```
int32_t util::xmsg::XPumpCounts::pressure_counts_  [private]
```

The raw pressure counts of the measured pressure during pumping.

Referenced by PressureValue().

10.109.4.5 pump_current_ma_

```
uint16_t util::xmsg::XPumpCounts::pump_current_ma_  [private]
```

The measured current of the pump supply during pumping, in milliamps.

Referenced by pump_current_a().

10.109.4.6 pump_duration_sec_

```
int16_t util::xmsg::XPumpCounts::pump_duration_sec_  [private]
```

The duration that the pump ran, in seconds.

Referenced by GenerateListingString().

10.109.4.7 pump_voltage_cv_

```
uint16_t util::xmsg::XPumpCounts::pump_voltage_cv_  [private]
```

The measured voltage of the pump supply during pumping, in 0.01 volts.

Referenced by pump_voltage_v().

The documentation for this class was generated from the following file:

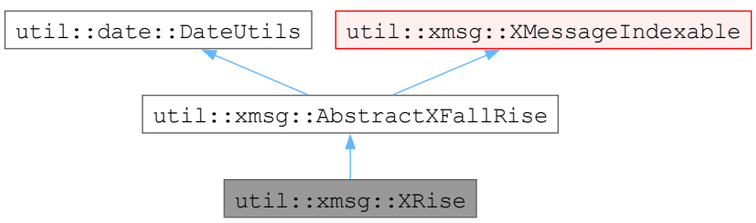
- data/xmsg/common/XPumpCounts.h

10.110 util::xmsg::XRise Class Reference

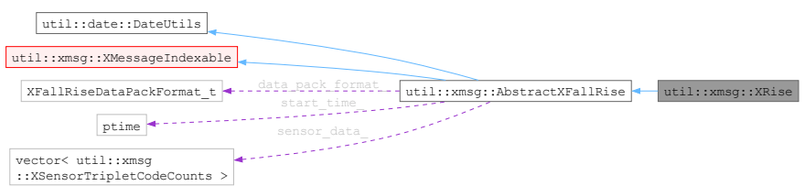
Class representing a rise data X-Message.

```
#include <XRise.h>
```

Inheritance diagram for util::xmsg::XRise:



Collaboration diagram for util::xmsg::XRise:



Public Member Functions

- XRise (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)

  The parameterized constructor.
- ~XRise ()

  The destructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)

  Check the X-message for the correct ID, minimum size, and message terminator.
- XFallRiseDataPackFormat_t data_pack_format () const

  Get the enumerated data packing format type.
- void DecodeXMsgData (const vector< uint8_t > &data)

  Decode the rise data X-Message from the binary message data.
- const string GenerateListingString (uint16_t pg, uint16_t po, uint16_t sg, uint16_t so, uint16_t tg, uint16_t to, float pc) const

  Get the listing entry string for this rise data X-Message.
- int16_t id_dive () const

  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const

  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const

  Get the enumerated X-Message type identifier.
- size_t num_samples () const

  Get the number of samples in this message.
- const vector< XSensorTripletCodeCounts > & sensor_data () const

  Get the vector of sensor data triplets.
- const ptime & start_time () const

  Get the start time of this message.
- uint8_t xmsg_index () const

  Get the index of this X-Message.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Static Public Member Functions

- static string GenerateCurrentUtcTimeIso8601String ()

  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- static string GenerateIso8601String (const ptime &p, bool extended=true)

  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)

  Convert a date/time to fractional days since a reference date/time.
- static const string GenerateListingComment ()

  Get the listing entry comment string.
- static ptime GetCurrentUtcTime ()

  Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Protected Member Functions

- void set_data_pack_format (XFallRiseDataPackFormat_t data_pack_format)

  Set the enumerated data packing format value for this message.
- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_start_time (const ptime &start_time)

  Set the start time of this message.
- void set_xmsg_index (uint8_t xmsg_index)

  Set the index of this X-Message.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.
- vector< XSensorTripletCodeCounts > UnpackData (const vector< uint8_t > &data)

  Unpack the fall/rise data from the binary message.

Private Attributes

- XFallRiseDataPackFormat_t data_pack_format_
  The packing format type identifier.
- int16_t id_dive_
  The dive or cycle number of this message.
- uint16_t id_instrument_
  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_
  The X-message type identifier.
- vector< XSensorTripletCodeCounts > sensor_data_
  The raw counts of measured fall, rise, or surface time-series data.
- ptime start_time_
  The start time reference.
- uint8_t xmsg_index_
  The index of this X-Message.
- uint16_t xmsg_size_bytes_
  The size of the X message, in bytes.

10.110.1 Detailed Description

Class representing a rise data X-Message.

10.110.2 Constructor & Destructor Documentation

10.110.2.1 XRise()

```
util::xmsg::XRise::XRise (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

The parameterized constructor.

Parameters

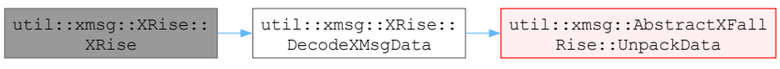
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.110.2.2 ~XRise()

```
util::xmsg::XRise::~XRise ()  [inline]
```

The destructor.

10.110.3 Member Function Documentation

10.110.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

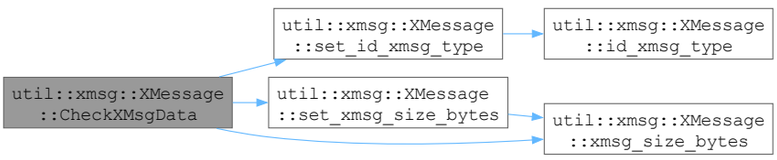
Here is the call graph for this function:



10.110.3.2 data_pack_format()

```
XFallRiseDataPackFormat_t util::xmsg::AbstractXFallRise::data_pack_format () const  [inline],
[inherited]
```

Get the enumerated data packing format type.

Returns

The enumerated data packing format type.

References util::xmsg::AbstractXFallRise::data_pack_format_.

Referenced by util::xmsg::AbstractXFallRise::set_data_pack_format(), and util::xmsg::AbstractXFallRise::UnpackData().

10.110.3.3 DecodeXMsgData()

```
void util::xmsg::XRise::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode the rise data X-Message from the binary message data.

Parameters

in	*data*	The binary message data to decode.

Implements util::xmsg::AbstractXFallRise.

References CATCH_BLOCK, EXC_THROW, util::xmsg::AbstractXFallRise::UnpackData(), and util::xmsg::XMSG_TYPE_ID_RISE0.

Referenced by XRise().

10.110.3.4 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

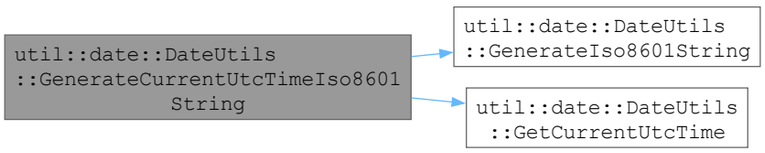
Returns

An ISO8601 format date/time string representation of the current time.

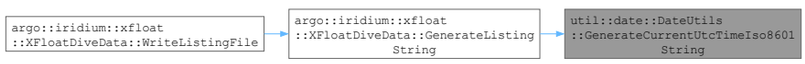
References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:



10.110.3.5 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

10.110.3.6 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref↩ _dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.110.3.7 GenerateListingComment()

```
static const string util::xmsg::AbstractXFallRise::GenerateListingComment ()  [inline], [static],
[inherited]
```

Get the listing entry comment string.

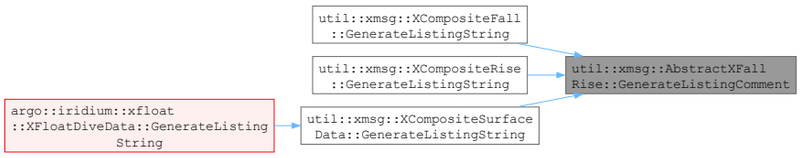
Returns

The listing entry comment string.

References CATCH_BLOCK.

Referenced by util::xmsg::XCompositeFall::GenerateListingString(), util::xmsg::XCompositeRise::GenerateListingString(), and util::xmsg::XCompositeSurfaceData::GenerateListingString().

Here is the caller graph for this function:



10.110.3.8 GenerateListingString()

```
const string util::xmsg::XRise::GenerateListingString (
            uint16_t pg,
            uint16_t po,
            uint16_t sg,
            uint16_t so,
            uint16_t tg,
            uint16_t to,
            float pc) const  [inline]
```

Get the listing entry string for this rise data X-Message.

Parameters

in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*sg*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*so*	The salinity sensor offset, in PSU.
in	*tg*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*to*	The temperature sensor offset, in degC.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Exceptions

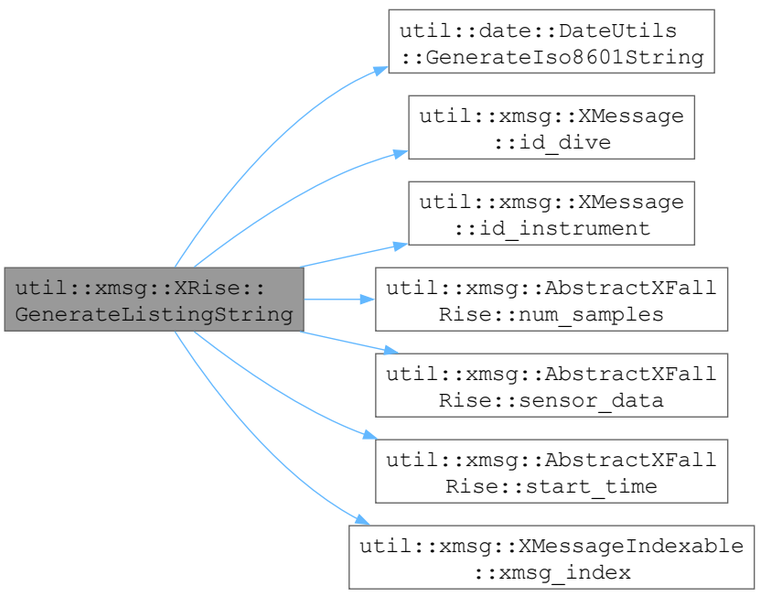
log::MessageException	if an error occurs while generating the listing string.

Returns

The listing entry string for this rise data X-Message.

References CATCH_BLOCK, util::date::DateUtils::GenerateIso8601String(), util::xmsg::XMessage::id_dive(), util::xmsg::XMessage::id_ins
util::xmsg::AbstractXFallRise::num_samples(), util::xmsg::AbstractXFallRise::sensor_data(), util::xmsg::AbstractXFallRise::start_time(),
and util::xmsg::XMessageIndexable::xmsg_index().

Here is the call graph for this function:



10.110.3.9 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

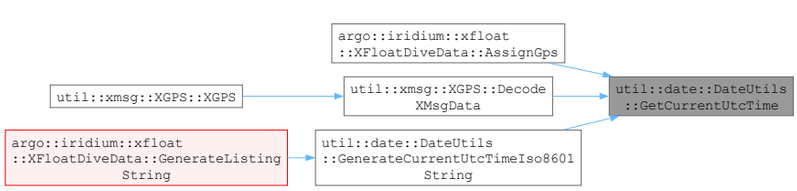
Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

Here is the caller graph for this function:



10.110.3.10 id_dive()

```
int16_t util::xmsg::XMessage::id_dive () const  [inline], [inherited]
```

Get the dive or cycle number of this X-Message.

Returns

The dive or cycle number of this X-Message.

References util::xmsg::XMessage::id_dive_.

Referenced by util::xmsg::XGPS::DeleteFromDatabase(), util::xmsg::XArgo::GenerateListingString(), util::xmsg::XEngAscent::GenerateLis

10.110.3.14 sensor_data()

```
const vector< XSensorTripletCodeCounts > & util::xmsg::AbstractXFallRise::sensor_data () const
[inline], [inherited]
```

Get the vector of sensor data triplets.

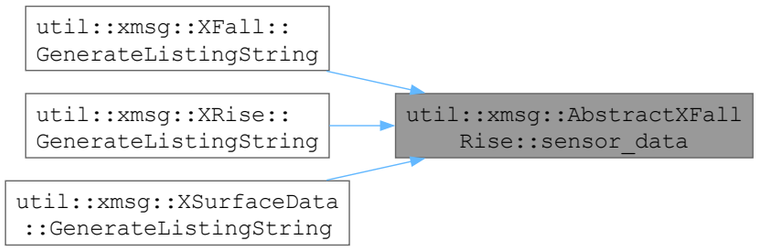
Returns

The vector of sensor data triplets.

References util::xmsg::AbstractXFallRise::sensor_data_.

Referenced by util::xmsg::XFall::GenerateListingString(), GenerateListingString(), and util::xmsg::XSurfaceData::GenerateListingString().

Here is the caller graph for this function:



10.110.3.15 set_data_pack_format()

```
void util::xmsg::AbstractXFallRise::set_data_pack_format (
            XFallRiseDataPackFormat_t data_pack_format)  [inline], [protected], [inherited]
```

Set the enumerated data packing format value for this message.

Parameters

in	*data_pack_format*	The enumerated data packing format value for this message to set.

References util::xmsg::AbstractXFallRise::data_pack_format(), and util::xmsg::AbstractXFallRise::data_pack_format_.

Referenced by util::xmsg::AbstractXFallRise::UnpackData().

```
vector< XSensorTripletCodeCounts > util::xmsg::AbstractXFallRise::UnpackData (
            const vector< uint8_t > & data)  [inline], [protected], [inherited]
```

Unpack the fall/rise data from the binary message.

Parameters

in	*data*	The binary message to unpack.

Exceptions

util::log::MessageException	if • the message is of insufficient length, • an invalid packing format is encountered, or • the message terminator is in an invalid location.

Returns

The raw counts of measured fall or rise time-series data.

References CATCH_BLOCK, util::xmsg::XMessage::CheckXMsgData(), util::xmsg::AbstractXFallRise::data_pack_format(), EXC_THROW, lwrn, s2000, util::xmsg::AbstractXFallRise::sensor_data_, util::xmsg::AbstractXFallRise::set_data_pack_format(), util::xmsg::AbstractXFallRise::set_start_time(), util::xmsg::XMessageIndexable::set_xmsg_index(), util::xmsg::XMessage::set_xmsg_size_ XMSG_SENS_BAD, util::xmsg::XMessage::xmsg_size_bytes(), util::xmsg::XPHASE_CODE_UNKNOWN, util::xmsg::XRISEFALL_FMT_ util::xmsg::XRISEFALL_FMT_STNDRD, util::xmsg::XRISEFALL_FMT_STNDRD_WITH_TEMP_AND_SALN, and util::xmsg::XRISEFALL_FMT_UNKNOWN.

10.110.4 Member Data Documentation

10.110.4.1 data_pack_format_

```
XFallRiseDataPackFormat_t util::xmsg::AbstractXFallRise::data_pack_format_  [private], [inherited]
```

The packing format type identifier.

Referenced by util::xmsg::AbstractXFallRise::data_pack_format(), and util::xmsg::AbstractXFallRise::set_data_pack_format().

10.110.4.2 id_dive_

`int16_t util::xmsg::XMessage::id_dive_ [private], [inherited]`

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.110.4.3 id_instrument_

`uint16_t util::xmsg::XMessage::id_instrument_ [private], [inherited]`

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.110.4.4 id_xmsg_type_

`XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_ [private], [inherited]`

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.110.4.5 sensor_data_

`vector<XSensorTripletCodeCounts> util::xmsg::AbstractXFallRise::sensor_data_ [private], [inherited]`

The raw counts of measured fall, rise, or surface time-series data.

Referenced by util::xmsg::AbstractXFallRise::num_samples(), util::xmsg::AbstractXFallRise::sensor_data(), and util::xmsg::AbstractXFallRise::UnpackData().

10.110.4.6 start_time_

`ptime util::xmsg::AbstractXFallRise::start_time_ [private], [inherited]`

The start time reference.

Referenced by util::xmsg::AbstractXFallRise::set_start_time(), and util::xmsg::AbstractXFallRise::start_time().

10.110.4.7 xmsg_index_

`uint8_t util::xmsg::XMessageIndexable::xmsg_index_ [private], [inherited]`

The index of this X-Message.

Referenced by util::xmsg::XMessageIndexable::set_xmsg_index(), and util::xmsg::XMessageIndexable::xmsg_index().

10.110.4.8 xmsg_size_bytes_

`uint16_t util::xmsg::XMessage::xmsg_size_bytes_ [private], [inherited]`

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

  Get the measured temperature value, in degC.

Static Public Member Functions

- static const char * GetPhaseCodeName (XPhaseCode_t code)
  Get the phase code name C-string for a given phase code value.

Private Attributes

- uint16_t elapsed_seconds_since_reference_time_
  The elapsed time since the reference time, in seconds.
- XPhaseCode_t phase_code_
  The phase code of this pressure measurement.
- int32_t pressure_counts_
  The pressure measurement, in raw sensor counts.
- int32_t salinity_counts_
  The salinity measurement, in raw sensor counts.
- int32_t temperature_counts_
  The temperature measurement, in raw sensor counts.

Static Private Attributes

- static const char * phase_code_names_ [ ]
  The phase code names.

10.111.1 Detailed Description

The sensor triplet and phase code class.

This class represents a pressure, temperature, and salinity measurement triplet and a phase code. The phase code is used to indicate the context of the measurement (see XPhaseCode_t). This class is used to store a single data point for the rise, fall, or surface time-series data.

10.111.2 Constructor & Destructor Documentation

10.111.2.1 XSensorTripletCodeCounts()

```
util::xmsg::XSensorTripletCodeCounts::XSensorTripletCodeCounts (
            uint16_t sec,
            XPhaseCode_t code,
            int32_t pres_counts,
            int32_t temp_counts = XMSG_SENS_BAD,
            int32_t saln_counts = XMSG_SENS_BAD)  [inline]
```

The constructor.

Parameters

in	*sec*	The elapsed time since the reference time, in seconds.
in	*code*	The phase code of this pressure measurement.
in	*pres_counts*	The pressure measurement, in raw sensor counts.
in	*temp_counts*	The temperature measurement, in raw sensor counts.
in	*saln_counts*	The salinity measurement, in raw sensor counts.

10.111.2.2 ~XSensorTripletCodeCounts()

```
util::xmsg::XSensorTripletCodeCounts::~XSensorTripletCodeCounts ()  [inline]
```

The destructor.

10.111.3 Member Function Documentation

10.111.3.1 elapsed_seconds_since_reference_time()

```
uint16_t util::xmsg::XPresCounts::elapsed_seconds_since_reference_time () const  [inline], [inherited]
```

Get the elapsed time since the reference time, in seconds.

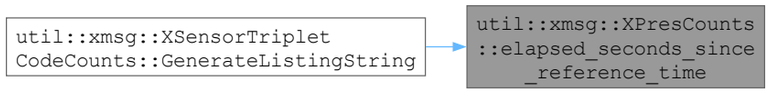
Returns

The elapsed time since the reference time, in seconds.

References util::xmsg::XPresCounts::elapsed_seconds_since_reference_time_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.111.3.2 GenerateListingString() [1/2]

```
const string util::xmsg::XPresCodeCounts::GenerateListingString (
            uint16_t pg,
            uint16_t po,
            float pc) const  [inline], [inherited]
```

Generate a listing entry string from this pressure measurement object.

Parameters

in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Exceptions

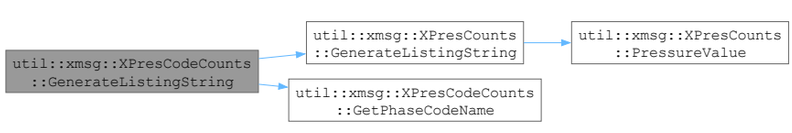
log::MessageException	if an error occurs while generating the listing string.

Returns

A listing entry string representation of this pressure measurement object.

References CATCH_BLOCK, util::xmsg::XPresCounts::GenerateListingString(), util::xmsg::XPresCodeCounts::GetPhaseCodeName(), and util::xmsg::XPresCodeCounts::phase_code_.

Here is the call graph for this function:



10.111.3.3 GenerateListingString() [2/2]

```
const string util::xmsg::XSensorTripletCodeCounts::GenerateListingString (
            uint16_t pg,
            uint16_t po,
            uint16_t sg,
            uint16_t so,
            uint16_t tg,
            uint16_t to,
            float pc) const  [inline]
```

Generate a listing entry string from this sensor triplet object.

Parameters

in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*sg*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*so*	The salinity sensor offset, in PSU.
in	*tg*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*to*	The temperature sensor offset, in degC.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Exceptions

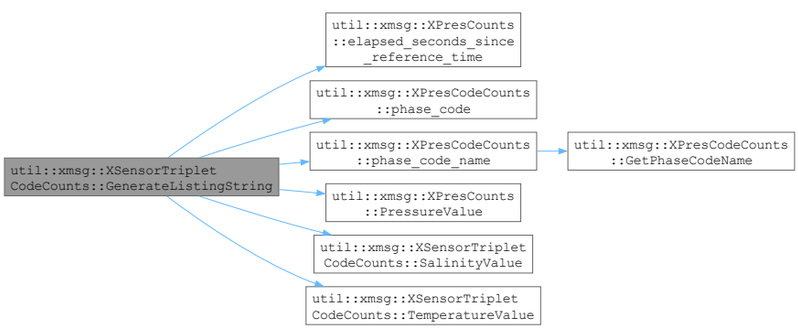
log::MessageException	if an error occurs while generating the listing string.

Returns

A listing entry string representation of this sensor triplet object.

References CATCH_BLOCK, util::xmsg::XPresCounts::elapsed_seconds_since_reference_time(), util::xmsg::XPresCodeCounts::phase_c
util::xmsg::XPresCodeCounts::phase_code_name(), util::xmsg::XPresCounts::PressureValue(), SalinityValue(), and
TemperatureValue().

Here is the call graph for this function:



10.111.3.4 GetPhaseCodeName()

```
static const char * util::xmsg::XPresCodeCounts::GetPhaseCodeName (
            XPhaseCode_t code)  [inline], [static], [inherited]
```

Get the phase code name C-string for a given phase code value.

Parameters

in	*code*	The phase code.

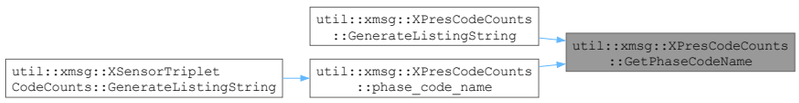
Returns

The phase code name C-string for the given phase code value.

References CATCH_BLOCK, EXC_THROW, and util::xmsg::XPresCodeCounts::phase_code_names_.

Referenced by util::xmsg::XPresCodeCounts::GenerateListingString(), and util::xmsg::XPresCodeCounts::phase_code_name().

Here is the caller graph for this function:



10.111.3.5 phase_code()

```
XPhaseCode_t util::xmsg::XPresCodeCounts::phase_code () const  [inline], [inherited]
```

Get the phase code.

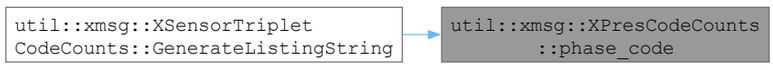
Returns

The phase code.

References util::xmsg::XPresCodeCounts::phase_code_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.111.3.6 phase_code_name()

```
const char * util::xmsg::XPresCodeCounts::phase_code_name () const  [inline], [inherited]
```

Get the phase code name C-sting.

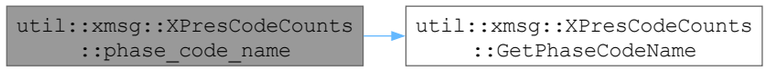
Returns

The phase code name C-sting.

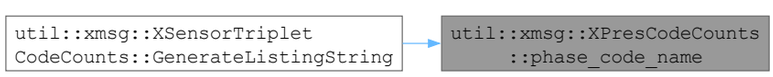
References util::xmsg::XPresCodeCounts::GetPhaseCodeName(), and util::xmsg::XPresCodeCounts::phase_code_.

Referenced by GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:



10.111.3.7 PressureValue()

```
template<typename T = float>
T util::xmsg::XPresCounts::PressureValue (
            uint16_t pg,
            uint16_t po,
            float pres_corr) const  [inline], [inherited]
```

Get the measured pressure value, in dBar.

Parameters

in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*pres_corr*	The pressure correction, in dBar, to be subtracted computed pressure value.

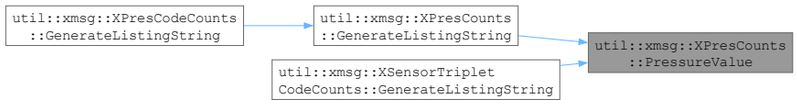
Returns

The measured pressure value, in dBar.

References util::xmsg::XPresCounts::pressure_counts_, XMSG_SENS_BAD_PRES, and XMSG_SENS_MAX_PRES.

Referenced by util::xmsg::XPresCounts::GenerateListingString(), and GenerateListingString().

Here is the caller graph for this function:



10.111.3.8 SalinityValue()

```
template<typename T = double>
T util::xmsg::XSensorTripletCodeCounts::SalinityValue (
            uint16_t sg,
            uint16_t so) const  [inline]
```

Get the measured salinity value, in PSU.

Parameters

in	*sg*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*so*	The salinity sensor offset, in PSU.

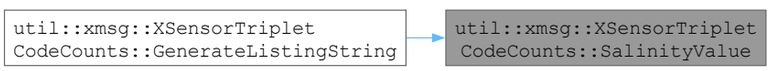
Returns

The measured salinity value, in PSU.

References salinity_counts_, XMSG_SENS_BAD_SALN, and XMSG_SENS_MAX_SALN.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.111.3.9 TemperatureValue()

```
template<typename T = double>
T util::xmsg::XSensorTripletCodeCounts::TemperatureValue (
            uint16_t tg,
            uint16_t to) const  [inline]
```

Get the measured temperature value, in degC.

Parameters

in	*tg*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*to*	The temperature sensor offset, in degC.

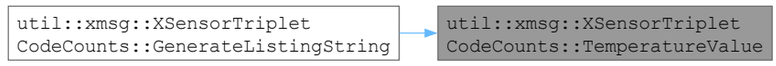
Returns

The measured temperature value, in degC.

References temperature_counts_, XMSG_SENS_BAD_TEMP, and XMSG_SENS_MAX_TEMP.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.111.4 Member Data Documentation

10.111.4.1 elapsed_seconds_since_reference_time_

```
uint16_t util::xmsg::XPresCounts::elapsed_seconds_since_reference_time_  [private], [inherited]
```

The elapsed time since the reference time, in seconds.

Referenced by util::xmsg::XPresCounts::elapsed_seconds_since_reference_time(), and util::xmsg::XPresCounts::GenerateListingString()

10.111.4.2 phase_code_

```
XPhaseCode_t util::xmsg::XPresCodeCounts::phase_code_  [private], [inherited]
```

The phase code of this pressure measurement.

Referenced by util::xmsg::XPresCodeCounts::GenerateListingString(), util::xmsg::XPresCodeCounts::phase_code(), and util::xmsg::XPresCodeCounts::phase_code_name().

10.111.4.3 phase_code_names_

```
const char * util::xmsg::XPresCodeCounts::phase_code_names_  [static], [private], [inherited]
```

Initial value:

```
= {
        "unknown",
        "start of descent",
        "first descent pump",
        "seek to drift pres",
        "start of drift",
        "seek during drift",
        "start of descent to profile",
        "start of ascent",
        "end of ascent",
        "ice turn-around",
        "descending",
        "drift/park",
        "descending to profile",
        "ascending",
        "surface",
        "invalid phase code"
        }
```

The phase code names.

Referenced by util::xmsg::XPresCodeCounts::GetPhaseCodeName().

10.111.4.4 pressure_counts_

```
int32_t util::xmsg::XPresCounts::pressure_counts_  [private], [inherited]
```

The pressure measurement, in raw sensor counts.

Referenced by util::xmsg::XPresCounts::PressureValue().

10.111.4.5 salinity_counts_

```
int32_t util::xmsg::XSensorTripletCodeCounts::salinity_counts_  [private]
```

The salinity measurement, in raw sensor counts.

Referenced by SalinityValue().

10.111.4.6 temperature_counts_

```
int32_t util::xmsg::XSensorTripletCodeCounts::temperature_counts_  [private]
```

The temperature measurement, in raw sensor counts.

Referenced by TemperatureValue().

The documentation for this class was generated from the following file:

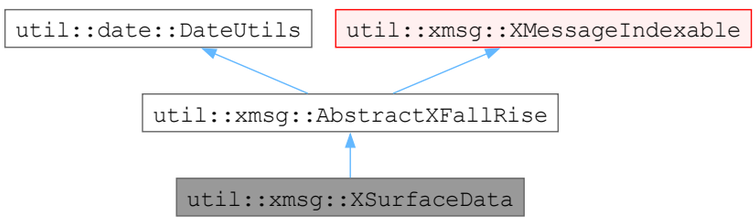
10.112 util::xmsg::XSurfaceData Class Reference

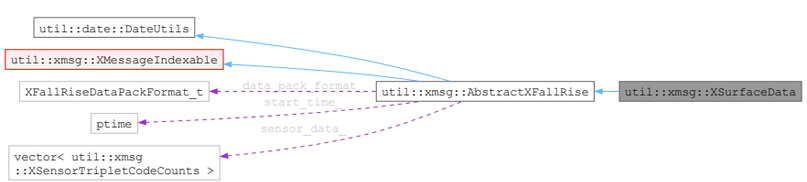
The surface time-series data X-Message class.

```
#include <XSurfaceData.h>
```

Inheritance diagram for util::xmsg::XSurfaceData:



Collaboration diagram for util::xmsg::XSurfaceData:



Public Member Functions

- XSurfaceData (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)

  Parameterized constructor.
- ~XSurfaceData ()

  Destructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)

  Check the X-message for the correct ID, minimum size, and message terminator.
- XFallRiseDataPackFormat_t data_pack_format () const

  Get the enumerated data packing format type.
- void DecodeXMsgData (const vector< uint8_t > &data)

  Decode the surface pressure X-message.
- const string GenerateListingString (uint16_t pg, uint16_t po, uint16_t sg, uint16_t so, uint16_t tg, uint16_t to, float pc) const

  Generate the listing entry string for this surface time-series data X-Message.
- int16_t id_dive () const

  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const

  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const

  Get the enumerated X-Message type identifier.
- size_t num_samples () const

  Get the number of samples in this message.
- const vector< XSensorTripletCodeCounts > & sensor_data () const

  Get the vector of sensor data triplets.
- const ptime & start_time () const

  Get the start time of this message.
- uint8_t xmsg_index () const

  Get the index of this X-Message.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Static Public Member Functions

- static string GenerateCurrentUtcTimeIso8601String ()

  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- static string GenerateIso8601String (const ptime &p, bool extended=true)

  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)

  Convert a date/time to fractional days since a reference date/time.
- static const string GenerateListingComment ()

  Get the listing entry comment string.
- static ptime GetCurrentUtcTime ()

  Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Protected Member Functions

- void set_data_pack_format (XFallRiseDataPackFormat_t data_pack_format)

  Set the enumerated data packing format value for this message.
- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_start_time (const ptime &start_time)

  Set the start time of this message.
- void set_xmsg_index (uint8_t xmsg_index)

  Set the index of this X-Message.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.
- vector< XSensorTripletCodeCounts > UnpackData (const vector< uint8_t > &data)

  Unpack the fall/rise data from the binary message.

Private Attributes

- XFallRiseDataPackFormat_t data_pack_format_

  The packing format type identifier.
- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- vector< XSensorTripletCodeCounts > sensor_data_

  The raw counts of measured fall, rise, or surface time-series data.
- ptime start_time_

  The start time reference.
- uint8_t xmsg_index_

  The index of this X-Message.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.112.1 Detailed Description

The surface time-series data X-Message class.

10.112.2 Constructor & Destructor Documentation

10.112.2.1 XSurfaceData()

```
util::xmsg::XSurfaceData::XSurfaceData (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

Parameterized constructor.

Parameters

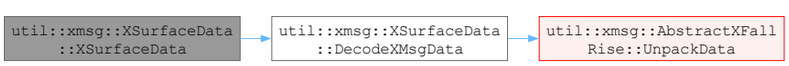
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	Binary surface pressure X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.112.2.2 ~XSurfaceData()

```
util::xmsg::XSurfaceData::~XSurfaceData ()  [inline]
```

Destructor.

10.112.3 Member Function Documentation

10.112.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref*↩ *_dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.112.3.7 GenerateListingComment()

```
static const string util::xmsg::AbstractXFallRise::GenerateListingComment ()  [inline], [static],
[inherited]
```

Get the listing entry comment string.

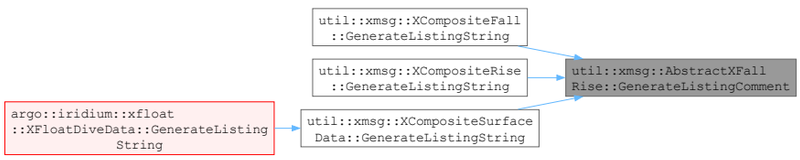
Returns

The listing entry comment string.

References CATCH_BLOCK.

Referenced by util::xmsg::XCompositeFall::GenerateListingString(), util::xmsg::XCompositeRise::GenerateListingString(), and util::xmsg::XCompositeSurfaceData::GenerateListingString().

Here is the caller graph for this function:



10.112.3.8 GenerateListingString()

```
const string util::xmsg::XSurfaceData::GenerateListingString (
            uint16_t pg,
            uint16_t po,
            uint16_t sg,
            uint16_t so,
            uint16_t tg,
            uint16_t to,
            float pc) const  [inline]
```

Generate the listing entry string for this surface time-series data X-Message.

Parameters

in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*sg*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*so*	The salinity sensor offset, in PSU.
in	*tg*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*to*	The temperature sensor offset, in degC.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Exceptions

log::MessageException	if an error occurs while generating the listing string.

Returns

The listing entry string for this surface time-series data X-Message.

References CATCH_BLOCK, util::date::DateUtils::GenerateIso8601String(), util::xmsg::XMessage::id_dive(), util::xmsg::XMessage::id_ins

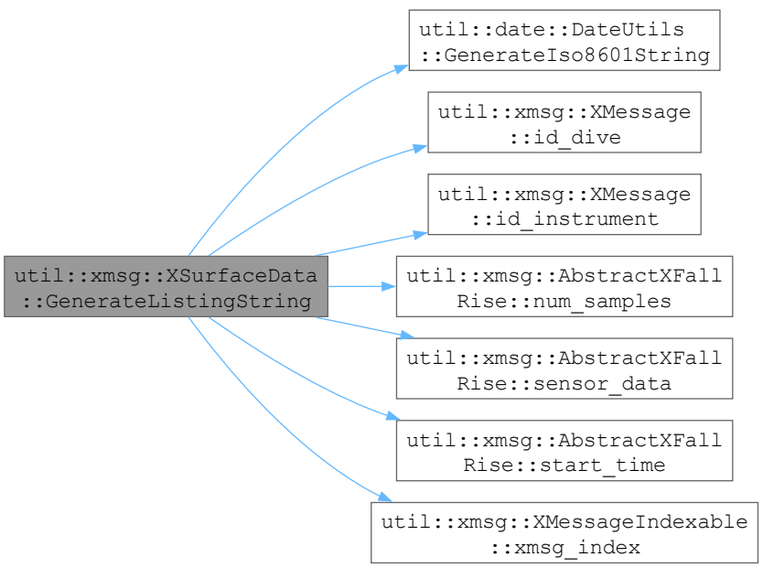
Here is the call graph for this function:



10.112.3.9 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

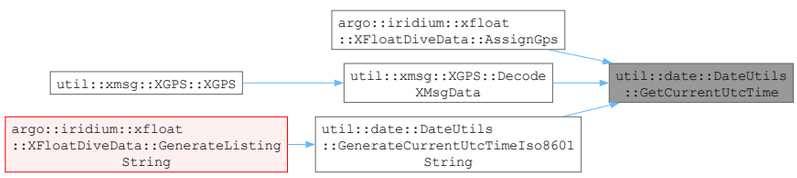
Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

Here is the caller graph for this function:



10.112.3.10 id_dive()

```
int16_t util::xmsg::XMessage::id_dive () const  [inline], [inherited]
```

Get the dive or cycle number of this X-Message.

Returns

The dive or cycle number of this X-Message.

References util::xmsg::XMessage::id_dive_.

Referenced by util::xmsg::XGPS::DeleteFromDatabase(), util::xmsg::XArgo::GenerateListingString(), util::xmsg::XEngAscent::GenerateLis

```
vector< XSensorTripletCodeCounts > util::xmsg::AbstractXFallRise::UnpackData (
            const vector< uint8_t > & data)  [inline], [protected], [inherited]
```

Unpack the fall/rise data from the binary message.

Parameters

in	*data*	The binary message to unpack.

Exceptions

util::log::MessageException	if • the message is of insufficient length, • an invalid packing format is encountered, or • the message terminator is in an invalid location.

Returns

The raw counts of measured fall or rise time-series data.

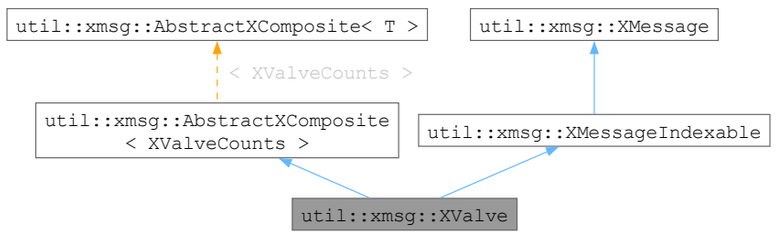
- data/xmsg/XSurfaceData.h

10.113 util::xmsg::XValve Class Reference

The valve data message class.

`#include <XValve.h>`

Inheritance diagram for util::xmsg::XValve:



Collaboration diagram for util::xmsg::XValve:

Public Member Functions

- XValve (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)

  Parameterized constructor.
- void AppendAllElements (const static_vector< Element_t, I > &elements)

  Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.
- virtual void AssignElement (const Element_t &element)

  Assign an element to this composite object.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)

  Check the X-message for the correct ID, minimum size, and message terminator.
- void DecodeXMsgData (const vector< uint8_t > &data)

  Decode a valve data X-message (type 0xEB).
- const vector< Element_t > & elements () const

  Get the vector of individual X-Messages elements that compose this composite object.
- const string **GenerateListingString** (uint16_t pGain, uint16_t pOff, float pres_correction) const
- int16_t id_dive () const

  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const

  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const

  Get the enumerated X-Message type identifier.
- virtual bool **IsEmpty** () const
- virtual size_t num_elements () const

  Get the number of individual elements that compose this composite object.
- uint8_t xmsg_index () const

  Get the index of this X-Message.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Static Public Member Functions

- static const string GenerateListingComment ()

  The the listing file comment string.

Protected Member Functions

- void AppendAllElements (const vector< Element_t > &elements)

  Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.
- void AppendElement (const Element_t &element)

  Append one element to the vector of individual X-Messages elements that compose this composite object.
- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_xmsg_index (uint8_t xmsg_index)

  Set the index of this X-Message.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.

Private Types

- typedef XValveCounts Element_t

  Type definition for the element aggregated by this object.
- typedef ElementVec_t::const_iterator **ElementConstIter_t**
- typedef ElementVec_t::iterator **ElementIter_t**
- typedef vector< Element_t > **ElementVec_t**

Private Attributes

- ElementVec_t elements_

  The vector of individual X-Messages elements that compose this composite object.
- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint8_t xmsg_index_

  The index of this X-Message.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.113.1 Detailed Description

The valve data message class.

An instance of this class represents a decoded valve data X-message, composed of the valve operation samples (see XValveCounts) reported for a dive.

10.113.2 Member Typedef Documentation

10.113.2.1 Element_t

```
typedef XValveCounts util::xmsg::AbstractXComposite< XValveCounts >::Element_t  [private], [inherited]
```

Type definition for the element aggregated by this object.

10.113.3 Constructor & Destructor Documentation

10.113.3.1 XValve()

```
util::xmsg::XValve::XValve (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

Parameterized constructor.

Parameters

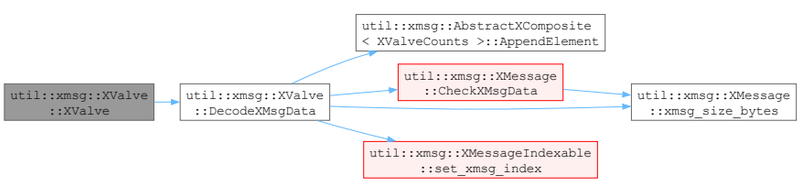
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI instrument identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if the message cannot be decoded.

References DecodeXMsgData().

Here is the call graph for this function:



10.113.4 Member Function Documentation

10.113.4.1 AppendAllElements() [1/2]

```
void util::xmsg::AbstractXComposite< XValveCounts >::AppendAllElements (
            const static_vector< Element_t, I > & elements)  [inline], [inherited]
```

Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*elements*	The vector of elements to append.

10.113.4.2 AppendAllElements() [2/2]

```
void util::xmsg::AbstractXComposite< XValveCounts >::AppendAllElements (
            const vector< Element_t > & elements)  [inline], [protected], [inherited]
```

Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*elements*	The vector of elements to append.

10.113.4.3 AppendElement()

```
void util::xmsg::AbstractXComposite< XValveCounts >::AppendElement (
            const Element_t & element)  [inline], [protected], [inherited]
```

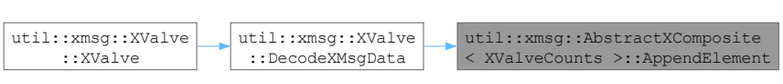
Append one element to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*element*	The element to append.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.113.4.4 AssignElement()

```
virtual void util::xmsg::AbstractXComposite< XValveCounts >::AssignElement (
            const Element_t & element)  [inline], [virtual], [inherited]
```

Assign an element to this composite object.

The default implementation appends the element; derived classes may override it to insert elements in order or reject duplicates.

Parameters

in	*element*	The element to assign.

10.113.4.5 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::XMessage::set_xmsg_size_byte
u16, and util::xmsg::XMessage::xmsg_size_bytes().

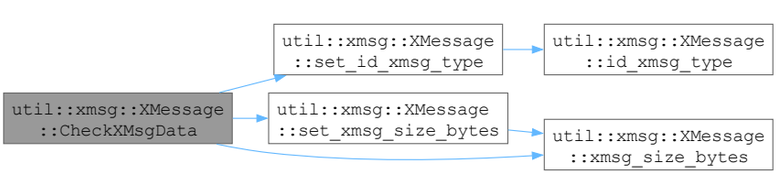
Here is the call graph for this function:



10.113.4.6 DecodeXMsgData()

```
void util::xmsg::XValve::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode a valve data X-message (type 0xEB).

The low nibble of byte 3 is the message index. From byte 4, each valve operation is a 7-byte sample: a phase code (high nibble of the first byte), a 20-bit pressure count (low nibble plus the next two bytes), the valve duration in seconds (2 bytes) and the case vacuum after the operation (2 bytes). The case vacuum before the operation is not reported and is set to XMSG_BAD_U16. Each sample is stored as an XValveCounts element.

Parameters

in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if the message is shorter than its size field or the terminator is missing.

Implements util::xmsg::XMessageIndexable.

References util::xmsg::AbstractXComposite< XValveCounts >::AppendElement(), CATCH_BLOCK, util::xmsg::XMessage::CheckXMsgD
lwrn, util::xmsg::XMessageIndexable::set_xmsg_index(), XMSG_BAD_U16, and util::xmsg::XMessage::xmsg_size_bytes().

10.113.4.7 elements()

```
const vector< Element_t > & util::xmsg::AbstractXComposite< XValveCounts >::elements () const
[inline], [inherited]
```

Get the vector of individual X-Messages elements that compose this composite object.

Returns

The vector of individual X-Messages elements that compose this composite object.

10.113.4.8 GenerateListingComment()

```
static const string util::xmsg::XValve::GenerateListingComment ()  [inline], [static]
```

The the listing file comment string.

Returns

The listing file comment string.

References CATCH_BLOCK.

10.113.4.9 id_dive()

```
int16_t util::xmsg::XMessage::id_dive () const  [inline], [inherited]
```

Get the dive or cycle number of this X-Message.

Returns

The dive or cycle number of this X-Message.

References util::xmsg::XMessage::id_dive_.

Referenced by util::xmsg::XGPS::DeleteFromDatabase(), util::xmsg::XArgo::GenerateListingString(), util::xmsg::XEngAscent::GenerateLis

10.113.4.12 num_elements()

```
virtual size_t util::xmsg::AbstractXComposite< XValveCounts >::num_elements () const  [inline],
[virtual], [inherited]
```

Get the number of individual elements that compose this composite object.

Returns

The number of individual elements that compose this composite object.

10.113.4.13 set_id_dive()

```
void util::xmsg::XMessage::set_id_dive (
            int16_t id_dive)  [inline], [protected], [inherited]
```

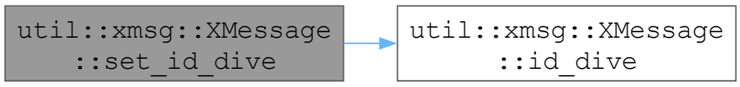
Set the dive or cycle number of this message.

Parameters

in	*id_dive*	The dive or cycle number of this message to set.

References util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::id_dive_.

Here is the call graph for this function:



10.113.4.14 set_id_instrument()

```
void util::xmsg::XMessage::set_id_instrument (
            uint16_t id_instrument)  [inline], [protected], [inherited]
```

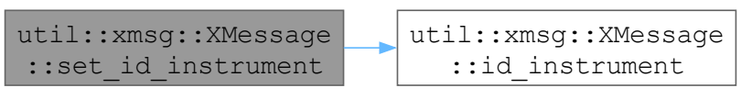
Set the unique instrument identifier.

Parameters

in	*id_instrument*	The unique instrument identifier to set.

References util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::id_instrument_.

Here is the call graph for this function:



10.113.4.15 set_id_xmsg_type()

10.114.1 Detailed Description

The valve counts class.

An instance of this class represents a single valve operation decoded from a valve data message (see XValve): the pressure, and the case vacuum before and after the valve operation.

10.114.2 Constructor & Destructor Documentation

10.114.2.1 XValveCounts()

```
util::xmsg::XValveCounts::XValveCounts (
            XPhaseCode_t code,
            int32_t count,
            int16_t sec,
            uint16_t vac0,
            uint16_t vac1)  [inline]
```

The parameterized constructor.

Parameters

in	*code*	The phase code.
in	*count*	The measured pressure, before opening the valve, in raw sensor counts.
in	*sec*	The duration that the valve was open, in seconds.
in	*vac0*	The measured vacuum after opening the valve, in 0.01inHg.
in	*vac1*	The measured vacuum before opening the valve, in 0.01inHg.

10.114.2.2 ~XValveCounts()

```
util::xmsg::XValveCounts::~XValveCounts ()  [inline]
```

The destructor.

10.114.3 Member Function Documentation

10.114.3.1 case_vac_after_pumping_inhg()

```
template<typename T = float>
T util::xmsg::XValveCounts::case_vac_after_pumping_inhg () const  [inline]
```

Get the measured vacuum after pumping, in inHg.

Returns

The measured vacuum after pumping, in inHg.

10.114.3.2 case_vac_before_pumping_inhg()

```
template<typename T = float>
T util::xmsg::XValveCounts::case_vac_before_pumping_inhg () const  [inline]
```

Get the measured vacuum before pumping, in inHg.

Returns

The measured vacuum before pumping, in inHg.

10.114.3.3 PressureValue()

```
template<typename T = double>
T util::xmsg::XValveCounts::PressureValue (
            uint16_t pg,
            uint16_t po,
            float pc) const  [inline], [protected]
```

Get the measured pressure value, in dBar.

Parameters

in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Returns

The measured pressure value, in dBar.

References pressure_counts_, XMSG_SENS_BAD_PRES, and XMSG_SENS_MAX_PRES.

10.114.4 Member Data Documentation

10.114.4.1 case_vac_after_valve_cinhg_

```
uint16_t util::xmsg::XValveCounts::case_vac_after_valve_cinhg_  [private]
```

The measured vacuum after opening the valve, in 0.01inHg.

10.114.4.2 case_vac_before_valve_cinhg_

```
uint16_t util::xmsg::XValveCounts::case_vac_before_valve_cinhg_  [private]
```

The measured vacuum before opening the valve, in 0.01inHg.

10.114.4.3 phase_code_

```
XPhaseCode_t util::xmsg::XValveCounts::phase_code_  [private]
```

The phase code of this valve data measurement.

10.114.4.4 pressure_counts_

```
int32_t util::xmsg::XValveCounts::pressure_counts_  [private]
```

The measured pressure, before opening the valve, in raw sensor counts.

Referenced by PressureValue().

10.114.4.5 valve_duration_sec_

```
int16_t util::xmsg::XValveCounts::valve_duration_sec_  [private]
```

The duration that the valve was open, in seconds.

The documentation for this class was generated from the following file:

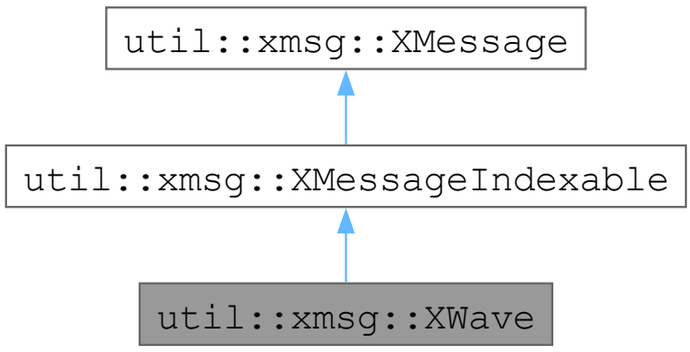
- data/xmsg/common/XValveCounts.h

10.115 util::xmsg::XWave Class Reference

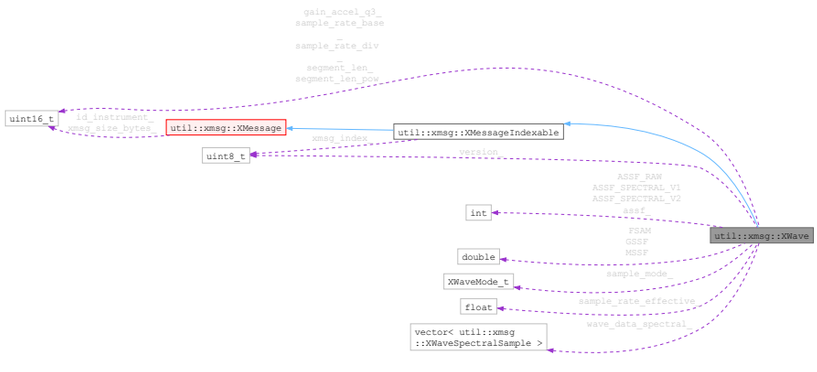
Class representing measured ocean surface wave data X message.

```
#include <XWave.h>
```

Inheritance diagram for util::xmsg::XWave:



Collaboration diagram for util::xmsg::XWave:



Public Member Functions

- XWave (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)

  The parameterized constructor.
- ~XWave ()

  The destructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)

  Check the X-message for the correct ID, minimum size, and message terminator.
- void DecodeXMsgData (const vector< uint8_t > &data)

  Decode the wave data message.
- unsigned int **effective_ssf** () const
- void FixFuckup9000 ()

  Fix MRV's 9000th data encoding fuckup.
- float **gain_accel** () const
- const string GenerateListingString () const

  Generate a listing entry string from this ocean surface wave-field data message.
- int16_t id_dive () const

  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const

  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const

  Get the enumerated X-Message type identifier.
- uint16_t **segment_len** () const
- uint16_t **segment_len_pow** () const
- void **set_segment_len** (uint16_t segment_len)
- void **set_segment_len_pow** (uint16_t segment_len_pow)
- uint8_t xmsg_index () const

  Get the index of this X-Message.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Protected Member Functions

- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_xmsg_index (uint8_t xmsg_index)

  Set the index of this X-Message.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.

Private Attributes

- unsigned int assf_

  The accelerometer sensitivity scale factor, in LSB/g.
- uint16_t gain_accel_q3_

  Accelerometer software gain.
- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- XWaveMode_t sample_mode_

  The ocean surface wave field sampling mode.
- uint16_t sample_rate_base_

  The base sample rate, in Hz.
- uint16_t sample_rate_div_

  The sample rate divider, in Hz/Hz.

- float sample_rate_effective_

  The sample rate of the ocean surface wave measurements, in Hz.
- uint16_t segment_len_

  The power-of-two segment length for spectral data.
- uint16_t segment_len_pow_

  The power-of-two segment length for spectral data.
- uint8_t **version_**
- vector< XWaveSpectralSample > wave_data_spectral_

  The spectral data samples.
- uint8_t xmsg_index_

  The index of this X-Message.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

Static Private Attributes

- static const unsigned int ASSF_RAW [ ] = { 16384, 8192, 4096, 2048 }

  Available accelerometer sensitivity scale factors for raw wave data.
- static const unsigned int ASSF_SPECTRAL_V1 [ ] = { 8192, 2048, 512, 128 }

  Available accelerometer sensitivity scale factors for spectral wave data – message version 1.
- static const unsigned int ASSF_SPECTRAL_V2 [ ] = { 8192, 2048, 512, 128 }

  Available accelerometer sensitivity scale factors for spectral wave data – message version 2.
- static const double FSAM [ ] = { 1 }

  Available ample rate frequencies.
- static const double GSSF [ ] = { 131.072, 65.536, 32.768, 16.384 }

  Available gyrscope sensitivity scale factors.
- static const double MSSF [ ] = { (30.0 / 9.0) }

  Available magenetometer sensitivity scale factors.

10.115.1 Detailed Description

Class representing measured ocean surface wave data X message.

10.115.2 Constructor & Destructor Documentation

10.115.2.1 XWave()

```
util::xmsg::XWave::XWave (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

The parameterized constructor.

Parameters

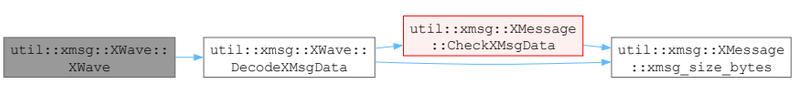
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	Binary surface pressure X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.115.2.2 ~XWave()

```
util::xmsg::XWave::~XWave ()  [inline]
```

The destructor.

10.115.3 Member Function Documentation

10.115.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::XMessage::set_xmsg_size_byte
u16, and util::xmsg::XMessage::xmsg_size_bytes().

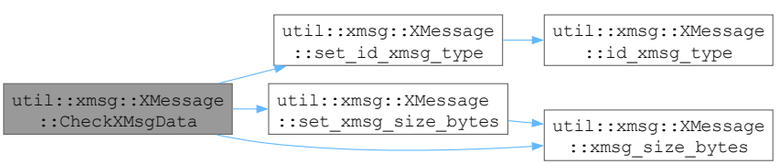
Here is the call graph for this function:



10.115.3.2 DecodeXMsgData()

```
void util::xmsg::XWave::DecodeXMsgData (
            const vector< uint8_t > & data)  [virtual]
```

Decode the wave data message.

Parameters

in	*data*	The byte array to decode.

Exceptions

log::MessageException	on error.

Implements util::xmsg::XMessageIndexable.

References assf_, ASSF_SPECTRAL_V1, ASSF_SPECTRAL_V2, CATCH_BLOCK, util::xmsg::XMessage::CheckXMsgData(), dbg1, EXC_THROW, gain_accel_q3_, i16, ldbg, lerr, lwrn, sample_mode_, sample_rate_base_, sample_rate_div_, sample_rate_effective_, u08, u16, wave_data_spectral_, util::xmsg::XMessage::xmsg_size_bytes(), util::xmsg::XWAVE_MODE_RAW, util::xmsg::XWAVE_MODE_SPECTRAL, and util::xmsg::XWAVE_MODE_UNKNOWN.

10.115.3.7 id_xmsg_type()

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type () const  [inline], [inherited]
```

Get the enumerated X-Message type identifier.

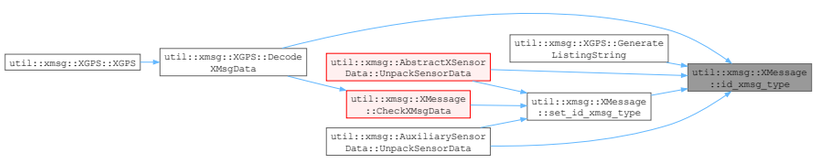
Returns

The enumerated X-Message type identifier.

References util::xmsg::XMessage::id_xmsg_type_.

Referenced by util::xmsg::XGPS::DecodeXMsgData(), util::xmsg::XGPS::GenerateListingString(), util::xmsg::XMessage::set_id_xmsg_typ
util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

Here is the caller graph for this function:



10.115.3.8 set_id_dive()

```
void util::xmsg::XMessage::set_id_dive (
            int16_t id_dive)  [inline], [protected], [inherited]
```

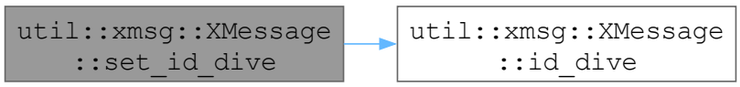
Set the dive or cycle number of this message.

Parameters

in	*id_dive*	The dive or cycle number of this message to set.

References util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::id_dive_.

Here is the call graph for this function:



10.115.3.9 set_id_instrument()

```
void util::xmsg::XMessage::set_id_instrument (
            uint16_t id_instrument)  [inline], [protected], [inherited]
```

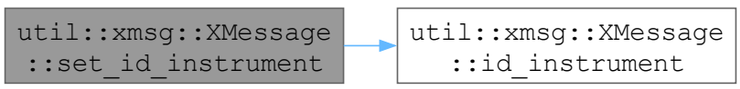
Set the unique instrument identifier.

Parameters

in	*id_instrument*	The unique instrument identifier to set.

References util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::id_instrument_.

Here is the call graph for this function:



10.115.3.10 set_id_xmsg_type()

```
void util::xmsg::XMessage::set_id_xmsg_type (
            XMsgTypeId_t id_xmsg_type)  [inline], [protected], [inherited]
```

Set the X-Message type identifier.

Parameters

in	*id_xmsg_type*	The X-Message type identifier to set.

References util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::id_xmsg_type_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

10.115.4 Member Data Documentation

10.115.4.1 assf_

```
unsigned int util::xmsg::XWave::assf_  [private]
```

The accelerometer sensitivity scale factor, in LSB/g.

Note

Dividing accelerometer counts by this number produces this measured acceleration, in g.

Referenced by DecodeXMsgData(), and GenerateListingString().

10.115.4.2 ASSF_RAW

```
const unsigned int util::xmsg::XWave::ASSF_RAW = { 16384, 8192, 4096, 2048 }  [static], [private]
```

Available accelerometer sensitivity scale factors for raw wave data.

10.115.4.3 ASSF_SPECTRAL_V1

```
const unsigned int util::xmsg::XWave::ASSF_SPECTRAL_V1 = { 8192, 2048, 512, 128 }  [static], [private]
```

Available accelerometer sensitivity scale factors for spectral wave data – message version 1.

Referenced by DecodeXMsgData().

10.115.4.4 ASSF_SPECTRAL_V2

```
const unsigned int util::xmsg::XWave::ASSF_SPECTRAL_V2 = { 8192, 2048, 512, 128 }  [static], [private]
```

Available accelerometer sensitivity scale factors for spectral wave data – message version 2.

Referenced by DecodeXMsgData().

10.115.4.5 FSAM

```
const double util::xmsg::XWave::FSAM = { 1 }  [static], [private]
```

Available ample rate frequencies.

10.115.4.6 gain_accel_q3_

```
uint16_t util::xmsg::XWave::gain_accel_q3_  [private]
```

Accelerometer software gain.

Referenced by DecodeXMsgData().

10.115.4.7 GSSF

```
const double util::xmsg::XWave::GSSF = { 131.072, 65.536, 32.768, 16.384 }  [static], [private]
```

Available gyrscope sensitivity scale factors.

10.115.4.8 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.115.4.9 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.115.4.10 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.115.4.11 MSSF

```
const double util::xmsg::XWave::MSSF = { (30.0 / 9.0) }  [static], [private]
```

Available magenetometer sensitivity scale factors.

10.115.4.12 sample_mode_

```
XWaveMode_t util::xmsg::XWave::sample_mode_  [private]
```

The ocean surface wave field sampling mode.

This field indicates whether this message contains raw wave motion measurements or spectrally encoded data.

Referenced by DecodeXMsgData(), and GenerateListingString().

10.115.4.13 sample_rate_base_

```
uint16_t util::xmsg::XWave::sample_rate_base_  [private]
```

The base sample rate, in Hz.

Referenced by DecodeXMsgData(), FixFuckup9000(), and GenerateListingString().

10.115.4.14 sample_rate_div_

```
uint16_t util::xmsg::XWave::sample_rate_div_  [private]
```

The sample rate divider, in Hz/Hz.

Referenced by DecodeXMsgData(), FixFuckup9000(), and GenerateListingString().

10.115.4.15 sample_rate_effective_

```
float util::xmsg::XWave::sample_rate_effective_  [private]
```

The sample rate of the ocean surface wave measurements, in Hz.

Referenced by DecodeXMsgData(), FixFuckup9000(), and GenerateListingString().

10.115.4.16 segment_len_

```
uint16_t util::xmsg::XWave::segment_len_  [private]
```

The power-of-two segment length for spectral data.

10.115.4.17 segment_len_pow_

```
uint16_t util::xmsg::XWave::segment_len_pow_  [private]
```

The power-of-two segment length for spectral data.

10.115.4.18 wave_data_spectral_

```
vector<XWaveSpectralSample> util::xmsg::XWave::wave_data_spectral_  [private]
```

The spectral data samples.

Referenced by DecodeXMsgData(), FixFuckup9000(), and GenerateListingString().

10.115.4.19 xmsg_index_

```
uint8_t util::xmsg::XMessageIndexable::xmsg_index_  [private], [inherited]
```

The index of this X-Message.

Referenced by util::xmsg::XMessageIndexable::set_xmsg_index(), and util::xmsg::XMessageIndexable::xmsg_index().

10.115.4.20 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following files:

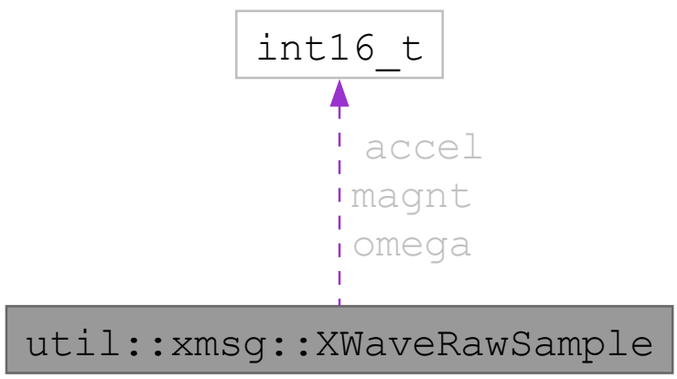
- data/xmsg/XWave.h
- data/xmsg/XWave.cpp

10.116 util::xmsg::XWaveRawSample Class Reference

Class representing a single raw motion measurement in the surface time series wave data X-message.

```
#include <XWaveRawSample.h>
```

Collaboration diagram for util::xmsg::XWaveRawSample:



Public Member Functions

- XWaveRawSample () ATTR_NO_EXCEPTIONS
  Default constructor.
- ~XWaveRawSample ()
  Destructor.
- const string GenerateListingString (double assf, double gssf, double mssf) const
  Generate a listing entry string representation of this raw motion measurement.

Private Attributes

- int16_t accel [3]
  Measured acceleration in the starboard (x'), bow (y'), and upward (z') directions.
- int16_t magnt [3]
  Measured magnetism in the starboard (x'), bow (y'), and upward (z') directions.
- int16_t omega [3]
  Measured rotational velocity in the gamma (starboard-up), beta (bow-up), and alpha (increasing azimuth) directions.

Friends

- class **XWave**

10.116.1 Detailed Description

Class representing a single raw motion measurement in the surface time series wave data X-message.

Note

This class is used for raw data mode only.

10.116.2 Constructor & Destructor Documentation

10.116.2.1 XWaveRawSample()

```
util::xmsg::XWaveRawSample::XWaveRawSample ()  [inline]
```

Default constructor.

10.116.2.2 ~XWaveRawSample()

```
util::xmsg::XWaveRawSample::~XWaveRawSample ()  [inline]
```

Destructor.

10.116.3 Member Function Documentation

10.116.3.1 GenerateListingString()

```
const string util::xmsg::XWaveRawSample::GenerateListingString (
            double assf,
            double gssf,
            double mssf) const  [inline]
```

Generate a listing entry string representation of this raw motion measurement.

Parameters

in	*assf*	The accelerometer sensitivity scale factor, in LSB/g.
in	*gssf*	The gyroscope sensitivity scale factor, in LSB/(deg/s).
in	*mssf*	The magnetometer sensitivity scale factor, in LSB/uT.

Returns

A listing entry string representation of this raw motion measurement.

References accel, CATCH_BLOCK, magnt, and omega.

10.116.4 Member Data Documentation

10.116.4.1 accel

```
int16_t util::xmsg::XWaveRawSample::accel[3]  [private]
```

Measured acceleration in the starboard (x'), bow (y'), and upward (z') directions.

Referenced by GenerateListingString().

10.116.4.2 magnt

```
int16_t util::xmsg::XWaveRawSample::magnt[3]  [private]
```

Measured magnetism in the starboard (x'), bow (y'), and upward (z') directions.

Referenced by GenerateListingString().

10.116.4.3 omega

```
int16_t util::xmsg::XWaveRawSample::omega[3]  [private]
```

Measured rotational velocity in the gamma (starboard-up), beta (bow-up), and alpha (increasing azimuth) directions.

Referenced by GenerateListingString().

The documentation for this class was generated from the following file:

- data/xmsg/common/XWaveRawSample.h

10.117 util::xmsg::XWaveSpectralSample Class Reference

The wave spectral sample class.

```
#include <XWaveSpectralSample.h>
```

10.117.1 Detailed Description

The wave spectral sample class.

An instance of this class represents the acceleration spectra and co-/quadrature spectra at a single frequency, decoded from a wave X-message (see XWave).

The documentation for this class was generated from the following files:

- data/xmsg/common/XWaveSpectralSample.h
- data/xmsg/common/XWaveSpectralSample.cpp

Chapter 11

File Documentation

11.1 AdditionalDocumentation.h File Reference

Additional Doxygen documentation.

Classes

- class boost::container::flat_map< C, D >

  Dummy template class used for configuring Doxygen to interpret boost::container::flat_map correctly.
- class boost::shared_ptr< A >

  Dummy template class used for configuring Doxygen to interpret boost::shared_ptr objects as plain pointers.
- class vmime::shared_ptr< F >

  Dummy template class used for configuring Doxygen to interpret vmime::shared_ptr objects as plain pointers.
- class boost::container::static_vector< E >

  Dummy template class used for configuring Doxygen to interpret boost::container::static_vector correctly.
- class boost::thread_specific_ptr< B >

  Dummy template class used for configuring Doxygen to interpret boost::thread_specific_ptr objects as plain pointers.

Namespaces

- namespace argo

  The Argo instrument namespace.

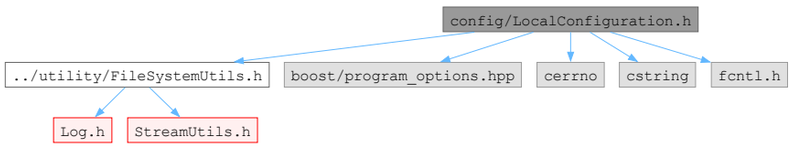
11.4 config/LocalConfiguration.h File Reference

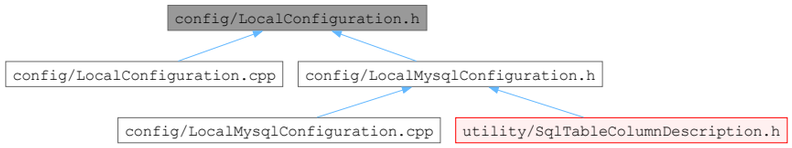
The util::config::LocalConfiguration class header file.

```
#include "../utility/FileSystemUtils.h"
#include <boost/program_options.hpp>
#include <cerrno>
#include <cstring>
#include <fcntl.h>
```

Include dependency graph for LocalConfiguration.h:



This graph shows which files directly or indirectly include this file:



Classes

- class util::config::LocalConfiguration

  Class representing all program run-time configuration options.

Namespaces

- namespace util

  The utility namespace.
- namespace util::config

  The configuration utility namespace.

Macros

- #define CFG_DEFAULT_ISDAEMON (false)

  The default value for daemon/service mode operation, if unspecified in the configuration settings.
- #define CFG_DEFAULT_MAIL_CHK_DLY (60)

  The default configuration file path to use, if not specified in the command line arguments.
- #define CFG_DEFAULT_MAX_FETCH (127)

  The default number of mail messages to fetch concurrently, if unspecified in the configuration settings.
- #define CFG_DEFAULT_MIN_UID (0)

  The placeholder value for an unspecified starting mail message UID.
- #define CFG_DEFAULT_NDECO (1)

  The default number of telemetry decoder threads to instantiate, if unspecified in the configuration settings.
- #define CFG_DEFAULT_NPROC (1)

  The default number of mail message processing threads to instantiate, if unspecified in the configuration settings.
- #define CFG_DEFAULT_PATH "../cfg/options.cfg"

  The default configuration file path to use, if not specified in the command line arguments.
- #define CFG_DEFAULT_PATH_PID "/var/lock/" PROG_NAME "/lock.pid"

  The default path to the PID file.
- #define **CFG_DEFAULT_REPROCESS_ACTIVE** (true)
- #define CFG_DEFAULT_REPROCESS_ALL (false)

  The default value for the reprocess-all boolean switch, if unspecified in the configuration settings.
- #define CFG_FMT_DESC_LEN (85)

  The configuration option description minimum line length.
- #define CFG_FMT_LINE_LEN (100)

  The configuration option line length for printing to standard output.
- #define PROG_DESC "X-Message Mail-Telemetry Processing Service"

  Brief program description.
- #define PROG_ID "=== " PROG_NAME " v" PROG_VERS " - " PROG_DESC " ==="

  Program identifier string.
- #define PROG_MAJOR_VERS 0

  Program major version.
- #define PROG_MINOR_VERS 6

  Program version.
- #define PROG_NAME "xmtps"

  Program name.
- #define PROG_VERS

  Program version.
- #define PROG_XVERS 2.2

  Supported X-Message version.

11.4.1 Detailed Description

The util::config::LocalConfiguration class header file.

11.4.2 Macro Definition Documentation

11.4.2.1 CFG_DEFAULT_ISDAEMON

```
#define CFG_DEFAULT_ISDAEMON (false)
```

The default value for daemon/service mode operation, if unspecified in the configuration settings.

Referenced by util::config::LocalConfiguration::GenerateCommandLineOptionsDescription().

11.4.2.2 CFG_DEFAULT_MAIL_CHK_DLY

```
#define CFG_DEFAULT_MAIL_CHK_DLY (60)
```

The default configuration file path to use, if not specified in the command line arguments.

Referenced by util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription().

11.4.2.3 CFG_DEFAULT_MAX_FETCH

```
#define CFG_DEFAULT_MAX_FETCH (127)
```

The default number of mail messages to fetch concurrently, if unspecified in the configuration settings.

Referenced by util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription().

11.4.2.4 CFG_DEFAULT_MIN_UID

```
#define CFG_DEFAULT_MIN_UID (0)
```

The placeholder value for an unspecified starting mail message UID.

11.4.2.5 CFG_DEFAULT_NDECO

```
#define CFG_DEFAULT_NDECO (1)
```

The default number of telemetry decoder threads to instantiate, if unspecified in the configuration settings.

Referenced by util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription().

11.4.2.6 CFG_DEFAULT_NPROC

```
#define CFG_DEFAULT_NPROC (1)
```

The default number of mail message processing threads to instantiate, if unspecified in the configuration settings.

Referenced by util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription().

11.4.2.7 CFG_DEFAULT_PATH

```
#define CFG_DEFAULT_PATH "../cfg/options.cfg"
```

The default configuration file path to use, if not specified in the command line arguments.

Referenced by util::config::LocalConfiguration::GenerateCommandLineOptionsDescription().

11.4.2.8 CFG_DEFAULT_PATH_PID

```
#define CFG_DEFAULT_PATH_PID "/var/lock/" PROG_NAME "/lock.pid"
```

The default path to the PID file.

Referenced by util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription().

11.4.2.9 CFG_DEFAULT_REPROCESS_ALL

```
#define CFG_DEFAULT_REPROCESS_ALL (false)
```

The default value for the reprocess-all boolean switch, if unspecified in the configuration settings.

Referenced by util::config::LocalConfiguration::GenerateCommandLineOptionsDescription().

11.4.2.10 CFG_FMT_DESC_LEN

```
#define CFG_FMT_DESC_LEN (85)
```

The configuration option description minimum line length.

Referenced by util::config::LocalConfiguration::GenerateCommandLineOptionsDescription(), and util::config::LocalConfiguration::Generat

11.4.2.11 CFG_FMT_LINE_LEN

```
#define CFG_FMT_LINE_LEN (100)
```

The configuration option line length for printing to standard output.

Referenced by util::config::LocalConfiguration::GenerateCommandLineOptionsDescription(), and util::config::LocalConfiguration::Generat

11.4.2.12 PROG_DESC

```
#define PROG_DESC "X-Message Mail-Telemetry Processing Service"
```

Brief program description.

11.4.2.13 PROG_ID

```
#define PROG_ID "=== " PROG_NAME " v" PROG_VERS " - " PROG_DESC " ==="
```

Program identifier string.

11.4.2.14 PROG_MAJOR_VERS

```
#define PROG_MAJOR_VERS 0
```

Program major version.

11.4.2.15 PROG_MINOR_VERS

```
#define PROG_MINOR_VERS 6
```

Program version.

11.4.2.16 PROG_NAME

```
#define PROG_NAME "xmtps"
```

Program name.

11.4.2.17 PROG_VERS

```
#define PROG_VERS
```

Value:

```
PP_STR(PROG_MAJOR_VERS) "." PP_STR(PROG_MINOR_VERS) "." \
PP_STR(BUILD_NUMBER) "b"
```

Program version.

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

11.4.2.18 PROG_XVERS

```
#define PROG_XVERS 2.2
```

Supported X-Message version.

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

11.11.1 Detailed Description

The argo::iridium::Iridium class header file.

This is the header file for the argo::iridium::Iridium class. This class represents an individual instrument and its associated unique identifiers. This class is not used explicitly. Rather, all other classes that are associated with an instrument's unique identifiers inherit from this class.

This file contains the class definition and the complete functionality of the class.

11.13.2 Macro Definition Documentation

11.13.2.1 IRI_DIVE_UNKNOWN

```
#define IRI_DIVE_UNKNOWN -999
```

The default/bad/invalid dive value.

11.13.2.2 IRI_GAIN_INVALID

```
#define IRI_GAIN_INVALID 9999
```

Default/fill value for invalid Iridium message gain value.

11.13.2.3 IRI_ID_UNKNOWN

```
#define IRI_ID_UNKNOWN -1
```

The default/bad/invalid unique identifier value.

11.13.2.4 IRI_OFFS_INVALID

```
#define IRI_OFFS_INVALID 9999
```

Default/fill value for invalid Iridium message offset value.

11.13.2.5 IRI_POS_INVALID_CEP

```
#define IRI_POS_INVALID_CEP 999999
```

Default/fill value for invalid Iridium Circular Error Probable (CEP) radius.

11.13.2.6 IRI_POS_INVALID_LAT

```
#define IRI_POS_INVALID_LAT UTIL_POS_INVALID_LAT
```

Default/fill value for invalid Iridium position latitude.

11.13.2.7 IRI_POS_INVALID_LON

```
#define IRI_POS_INVALID_LON UTIL_POS_INVALID_LAT
```

Default/fill value for invalid Iridium position longitude.

  The Iridium position class.

Namespaces

- namespace argo

  The Argo instrument namespace.
- namespace argo::iridium

  The Argo Iridium instrument namespace.

11.15.1 Detailed Description

The argo::iridium::IridiumPosition class header file.

This is the header file for the argo::iridium::IridiumPosition class. This class represents a position that was acquired through the Iridium system. It represents an estimate of the position of the instrument and is provided in the body of an email message received from the Iridium system along the an Iridium Short Burst Data (SBD) message attachment.

This file contains the class definition and the complete functionality of the class.

11.17.1 Detailed Description

The argo::iridium::xfloat::XFloat class source file.

This is the source file for the argo::iridium::xfloat::XFloat class. This class represents a single instrument or float. Each instance of this contains information about an instrument including unique identifiers, sensor gains and offsets, metadata, and the instrument type. It also contains a dive-or-cycle-number-to-dive-data-object map that contains all of the incomplete dive data objects that belong to the instrument, uniquely indexed by dive or cycle number. As the application receives the telemetry data from the instrument, the data is decoded and assigned to the corresponding dive data object. Once it is determined that the data is complete for a single dive, the intermediate and PHY listing files are written to the local filesystem, the dive data object is persisted to the SQL database, and then the shared reference to the dive data object is released, thereby purging the dive data from the program's memory.

At run-time, at most one float object will exist for each instrument. Each float object is accessed and/or manipulated by the worker threads through a shared reference. A shared reference to all float objects is contained in the instrument-identifier-to-instrument-object map which is indexed by the unique instrument identifier. During application initialization, the map is populated as a result of querying all the known instruments from the SQL database. Each time a float object is created, it is added to the map. During application termination, the daemon thread iterates over the contents of the map and persists each of the float objects to the SQL database.

This file contains the static data members and some of the member functions of the argo::iridium::xfloat::XFloat class. Several of the member functions of the argo::iridium::xfloat::XFloatDiveData class are also defined in this file.

00001 /** The @ref argo::iridium::xfloat::XFloat class header file.
00002  *
00003  *  This is the header file for the @ref argo::iridium::xfloat::XFloat class. This class
00004  *  represents a single instrument or float. Each instance of this contains information about an
00005  *  instrument including unique identifiers, sensor gains and offsets, metadata, and the
00006  *  instrument type. It also contains a dive-or-cycle-number-to-dive-data-object map that
00007  *  contains all of the incomplete dive data objects that belong to the instrument, uniquely
00008  *  indexed by dive or cycle number. As the application receives the telemetry data from the
00009  *  instrument, the data is decoded and assigned to the corresponding dive data object. Once it
00010  *  is determined that the data is complete for a single dive, the intermediate and PHY listing
00011  *  files are written to the local filesystem, the dive data object is persisted to the SQL
00012  *  database, and then the shared reference to the dive data object is released, thereby purging
00013  *  the dive data from the program's memory.
00014  *
00015  *  At run-time, at most one float object will exist for each instrument. Each float object is
00016  *  accessed and/or manipulated by the worker threads through a shared reference. A shared
00017  *  reference to all float objects is contained in the instrument-identifier-to-instrument-object
00018  *  map which is indexed by the unique instrument identifier. During application initialization,
00019  *  the map is populated as a result of querying all the known instruments from the SQL database.
00020  *  Each time a float object is created, it is added to the map. During application termination,
00021  *  the daemon thread iterates over the contents of the map and persists each of the float objects
00022  *  to the SQL database.
00023  *
00024  *  This file contains the @ref argo::iridium::xfloat::XFloat class definition and the majority
00025  *  of the functionality of the class.
00026  *
00027  *  @file

00053 #include "XFloatMetadata.h"
00054
00055 namespace argo {
00056 namespace iridium {
00057 namespace xfloat {
00058
00059 /* Class Definition: */
00060
00061 class XFloatTelemetryDecoderService;    // forward declaration
00062
00063 /** The instrument or float class.
00064  *
00065  *  This class represents a single instrument or float. Each instance of this contains information
00066  *  about an instrument including unique identifiers, sensor gains and offsets, metadata, and the
00067  *  instrument type. It also contains a dive-or-cycle-number-to-dive-data-object, @ref
00068  *  dive2data_map_, map that contains all of the incomplete dive data objects that belong to the
00069  *  instrument, uniquely indexed by dive or cycle number. As the application receives the
00070  *  telemetry data from the instrument, the data is decoded and assigned to the corresponding dive
00071  *  data object. Once it is determined that the data is complete for a single dive, the
00072  *  intermediate and PHY listing files are written to the local filesystem, the dive data object
00073  *  is persisted to the SQL database, and then the shared reference to the dive data object is
00074  *  released, thereby purging the dive data from the program's memory.
00075  *
00076  *  At run-time, at most one float object will exist for each instrument. Each float object is
00077  *  accessed and/or manipulated by the worker threads through a shared reference. A shared
00078  *  reference to all float objects is contained in the instrument-identifier-to-instrument-object
00079  *  map, @ref id2float_map_, which is indexed by the unique instrument identifier. During
00080  *  application initialization, the map is populated as a result of querying all the known
00081  *  instruments from the SQL database. Each time a float object is created, it is added to the
00082  *  map. During application termination, the daemon thread iterates over the contents of the map
00083  *  and persists each of the float objects to the SQL database.
00084  *
00085  *  @note   This object is lockable. It contains a recursive mutual exclusion (mutex) lock in
00086  *          order to synchronize access to and modification of objects of this type by various
00087  *          worker threads. Once the object is locked, any other thread that attempts to access
00088  *          or modify the object will block until the initial lock is released. Since the mutex
00089  *          is recursive, the object may be locked multiple times by the same thread without
00090  *          causing the thread to block indefinitely.
00091  *
00092  *  @note   This class is mapped to an SQL database table by the @ref sql_table_description_
00093  *          object. This allows some or all of the field of this class to be persisted to the SQL
00094  *          database. Likewise, an object of this type may be constructed from the results of an
00095  *          SQL query to the corresponding table.
00096  *
00097  *  @todo   Devise a method to actively check for (1) changes in the metadata files and (2) newly
00098  *          created metadata files. Load the metadata from the new or modified files and assign
00099  *          them to the corresponding float object. If necessary, retroactively process the mail
00100 *          messages for these instruments. Persist updates to the SQL database as necessary.
00101  */

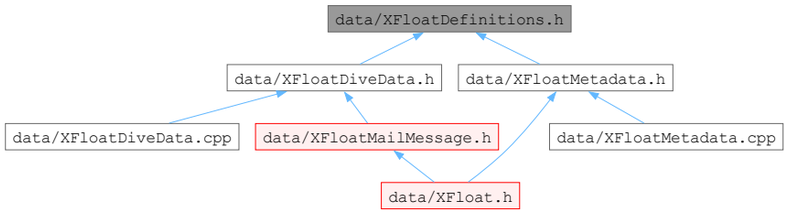
This graph shows which files directly or indirectly include this file:



Namespaces

- namespace argo

  The Argo instrument namespace.
- namespace argo::iridium

  The Argo Iridium instrument namespace.
- namespace argo::iridium::xfloat

  The X-Float instrument namespace.

Macros

- #define XFLT_DAEMON_FLUSH_LOG_SEC (30)

  The interval at which the daemon tread will flush the global logger, in seconds.
- #define **XFLT_DAEMON_THREAD_SPINUP_DELAY_SEC** (10)
- #define XFLT_DIVE_UNKNOWN XMSG_DIVE_UNKNOWN

  The default/bad/invalid dive value.
- #define XFLT_GAIN_INVALID XMSG_GAIN_INVALID

  Default/fill value for invalid Iridium message gain value.
- #define XFLT_ID_UNKNOWN XMSG_ID_UNKNOWN

  The default/bad/invalid unique identifier value.
- #define XFLT_OFFS_INVALID XMSG_OFFS_INVALID

  Default/fill value for invalid Iridium message offset value.
- #define XFLT_PID_INVALID (-1)

  Default/fill value for invalid Iridium message offset value.
- #define XFLT_POS_INVALID_LAT IRI_POS_INVALID_LAT

  Default/fill value for invalid position latitude.
- #define XFLT_POS_INVALID_LON IRI_POS_INVALID_LAT

  Default/fill value for invalid position longitude.
- #define XFLT_QUEUE_SIZE_MAIL_PROCESSING (1024∗8)

  Default mail message processing queue capacity.
- #define **XFLT_QUEUE_SIZE_NC_FILE_WRITER** (1024∗64)
- #define **XFLT_QUEUE_SIZE_PPROCESSING** (1024∗64)
- #define XFLT_QUEUE_SIZE_TELEMETRY (1024∗8)

  Default telemetry decode queue capacity.
- #define XFLT_SBD_SESSION_STATUS_CODE_UNKNOWN (-1)

  The default/fill value for the Iridium session status code.
- #define XFLT_SBD_SIZE_BYTES_UNKNOWN (-1)

  The default/fill value for SBD data size, in bytes.
- #define XFLT_THREAD_SLEEP_MS (100)

  XFloat service threads' idle sleep time, in milliseconds.

11.20.1 Detailed Description

The XFloat Definitions header file.

This file contains definitions that are used by the argo::iridium::xfloat::XFloat class and the classes that are associated with it.

Version

0.6

Date

11.20.2 Macro Definition Documentation

11.20.2.1 XFLT_DAEMON_FLUSH_LOG_SEC

```
#define XFLT_DAEMON_FLUSH_LOG_SEC (30)
```

The interval at which the daemon tread will flush the global logger, in seconds.

Referenced by main().

11.20.2.2 XFLT_DIVE_UNKNOWN

```
#define XFLT_DIVE_UNKNOWN XMSG_DIVE_UNKNOWN
```

The default/bad/invalid dive value.

Referenced by argo::iridium::xfloat::XFloatTelemetryDecoderService::DecodeMessage(), and argo::iridium::xfloat::XFloatDiveData::GetDi

11.20.2.3 XFLT_GAIN_INVALID

```
#define XFLT_GAIN_INVALID XMSG_GAIN_INVALID
```

Default/fill value for invalid Iridium message gain value.

Referenced by argo::iridium::xfloat::XFloatDiveData::GetGainsAndOffsets(), and argo::iridium::xfloat::XFloatDiveData::GetSurfaceGainsA

11.20.2.4 XFLT_ID_UNKNOWN

```
#define XFLT_ID_UNKNOWN XMSG_ID_UNKNOWN
```

The default/bad/invalid unique identifier value.

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignParentInstrument(), argo::iridium::xfloat::XFloatDiveData::ComputePressureO argo::iridium::xfloat::XFloatDiveData::GetDiveDataMailMessagesFromDatabase(), argo::iridium::xfloat::XFloatDiveData::GetDiveDataObj argo::iridium::xfloat::XFloatMailProcessingService::ProcessMailMsg(), and argo::iridium::xfloat::XFloatMailMessage::WriteFiles().

11.20.2.5 XFLT_OFFS_INVALID

```
#define XFLT_OFFS_INVALID XMSG_OFFS_INVALID
```

Default/fill value for invalid Iridium message offset value.

Referenced by argo::iridium::xfloat::XFloatDiveData::GetGainsAndOffsets(), and argo::iridium::xfloat::XFloatDiveData::GetSurfaceGainsA

11.20.2.6 XFLT_PID_INVALID

```
#define XFLT_PID_INVALID (-1)
```

Default/fill value for invalid Iridium message offset value.

11.20.2.7 XFLT_POS_INVALID_LAT

```
#define XFLT_POS_INVALID_LAT IRI_POS_INVALID_LAT
```

Default/fill value for invalid position latitude.

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps().

11.20.2.8 XFLT_POS_INVALID_LON

```
#define XFLT_POS_INVALID_LON IRI_POS_INVALID_LAT
```

Default/fill value for invalid position longitude.

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps().

11.20.2.9 XFLT_QUEUE_SIZE_MAIL_PROCESSING

```
#define XFLT_QUEUE_SIZE_MAIL_PROCESSING (1024*8)
```

Default mail message processing queue capacity.

11.20.2.10 XFLT_QUEUE_SIZE_TELEMETRY

```
#define XFLT_QUEUE_SIZE_TELEMETRY (1024*8)
```

Default telemetry decode queue capacity.

11.20.2.11 XFLT_SBD_SESSION_STATUS_CODE_UNKNOWN

```
#define XFLT_SBD_SESSION_STATUS_CODE_UNKNOWN (-1)
```

The default/fill value for the Iridium session status code.

11.20.2.12 XFLT_SBD_SIZE_BYTES_UNKNOWN

```
#define XFLT_SBD_SIZE_BYTES_UNKNOWN (-1)
```

The default/fill value for SBD data size, in bytes.

11.20.2.13 XFLT_THREAD_SLEEP_MS

```
#define XFLT_THREAD_SLEEP_MS (100)
```

XFloat service threads' idle sleep time, in milliseconds.

Referenced by main(), argo::iridium::xfloat::XFloatMailProcessingService::operator()(), argo::iridium::xfloat::XFloatMailRetrievalService::o
argo::iridium::xfloat::XFloatPostProcessingService::operator()(), and argo::iridium::xfloat::XFloatTelemetryDecoderService::operator()().

11.22.1 Detailed Description

The argo::iridium::xfloat::XFloatDiveData class source file.

This is the source file for the argo::iridium::xfloat::XFloatDiveData class. This class contains all of the mail messages and corresponding decoded telemetry data for an instrument for a single dive. Each time a mail message is received by the telemetry decoder thread, argo::iridium::xfloat::XFloatTelemetryDecoderService, the corresponding dive data object is retrieved and the mail message is assigned to it. Then, the binary data from the attached Iridium Short Burst Data (SBD) message is decoded. As a result of decoding the binary message data, an object corresponding to the message type is created and its field are populated from the decoded data in the binary message. The newly created object will be of a type that inherits from util::xmsg::XMessage. A shared reference to the object is assigned to the dive data object.

This class contains the functionality for writing the formatted intermediate and PHY listing files to the local filesystem. Each time a new message is received, the entire intermediate listing file will be written to the local filesystem, overwriting the previous listing file, if it exists. The PHY file is written only when the dive data object is determined to contain the complete data for dive, and only if the instrument has been deployed i.e. it has a metadata file with valid DAC and WMO identifiers.

This file contains the static data members of the class.

00060 /** The instrument or float dive data class.
00061  *
00062  *  This class contains all of the mail messages and corresponding decoded telemetry data for an
00063  *  instrument for a single dive. Each time a mail message is received by the telemetry decoder
00064  *  thread, @ref XFloatTelemetryDecoderService, the corresponding dive data object is retrieved
00065  *  and the mail message is assigned to it. Then, the binary data from the attached Iridium Short
00066  *  Burst Data (SBD) message is decoded by calling @ref DecodeXMsgData(). As a result of decoding
00067  *  the binary message data, an object corresponding to the message type is created and its field
00068  *  are populated from the decoded data in the binary message. The newly created object will be
00069  *  of a type that inherits from @ref util::xmsg::XMessage. A shared reference to the object is
00070  *  assigned to the dive data object.
00071  *
```

```
00072  *  This class contains the functionality for writing the formatted intermediate and PHY listing
00073  *  files to the local filesystem. Each time a new message is received, the entire intermediate
00074  *  listing file will be written to the local filesystem, overwriting the previous listing file,
00075  *  if it exists. The PHY file is written only when the dive data object is determined to contain
00076  *  the complete data for dive, and only if the instrument has been deployed i.e. it has a
00077  *  metadata file with valid DAC and WMO identifiers.
00078  *
00079  *  @note   This object is lockable. It contains a recursive mutual exclusion (mutex) lock in
00080  *          order to synchronize access to and modification of objects of this type by various
00081  *          worker threads. Once the object is locked, any other thread that attempts to access
00082  *          or modify the object will block until the initial lock is released. Since the mutex
00083  *          is recursive, the object may be locked multiple times by the same thread without
00084  *          causing the thread to block indefinitely.
00085  *
00086  *  @note   This class is mapped to an SQL database table by the @ref sql_table_description_
00087  *          object. This allows some or all of the field of this class to be persisted to the SQL
00088  *          database. Likewise, an object of this type may be constructed from the results of an
00089  *          SQL query to the corresponding table.
00090  *
00091  *  @todo   Devise a scheme to ensure that the dive data objects do not remain in memory
00092  *          indefinitely if one or more message for the dive or cycle are not received and the dive
00093  *          data object is not completed.

Namespaces

- namespace argo

  The Argo instrument namespace.
- namespace argo::iridium

  The Argo Iridium instrument namespace.
- namespace argo::iridium::xfloat

  The X-Float instrument namespace.
- namespace util

  The utility namespace.
- namespace util::xmsg

  The X-Message utility namespace.

Functions

- ostream & argo::iridium::xfloat::operator<< (ostream &os, const XFloatMailMessage &mail)

  The stream insertion operator overload function for XFloatMailMessage.
- ostream & argo::iridium::xfloat::operator<< (ostream &os, const XMailSbdData_t &data)

  The stream insertion operator for the SBD data type.
- istream & argo::iridium::xfloat::operator>> (istream &is, XFloatMailMessage &mail)

  The stream extraction operator overload function for XFloatMailMessage.

11.25.1 Detailed Description

The argo::iridium::xfloat::XFloatMailMessage class source file.

This is the header file for the argo::iridium::xfloat::XFloatMailMessage class. This class represents a single mail message received from the Iridium system, including fields that are parsed from the various parts of the mail message and the attached Iridium Short Burst Data (SBD) file. It is used to parse, validate, and write the mail message files to the local filesystem.

This file contains the static data members of the class and some of the class's functionality.

Classes

- class argo::iridium::xfloat::XFloatMailMessage

  The mail message class.

Namespaces

- namespace argo

  The Argo instrument namespace.
- namespace argo::iridium

  The Argo Iridium instrument namespace.
- namespace argo::iridium::xfloat

  The X-Float instrument namespace.

Macros

- #define XMAIL_DFLT_MSG_HEADER_VALID_SNDR_REGEX "(sbdservice@sbd.iridium.com|service@sbd.↩ pac.disa.mil)"

  The default mail message header valid sender regular expression value.
- #define XMAIL_DFLT_MSG_HEADER_VALID_SUBJ_REGEX "SBD Msg From Unit: (\\d+)"

  The default mail message header valid subject regular expression value.
- #define XMAIL_DFLT_RAW_FILE_FORMAT XMAIL_RAW_FORMAT_EXTENDED

  The default mail message raw file format.
- #define XMAIL_DFLT_RAW_FILE_GENERATRION_ENABLE true

  The default mail message RAW-mail-file-generation-is-enabled flag value.
- #define XMAIL_DFLT_SBD_FILE_GENERATRION_ENABLE true

  The default mail message binary-SBD-file-generation-is-enabled flag value.
- #define XMAIL_DFLT_SBD_FILE_VALID_NAME_REGEX "(\\d+)_(\\d{6})\\.sbd"

  The default mail message binary SBD file attachment file name valid regular expression.

Typedefs

- typedef uint8_t argo::iridium::xfloat::XMailSbdByte_t

  The SBD byte type.
- typedef vector< XMailSbdByte_t > argo::iridium::xfloat::XMailSbdData_t

  The SBD data type.

Enumerations

- enum argo::iridium::xfloat::XFloatMailRawFileFormat_t {
  argo::iridium::xfloat::XMAIL_RAW_FORMAT_STANDARD = 0 ,
  argo::iridium::xfloat::XMAIL_RAW_FORMAT_EXTENDED = 1 }

  The mail message raw file format type identifier enumeration.

Functions

- ostream & argo::iridium::xfloat::operator<< (ostream &os, const XFloatMailMessage &mail)

  The stream insertion operator overload function for XFloatMailMessage.
- ostream & argo::iridium::xfloat::operator<< (ostream &os, const XMailSbdData_t &data)

  The stream insertion operator for the SBD data type.
- istream & argo::iridium::xfloat::operator>> (istream &is, XFloatMailMessage &mail)

  The stream extraction operator overload function for XFloatMailMessage.

11.26.1 Detailed Description

The argo::iridium::xfloat::XFloatMailMessage class header file.

This is the header file for the argo::iridium::xfloat::XFloatMailMessage class. This class represents a single mail message received from the Iridium system, including fields that are parsed from the various parts of the mail message and the attached Iridium Short Burst Data (SBD) file. It is used to parse, validate, and write the mail message files to the local filesystem.

This file contains the class definition and the majority of the functionality of the class.

11.26.2 Macro Definition Documentation

11.26.2.1 XMAIL_DFLT_MSG_HEADER_VALID_SNDR_REGEX

```
#define XMAIL_DFLT_MSG_HEADER_VALID_SNDR_REGEX  "(sbdservice@sbd.iridium.com|service@sbd.pac.↩
disa.mil)"
```

The default mail message header valid sender regular expression value.

The mail message header valid sender regular expression value, argo::iridium::xfloat::XFloatMailMessage::msg_header_valid_sender_reg is set as a result of parsing the command-line arguments and/or configuration file options during application initialization. If the option is not explicitly specified, then it will default to this value.

Referenced by util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription().

11.26.2.2 XMAIL_DFLT_MSG_HEADER_VALID_SUBJ_REGEX

```
#define XMAIL_DFLT_MSG_HEADER_VALID_SUBJ_REGEX "SBD Msg From Unit:  (\\d+)"
```

The default mail message header valid subject regular expression value.

The mail message header valid subject regular expression value, argo::iridium::xfloat::XFloatMailMessage::msg_header_valid_subject_reg
is set as a result of parsing the command-line arguments and/or configuration file options during application initialization.
If the option is not explicitly specified, then it will default to this value.

Referenced by util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription().

11.26.2.3 XMAIL_DFLT_RAW_FILE_FORMAT

```
#define XMAIL_DFLT_RAW_FILE_FORMAT XMAIL_RAW_FORMAT_EXTENDED
```

The default mail message raw file format.

The mail message raw file format, argo::iridium::xfloat::XFloatMailMessage::raw_file_format_, is set as a result of parsing the command-line arguments and/or configuration file options during application initialization. If the option is not explicitly specified, then it will default to this value.

11.26.2.4 XMAIL_DFLT_RAW_FILE_GENERATRION_ENABLE

```
#define XMAIL_DFLT_RAW_FILE_GENERATRION_ENABLE true
```

The default mail message RAW-mail-file-generation-is-enabled flag value.

The mail message RAW-mail-file-generation-is-enabled flag value, argo::iridium::xfloat::XFloatMailMessage::raw_file_generation_is_enabl
is set as a result of parsing the command-line arguments and/or configuration file options during application initialization.
If the option is not explicitly specified, then it will default to this value.

11.26.2.5 XMAIL_DFLT_SBD_FILE_GENERATRION_ENABLE

```
#define XMAIL_DFLT_SBD_FILE_GENERATRION_ENABLE true
```

The default mail message binary-SBD-file-generation-is-enabled flag value.

The mail message binary-SBD-file-generation-is-enabled flag value, argo::iridium::xfloat::XFloatMailMessage::sbd_file_generation_is_ena
is set as a result of parsing the command-line arguments and/or configuration file options during application initialization.
If the option is not explicitly specified, then it will default to this value.

11.26.2.6 XMAIL_DFLT_SBD_FILE_VALID_NAME_REGEX

```
#define XMAIL_DFLT_SBD_FILE_VALID_NAME_REGEX "(\\d+)_(\\d{6})\\.sbd"
```

The default mail message binary SBD file attachment file name valid regular expression.

The mail message binary SBD file attachment file name valid regular expression, argo::iridium::xfloat::XFloatMailMessage::sbd_file_valid_r
is set as a result of parsing the command-line arguments and/or configuration file options during application initialization.
If the option is not explicitly specified, then it will default to this value.

Referenced by util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription().

00301      *
00302      *  This field is provides a non-unique index of the dive or cycle number of the mail message
00303      *  object for a given instrument. It is used to determine to which dive this mail message
00304      *  belongs. Together, the dive or cycle number and the Iridium Short Burst Data (SBD) packet
00305      *  index, @ref id_sbd_packet_, provide a unique index of the mail message. However, these
00306      *  fields are not used as the primary index of the mail message objects.
00307      *
00308      *  The value of this field is set as a result of parsing the mail message attachment. The
00309      *  value is read from the header of the attached SBD file. If the mail message has no SBD
00310      *  attachment, or the attachment is invalid, then the value of this field will be set to
00311      *  @ref XFLT_DIVE_UNKNOWN, which specifies an unknown dive or cycle number.
00312      */
00313     int id_dive_;
00314
00315     /** The mail message unique identifier string.
00316      *
00317      *  This character sequence is a unique identifier for the mail message that is assigned by
00318      *  the mail server. However, this value is not used a primary identifier because the mail
```

```
00319      *  server all provides a unique integer identifier.
00320      *
00321      *  The value of this field is set as a result of parsing the mail message header. All mail
00322      *  messages will be assigned a unique identifier string, regardless of their validity.
00323      */

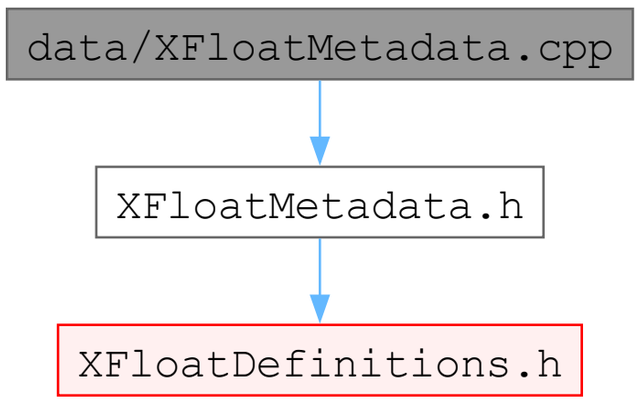
11.28 data/XFloatMetadata.cpp File Reference

The argo::iridium::xfloat::XFloatMetadata class source file.

`#include "XFloatMetadata.h"`
Include dependency graph for XFloatMetadata.cpp:



Namespaces

- namespace argo

  The Argo instrument namespace.
- namespace argo::iridium

  The Argo Iridium instrument namespace.
- namespace argo::iridium::xfloat

  The X-Float instrument namespace.

Functions

- istream & argo::iridium::xfloat::operator>> (istream &in, XFloatMetadata &metadata)

  Stream extraction operator overload function for the XFloatMetadata class.

11.28.1 Detailed Description

The argo::iridium::xfloat::XFloatMetadata class source file.

This is the source file for the argo::iridium::xfloat::XFloatMetadata class. This class contains the metadata for a single instrument. The metadata object includes information about the instrument including details about deployment, principal investigators, and the instrument type. During application initialization, the metadata files are read from the local filesystem, and used to construct one metadata object per metadata file. Additionally, the metadata is persisted to the SQL database.

This file contains the class definition and the majority of the functionality of the class.

  util::xmsg::XSENS_FMT_UNKNOWN = 0xFF }

  The X-Message sensor data packing format enumeration.

11.35.1 Detailed Description

The util::xmsg::AbstractXSensorData class header file.

This is the header file for the util::xmsg::AbstractXSensorData class. The abstract sensor data class provides the functionality to decode sensor data messages using either first-difference or curvature encoding. It is used to decode and represent the sensor data returned from the instrument that is contained within a single message.

The classes that inherit from this class represent profile or drift data taken from a single sensor e.g. pressure, temperature, or salinity. The sensor data is stored in a vector of raw integer counts, util::xmsg::AbstractXSensorData::raw_sensor_data_. The data from the sensor is recovered in scientific units by applying the appropriate offset and gain corrections, as specified in the Argo data message.

00075          *
00076          *  This field unpacks the encoded sensor data from the message and stores the decoded sensor
00077          *  values in @ref raw_sensor_data_. First the function checks the size of the message, and
00078          *  the data packing format. The message data is decoded according to the packing format type.
00079          *  Both first-difference and curvature encoding are supported. The encoding method is
00080          *  determined from the value of the high nibble of byte @c data[1].
00081          *
00082          *  Once this function completes successfully, then the data may be recovered in scientific
00083          *  units from the raw sensor values by applying the appropriate sensor gain and offset values.
00084          *
00085          *  @param[in]      data        The binary message to unpack, in a vector of unsigned bytes.
00086          *
00087          *  @warning        The function assumes the message data is valid. Message validity should
00088          *                  be ensured before this function is called.
00089          *
00090          *  @throw          util::log::MessageException if
00091          *                      - an error occurs while decoding the message,
00092          *                      - the message is of insufficient length, or
00093          *                      - an invalid packing format is encountered.
00094          *
00095          *  @return         The sensor data raw counts, in a vector of signed integers.

- #define u24(x, n) (((uint32_t)u08(x,(n)) << 16) | (uint32_t)(u08(x,(n)+1) << 8) | (uint32_t)u08(x,(n)+2))

  Get unsigned three byte [n:n+2] value from array x.
- #define u32(x, n) (((uint32_t)u16(x,(n)) << 16) | (uint32_t)u16(x,(n)+2))

  Get unsigned four byte [n:n+3] value from array x.
- #define XMSG_BAD_DBL DBL_MIN

  The default/bad/invalid/fill/unknown value for fields of type double.
- #define XMSG_BAD_FLT FLT_MIN

  The default/bad/invalid/fill/unknown value for fields of type float.
- #define XMSG_BAD_I08 INT8_MIN

  The default/bad/invalid/fill/unknown value for fields of type int8_t.
- #define XMSG_BAD_I16 INT16_MIN

  The default/bad/invalid/fill/unknown value for fields of type int16_t.
- #define XMSG_BAD_I32 INT32_MIN

  The default/bad/invalid/fill/unknown value for fields of type int32_t.
- #define XMSG_BAD_U08 UINT8_MAX

  The default/bad/invalid/fill/unknown value for fields of type uint8_t.
- #define XMSG_BAD_U16 UINT16_MAX

  The default/bad/invalid/fill/unknown value for fields of type uint16_t.
- #define XMSG_BAD_U32 UINT32_MAX

  The default/bad/invalid/fill/unknown value for fields of type uint32_t.
- #define XMSG_DEBUG_AGGREGATE_TIMESERIES_DATA (false)

The debug-aggregation-of-time-series-data flag.

- #define XMSG_DEBUG_ALAMO_MISS_GFG (false)

  The debug-alamo-mission-configuration flag.
- #define XMSG_DEBUG_BIST (true)

  The debug-bist flag.
- #define XMSG_DEBUG_ENG_SURF (false)

  The debug-surface-engineering flag.
- #define XMSG_DEBUG_MFA_MISS_GFG (true)

  The debug-MFA-mission-configuration flag.
- #define XMSG_DEBUG_SENSOR_CURVATURE (false)

  The debug-curvature-encoded-sensor-data flag.
- #define XMSG_DEBUG_SURF_PRES_AGGR_DATA (false)

  The debug-surface-data flag.
- #define XMSG_DIVE_UNKNOWN IRI_DIVE_UNKNOWN

  The default/bad/invalid dive value.
- #define XMSG_ENABLE_MULTI_PROF (false)

  Preprocessor switch enable multiple profile data message with the same unique message identifier to be included in the same dive data object.
- #define XMSG_ENG_BAD_VER XMSG_BAD_U08

  The default/bad/invalid ALAMO engineering message version.
- #define XMSG_GAIN_INVALID IRI_GAIN_INVALID

  Default/fill value for invalid Iridium message gain value.
- #define XMSG_HEADER(x)

  Macro to generate a section header for ASCII listing files.
- #define XMSG_HEADER2(x)

  Macro to generate a section sub-header for ASCII listing files.
- #define XMSG_ID_UNKNOWN IRI_ID_UNKNOWN

  The default/bad/invalid unique identifier value.
- #define XMSG_INIT_SAM_N_RESERVE (1024)

  The number of samples to reserve upon construction of the composite sensor data objects.
- #define XMSG_MAX_DRFT (8)

  The maximum number of drift data messages that may be received for a single sensor (e.g.
- #define XMSG_MAX_FALL (16)

  The maximum number of fall data messages that may be received for a single dive.
- #define XMSG_MAX_GPS (1024)

  The maximum number of GPS position messages that may be received for a single dive.
- #define XMSG_MAX_MAIL (256)

  The maximum number of email/SBD data messages that may be received for a single dive.
- #define XMSG_MAX_MFA_MISS (2)

  The maximum number of mission configuration messages that may be received for a single dive.
- #define XMSG_MAX_MISS (16)

  The maximum number of mission configuration messages that may be received for a single dive.
- #define XMSG_MAX_PROF (16)

  The maximum number of binned profile messages that may be received for a single sensor (e.g.
- #define XMSG_MAX_PROF_HIRES (8)

  The maximum number of unbinned or row profile messages that may be received for a single sensor (e.g.
- #define XMSG_MAX_PUMP (16)

  The maximum number of pump data messages that may be received for a single dive.
- #define XMSG_MAX_RISE (16)

  The maximum number of rise data messages that may be received for a single dive.
- #define XMSG_MAX_SURF_PRES (16)

  The maximum number of surface pressure data messages that may be received for a single dive.
- #define XMSG_MAX_VALVE (16)

  The maximum number of valve data messages that may be received for a single dive.
- #define XMSG_MAX_WAVE (256)

  The maximum number of ocean surface wave data messages that may be received for a single dive.
- #define XMSG_OFFS_INVALID IRI_OFFS_INVALID

  Default/fill value for invalid Iridium message offset value.
- #define XMSG_PHY(os, name, value) os << boost::format("%-39s %s") % name % value << "\n"

  Macro for stupid PHY file format lines.
- #define XMSG_SBD_MIN_BYTES (8)

  The minimum allowable number of bytes in an SBD message.
- #define XMSG_SECTION(x)

Macro to generate a section divider for ASCII listing files.

- #define XMSG_SECTION_BREAK()

  Macro to generate a section break for ASCII listing files.
- #define XMSG_SENS_BAD (-99999)

  The default/bad/invalid sensor counts fill value.
- #define XMSG_SENS_BAD_PRES (-9.999)

  The default/bad/invalid pressure sensor fill value.
- #define XMSG_SENS_BAD_SALN (-9.999)

  The default/bad/invalid salinity sensor fill value.
- #define XMSG_SENS_BAD_TEMP (-9.999)

  The default/bad/invalid temperature sensor fill value.
- #define XMSG_SENS_MAX_PRES (2610.000)

  The maximum valid pressure sensor value.
- #define XMSG_SENS_MAX_SALN (41.000)

  The maximum valid salinity sensor value.
- #define XMSG_SENS_MAX_SAMPLES (1024∗16)

  The maximum number of samples for a single instrument, sensor, and dive cycle.
- #define XMSG_SENS_MAX_SUB (25)

  The maximum number of sensor data samples in a profile data message sub-block.
- #define XMSG_SENS_MAX_TEMP (40.000)

  The maximum valid temperature sensor value.
- #define XMSG_SENS_MIN_PRES (-5.000)

  The minimum valid pressure sensor value.
- #define XMSG_SENS_MIN_SALN (2.000)

  The minimum valid salinity sensor value.
- #define XMSG_SENS_MIN_TEMP (-5.0)

  The minimum valid temperature sensor value.
- #define XMSG_VERSION_UNKNOWN (255)

  The unknown X-Message version value.

11.46.1 Detailed Description

The XDefinitions header file.

This file includes common preprocessor definitions and macros that are used by the X-Message classes.

Version

0.6

11.46.2 Macro Definition Documentation

11.46.2.1 i08

```
#define i08(
              x,
              n) (( int8_t)x[n])
```

Get signed one byte [n:n] value from array x.

Referenced by util::xmsg::XGPS::DecodeXMsgData().

11.46.2.2 i16

```
#define i16(
              x,
              n) ((int16_t)u16(x,n))
```

Get signed two byte [n:n+2] value from array x.

Referenced by util::xmsg::XAlamoMissionConfiguration::DecodeXMsgData(), util::xmsg::XEngDescent::DecodeXMsgData(), util::xmsg::XEngSurface::DecodeXMsgData(), util::xmsg::XMfaMissionCfg::DecodeXMsgData(), util::xmsg::XWave::DecodeXMsgData(), and argo::iridium::xfloat::XFloatMailMessage::ParseMailMsgSbdAttachment().

11.46.2.3 i24

```
#define i24(
              x,
              n) (u24(x,n) >= (1<<23) ?  ((int32_t)u24(x,n)) - (1 << 24) :  u24(x,n))
```

Get signed three byte [n:n+2] value from array x.

Referenced by util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

11.46.2.4 i32

```
#define i32(
              x,
              n) ((int32_t)u32(x,n))
```

Get signed four byte [n:n+3] value from array x.

Referenced by util::xmsg::XGPS::DecodeXMsgData().

11.46.2.5 s1970

```
#define s1970(
              x,
              n)
```

Value:

```
(u32(x,n) ? (boost::posix_time::ptime(\
boost::gregorian::date(1970,boost::date_time::Jan,1),\
boost::posix_time::seconds((long int)u32(x,n))))\
: (boost::posix_time::ptime(boost::posix_time::not_a_date_time)))
```

Get posix time from given seconds since 1970-01-01T00:00:00Z.

Referenced by util::xmsg::XAlamoBit2::DecodeXMsgData().

11.46.2.6 s2000

```
#define s2000(
              x,
              n)
```

Value:

```
(u32(x,n) ? (boost::posix_time::ptime(\
boost::gregorian::date(2000,boost::date_time::Jan,1),\
boost::posix_time::seconds((long int)u32(x,n))))\
: (boost::posix_time::ptime(boost::posix_time::not_a_date_time)))
```

Get posix time from given seconds since 2000-01-01T00:00:00Z.

Referenced by util::xmsg::XAlamoMissionConfiguration::DecodeXMsgData(), util::xmsg::XArgo::DecodeXMsgData(), util::xmsg::XEngAscent::DecodeXMsgData(), util::xmsg::XEngDescent::DecodeXMsgData(), util::xmsg::XEngDrift::DecodeXMsgData(), util::xmsg::XEngIce::DecodeXMsgData(), util::xmsg::XEngSurface::DecodeXMsgData(), util::xmsg::XMfaMissionCfg::DecodeXMsgData(), and util::xmsg::AbstractXFallRise::UnpackData().

11.46.2.7 u08

```
#define u08(
              x,
              n) ((uint8_t)x[n])
```

Get unsigned one byte [n:n] value from array x.

Referenced by util::xmsg::XAcousticPosition::DecodeXMsgData(), util::xmsg::XAlamoBit2::DecodeXMsgData(), util::xmsg::XAlamoBit::DecodeXMsgData(), util::xmsg::XArgo::DecodeXMsgData(), util::xmsg::XEngDescent::DecodeXMsgData(), util::xmsg::XEngDrift::DecodeXMsgData(), util::xmsg::XEngIce::DecodeXMsgData(), util::xmsg::XEngSurface::DecodeXMsgData(), util::xmsg::XGPS::DecodeXMsgData(), util::xmsg::XMfaMissionCfg::DecodeXMsgData(), util::xmsg::XWave::DecodeXMsgData(), and argo::iridium::xfloat::XFloatMailMessage::ParseMailMsgSbdAttachment().

11.46.2.8 u16

```
#define u16(
              x,
              n) (((uint16_t)u08(x,(n)) << 8) | (uint16_t)u08(x,(n)+1))
```

Get unsigned two byte [n:n+1] value from array x.

Referenced by util::xmsg::XMessage::CheckXMsgData(), argo::iridium::xfloat::XFloatDiveData::DecodeXMsgData(), util::xmsg::XAcousticCacst::DecodeXMsgData(), util::xmsg::XAlamoBit2::DecodeXMsgData(), util::xmsg::XAlamoBit::DecodeXMsgData(), util::xmsg::XAlamoMissionConfiguration::DecodeXMsgData(), util::xmsg::XArgo::DecodeXMsgData(), util::xmsg::XEngAscent::DecodeXM util::xmsg::XEngDescent::DecodeXMsgData(), util::xmsg::XEngDrift::DecodeXMsgData(), util::xmsg::XEngIce::DecodeXMsgData(), util::xmsg::XEngSurface::DecodeXMsgData(), util::xmsg::XGPS::DecodeXMsgData(), util::xmsg::XMfaMissionCfg::DecodeXMsgData(), util::xmsg::XWave::DecodeXMsgData(), argo::iridium::xfloat::XFloatMailMessage::ParseMailMsgSbdAttachment(), util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

11.46.2.9 u24

```
#define u24(
              x,
              n) (((uint32_t)u08(x,(n)) << 16) | (uint32_t)(u08(x,(n)+1) << 8) | (uint32_t)u08(x,(n)+2))
```

Get unsigned three byte [n:n+2] value from array x.

Referenced by util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

11.46.2.10 u32

```
#define u32(
              x,
              n) (((uint32_t)u16(x,(n)) << 16) | (uint32_t)u16(x,(n)+2))
```

Get unsigned four byte [n:n+3] value from array x.

Referenced by util::xmsg::XMfaMissionCfg::AssignMessage(), util::xmsg::XAcousticCacst::DecodeXMsgData(), util::xmsg::XAcousticWindow::DecodeXMsgData(), util::xmsg::XAlamoBit2::DecodeXMsgData(), util::xmsg::XAlamoBit::DecodeXMsgData util::xmsg::XAlamoMissionConfiguration::DecodeXMsgData(), util::xmsg::XEngIce::DecodeXMsgData(), util::xmsg::XEngSurface::Decode and util::xmsg::XMfaMissionCfg::DecodeXMsgData().

11.46.2.11 XMSG_BAD_DBL

```
#define XMSG_BAD_DBL DBL_MIN
```

The default/bad/invalid/fill/unknown value for fields of type double.

11.46.2.12 XMSG_BAD_FLT

```
#define XMSG_BAD_FLT FLT_MIN
```

The default/bad/invalid/fill/unknown value for fields of type float.

11.46.2.13 XMSG_BAD_I08

```
#define XMSG_BAD_I08 INT8_MIN
```

The default/bad/invalid/fill/unknown value for fields of type int8_t.

11.46.2.14 XMSG_BAD_I16

```
#define XMSG_BAD_I16 INT16_MIN
```

The default/bad/invalid/fill/unknown value for fields of type int16_t.

11.46.2.15 XMSG_BAD_I32

```
#define XMSG_BAD_I32 INT32_MIN
```

The default/bad/invalid/fill/unknown value for fields of type int32_t.

11.46.2.16 XMSG_BAD_U08

```
#define XMSG_BAD_U08 UINT8_MAX
```

The default/bad/invalid/fill/unknown value for fields of type uint8_t.

11.46.2.17 XMSG_BAD_U16

```
#define XMSG_BAD_U16 UINT16_MAX
```

The default/bad/invalid/fill/unknown value for fields of type uint16_t.

Referenced by util::xmsg::XAlamoMissionConfiguration::DecodeXMsgData(), util::xmsg::XMfaMissionCfg::DecodeXMsgData(), util::xmsg::XPump::DecodeXMsgData(), and util::xmsg::XValve::DecodeXMsgData().

11.46.2.18 XMSG_BAD_U32

```
#define XMSG_BAD_U32 UINT32_MAX
```

The default/bad/invalid/fill/unknown value for fields of type uint32_t.

11.46.2.19 XMSG_DEBUG_AGGREGATE_TIMESERIES_DATA

```
#define XMSG_DEBUG_AGGREGATE_TIMESERIES_DATA (false)
```

The debug-aggregation-of-time-series-data flag.

If TRUE, then additional debug messages will be reported when decoding aggregate time-series data messages.

11.46.2.20 XMSG_DEBUG_ALAMO_MISS_GFG

```
#define XMSG_DEBUG_ALAMO_MISS_GFG (false)
```

The debug-alamo-mission-configuration flag.

If TRUE, then additional debug messages will be reported when decoding ALAMO mission configuration messages.

11.46.2.21 XMSG_DEBUG_BIST

```
#define XMSG_DEBUG_BIST (true)
```

The debug-bist flag.

If TRUE, then additional debug messages will be reported when decoding MFA mission configuration messages.

11.46.2.22 XMSG_DEBUG_ENG_SURF

```
#define XMSG_DEBUG_ENG_SURF (false)
```

The debug-surface-engineering flag.

11.46.2.23 XMSG_DEBUG_MFA_MISS_GFG

```
#define XMSG_DEBUG_MFA_MISS_GFG (true)
```

The debug-MFA-mission-configuration flag.

If TRUE, then additional debug messages will be reported when decoding MFA mission configuration messages.

11.46.2.24 XMSG_DEBUG_SENSOR_CURVATURE

```
#define XMSG_DEBUG_SENSOR_CURVATURE (false)
```

The debug-curvature-encoded-sensor-data flag.

If TRUE, then additional debug messages will be reported when decoding curvature-encoded sensor data.

11.46.2.25 XMSG_DEBUG_SURF_PRES_AGGR_DATA

```
#define XMSG_DEBUG_SURF_PRES_AGGR_DATA (false)
```

The debug-surface-data flag.

If TRUE, then additional debug messages will be reported when decoding surface data.

11.46.2.26 XMSG_DIVE_UNKNOWN

```
#define XMSG_DIVE_UNKNOWN IRI_DIVE_UNKNOWN
```

The default/bad/invalid dive value.

11.46.2.27 XMSG_ENABLE_MULTI_PROF

```
#define XMSG_ENABLE_MULTI_PROF (false)
```

Preprocessor switch enable multiple profile data message with the same unique message identifier to be included in the same dive data object.

Note

This switch is a temporary fix to include the full profile data in the intermediate listing for ALAMO #9038 which erroneously returns profile data messages with non-unique identifiers.

Warning

This switch should be disabled for the release build configuration.

If TRUE, then multiple profile data message with the same unique message identifier will be allowed for a single dive. Otherwise, messages with duplicate unique identifiers will overwrite or replace previously received messages with the same identifier.

11.46.2.28 XMSG_ENG_BAD_VER

```
#define XMSG_ENG_BAD_VER XMSG_BAD_U08
```

The default/bad/invalid ALAMO engineering message version.

11.46.2.29 XMSG_GAIN_INVALID

```
#define XMSG_GAIN_INVALID IRI_GAIN_INVALID
```

Default/fill value for invalid Iridium message gain value.

11.46.2.30 XMSG_HEADER

```
#define XMSG_HEADER(
                x)
```

Value:

```
do {\
    static const char* _line =
      "#=============================================================================================================";\
    os « _line « std::endl « "# " « x « std::endl « _line « std::endl;\
} while(0)
```

Macro to generate a section header for ASCII listing files.

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

11.46.2.31 XMSG_HEADER2

```
#define XMSG_HEADER2(
                x)
```

Value:

```
do {\
    static const char* _line = "#============================================================"\
        "================================\n";\
    static const char* _sec = "# " x "\n";\
    os « _line  « _sec  « _line ;\
} while(0)
```

Macro to generate a section sub-header for ASCII listing files.

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

11.46.2.32 XMSG_ID_UNKNOWN

```
#define XMSG_ID_UNKNOWN IRI_ID_UNKNOWN
```

The default/bad/invalid unique identifier value.

Referenced by argo::iridium::xfloat::XFloatMailMessage::ParseMailMsgBody().

11.46.2.33 XMSG_INIT_SAM_N_RESERVE

```
#define XMSG_INIT_SAM_N_RESERVE (1024)
```

The number of samples to reserve upon construction of the composite sensor data objects.

Referenced by util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AbstractXS

11.46.2.34 XMSG_MAX_DRFT

```
#define XMSG_MAX_DRFT (8)
```

The maximum number of drift data messages that may be received for a single sensor (e.g.

pressure, temperature, or salinity) and for a single dive.

11.46.2.35 XMSG_MAX_FALL

```
#define XMSG_MAX_FALL (16)
```

The maximum number of fall data messages that may be received for a single dive.

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateCompositeFallTimeSeriesData().

11.46.2.36 XMSG_MAX_GPS

```
#define XMSG_MAX_GPS (1024)
```

The maximum number of GPS position messages that may be received for a single dive.

11.46.2.37 XMSG_MAX_MAIL

```
#define XMSG_MAX_MAIL (256)
```

The maximum number of email/SBD data messages that may be received for a single dive.

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateCompositeIridiumPosition().

11.46.2.38 XMSG_MAX_MFA_MISS

```
#define XMSG_MAX_MFA_MISS ( 2 )
```

The maximum number of mission configuration messages that may be received for a single dive.

Referenced by util::xmsg::XMfaMissionCfg::XMfaMissionCfg(), and util::xmsg::XMfaMissionCfg::AssignMessage().

11.46.2.39 XMSG_MAX_MISS

```
#define XMSG_MAX_MISS (16)
```

The maximum number of mission configuration messages that may be received for a single dive.

11.46.2.40 XMSG_MAX_PROF

```
#define XMSG_MAX_PROF (16)
```

The maximum number of binned profile messages that may be received for a single sensor (e.g.

pressure, temperature, or salinity) and for a single dive.

11.46.2.41 XMSG_MAX_PROF_HIRES

```
#define XMSG_MAX_PROF_HIRES (8)
```

The maximum number of unbinned or row profile messages that may be received for a single sensor (e.g.

pressure, temperature, or salinity) and for a single dive.

11.46.2.42 XMSG_MAX_PUMP

```
#define XMSG_MAX_PUMP (16)
```

The maximum number of pump data messages that may be received for a single dive.

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateCompositePumpTimeSeriesData().

11.46.2.43 XMSG_MAX_RISE

```
#define XMSG_MAX_RISE (16)
```

The maximum number of rise data messages that may be received for a single dive.

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateCompositeRiseTimeSeriesData().

11.46.2.44 XMSG_MAX_SURF_PRES

```
#define XMSG_MAX_SURF_PRES (16)
```

The maximum number of surface pressure data messages that may be received for a single dive.

11.46.2.45 XMSG_MAX_VALVE

```
#define XMSG_MAX_VALVE (16)
```

The maximum number of valve data messages that may be received for a single dive.

11.46.2.46 XMSG_MAX_WAVE

```
#define XMSG_MAX_WAVE (256)
```

The maximum number of ocean surface wave data messages that may be received for a single dive.

11.46.2.47 XMSG_OFFS_INVALID

```
#define XMSG_OFFS_INVALID IRI_OFFS_INVALID
```

Default/fill value for invalid Iridium message offset value.

11.46.2.48 XMSG_PHY

```
#define XMSG_PHY(
              os,
              name,
              value) os << boost::format("%-39s %s") % name % value << "\n"
```

Macro for stupid PHY file format lines.

Referenced by argo::iridium::xfloat::XFloatDiveData::GeneratePhyString().

11.46.2.49 XMSG_SBD_MIN_BYTES

```
#define XMSG_SBD_MIN_BYTES (8)
```

The minimum allowable number of bytes in an SBD message.

Any SBD message that has less than this number of bytes will be considered invalid and ignored.

Referenced by argo::iridium::xfloat::XFloatMailMessage::ParseMailMsgSbdAttachment().

11.46.2.50 XMSG_SECTION

```
#define XMSG_SECTION(
              x)
```

Value:

```
do {\
    static const char* _line = "#----------------------------------------------------------------"\
        "---------------------------------\n";\
    static const char* _sec = "# " x "\n";\
    os « _line « _sec  « _line ;\
} while(0)
```

Macro to generate a section divider for ASCII listing files.

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString(), and util::xmsg::XCompositeSurfaceData::GenerateListingStr

11.46.2.51 XMSG_SECTION_BREAK

```
#define XMSG_SECTION_BREAK()
```

Value:

```
do {\
    static const char* _line = "#----------------------------------------------------------------"\
        "---------------------------------\n";\
    os « _line;\
} while(0)
```

Macro to generate a section break for ASCII listing files.

Referenced by util::xmsg::XCompositeFall::GenerateListingString(), util::xmsg::XCompositePump::GenerateListingString(), and util::xmsg::XCompositeRise::GenerateListingString().

11.46.2.52 XMSG_SENS_BAD

```
#define XMSG_SENS_BAD (-99999)
```

The default/bad/invalid sensor counts fill value.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), util::xmsg::XCompositeSurfa util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::ResetAggregatedData(), util::xmsg::AbstractXSensorDataComposite util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::SamplePres(), util::xmsg::AbstractXSensorDataComposite< PRES_ util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::SampleSaln(), util::xmsg::AbstractXSensorDataComposite< PRES_ util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::SampleTemp(), and util::xmsg::AbstractXFallRise::UnpackData().

11.46.2.53 XMSG_SENS_BAD_PRES

```
#define XMSG_SENS_BAD_PRES (-9.999)
```

The default/bad/invalid pressure sensor fill value.

Referenced by util::xmsg::XPresCounts::PressureValue(), util::xmsg::XPumpCounts::PressureValue(), util::xmsg::XValveCounts::Pressure
util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::SamplePresAsFloat(),
util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::SamplePresAsFloat(), util::xmsg::AbstractXSensorData::SampleValu
and argo::iridium::xfloat::XFloatDiveData::UpdateDerivedSurfaceDataFields().

11.46.2.54 XMSG_SENS_BAD_SALN

```
#define XMSG_SENS_BAD_SALN (-9.999)
```

The default/bad/invalid salinity sensor fill value.

Referenced by util::xmsg::XSensorTripletCodeCounts::SalinityValue(), util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN
util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::SampleSalnAsFloat(), and util::xmsg::AbstractXSensorData::SampleV

11.46.2.55 XMSG_SENS_BAD_TEMP

```
#define XMSG_SENS_BAD_TEMP (-9.999)
```

The default/bad/invalid temperature sensor fill value.

Referenced by util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::SampleTem
util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::SampleTempAsFloat(), util::xmsg::AbstractXSensorData::SampleValu
and util::xmsg::XSensorTripletCodeCounts::TemperatureValue().

11.46.2.56 XMSG_SENS_MAX_PRES

```
#define XMSG_SENS_MAX_PRES (2610.000)
```

The maximum valid pressure sensor value.

Referenced by util::xmsg::XPresCounts::PressureValue(), util::xmsg::XPumpCounts::PressureValue(), util::xmsg::XValveCounts::Pressure
util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::SamplePresAsFloat(),
util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::SamplePresAsFloat(), and util::xmsg::AbstractXSensorData::SampleV

11.46.2.57 XMSG_SENS_MAX_SALN

```
#define XMSG_SENS_MAX_SALN (41.000)
```

The maximum valid salinity sensor value.

Referenced by util::xmsg::XSensorTripletCodeCounts::SalinityValue(), util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN
util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::SampleSalnAsFloat(), and util::xmsg::AbstractXSensorData::SampleV

11.46.2.58 XMSG_SENS_MAX_SAMPLES

```
#define XMSG_SENS_MAX_SAMPLES (1024*16)
```

The maximum number of samples for a single instrument, sensor, and dive cycle.

11.46.2.59 XMSG_SENS_MAX_SUB

```
#define XMSG_SENS_MAX_SUB (25)
```

The maximum number of sensor data samples in a profile data message sub-block.

Referenced by util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

11.46.2.60 XMSG_SENS_MAX_TEMP

```
#define XMSG_SENS_MAX_TEMP (40.000)
```

The maximum valid temperature sensor value.

Referenced by util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::SampleTem
util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::SampleTempAsFloat(), util::xmsg::AbstractXSensorData::SampleValu
and util::xmsg::XSensorTripletCodeCounts::TemperatureValue().

11.46.2.61 XMSG_SENS_MIN_PRES

```
#define XMSG_SENS_MIN_PRES (-5.000)
```

The minimum valid pressure sensor value.

11.46.2.62 XMSG_SENS_MIN_SALN

```
#define XMSG_SENS_MIN_SALN (2.000)
```

The minimum valid salinity sensor value.

11.46.2.63 XMSG_SENS_MIN_TEMP

```
#define XMSG_SENS_MIN_TEMP (-5.0)
```

The minimum valid temperature sensor value.

11.46.2.64 XMSG_VERSION_UNKNOWN

```
#define XMSG_VERSION_UNKNOWN (255)
```

The unknown X-Message version value.

11.55.1 Detailed Description

The util::xmsg::XSensorTripletCodeCounts class header file.

This is the header file for the sensor triplet and phase code class, util::xmsg::XSensorTripletCodeCounts. This class represents a pressure, temperature, and salinity measurement triplet and a phase code. The phase code is used to indicate the context of the measurement (see util::xmsg::XPhaseCode_t). This class is used to store a single data point for the rise, fall, or surface time-series data.

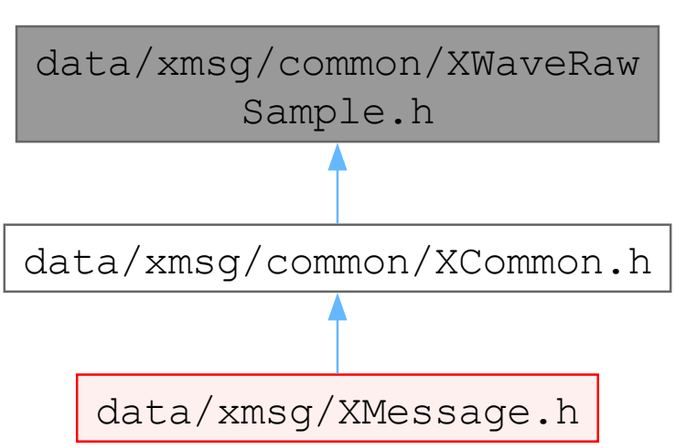
11.60 data/xmsg/common/XWaveRawSample.h File Reference

The util::xmsg::XWaveRawSample class header file.

`#include "XDefinitions.h"`

Include dependency graph for XWaveRawSample.h:

This graph shows which files directly or indirectly include this file:



Classes

- class util::xmsg::XWaveRawSample

  Class representing a single raw motion measurement in the surface time series wave data X-message.

Namespaces

- namespace util

  The utility namespace.
- namespace util::xmsg

  The X-Message utility namespace.

11.60.1 Detailed Description

The util::xmsg::XWaveRawSample class header file.

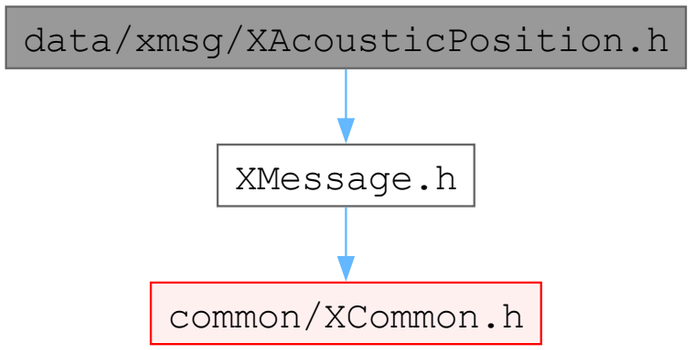
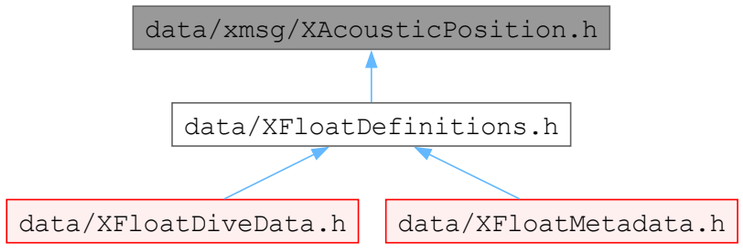
11.65 data/xmsg/XAcousticPosition.h File Reference

The util::xmsg::XAcousticPosition class header file.

`#include "XMessage.h"`
Include dependency graph for XAcousticPosition.h:



This graph shows which files directly or indirectly include this file:



Classes

- class util::xmsg::XAcousticCacst
  An acoustic reception (CACST) record.
- class util::xmsg::XAcousticPosition
  Class representing an acoustic position X-Message.
- class util::xmsg::XAcousticWindow
  An acoustic listening window.

Namespaces

- namespace util

  The utility namespace.
- namespace util::xmsg

  The X-Message utility namespace.

11.65.1 Detailed Description

The util::xmsg::XAcousticPosition class header file.

Version

0.6
