XMTPS: X-Message Telemetry Processing Service

0.6

Generated on Sat Oct 24 2026 14:53:30 for XMTPS: X-Message Telemetry Processing Service by Doxygen 1.11.0

Sat Oct 24 2026 14:53:30

1 XMTPS — X-Message Telemetry Processing Service 1
1.1 How it works . . . 1
1.1.1 Source layout . . . 1
1.2 Building . . . 2
1.3 Configuration . . . 2
1.3.1 How options are read . . . 2
1.3.2 Command-line only options . . . 2
1.3.3 Configuration file options . . . 3
1.3.4 Example configuration file . . . 4
1.3.5 Float metadata . . . 5
1.4 Running . . . 5
1.4.1 Output files . . . 5
1.5 Database schema . . . 5
1.5.1 `XFloat` . . . 6
1.5.2 `XFloatMetadata` . . . 6
1.5.3 `XFloatDive` . . . 6
1.5.4 `XGPS` . . . 7
1.5.5 `XFloatMail` . . . 7
1.6 Deployment . . . 7
1.7 Python tools (`bin/py`) . . . 7
1.7.1 Command-line options . . . 8
1.8 Changelog . . . 9
1.8.1 2026-10-24 . . . 9
1.8.2 2026-10-23 . . . 9
1.8.3 2026-08-11 . . . 9
1.8.4 2026-08-06 . . . 10
1.8.5 2026-08-05 . . . 10
1.9 Author and license . . . 10

2 Libraries and Database Schema 11
2.1 Libraries . . . 11
2.1.1 Boost C++ Libraries . . . 11
2.1.1.1 program_options . . . 11
2.1.1.2 filesystem . . . 11
2.1.1.3 log . . . 11
2.1.1.4 thread . . . 11
2.1.2 MySQL C++ Connector . . . 11
2.1.3 VMime MIME & Mail Library for C++ . . . 12
2.1.4 libkml . . . 12
2.2 SQL Database Schema . . . 12
2.2.1 Table XFloat . . . 13
2.2.2 Table XFloatMetadata . . . 14
2.2.3 Table XFloatDive . . . 14
2.2.4 Table XGPS . . . 14
2.2.5 Table XFloatMail . . . 15

Chapter 1

XMTPS — X-Message Telemetry Processing Service

XMTPS is the WHOI Float Group daemon that receives Iridium Short Burst Data (SBD) telemetry from ALAMO and ALTO profiling floats, decodes it, stores it in MySQL, and writes the listing, PHY, KML, status and RAW files used downstream. A set of Python tools in `bin/py` turns the listing files into JSON and generates the per-float plot pages and the fleet summary page.

1.1 How it works

Iridium delivers each SBD message as an email with a binary `.sbd` attachment. XMTPS processes them in a four-stage pipeline of worker threads, connected by bounded queues:

Stage	Source	Role
1. Mail retrieval	`src/stage1_MailRetrieval↩ Thread.*`	Fetches mail from the IMAP server (or RAW mail files from a directory) and queues it. Optionally reprocesses stored messages from the database at startup.
2. Mail processing	`src/stage2_MailProcessing↩ Thread.*`	Validates the header and SBD attachment, resolves the float's identifiers, writes the RAW/SBD files, and saves the message to MySQL.
3. Telemetry decoding	`src/stage3_TelemetryDecoder↩ Thread.*`	Decodes the SBD data into X-messages, assigns them to the float's dive, and writes listing/PHY files and dive records when a dive is complete.
4. Post-processing	`src/stage4b_PostProcessing↩ Thread.*`	Periodically writes each float's KML and status files and the master KML file.

The main thread (`src/Main.cpp`) parses the configuration, takes the run-time PID lock, loads the cached float data and metadata, starts the workers, and shuts them down in pipeline order when it receives a signal. Each stage drains its queue before exiting.

1.1.1 Source layout

```
src/
  Main.cpp, stage*_*.cpp/.h   daemon entry point and pipeline stages
  config/                     command-line/config-file options, MySQL connection settings
  data/                       floats (XFloat), dives (XFloatDiveData), mail messages, metadata
  data/xmsg/                  X-message decoders (GPS, profiles, drift, engineering, ice, wave, ...)
  utility/                    logging, MySQL/SQL table helpers, KML, queues, file-system helpers
bin/
  py/                         JSON conversion, plotting and summary-page tools
  xmtps-alamo.service         systemd unit for the decoder daemon
  xmtps-alamo-plot.service    systemd unit for the plot-generation loop
build/                        build-number script and counter
```

1.2 Building

XMTPS is a C++11 project built with Eclipse CDT managed builds (`.cproject`, `Debug/` and `Release/` makefiles) and g++ on Linux. It links against:

- Boost: `chrono`, `date_time`, `filesystem`, `iostreams`, `log`, `log_setup`, `program_options`, `regex`, `thread`
- `VMime` (IMAP and MIME parsing)
- MySQL Connector/C++ (`mysqlcppconn`)
- libkml (`kmlbase`, `kmldom`, `kmlengine`)
- pthreads

The build number embedded in the binary comes from `build/buildNo.txt`, which `build/incrementBuild.sh` bumps as a build step.

The code uses POSIX APIs (`open`/`O_EXCL`, `getpid`, signals), so it builds on Linux only.

1.3 Configuration

1.3.1 How options are read

- Every option can be given on the command line. The options in the "Configuration file options" tables below can also be set in the configuration file.
- The configuration file (`-c PATH`, default `../cfg/options.cfg`, relative to the working directory) must exist; the program stops if it is missing or contains an unknown option.
- Command-line values take precedence: the configuration file is read after the command line and only fills in options that were not given there.
- In the configuration file, options in a table's section are written as `name = value` under a `[section]` header (for example `host` under `[mail]`); on the command line they are written with the section as a prefix (for example `--mail.host maila.whoi.edu`).
- Boolean values are written as `0`/`1` or `false`/`true`, except the switches `-D` and `-R`, which take no value.
- `xmtps --help` prints all options with their defaults and exits.

1.3.2 Command-line only options

Option	Default	Description
`-c`, `--config PATH`	`../cfg/options.cfg`	Path to the configuration file.
`-D`, `--daemon`	off	Run as a daemon: keep running until a termination signal or until the run-time lock is lost. Without it, the program starts the pipeline, waits briefly, and exits.
`-h`, `--help`		Print all options with their defaults, then exit.
`-V`, `--version`		Print the version banner, then exit.
`-d`, `--debug`		Log at debug level.
`-v`, `--verbose`		Log informational messages as well (used if `-d` is not given).
`-q`, `--quiet`		Log only warnings and errors (used if neither `-d` nor `-v` is given).
`-r`, `--reprocess ID ...`	none	Reprocess all stored mail messages for the given instrument serial numbers before normal operation: their dive data is deleted and rebuilt from the database. Repeatable, and accepts several IDs.
`-R`, `--reprocess-all`	off	Reprocess the stored mail messages of every cached instrument at startup.

Option	Default	Description
-A, --reprocess-active 0|1	1	Reprocess every instrument that reported in the last 90 days at startup. **On by default.**
--phy-enable ID	none	Enable PHY file generation for an instrument (repeatable). The instrument is also reprocessed at startup.
--phy-disable ID	none	Disable PHY file generation for an instrument (repeatable).

With no logging option, the normal log level is used: operational messages, warnings and errors.

1.3.3 Configuration file options

General:

Option	Default	Description
-m, maxFetch N	127	Maximum number of mail messages fetched from the server, or files read from dir.mail, per batch.
-M, msgStartIdx N	1	Index of the first message on the mail server to fetch (server mode only).
-n, nProcThrd N	1	Number of mail processing threads.
-N, nDecoThrd N	1	Number of telemetry decoder threads.
-p, pid-file PATH	/var/lock/xmtps/lock.pid	Run-time lock (PID) file. Only one instance can hold it.

[dir] — directories (relative paths are relative to the working directory):

Option	Default	Description
dir.kml	kml	KML files.
dir.lis	lis	Intermediate listing files.
dir.log	log	Log files.
dir.meta	meta	Float metadata (.meta) files.
dir.phy	phy	PHY listing files.
dir.raw	raw	RAW mail message output files.
dir.mail	raw/incoming	RAW mail input files (file-system fetch mode).
dir.mail.processed	raw/processed	Processed RAW mail input files. Accepted but not currently used.
dir.sbd	sbd	Binary SBD message files.
dir.stat	stat	Status files.

[gen] — which output files to write:

Option	Default	Description
gen.kml	1	Google Earth KML files.
gen.lis	1	Intermediate listing files.
gen.phy	1	PHY listing files.
gen.raw	1	RAW mail message files.
gen.raw.format	1	RAW file format: 0 standard, 1 extended (adds headers, Iridium session details and an SBD hex dump).
gen.sbd	0	Binary SBD message files.
gen.stat	0	Status files.

[poc] — surface pressure offset correction (applied only for sensor types that need it; see Float metadata):

Option	Default	Description
poc.lis	1	Apply the correction in listing files.
poc.phy	1	Apply the correction in PHY files.

[mail] — mail server and message validation:

Option	Default	Description
mail.host	maila.whoi.edu	Mail server host name or IP address.
mail.protocol	imap	Mail server protocol.
mail.user	alamo	Mail account user name.
mail.password	none	Mail account password.
mail.folder	empty (server default)	Folder to read messages from, e.g. INBOX.
mail.fetchMode	0	0 fetch from the mail server; 1 read RAW mail files from dir.mail (renamed to .err if they can't be parsed).
mail.moveMessages	0	After processing, move server messages to the folder INBOX.<YYYYMM> for their header date.
mail.xDlyS	60	Seconds to wait before checking again when no new messages are found.
mail.validSenderRegex	(sbdservice@sbd.↩ iridium.↩ com|service@sbd.pac.↩ disa.mil)	Senders whose messages are accepted.
mail.validSubjectRegex	SBD Msg From Unit↩ : (\d+)	Accepted subjects; the captured number is the IMEI.
mail.validSbdFilename↩ Regex	(\d+)_(\d{6})\.sbd	Accepted SBD attachment file names.

The mail user and password may contain any characters; they are percent-encoded when the server URL is built.

[sql] — MySQL server:

Option	Default	Description
sql.host	127.0.↩ 0.1	Server host name or IP address.
sql.port	3306	Server port.
sql.protocol	tcp	Connection protocol.
sql.schema	float_db	Database schema name.
sql.user	none	Account user name.
sql.password	none	Account password.

1.3.4 Example configuration file

Credentials omitted:

```
maxFetch                = 16
nProcThrd               = 1
nDecoThrd               = 1

[dir]
meta                    = /data1/alamo/meta/dac
lis                     = /data1/alamo/data/list
raw                     = /data1/alamo/data/raw

[gen]
kml                     = true
stat                    = true

[mail]
host                    = maila.whoi.edu
protocol                = imap
folder                  = INBOX
fetchMode               = 0
validSenderRegex        = (sbdservice@sbd\.iridium\.com|service@sbd\.pac\.disa\.mil)
validSubjectRegex       = SBD Msg From Unit: (\d+)

[sql]
host                    = 127.0.0.1
port                    = 3306
schema                  = xmtps_alamo
```

Keep real configuration files, with their credentials, out of version control (cfg/ is ignored).

1.3.5 Float metadata

Each float's metadata is read at startup from `<dir.meta>/<DAC-ID>_<serial>.meta`, a plain-text file with the field name in the first 40 columns and the value after it. Files must be plain ASCII text (not RTF). The daemon uses, among others, the WMO ID, WMO instrument type, launch time (`dd mm yyyy hh mm`) and launch position (`lat latm lon lonm`, with the minutes carrying the same sign as the degrees). A field that fails to parse is logged and skipped. DAC ID `9999` marks a placeholder file and is ignored.

Supported WMO instrument types: 866, 867, 868 (ALAMO) and 873, 875, 876 (ALTO). The surface pressure offset correction is applied for RBR conductivity sensors (867, 875) and for floats without one (866), and is skipped for SBE sensors (868, 876) and for 873.

1.4 Running

```
xmtps --config /data1/alamo/etc/xmtps.cfg --daemon --pid-file /data1/alamo/var/lock/xmtps.pid
```

See Configuration for every option. Note that `--reprocess-active` is on by default, so each start reprocesses the floats active in the last 90 days; pass `-A 0` to skip it.

The PID file is created exclusively at startup, so only one instance can run at a time. It is removed on shutdown only by the process that owns it.

Logs are written to `<dir.log>/YYYY-MM-DD.log`, with warnings and errors also in `<dir.log>/YYYY-MM-DD.error.log`.

1.4.1 Output files

Output	Location
RAW mail	`<dir.raw>/<serial>/raw<serial>-<MOMSN>-<dive>-<packet>.txt`
Listings	`<dir.lis>/<serial>/lis<serial>-<dive>.txt`
PHY, KML, status, SBD	under `dir.phy`, `dir.kml`, `dir.stat`, `dir.sbd`

Decoded data, messages, floats and dives are also stored in the MySQL schema set by `sql.schema`.

1.5 Database schema

XMTPS stores its state in five InnoDB tables in the MySQL schema named by `sql.schema` (production: `xmtps_alamo`). Each table is mapped to one C++ class through a static `util::mysql::SqlTableDescription`. The description lists the column names and the getter and setter used to read and write each column, and generates the `SELECT`, `DELETE` and `INSERT ... ON DUPLICATE KEY UPDATE` statements. Saving an object therefore inserts a new row or overwrites the existing row with the same primary key.

Table	Class	Primary key	One row per	Written by
`XFloat`	`XFloat`	`id_instrument`	instrument	startup, stage 3 and shutdown
`XFloat_Metadata`	`XFloat_Metadata`	`id_instrument`	instrument, from its `.meta` file	saved with `XFloat`
`XFloatDive`	`XFloatDive_Data`	`id_instrument`, `id_dive`	dive cycle	stage 3
`XGPS`	`XGPS`	`id_instrument`, `id_dive`, `datetime`	GPS fix	stage 3, saved with the dive
`XFloatMail`	`XFloatMail_Message`	`id_dive`, `id_imei`, `id_sbd_momsn`, `id_sbd_packet`, `id_msg`	mail message (one SBD packet)	stage 2

Relationships (foreign keys):

```
XFloat (id_instrument)
 +- XFloatMetadata.id_instrument              fk_XFloatMetadata_1
 `- XFloatDive.id_instrument                  fk_XFloatDive_1
      `- XGPS (id_instrument, id_dive)        fk_XGPS_1
XFloatMail                                    no foreign key; linked by id_instrument / id_imei
```

Because of these keys a float's `XFloat` row must exist before its dives are saved, and a dive's row before its GPS fixes; `XFloatDiveData::SaveObjectToDatabase()` saves the parent float first. `XFloatMail` has no foreign key, so a message can be stored before its float is known (stage 2).

Common identifier columns:

Column	Meaning
id_instrument	Float serial number (the instrument ID used throughout XMTPS).
id_imei	IMEI of the float's Iridium modem.
id_wmo	WMO platform number (-1 if not assigned).
id_dac	Argo data assembly center ID.
id_dive	Dive (profile) number.

Unset values use sentinel defaults rather than NULL: -1 for IDs, 1400-01-01 00:00:00 for dates, 99.↩ 99999/999.99999 for latitude/longitude, and 9999 for gains and offsets.

1.5.1 XFloat

The current state of each float, reloaded at startup so that processing resumes where it left off.

- Identifiers: id_instrument, id_imei, id_wmo, id_dac, and argo_instrument_type (Argo instrument type code).
- Calibration: gain_* and offset_* for pressure, salinity and temperature, with separate *_surface values for the surface sample.
- Latest positions: latest_gps_position_* and latest_iridium_position_* (date/time, dive number, latitude, longitude, and Iridium CEP radius), used for the KML and status files.
- Iridium sequence numbers: latest_sbd_momsn and latest_sbd_mtmsn, the most recent mobile-originated and mobile-terminated message sequence numbers.
- Output switches: phy_file_generation_is_enabled and netcdf_file_generation_is_↩ enabled.
- Mission: start_of_mission_datetime, and xmsg_version_major/xmsg_version_minor (the X-Message format version the float reports).
- latest_iridium_startup_position_datetime and latest_iridium_startup_sbd_↩ momsn exist in the production table but are not read or written by the current code.

1.5.2 XFloatMetadata

Deployment metadata parsed from the float's .meta file (see Float metadata).

- Deployment: deployment_datetime, deployment_latitude/deployment_longitude, deployment_position_valid, the deployment_*_status fields, deployment_platform, deployment_cruise_id and deployment_type.
- People: deployer, deployer_address, principal_investigators, principal_investigators↩ _address, principal_investigators_originating_country.
- Instrument: manufacturer, wmo_instrument_type (for example 873, 875 or 876 for ALTO floats), and wmo_recorder_type.
- Other: comment, and local_path, the path of the .meta file.

1.5.3 XFloatDive

One dive cycle, built from all the SBD messages received for it.

- complete: the dive has a complete profile, known sensor gains and offsets, contiguous message IDs and a valid position.
- num_sbd_msgs: the number of SBD messages received for the dive.
- iridium_position_datetime_first/_last: the first and last Iridium fix times for the dive.
- intermediate_listing_file_path and phy_file_path: the output files written for the dive.
- surface_pres_*: statistics of the surface pressure samples (min, max, mean, variance, valid).
- pres_offs*: the pressure offset applied to the profile, with the number of dives and samples it was computed from and whether it is valid.

1.5.4 XGPS

One GPS fix reported in an X-Message.

- datetime, latitude, longitude and valid.
- id_type: the GPS message type.
- Fix quality: hdop, num_satellites, snr_min, snr_mean, snr_max, and time_to_fix.

1.5.5 XFloatMail

Every Iridium SBD mail message received, so that a float can be reprocessed from the database with -r/--reprocess.

- Keys: id_imei, id_sbd_momsn, id_sbd_packet and id_dive identify the packet; id_msg is the mail Message-ID; id_msg_uid is the IMAP UID; id_sbd_mtmsn is the MTMSN.
- Mail: msg_header_datetime, msg_header_from, msg_header_subject, msg_header_raw↩ _text, msg_body_text and msg_raw_text, each with an *_is_valid flag, and msg_is_valid for the whole message.
- Iridium session: iridium_position_* (latitude, longitude, CEP radius, date/time, valid), and sbd_↩ session_status_code/sbd_session_status_string.
- Attachment: sbd_data (the raw SBD bytes), sbd_data_is_valid, sbd_file_name and sbd_file↩ _size_bytes.
- Files written: sbd_file_local_path and raw_file_local_path.
- id_dac and id_wmo exist in the production table but are not written by the current code, so they keep their default of -1.

Reprocessing (-r ID) deletes the float's XGPS and XFloatDive rows and rebuilds them from its XFloatMail rows. The full CREATE TABLE statements are in the Doxygen documentation (the "Libraries and Database Schema" page in doc/xmtps.pdf).

1.6 Deployment

The bin/*.service files are systemd units:

- xmtps-alamo.service runs the decoder daemon with Restart=always and RestartSec=30, so a startup failure (for example MySQL being unavailable) keeps retrying without hitting systemd's start limit.
- xmtps-alamo-plot.service runs bin/py/update-plots-service.sh.

After installing or changing a unit file, run sudo systemctl daemon-reload.

1.7 Python tools (bin/py)

Requires Python 3 with numpy, scipy, pandas, plotly (plus kaleido for PNG export), jsonpickle, geographiclib, pytz, python-dateutil, Pillow and yattag.

Script	Purpose
xmtps-list2json.py	Converts listing files into per-dive JSON (<out>/<serial>/dives/<serial>_↩ <dive>.json), adding density and σ_0 from RhoLUT.py and wave statistics from FloatClasses.py.
xmtps-aggregate-json.py	Aggregates a float's dive JSON into per-float JSON files (<serial>_profile.json, _wave_spectra.json, _↩ summary.json, ...) and, with -p DIR, writes the plot images and the float's HTML page.
xmtps-generate-summary-page.py	Builds the fleet summary page from the per-float _summary.↩ json files.
update-plots-service.sh	Loop used by the plot service: regenerates JSON and plots for floats with recent listings, then the summary page.

All three scripts share JSON version 0.11; JSON files with a different version are ignored.

1.7.1 Command-line options

Each script takes one or more input paths (directories and/or files) as positional arguments. Paths matching an include pattern are tested with a regular-expression search on the full path (using / separators), so a pattern only needs to match part of it.

Options common to all three scripts:

Option	Default	Description
-d, --debug		Print debug output.
-v, --verbose		Print informational output (used if -d is not given).
-q, --quiet		Print only errors (used if neither -d nor -v is given).
-H, --halt-on-error	off	Stop at the first error instead of logging it and continuing.
-i, --include REGEX	all files	Process only files whose path matches REGEX. Repeatable; a file is processed if it matches any pattern.
-o, --output DIR	.	Output directory (see each script).

With no logging option, only warnings and errors are printed.

xmtps-list2json.py [options] PATH ... — converts listing files (PATH may be listing files or directories containing them) into per-dive JSON files in <output>/<serial>/dives/:

Option	Default	Description
-r, --recursive	off	Descend into subdirectories of the input directories.
-x, --exclude REGEX	none	Skip directories and files whose path matches REGEX. Repeatable.
-f, --force	off	Rewrite every dive JSON file, even if it is newer than its listing file.
-s, --skip	off	Skip listing files whose dive JSON already exists, even if the listing is newer.
-S, --strip-path REGEX	.*/alamo/	Remove the matching part of the listing file path before storing it in the JSON.

Without -f or -s, a listing file is converted only if its dive JSON doesn't exist yet or is older than the listing file.

xmtps-aggregate-json.py [options] PATH ... — reads dive JSON files (PATH is usually a float's dives directory) and writes the per-float aggregate JSON files to <output>/<serial>/:

Option	Default	Description
-p, --plots DIR	none	Also write the plot images, plot HTML files and the float's index.html page to DIR/<serial>/. DIR must exist.
-r, --recursive	off	Descend into subdirectories of the input directories.
-x, --exclude REGEX	none	Skip subdirectories whose path matches REGEX (applies to directories only). Repeatable.
-f, --force	off	Process every directory, ignoring its .lastprocessed file.
-S, --strip-path REGEX	.*/alamo/	Remove the matching part of file paths before storing them in the JSON and the plot pages.
-D, --display-figures	off	Also open each figure in a web browser as it is generated (interactive use).
-s, --skip		Accepted but has no effect in this script.

Without -f, a directory is skipped when none of its included files is newer than the time in its .lastprocessed file. That file is written only after all aggregate JSON and plot output has been written, so a failed or interrupted run is retried next time. Use -f after changing RhoLUT.py or FloatClasses.py.

xmtps-generate-summary-page.py [options] PATH ... — reads the per-float <serial>_summary.json files (searching input directories recursively) and writes the fleet summary page to <output>/index.html. DIR for -o must exist. It takes only the common options above, and always rebuilds the page from all matching summary files.

Example (as run by update-plots-service.sh for one float):

```
xmtps-list2json.py -i "/data1/alamo/data/list/[0-9]+/lis[0-9]+-(-?)[0-9]+.txt" \
    -x "/\..*" -o /data1/alamo/data/json /data1/alamo/data/list/9308
xmtps-aggregate-json.py -i "/data1/alamo/data/json/[0-9]+/dives/[0-9]+_-?[0-9]+.json" \
    -o /data1/alamo/data/json -p /data1/alamo/data/plots2 /data1/alamo/data/json/9308/dives
xmtps-generate-summary-page.py -i "/data1/alamo/data/json/[0-9]+/[0-9]+_summary.json" \
    -o /data1/alamo/data/plots2 /data1/alamo/data/json
```

1.8 Changelog

1.8.1 2026-10-24

- Added this README.

1.8.2 2026-10-23

Decoder daemon:

- Fixed the mail retrieval thread busy-looping on an unparseable mail file (now renamed to `.err`), and replaying a whole batch when one server message failed.
- Worker threads now drain their queues on shutdown, and termination flags are atomic.
- Fixed the latest Iridium position being compared against the GPS time instead of the Iridium time.
- Fixed composite Iridium positions: latitude/longitude were swapped in the variance calculation, and longitudes are now averaged correctly across ±180°.
- Mail parsing: "Message Size" is now parsed, the Date header timezone is converted to UTC correctly, and SBD attachments must be at least 8 bytes.
- The mail fetch limit is applied after filtering for `.raw`/`.txt` files, and the mail user and password are percent-encoded in the server URL.
- Status files now follow `gen.stat` instead of `gen.kml`; archived floats go into the KML "archive" folder; floats with a single GPS fix get a latest-position marker.
- Metadata: launch times at hour or minute 0 are accepted, a bad field no longer stops parsing of the rest of the file, launch positions accept any whitespace, and DAC ID 9999 placeholders are ignored.
- The run-time PID lock is created exclusively and removed only by its owner.
- The post-processing thread keeps going when one float's KML or status file fails.
- A float's record is saved before its dives (fixes foreign-key failures for new floats), and the shutdown save continues past a failing float.
- Added ALTO WMO instrument types 873, 875 and 876.
- Fixed ice engineering (v0x11) messages being rejected whenever they reported error codes.
- Identical retransmitted SBD packets are no longer decoded twice.
- Stopped tracking the Debug/Release binaries; build number 3287.

Python tools:

- Updated to JSON version 0.11.
- Fixed the RhoLUT maximum temperature (39 °C, was 34 °C).
- Fixed drift fill values, a crash on 0 V pump records, and `.lastprocessed` being written before output succeeded.
- Wave directional coefficients now use the displacement formulation; `r1` and `r2` are distinct and lie in [0, 1].
- Fixed the drift σ_0 average plot title, wave plots not being linked when a float has one wave dive, and plot path handling.

Operations:

- The decoder service waits 30 s between restarts (`RestartSec=30`).

1.8.3 2026-08-11

- The post-processing thread closes its SQL connection after each pass, avoiding "lost connection to MySQL server" errors.

1.8.4 2026-08-06

- Added mission parameter support for firmware 0x0A0C0001 (10.12.0.1, RBR).

1.8.5 2026-08-05

- Initial commit.

Chapter 2

Libraries and Database Schema

This page describes the external libraries XMTPS uses and its MySQL database schema. For an overview, building, configuration and the command-line options, see the main page (XMTPS — X-Message Telemetry Processing Service).

2.1 Libraries

2.1.1 Boost C++ Libraries

Several of the Boost C++ libraries are utilized by xmtps.

See http://www.boost.org/.

2.1.1.1 program_options

The program_options library allows program developers to obtain program options, that is (name, value) pairs from the user, via conventional methods such as command line and config file.

See http://www.boost.org/doc/libs/1_55_0/doc/html/program_options.html.

2.1.1.2 filesystem

The Boost filesystem library provides facilities to manipulate files and directories, and the paths that identify them.

See http://www.boost.org/doc/libs/1_55_0/libs/filesystem/doc/index.htm.

2.1.1.3 log

The Boost log library provides facilities for logging, formatting, and manipulating logger attributes.

See http://www.boost.org/doc/libs/1_55_0/libs/log/doc/html/log/tutorial.html.

2.1.1.4 thread

Boost.Thread enables the use of multiple threads of execution with shared data in portable C++ code. It provides classes and functions for managing the threads themselves, along with others for synchronizing data between the threads or providing separate copies of data specific to individual threads.

Seehttp://www.boost.org/doc/libs/1_56_0/doc/html/thread.html.

2.1.2 MySQL C++ Connector

The MySQL C++ connector provides an API for accessing and manipulating a MySQL database. MySQL is used as a back-end database solution for storing and retrieving persistent data that is needed by the application.

See http://dev.mysql.com/doc/connector-cpp/en/.

2.1.3 VMime MIME & Mail Library for C++

VMime provides the IMAP connection to the mail server and parsing of the mail messages and their SBD attachments.

See http://www.vmime.org/.

2.1.4 libkml

libkml is used to generate the Google Earth KML files for each instrument and the master KML file.

See https://github.com/libkml/libkml.

A MySQL server is used for persistent backend storage.

2.2 SQL Database Schema

XMTPS stores its state in five InnoDB tables in the MySQL schema named by `sql.schema` (production: `xmtps_alamo`). Each table is mapped to one class by a static util::mysql::SqlTableDescription member, which lists each column with its getter and setter and generates the SELECT, DELETE and INSERT ... ON DUPLICATE KEY UPDATE statements:

- argo::iridium::xfloat::XFloat - table XFloat, one row per instrument.
- argo::iridium::xfloat::XFloatMetadata - table XFloatMetadata, instrument metadata parsed from the metadata file.
- argo::iridium::xfloat::XFloatDiveData - table XFloatDive, all telemetered data for one dive cycle.
- util::xmsg::XGPS - table XGPS, one GPS fix.
- argo::iridium::xfloat::XFloatMailMessage - table XFloatMail, one mail message.

Foreign keys: XFloatMetadata and XFloatDive reference XFloat (id_instrument), and XGPS references XFloatDive (id_instrument, id_dive). XFloatMail has no foreign key, so messages can be stored before their float is known. The column-by-column description is in the "Database schema" section of the main page (XMTPS — X-Message Telemetry Processing Service). The figure below shows the schema; the CREATE TABLE statements that follow are taken from the production database (October 2026) and take precedence over the figure.

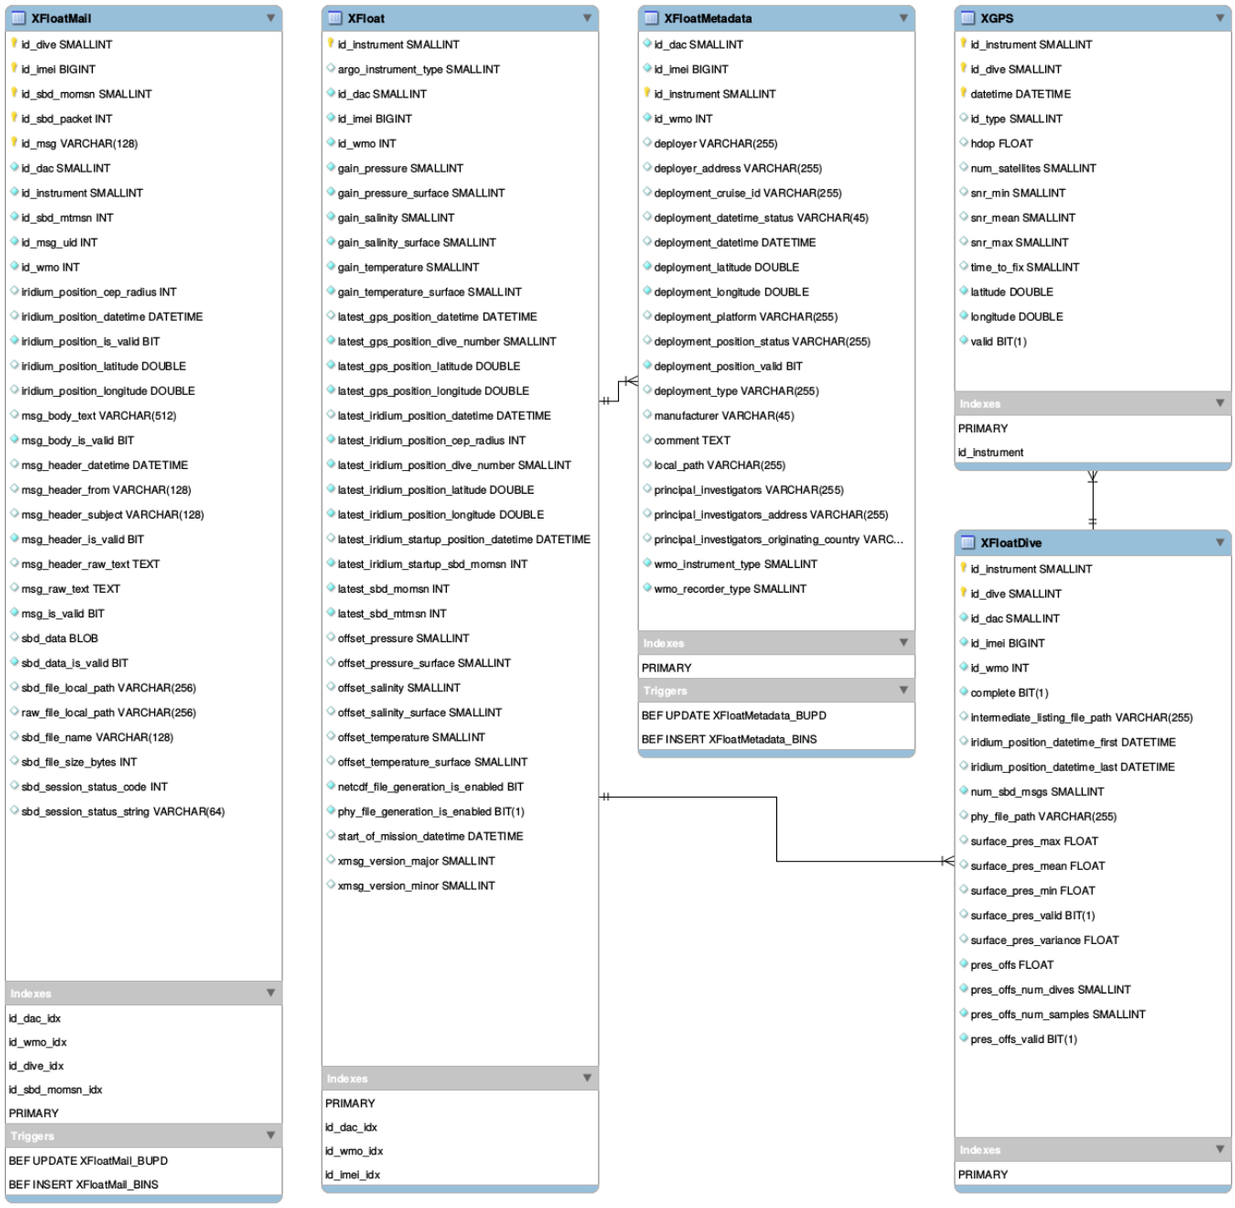

Figure 2.1 SQL Database Schema

2.2.1 Table XFloat

The current state of each float (identifiers, calibration, latest positions and SBD sequence numbers). Mapped to argo::iridium::xfloat::XFloat.

```
CREATE TABLE XFloat (
  id_instrument smallint NOT NULL,
  argo_instrument_type smallint unsigned DEFAULT '99',
  id_dac smallint NOT NULL DEFAULT '-1',
  id_imei bigint NOT NULL DEFAULT '-1',
  id_wmo int NOT NULL DEFAULT '-1',
  gain_pressure smallint unsigned NOT NULL DEFAULT '9999',
  gain_pressure_surface smallint unsigned NOT NULL DEFAULT '9999',
  gain_salinity smallint unsigned NOT NULL DEFAULT '9999',
  gain_salinity_surface smallint unsigned NOT NULL DEFAULT '9999',
  gain_temperature smallint unsigned NOT NULL DEFAULT '9999',
  gain_temperature_surface smallint unsigned NOT NULL DEFAULT '9999',
  latest_gps_position_datetime datetime NOT NULL DEFAULT '1400-01-01 00:00:00',
  latest_gps_position_dive_number smallint NOT NULL DEFAULT '-999',
  latest_gps_position_latitude double NOT NULL DEFAULT '99.99999',
  latest_gps_position_longitude double NOT NULL DEFAULT '999.99999',
  latest_iridium_position_datetime datetime NOT NULL DEFAULT '1400-01-01 00:00:00',
  latest_iridium_position_cep_radius int NOT NULL DEFAULT '-1',
  latest_iridium_position_dive_number smallint NOT NULL DEFAULT '-999',
  latest_iridium_position_latitude double NOT NULL DEFAULT '99.99999',
  latest_iridium_position_longitude double NOT NULL DEFAULT '999.99999',
  latest_iridium_startup_position_datetime datetime NOT NULL DEFAULT '1400-01-01 00:00:00',
  latest_iridium_startup_sbd_momsn int NOT NULL DEFAULT '-1',
  latest_sbd_momsn int NOT NULL DEFAULT '-1',
  latest_sbd_mtmsn int NOT NULL DEFAULT '-1',
  offset_pressure smallint unsigned DEFAULT '9999',
  offset_pressure_surface smallint unsigned DEFAULT '9999',
  offset_salinity smallint unsigned DEFAULT '9999',
  offset_salinity_surface smallint unsigned DEFAULT '999',
  offset_temperature smallint unsigned DEFAULT '9999',
  offset_temperature_surface smallint unsigned DEFAULT '9999',
  netcdf_file_generation_is_enabled bit(1) NOT NULL DEFAULT b'0',
  phy_file_generation_is_enabled bit(1) DEFAULT b'0',
```

```
  start_of_mission_datetime datetime NOT NULL DEFAULT '1400-01-01 00:00:00',
  xmsg_version_major smallint unsigned DEFAULT '255',
  xmsg_version_minor smallint unsigned DEFAULT '255',
  PRIMARY KEY (id_instrument),
  KEY id_dac_idx (id_dac),
  KEY id_wmo_idx (id_wmo),
  KEY id_imei_idx (id_imei)
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb3;
```

2.2.2 Table XFloatMetadata

Deployment metadata parsed from the float's `.meta` file. Mapped to argo::iridium::xfloat::XFloatMetadata.

```
CREATE TABLE XFloatMetadata (
  id_dac smallint NOT NULL DEFAULT '-1',
  id_imei bigint NOT NULL DEFAULT '-1',
  id_instrument smallint NOT NULL,
  id_wmo int NOT NULL DEFAULT '-1',
  deployer varchar(255) DEFAULT NULL,
  deployer_address varchar(255) DEFAULT NULL,
  deployment_cruise_id varchar(255) DEFAULT NULL,
  deployment_datetime_status varchar(45) DEFAULT NULL,
  deployment_datetime datetime DEFAULT '1400-01-01 00:00:00',
  deployment_latitude double NOT NULL DEFAULT '99.99999',
  deployment_longitude double NOT NULL DEFAULT '999.99999',

Chapter 3

Deprecated List

Member N_LOG_LEVEL_NAMES

Log names are no long used.

Namespace util::ftp

FTP client integration features have been scrapped. This namespace is no longer utilized.

Chapter 4

Todo List

Member argo::iridium::xfloat::operator>> (istream &in, XFloatMetadata &metadata)

Implement the functionality for parsing additional metadata field from stream

Class argo::iridium::xfloat::XFloat

Devise a method to actively check for (1) changes in the metadata files and (2) newly created metadata files. Load the metadata from the new or modified files and assign them to the corresponding float object. If necessary, retroactively process the mail messages for these instruments. Persist updates to the SQL database as necessary.

Member argo::iridium::xfloat::XFloat::start_of_mission_datetime_

Implement an alternative method to assign the value of this field if the date/time reported by the start-of-mission GPS position is invalid or unavailable.

Class argo::iridium::xfloat::XFloatDiveData

Devise a scheme to ensure that the dive data objects do not remain in memory indefinitely if one or more message for the dive or cycle are not received and the dive data object is not completed.

Member argo::iridium::xfloat::XFloatDiveData::DecodeXMsgData (const vector< uint8_t > &data, shared_ptr< vector< uint8_t > > xmsg_id_types=shared_ptr< vector< uint8_t > >()) ATTR_NO_EXCEPTIONS

Verify the X-Message checksum value during the decoding of the X-Message data.

Member argo::iridium::xfloat::XFloatDiveData::GeneratePhyString () const

Implement the functionality for generate a PHY string representation of a dive data object for a Solo-II float.

Implement the functionality for generate a PHY string representation of a dive data object for a Deep Argo float.

Member argo::iridium::xfloat::XFloatDiveData::HasValidIridiumPosition () const

Implement the functionality to determine if a dive data object has a valid Iridium position that accurately represents the position and date/time of the profile data for this dive cycle.

Member argo::iridium::xfloat::XFloatDiveData::ResetData ()

Implement NC variable generation for XFloatDiveData

Class argo::iridium::xfloat::XFloatMetadata

Devise a method to actively check for (1) changes in the metadata files and (2) newly created metadata files. Load the metadata from the new or modified files and assign them to the corresponding float object. If necessary, retroactively process the mail messages for these instruments. Persist updates to the SQL database as necessary.

Member util::mysql::SqlTableDescription< T >::SelectValueFromDatabase (const string &what, const string &where="", const string &groupBy="", const string &orderBy="", const unsigned int &offset=0) const

Implement the functionality to parse values of type vector<uint8_t> from the result set of an SQL query.

Member util::xmsg::XAcousticPosition::DecodeXMsgData (const vector< uint8_t > &data)

Implement the functionality for decoding the acoustic position message.

Member util::xmsg::XAcousticPosition::GenerateListingString () const

Implement the functionality for generating a listing string for the acoustic position message.

Member util::xmsg::XAlamoMissionConfiguration::ctf_

Determine gain for profile cutoff pressure field.

Member util::xmsg::XAlamoMissionConfiguration::ctl_

Determine gain for pressure sensor offset reset lower pressure limit field.

Member util::xmsg::XAlamoMissionConfiguration::ctu_

Determine gain for pressure sensor offset reset lower pressure limit field.

Member util::xmsg::XAlamoMissionConfiguration::DecodeXMsgData (const vector< uint8_t > &data)

Implement ALAMO mission parameter: SSP.

Implement ALAMO mission parameter: SSP.

Class util::xmsg::XArgo

Add support for the Solo-II-type Argo data message.

Add support for the Deep-Argo-type Argo data message.

Member util::xmsg::XArgo::DecodeXMsgData (const vector< uint8_t > &data)

Implement the functionality to decode the argo data message for Solo-II floats.

Implement the functionality to decode the argo data message for Deep Argo floats.

Member util::xmsg::XArgo::GenerateListingString () const

Implement the functionality for generating a listing string for a Solo-II-type Argo data message.

Implement the functionality for generating a listing string for a Deep-Argo-type Argo data message.

Member util::xmsg::XEngAbort::DecodeXMsgData (const vector< uint8_t > &data)

Implement the functionality to decode the abort/beacon mode engineering X-Message from the binary data.

Member util::xmsg::XEngAbort::GenerateListingString () const

Implement the functionality for generating a listing string for the Solo-II abort/beacon mode engineering data message.

Class util::xmsg::XEngBITPass

Add support for Solo-II type bit passed engineering data message.

Member util::xmsg::XEngDescent::oil_valve_closed_position_during_fall_pump_mv_

Clarify the description of the "oil valve position during fall pump" field.

Member util::xmsg::XEngDiagnostic::DecodeXMsgData (const vector< uint8_t > &data)

Implement the functionality for decoding the Solo-II diagnostic engineering data message.

Member util::xmsg::XEngDiagnostic::GenerateListingString () const

Implement the functionality for generating a listing string for the Solo-II diagnostic engineering data message.

Member util::xmsg::XEngStandard::DecodeXMsgData (const std::vector< uint8_t > &data)

Implement the functionality for decoding the Solo-II standard dive/cycle engineering data message.

Member util::xmsg::XEngStandard::GenerateListingString () const

Implement the functionality for generating a listing string for the Solo-II standard dive engineering data message.

Member util::xmsg::XEngSurface::ctd_status_code_

Define status code values for the ALAMO surface engineering data message.

Member util::xmsg::XMfaMissionCfg::ctf_

Determine gain for profile cutoff pressure field.

Member util::xmsg::XMfaMissionCfg::ctl_

Determine gain for pressure sensor offset reset lower pressure limit field.

Member util::xmsg::XMfaMissionCfg::ctu_

Determine gain for pressure sensor offset reset lower pressure limit field.

Member util::xmsg::XMissionCmdEcho::DecodeXMsgData (const vector< uint8_t > &data)

Implement the functionality to decode the ground station command echo-back X-Message from the binary message data.

Member util::xmsg::XMissionCmdEcho::GenerateListingString () const

Implement the functionality for generating a listing string for the ground station upload command echo-back message.

Chapter 5

Namespace Index

5.1 Namespace List

Here is a list of all documented namespaces with brief descriptions:

argo
The Argo instrument namespace . . . 37
argo::iridium
The Argo Iridium instrument namespace . . . 37
argo::iridium::xfloat
The X-Float instrument namespace . . . 37
boost
The Boost C++ library namespace . . . 41
boost::container
Boost container library namespace . . . 41
util
The utility namespace . . . 41
util::config
The configuration utility namespace . . . 42
util::date
Date utility namespace . . . 42
util::file
The filesystem utility namespace . . . 43
util::ftp
The ftp utility namespace . . . 43
util::log
The logging utility namespace . . . 43
util::mail
The mail utility namespace . . . 44
util::math
The math utility namespace . . . 45
util::mysql
The MySQL utility namespace . . . 45
util::position
The position utility namespace . . . 46
util::sig
The system signals utility namespace . . . 47
util::stream
The stream utility namespace . . . 47
util::string
The string utility namespace . . . 47
util::sys
The system utility namespace . . . 47
util::thread
The thread utility namespace . . . 48
util::types
The types utility namespace . . . 48
util::xmsg
The X-Message utility namespace . . . 48
vmime
VMime library namespace . . . 59

Chapter 6

Hierarchical Index

6.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

util::xmsg::AbstractXComposite< T > . . . 61
util::xmsg::AbstractXComposite< shared_ptr< argo::iridium::xfloat::XFloatMailMessage > > . . . 61

Chapter 7

Class Index

7.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

util::xmsg::AbstractXComposite< T >
An abstract class representing XFloat dive data that consists of multiple X-Messages 61
util::xmsg::AbstractXFallRise
An abstract class representing a fall, rise, or surface pressure time-series data X-message 65
util::xmsg::AbstractXSensorData
The abstract sensor data class 84
util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >
The AbstractXSensorDataComposite class 103
util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >
The abstract time-series data composite class template 127
util::xmsg::AuxiliarySensorData
The auxiliary sensor data class 137
util::mysql::Column_bool< C >
Template column description class for value of type bool 154
util::mysql::Column_char< C >
Template column description class for value of type double 161
util::mysql::Column_double< C >
Template column description class for value of type double 167
util::mysql::Column_filesystem_path< C >
Template column description class for value of type path 174
util::mysql::Column_float< C >
Template column description class for value of type float 181
util::mysql::Column_int< C >
Template column description class for value of type int 187
util::mysql::Column_int16_t< C >
Template column description class for value of type int16_t 194
util::mysql::Column_long< C >
Template column description class for value of type long 200
util::mysql::Column_posix_time< C >
Template column description class for value of type boost::posix_time::ptime 207
util::mysql::Column_string< C >
Template column description class for value of type string 214
util::mysql::Column_uint16_t< C >
Template column description class for value of type uint16_t 221
util::mysql::Column_uint8_t< C >
Template column description class for value of type uint8_t 227
util::mysql::Column_vector_uint8_t< C >
Template column description class for value of type vector<uint8_t> 234
util::stream::DataBuf< CharT, TraitsT >
Template class for wrapping an arbitrary contiguous section of data as a std::basic_streambuf object 241
util::date::DateUtils
Class providing library of useful date and time functions 243
util::file::FileSystemUtils
Class providing library of useful filesystem functions 246
boost::container::flat_map< C, D >
Dummy template class used for configuring Doxygen to interpret boost::container::flat_map correctly 251
argo::iridium::Iridium
The Iridium instrument class 252
argo::iridium::IridiumPosition
The Iridium position class 260

util::kml::KmlUtil
The KML utility class . . . 282
util::config::LocalConfiguration
Class representing all program run-time configuration options . . . 290
util::mysql::LocalMysqlConfiguration
Class providing useful functions for accessing and manipulating the MySQL database, given the local run-time configuration settings . . . 300
util::mysql::LocalPersistentEntity
An abstract class representing a persistent database entity in the database defined by the config::LocalConfiguration . . . 313
util::thread::Lockable
A lockable class . . . 325
util::log::Log
The logger class . . . 327
util::math::MathUtils
Class containing commonly-used mathematical functions . . . 332
util::log::MessageException
Exception class with associated message . . . 333
util::mysql::MysqlUtils
Class provides a library of function for accessing and manipulating a MySQL database . . . 335
util::position::Position
Abstract class representing a position, date, and time . . . 342
util::position::PositionUtils
Class providing library of useful functions for manipulating and processing geographic positions . . . 358
util::thread::RecursiveLockable
A recursively lockable class . . . 365
boost::shared_ptr< A >
Dummy template class used for configuring Doxygen to interpret boost::shared_ptr objects as plain pointers . . . 368
vmime::shared_ptr< F >
Dummy template class used for configuring Doxygen to interpret vmime::shared_ptr objects as plain pointers . . . 370
util::sig::SignalHandler
Class providing function for handling POSIX style system signals . . . 371
util::mysql::SqlTableColumnDescription< C, T >
The `SqlTableColumnDescription` class is a template class used to describe an SQL table column for class `C` and data member of type `T` . . . 372
util::mysql::SqlTableColumnDescriptionBase
An abstract base class for the description of an SQL database table column . . . 378
util::mysql::SqlTableDescription< T >
Template class representing the description of an SQL database table . . . 382
boost::container::static_vector< E >
Dummy template class used for configuring Doxygen to interpret boost::container::static_vector correctly . . . 407
util::stream::StreamUtils
Class providing useful functions for manipulating I/O streams . . . 408
util::thread::SynchronousQueue< T >
Synchronous queue template . . . 409
boost::thread_specific_ptr< B >
Dummy template class used for configuring Doxygen to interpret boost::thread_specific_ptr objects as plain pointers . . . 412
util::thread::ThreadUtils
Class providing useful functions for manipulating threads and processes . . . 413
util::stream::VectorBuf< CharT, TraitsT >
Template class for wrapping a vector<T> as a std::basic_streambuf<T> . . . 415
util::stream::VectorBuf_c< CharT >
Template class for wrapping a vector<T> as a std::basic_streambuf<char> . . . 417
util::xmsg::XAcousticCacst
An acoustic reception (CACST) record . . . 418
util::xmsg::XAcousticPosition
Class representing an acoustic position X-Message . . . 421
util::xmsg::XAcousticWindow
An acoustic listening window . . . 432
util::xmsg::XAlamoBit
Class representing the BIT test of an ALAMO float . . . 435
util::xmsg::XAlamoBit2
The ALAMO Built-in-Test (BIT) message, version 2 . . . 443
util::xmsg::XAlamoEngineering
Abstract class representing a version controlled engineering message for ALAMO-type instruments . . . 457
util::xmsg::XAlamoMissionConfiguration
Class representing an ALAMO Mission Configuration message . . . 474

util::xmsg::XArgo
Class representing Argo X message . . . 496
util::xmsg::XCompositeAuxTemp
The composite auxiliary temperature class . . . 539
util::xmsg::XCompositeDrift
Class representing the aggregate drift data for a single dive, composed from one or more drift messages . . . 543
util::xmsg::XCompositeFall
Class representing the aggregate fall time-series data for a single dive, composed from one or more fall time-series messages . . . 560
util::xmsg::XCompositeHiResProfile
Class representing the aggregate raw/high-resolution/unbinned profile data for a single dive, composed from one or more raw profile data messages . . . 564
util::xmsg::XCompositeIridiumPosition
Class representing the aggregate Iridium position for a single dive, composed from one or more Iridium message positions . . . 581
util::xmsg::XCompositeProfile
Class representing the aggregate bin-averaged profile data for a single dive, composed from one or more bin-averaged profile data messages . . . 602
util::xmsg::XCompositePump
Class representing the aggregate pump time-series data for a single dive, composed from one or more pump time-series messages . . . 619
util::xmsg::XCompositeRise
Class representing the aggregate pump data for a single dive, composed from one or more pump data messages . . . 623
util::xmsg::XCompositeSurfaceData
Class representing the aggregate surface pressure data for a single dive, composed from one or more surface pressure messages . . . 627
util::xmsg::XCompositeValve
The composite valve data class . . . 636
util::xmsg::XDriftPressure
Class representing a drift pressure time-series X-Message . . . 639
util::xmsg::XDriftSalinity
Class representing a drift salinity time-series X-Message . . . 658
util::xmsg::XDriftTemperature
Class reprenting a drift temperature X-Message . . . 677
util::xmsg::XEngAbort
Class representing an abort/beacon mode engineering X-Message . . . 696
util::xmsg::XEngAscent
Class representing an ascend state engineering X-Message . . . 706
util::xmsg::XEngBIT
The ALAMO Built-in-Test (BIT) engineering message . . . 726
util::xmsg::XEngBITFail
Class representing an engineering startup message for BIT failed . . . 738
util::xmsg::XEngBITPass
Class representing an engineering startup message for BIT passed . . . 750
util::xmsg::XEngDescent
Class representing an descend state engineering X-Message . . . 762
util::xmsg::XEngDiagnostic
Class representing a diagnostic dive engineering message . . . 784
util::xmsg::XEngDrift
Class representing an drift/park state engineering X-Message . . . 794
util::xmsg::XEngSurface::XEngErrorCode
The engineering surface data error code class . . . 814
util::xmsg::XEngIce
The ALAMO engineering (ice) message class . . . 820
util::xmsg::XEngIce::XEngIceErrorCode
The engineering (ice) error code class . . . 838
util::xmsg::XEngStandard
Class representing an engineering message for a standard dive cycle . . . 844
util::xmsg::XEngSurface
Class representing an surface state engineering X-Message . . . 855
util::xmsg::XFall
Class representing a fall time-series data X-Message . . . 881
argo::iridium::xfloat::XFloat
The instrument or float class . . . 902
argo::iridium::xfloat::XFloatDiveData
The instrument or float dive data class . . . 973
argo::iridium::xfloat::XFloatMailMessage
The mail message class . . . 1051
argo::iridium::xfloat::XFloatMailProcessingService
The mail processing thread class . . . 1136

argo::iridium::xfloat::XFloatMailRetrievalService
The mail retrieval thread class . . . 1155
argo::iridium::xfloat::XFloatMetadata
The instrument metadata class . . . 1182
argo::iridium::xfloat::XFloatPostProcessingService
The post-processing analysis thread class . . . 1234
argo::iridium::xfloat::XFloatTelemetryDecoderService
The telemetry decoder thread class . . . 1244
util::xmsg::XGPS
Class representing a GPS type X-Message . . . 1258
util::xmsg::XHiResPressure
Class representing high-resolution/raw/unbinned profile pressure X-Message . . . 1307
util::xmsg::XHiResSalinity
Class representing high-resolution/raw/unbinned profile salinity X-Message . . . 1326
util::xmsg::XHiResTemperature
Class representing high-resolution/raw/unbinned profile temperature X-Message . . . 1345
util::xmsg::XMessage
Class representing a message following the X format specification . . . 1364
util::xmsg::XMessageIndexable
Class representing an indexable X-Message . . . 1374
util::xmsg::XMfaMissionCfg
The ALAMO mission configuration (mission parameters) message class . . . 1386
util::xmsg::XMissionCmdEcho
Class representing a ground station command echo-back X-Message . . . 1415
util::xmsg::XMissionConfiguration
Class representing a mission configuration X-Message . . . 1425
util::xmsg::XPresCodeCounts
Class representing a raw pressure measurement and phase code for a rise or fall data X-Message 1438
util::xmsg::XPresCounts
Class representing a raw pressure measurement for a rise or fall data X-Message . . . 1444
util::xmsg::XProfilePressure
Class representing a profile pressure data X-Message . . . 1447
util::xmsg::XProfileSalinity
Class representing a profile salinity X-Message . . . 1466
util::xmsg::XProfileTemperature
Class representing a profile temperature X-Message . . . 1485
util::xmsg::XPump
Class representing a pump data X-Message . . . 1503
util::xmsg::XPumpCounts
Class representing a single pump data measurement for a pump data time-series X-Message . . . 1519
util::xmsg::XRise
Class representing a rise data X-Message . . . 1525
util::xmsg::XSensorTripletCodeCounts
The sensor triplet and phase code class . . . 1546
util::xmsg::XSurfaceData
The surface time-series data X-Message class . . . 1553
util::xmsg::XValve
The valve data message class . . . 1574
util::xmsg::XValveCounts
The valve counts class . . . 1588
util::xmsg::XWave
Class representing measured ocean surface wave data X message . . . 1591
util::xmsg::XWaveRawSample
Class representing a single raw motion measurement in the surface time series wave data X-message . . . 1607
util::xmsg::XWaveSpectralSample
The wave spectral sample class . . . 1609

Chapter 8

File Index

8.1 File List

Here is a list of all documented files with brief descriptions:

AdditionalDocumentation.h
: Additional Doxygen documentation . . . 1611

Main.cpp
: The main() function source file . . . 2086

Main.h
: The main() function header file . . . 2090

stage1_MailRetrievalThread.cpp
: The argo::iridium::xfloat::XFloatMailRetrievalService class source file . . . 2093

stage1_MailRetrievalThread.h
: The argo::iridium::xfloat::XFloatMailRetrievalService class header file . . . 2094

stage2_MailProcessingThread.cpp
: The argo::iridium::xfloat::XFloatMailProcessingService class source file . . . 2099

stage2_MailProcessingThread.h
: The argo::iridium::xfloat::XFloatMailProcessingService class header file . . . 2101

stage3_TelemetryDecoderThread.cpp
: The argo::iridium::xfloat::XFloatTelemetryDecoderService class source file . . . 2104

stage3_TelemetryDecoderThread.h
: The argo::iridium::xfloat::XFloatTelemetryDecoderService class header file . . . 2105

stage4b_PostProcessingThread.cpp
: The argo::iridium::xfloat::XFloatPostProcessingService class source file . . . 2113

stage4b_PostProcessingThread.h
: The argo::iridium::xfloat::XFloatPostProcessingService class header file . . . 2114

ThreadDefinitions.h
: The thread definitions header file . . . 2118

config/LocalConfiguration.cpp
: The util::config::LocalConfiguration class source file . . . 1615

config/LocalConfiguration.h
: The util::config::LocalConfiguration class header file . . . 1616

config/LocalMysqlConfiguration.cpp
: The util::mysql::LocalMysqlConfiguration class source file . . . 1625

config/LocalMysqlConfiguration.h
: The util::mysql::LocalMysqlConfiguration class header file . . . 1626

config/LocalPersistentEntity.h
: The util::mysql::LocalPersistentEntity class header file . . . 1628

data/Iridium.h
: The argo::iridium::Iridium class header file . . . 1630

data/IridiumDefinitions.h
: The Iridium Definitions header file . . . 1634

data/IridiumPosition.h
: The argo::iridium::IridiumPosition class header file . . . 1637

data/XFloat.cpp
: The argo::iridium::xfloat::XFloat class source file . . . 1640

data/XFloat.h
: The argo::iridium::xfloat::XFloat class header file . . . 1641

data/XFloatDefinitions.h
: The XFloat Definitions header file . . . 1658

data/XFloatDiveData.cpp
: The argo::iridium::xfloat::XFloatDiveData class source file . . . 1663

data/XFloatDiveData.h
: The argo::iridium::xfloat::XFloatDiveData class header file . . . 1665

data/XFloatMailMessage.cpp
The argo::iridium::xfloat::XFloatMailMessage class source file . . . 1684
data/XFloatMailMessage.h
The argo::iridium::xfloat::XFloatMailMessage class header file . . . 1685
data/XFloatMetadata.cpp
The argo::iridium::xfloat::XFloatMetadata class source file . . . 1706
data/XFloatMetadata.h
The argo::iridium::xfloat::XFloatMetadata class header file . . . 1707
data/xmsg/AbstractXComposite.h
The util::xmsg::AbstractXComposite class source file . . . 1717
data/xmsg/AbstractXFallRise.h
The util::xmsg::AbstractXFallRise class header file . . . 1719
data/xmsg/AbstractXSensorData.h
The util::xmsg::AbstractXSensorData class header file . . . 1724
data/xmsg/AbstractXSensorDataComposite.h
The util::xmsg::AbstractXSensorDataComposite class header file . . . 1733
data/xmsg/AbstractXTimeSeriesDataComposite.h
The util::xmsg::AbstractXTimeSeriesDataComposite class header file . . . 1745
data/xmsg/AuxiliarySensorData.cpp
The util::xmsg::AuxiliarySensorData class source file . . . 1757
data/xmsg/AuxiliarySensorData.h
The util::xmsg::AuxiliarySensorData class header file . . . 1759
data/xmsg/XAcousticPosition.h
The util::xmsg::XAcousticPosition class header file . . . 1808
data/xmsg/XAlamoBit.h
The util::xmsg::XAlamoBit class header file . . . 1816
data/xmsg/XAlamoBit2.h . . . 1828
data/xmsg/XAlamoEngineering.h
The util::xmsg::XAlamoEngineering class header file . . . 1841
data/xmsg/XAlamoMissionConfiguration.h
The util::xmsg::XAlamoMissionConfiguration class header file . . . 1844
data/xmsg/XArgo.h
The util::xmsg::XArgo class header file . . . 1901
data/xmsg/XCompositeAuxTemp.h
The util::xmsg::XCompositeAuxTemp class header file . . . 1915
data/xmsg/XCompositeDrift.h
The util::xmsg::XCompositeDrift class header file . . . 1918
data/xmsg/XCompositeFall.h
The util::xmsg::XCompositeFall class header file . . . 1921
data/xmsg/XCompositeHiResProfile.h
The util::xmsg::XCompositeHiResProfile class header file . . . 1923
data/xmsg/XCompositeIridiumPosition.h
The util::xmsg::XCompositeIridiumPosition class header file . . . 1926
data/xmsg/XCompositeProfile.h
The util::xmsg::XCompositeProfile class header file . . . 1931
data/xmsg/XCompositePump.h
The util::xmsg::XCompositePump class header file . . . 1934
data/xmsg/XCompositeRise.h
The util::xmsg::XCompositeRise class header file . . . 1937
data/xmsg/XCompositeSurfaceData.cpp
The util::xmsg::XCompositeSurfaceData class source file . . . 1939
data/xmsg/XCompositeSurfaceData.h
The util::xmsg::XCompositeSurfaceData class header file . . . 1940
data/xmsg/XCompositeValve.cpp
The util::xmsg::XCompositeValve class source file . . . 1946
data/xmsg/XCompositeValve.h
The util::xmsg::XCompositeValve class header file . . . 1947
data/xmsg/XDriftPressure.h
The util::xmsg::XDriftPressure class source file . . . 1949
data/xmsg/XDriftSalinity.h
The util::xmsg::XDriftSalinity class source file . . . 1951
data/xmsg/XDriftTemperature.h
The util::xmsg::XDriftTemperature class source file . . . 1953
data/xmsg/XEngAbort.h
The util::xmsg::XEngAbort class header file . . . 1955
data/xmsg/XEngAscent.h
The util::xmsg::XEngAscent class header file . . . 1958
data/xmsg/XEngBIT.h . . . 1963
data/xmsg/XEngBITFail.h
The util::xmsg::XEngBITFail class header file . . . 1964
data/xmsg/XEngBITPass.h
The util::xmsg::XEngBITPass class header file . . . 1967

data/xmsg/XEngDescent.h
The util::xmsg::XEngDescent class header file . . . 1969
data/xmsg/XEngDiagnostic.h
The util::xmsg::XEngDiagnostic class source file . . . 1974
data/xmsg/XEngDrift.h
The util::xmsg::XEngDrift class header file . . . 1977
data/xmsg/XEngIce.cpp
The util::xmsg::XEngIce class source file . . . 1983
data/xmsg/XEngIce.h
The util::xmsg::XEngIce class header file . . . 1984
data/xmsg/XEngStandard.h
The util::xmsg::XEngStandard class source file . . . 1991
data/xmsg/XEngSurface.h
The util::xmsg::XEngSurface class header file . . . 1994
data/xmsg/XFall.h
The util::xmsg::XFall class header file . . . 2012
data/xmsg/XGPS.cpp
The util::xmsg::XGPS class source file . . . 2015
data/xmsg/XGPS.h
The util::xmsg::XGPS class header file . . . 2017
data/xmsg/XHiResPressure.h
The util::xmsg::XHiResPressure class header file . . . 2023
data/xmsg/XHiResSalinity.h
The util::xmsg::XHiResSalinity class header file . . . 2025
data/xmsg/XHiResTemperature.h
The util::xmsg::XHiResTemperature class header file . . . 2027
data/xmsg/XMessage.h
The util::xmsg::XMessage class header file . . . 2029
data/xmsg/XMessageIndexable.h
The util::xmsg::XMessageIndexable class source file . . . 2038
data/xmsg/XMfaMissionCfg.cpp
The util::xmsg::XMfaMissionCfg class source file . . . 2040
data/xmsg/XMfaMissionCfg.h
The util::xmsg::XMfaMissionCfg class header file . . . 2042
data/xmsg/XMissionCmdEcho.h
The util::xmsg::XMissionCmdEcho class source file . . . 2054
data/xmsg/XMissionConfiguration.h
The util::xmsg::XMissionConfiguration class header file . . . 2057
data/xmsg/XProfilePressure.h
The util::xmsg::XProfilePressure class header file . . . 2059
data/xmsg/XProfileSalinity.h
The util::xmsg::XProfileSalinity class header file . . . 2061
data/xmsg/XProfileTemperature.h
The util::xmsg::XProfileTemperature class header file . . . 2063
data/xmsg/XPump.h
The util::xmsg::XPump class header file . . . 2065
data/xmsg/XRise.h
The util::xmsg::XRise class header file . . . 2070
data/xmsg/XSurfaceData.h
The util::xmsg::XSurfaceData class header file . . . 2072
data/xmsg/XValve.cpp
The util::xmsg::XValve class source file . . . 2075
data/xmsg/XValve.h
The util::xmsg::XValve class header file . . . 2077
data/xmsg/XWave.cpp
The util::xmsg::XWave class source file . . . 2080
data/xmsg/XWave.h
The util::xmsg::XWave class header file . . . 2081
data/xmsg/common/XCommon.h
The XCommon source file . . . 1765
data/xmsg/common/XDefinitions.h
The XDefinitions header file . . . 1766
data/xmsg/common/XPresCodeCounts.cpp
The util::xmsg::XPresCodeCounts class source file . . . 1783
data/xmsg/common/XPresCodeCounts.h
The util::xmsg::XPresCodeCounts class header file . . . 1784
data/xmsg/common/XPresCounts.h
The util::xmsg::XPresCounts class header file . . . 1788
data/xmsg/common/XPumpCounts.h
The util::xmsg::XPumpCounts class source file . . . 1790
data/xmsg/common/XSensorTripletCodeCounts.h
The util::xmsg::XSensorTripletCodeCounts class header file . . . 1794

data/xmsg/common/XValveCounts.cpp
The util::xmsg::XValveCounts class source file . . . 1797
data/xmsg/common/XValveCounts.h
The util::xmsg::XValveCounts class header file . . . 1798
data/xmsg/common/XWaveRawSample.h
The util::xmsg::XWaveRawSample class header file . . . 1801
data/xmsg/common/XWaveSpectralSample.cpp
The util::xmsg::XWaveSpectralSample class source file . . . 1803
data/xmsg/common/XWaveSpectralSample.h
The util::xmsg::XWaveSpectralSample class header file . . . 1805
utility/ContainerUtils.h
The ContainerUtils class header file . . . 2120
utility/DataBuf.h
The util::stream::DataBuf class header file . . . 2122
utility/DateUtils.h
The util::date::DateUtils class header file . . . 2124
utility/FileSystemUtils.h
The util::file::FileSystemUtils class header file . . . 2126
utility/KmlUtil.cpp
The util::kml::KmlUtil class source file . . . 2129
utility/KmlUtil.h
The util::kml::KmlUtil class header file . . . 2130
utility/Lockable.h
The util::thread::Lockable class header file . . . 2135
utility/Log.cpp
The util::log::Log class source file . . . 2137
utility/Log.h
The util::log::Log class header file . . . 2138
utility/MathUtils.h
The util::math::MathUtils class header file . . . 2153
utility/MessageException.h
The util::log::MessageException class header file . . . 2155
utility/MysqlUtils.cpp
The util::mysql::MysqlUtils class source file . . . 2157
utility/MysqlUtils.h
The util::mysql::MysqlUtils class header file . . . 2158
utility/Position.h
The util::position::Position class header file . . . 2163
utility/PositionUtils.cpp
The util::position::PositionUtils class source file . . . 2166
utility/PositionUtils.h
The util::position::PositionUtils class header file . . . 2167
utility/RecursiveLockable.h
The util::thread::RecursiveLockable class header file . . . 2170
utility/SignalHandler.h
The The util::sig::SignalHandler class header file . . . 2173
utility/SqlTableColumnDescription.h
The util::mysql::SqlTableColumnDescription class header file . . . 2175
utility/SqlTableDescription.cpp
The util::mysql::SqlTableDescription class source file . . . 2189
utility/SqlTableDescription.h
The util::mysql::SqlTableDescription class header file . . . 2190
utility/StreamUtils.h
The util::stream::StreamUtils class source file . . . 2199
utility/StringUtils.h
The StringUtils class header file . . . 2201
utility/SynchronousQueue.h
The The util::thread::SynchronousQueue class header file . . . 2202
utility/SystemUtils.h

Chapter 9

Namespace Documentation

9.1 argo Namespace Reference

The Argo instrument namespace.

Namespaces

- namespace iridium
  The Argo Iridium instrument namespace.

9.1.1 Detailed Description

The Argo instrument namespace.

9.2 argo::iridium Namespace Reference

The Argo Iridium instrument namespace.

Namespaces

- namespace xfloat
  The X-Float instrument namespace.

Classes

- class Iridium
  The Iridium instrument class.
- class IridiumPosition
  The Iridium position class.

9.2.1 Detailed Description

The Argo Iridium instrument namespace.

9.3 argo::iridium::xfloat Namespace Reference

The X-Float instrument namespace.

Classes

- class XFloat

  The instrument or float class.
- class XFloatDiveData

  The instrument or float dive data class.
- class XFloatMailMessage

  The mail message class.
- class XFloatMailProcessingService

  The mail processing thread class.
- class XFloatMailRetrievalService

  The mail retrieval thread class.
- class XFloatMetadata

  The instrument metadata class.
- class XFloatPostProcessingService

  The post-processing analysis thread class.
- class XFloatTelemetryDecoderService

  The telemetry decoder thread class.

Typedefs

- typedef uint8_t XMailSbdByte_t

  The SBD byte type.
- typedef vector< XMailSbdByte_t > XMailSbdData_t

  The SBD data type.

Enumerations

- enum **XFloatMailFetchMode_t** {
  MAIL_FETCH_SERVER = 0 ,
  MAIL_FETCH_FILESYSTEM = 1 }
- enum XFloatMailRawFileFormat_t {
  XMAIL_RAW_FORMAT_STANDARD = 0 ,
  XMAIL_RAW_FORMAT_EXTENDED = 1 }

  The mail message raw file format type identifier enumeration.

Functions

- ostream & operator<< (ostream &os, const XFloatMailMessage &mail)

  The stream insertion operator overload function for XFloatMailMessage.
- ostream & operator<< (ostream &os, const XMailSbdData_t &data)

  The stream insertion operator for the SBD data type.
- istream & operator>> (istream &in, XFloatMetadata &metadata)

  Stream extraction operator overload function for the XFloatMetadata class.
- istream & operator>> (istream &is, XFloatMailMessage &mail)

  The stream extraction operator overload function for XFloatMailMessage.

9.3.1 Detailed Description

The X-Float instrument namespace.

Note

This namespace contains all object that represents individual X-Floats (including ALAMOs and Solo-IIs), their dives and mail messages, and all of the constituents that make up these objects.

9.3.2 Typedef Documentation

9.3.2.1 XMailSbdByte_t

```
typedef uint8_t argo::iridium::xfloat::XMailSbdByte_t
```

The SBD byte type.

This type definition determines the type that is used to represent a single byte the Iridium Short Burst Data (SBD) message. Generally, this field should be a single signed or unsigned byte type.

9.3.2.2 XMailSbdData_t

```
typedef vector<XMailSbdByte_t> argo::iridium::xfloat::XMailSbdData_t
```

The SBD data type.

This type definition determines the type that is used to represent the Iridium Short Burst Data (SBD) message. It is defined to be a vector of bytes of type XMailSbdByte_t.

9.3.3 Enumeration Type Documentation

9.3.3.1 XFloatMailRawFileFormat_t

```
enum argo::iridium::xfloat::XFloatMailRawFileFormat_t
```

The mail message raw file format type identifier enumeration.

This enumeration lists the supported formats for the raw mail message file. The format of RAW mail message files that are written to the local files system will be specified by one of the values of this enumeration.

Enumerator

XMAIL_RAW_FORMAT_STANDARD	The standard or legacy format for raw mail message files. This format represents the standard raw mail message file format in which the attachment data is encoded in base-64. This format is currently used by the Solo-II decoding software.
XMAIL_RAW_FORMAT_EXTENDED	The extended format for raw mail message files. This format is an extended version of the raw file format in which the attachment data is encoded in hex, rather than base-64.

9.3.4 Function Documentation

9.3.4.1 operator<<() [1/2]

```
ostream & argo::iridium::xfloat::operator<< (
            ostream & os,
            const XFloatMailMessage & mail)
```

The stream insertion operator overload function for XFloatMailMessage.

Generates and inserts a RAW mail string representation of the mail message.

Exceptions

util::log::MessageException	of an error occurs.

Parameters

in	*os*	The ostream object.
in	*mail*	The mail message object.

Returns

The ostream object, os.

9.3.4.2 operator<<() [2/2]

```
ostream & argo::iridium::xfloat::operator<< (
            ostream & os,
            const XMailSbdData_t & data)
```

The stream insertion operator for the SBD data type.

Exceptions

util::log::MessageException	of an error occurs.

Parameters

in	*os*	The ostream object.
in	*data*	The SBD data.

Returns

The ostream object, os.

References CATCH_BLOCK.

9.3.4.3 operator>>() [1/2]

```
istream & argo::iridium::xfloat::operator>> (
            istream & in,
            XFloatMetadata & metadata)
```

Stream extraction operator overload function for the XFloatMetadata class.

Parameters

in	*in*	The input stream.
in	*metadata*	The metadata object.

Exceptions

util::log::MessageException	if the stream extraction fails.

Returns

The reference to the input stream, istream.

Todo Implement the functionality for parsing additional metadata field from stream

9.3.4.4 operator>>() [2/2]

```
istream & argo::iridium::xfloat::operator>> (
            istream & is,
            XFloatMailMessage & mail)
```

The stream extraction operator overload function for XFloatMailMessage.

Parses mail message from istream.

Exceptions

util::log::MessageException	of an error occurs.

Parameters

in	*is*	The istream object.
in	*mail*	The mail message object.

Returns

The istream object, is.

9.4 boost Namespace Reference

The Boost C++ library namespace.

Namespaces

- namespace container

  Boost container library namespace.

Classes

- class shared_ptr

  Dummy template class used for configuring Doxygen to interpret boost::shared_ptr objects as plain pointers.
- class thread_specific_ptr

  Dummy template class used for configuring Doxygen to interpret boost::thread_specific_ptr objects as plain pointers.

9.4.1 Detailed Description

The Boost C++ library namespace.

9.5 boost::container Namespace Reference

Boost container library namespace.

Classes

- class flat_map

  Dummy template class used for configuring Doxygen to interpret boost::container::flat_map correctly.
- class static_vector

  Dummy template class used for configuring Doxygen to interpret boost::container::static_vector correctly.

9.5.1 Detailed Description

Boost container library namespace.

9.6 util Namespace Reference

The utility namespace.

Namespaces

- namespace config
  The configuration utility namespace.
- namespace date
  Date utility namespace.
- namespace file
  The filesystem utility namespace.
- namespace ftp
  The ftp utility namespace.
- namespace log
  The logging utility namespace.
- namespace mail
  The mail utility namespace.
- namespace math
  The math utility namespace.
- namespace mysql
  The MySQL utility namespace.
- namespace position
  The position utility namespace.
- namespace sig
  The system signals utility namespace.
- namespace stream
  The stream utility namespace.
- namespace string
  The string utility namespace.
- namespace sys
  The system utility namespace.
- namespace thread
  The thread utility namespace.
- namespace types
  The types utility namespace.
- namespace xmsg
  The X-Message utility namespace.

9.6.1 Detailed Description

The utility namespace.

9.7 util::config Namespace Reference

The configuration utility namespace.

Classes

- class LocalConfiguration
  Class representing all program run-time configuration options.

9.7.1 Detailed Description

The configuration utility namespace.

9.8 util::date Namespace Reference

Date utility namespace.

Classes

- class DateUtils
  Class providing library of useful date and time functions.

9.8.1 Detailed Description

Date utility namespace.

9.9 util::file Namespace Reference

The filesystem utility namespace.

Classes

- class FileSystemUtils
  Class providing library of useful filesystem functions.

9.9.1 Detailed Description

The filesystem utility namespace.

9.10 util::ftp Namespace Reference

The ftp utility namespace.

9.10.1 Detailed Description

The ftp utility namespace.

Deprecated FTP client integration features have been scrapped. This namespace is no longer utilized.

9.11 util::log Namespace Reference

The logging utility namespace.

Classes

- class Log
  The logger class.
- class MessageException
  Exception class with associated message.

Typedefs

- typedef blg::sources::severity_logger_mt< blg::trivial::severity_level > sev_logger_mt
  A thread-safe severity logger object type.

Enumerations

- enum LogLevel_t {
  LOG_FAT = 0 ,
  LOG_ERR = 1 ,
  LOG_WRN = 2 ,
  LOG_LOG = 3 ,
  LOG_INF = 4 ,
  LOG_DBG = 5 ,
  LOG_DBG1 = 6 ,
  LOG_DBG2 = 7 ,
  LOG_DBG3 = 8 }

  Logging levels enumeration.

9.11.1 Detailed Description

The logging utility namespace.

9.11.2 Typedef Documentation

9.11.2.1 sev_logger_mt

```
typedef blg::sources::severity_logger_mt<blg::trivial::severity_level> util::log::sev_logger_mt
```

A thread-safe severity logger object type.

Note

This logger type uses the severity levels defined by blg::trivial::severity_level in the boost log library.

9.11.3 Enumeration Type Documentation

9.11.3.1 LogLevel_t

```
enum util::log::LogLevel_t
```

Logging levels enumeration.

Enumerator

LOG_FAT	Logging level 0: Fatal errors only.
LOG_ERR	Logging level 1: Errors only.
LOG_WRN	Logging level 2: Warnings, i.e. quiet.
LOG_LOG	Logging level 3: Standard/Default output logging level.
LOG_INF	Logging level 4: Informational messages, i.e. verbose.
LOG_DBG	Logging level 5: Debugging messages.
LOG_DBG1	Logging level 6: More debugging messages.
LOG_DBG2	Logging level 7: Even more debugging messages.
LOG_DBG3	Logging level 8: Most debugging messages.

9.12 util::mail Namespace Reference

The mail utility namespace.

9.12.1 Detailed Description

The mail utility namespace.

9.13 util::math Namespace Reference

The math utility namespace.

Classes

- class MathUtils

  Class containing commonly-used mathematical functions.

9.13.1 Detailed Description

The math utility namespace.

9.14 util::mysql Namespace Reference

The MySQL utility namespace.

Classes

- class Column_bool

  Template column description class for value of type bool.
- class Column_char

  Template column description class for value of type double.
- class Column_double

  Template column description class for value of type double.
- class Column_filesystem_path

  Template column description class for value of type path.
- class Column_float

  Template column description class for value of type float.
- class Column_int

  Template column description class for value of type int.
- class Column_int16_t

  Template column description class for value of type int16_t.
- class Column_long

  Template column description class for value of type long.
- class Column_posix_time

  Template column description class for value of type boost::posix_time::ptime.
- class Column_string

  Template column description class for value of type string.
- class Column_uint16_t

  Template column description class for value of type uint16_t.
- class Column_uint8_t

  Template column description class for value of type uint8_t.
- class Column_vector_uint8_t

  Template column description class for value of type vector<uint8_t>.
- class LocalMysqlConfiguration

  Class providing useful functions for accessing and manipulating the MySQL database, given the local run-time configuration settings.
- class LocalPersistentEntity

  An abstract class representing a persistent database entity in the database defined by the config::LocalConfiguration.
- class MysqlUtils

  Class provides a library of function for accessing and manipulating a MySQL database.
- class SqlTableColumnDescription

  The `SqlTableColumnDescription` class is a template class used to describe an SQL table column for class `C` and data member of type `T`.
- class SqlTableColumnDescriptionBase

  An abstract base class for the description of an SQL database table column.
- class SqlTableDescription

  Template class representing the description of an SQL database table.

Enumerations

- enum ColumDataType_t {
  COLUMN_DATA_TYPE_UNKOWN ,
  COLUMN_DATA_TYPE_BOOL ,
  COLUMN_DATA_TYPE_CHAR ,
  COLUMN_DATA_TYPE_DOUBLE ,
  COLUMN_DATA_TYPE_FILESYSTEM_PATH ,
  COLUMN_DATA_TYPE_FLOAT ,
  COLUMN_DATA_TYPE_INT ,
  COLUMN_DATA_TYPE_INT16_T ,
  COLUMN_DATA_TYPE_LONG ,
  COLUMN_DATA_TYPE_POSIX_TIME ,
  COLUMN_DATA_TYPE_STRING ,
  COLUMN_DATA_TYPE_TEST ,
  COLUMN_DATA_TYPE_UINT16_T ,
  COLUMN_DATA_TYPE_UINT8_T ,
  COLUMN_DATA_TYPE_VECTOR_UINT8_T }

  The ColumnDescription class is used to describe the attributes of a particular SQL table column including its name, type, and whether or not the column is part of the primary key for the SQL table.

Variables

- thread_specific_ptr< Connection > MysqlUtils::sql_connection_ & **CleanupSqlConnection**
- thread_specific_ptr< MySQL_Driver > MysqlUtils::sql_driver_ & **CleanupSqlDriver**

9.14.1 Detailed Description

The MySQL utility namespace.

9.14.2 Enumeration Type Documentation

9.14.2.1 ColumDataType_t

`enum util::mysql::ColumDataType_t`

The ColumnDescription class is used to describe the attributes of a particular SQL table column including its name, type, and whether or not the column is part of the primary key for the SQL table.

A collection of ColumnDescrition object may be used to fully describe the attributes of one or more SQL database tables.

9.15 util::position Namespace Reference

The position utility namespace.

Classes

- class Position

  Abstract class representing a position, date, and time.
- class PositionUtils

  Class providing library of useful functions for manipulating and processing geographic positions.

9.15.1 Detailed Description

The position utility namespace.

9.16 util::sig Namespace Reference

The system signals utility namespace.

Classes

- class SignalHandler

  Class providing function for handling POSIX style system signals.

9.16.1 Detailed Description

The system signals utility namespace.

9.17 util::stream Namespace Reference

The stream utility namespace.

Classes

- class DataBuf

  Template class for wrapping an arbitrary contiguous section of data as a std::basic_streambuf object.
- class StreamUtils

  Class providing useful functions for manipulating I/O streams.
- class VectorBuf

  Template class for wrapping a vector<T> as a std::basic_streambuf<T>.
- class VectorBuf_c

  Template class for wrapping a vector<T> as a std::basic_streambuf<char>.

9.17.1 Detailed Description

The stream utility namespace.

9.18 util::string Namespace Reference

The string utility namespace.

9.18.1 Detailed Description

The string utility namespace.

9.19 util::sys Namespace Reference

The system utility namespace.

9.19.1 Detailed Description

The system utility namespace.

9.20 util::thread Namespace Reference

The thread utility namespace.

Classes

- class Lockable

  A lockable class.
- class RecursiveLockable

  A recursively lockable class.
- class SynchronousQueue

  Synchronous queue template.
- class ThreadUtils

  Class providing useful functions for manipulating threads and processes.

9.20.1 Detailed Description

The thread utility namespace.

9.21 util::types Namespace Reference

The types utility namespace.

9.21.1 Detailed Description

The types utility namespace.

9.22 util::xmsg Namespace Reference

The X-Message utility namespace.

Classes

- class AbstractXComposite

  An abstract class representing XFloat dive data that consists of multiple X-Messages.
- class AbstractXFallRise

  An abstract class representing a fall, rise, or surface pressure time-series data X-message.
- class AbstractXSensorData

  The abstract sensor data class.
- class AbstractXSensorDataComposite

  The AbstractXSensorDataComposite class.
- class AbstractXTimeSeriesDataComposite

  The abstract time-series data composite class template.
- class AuxiliarySensorData

  The auxiliary sensor data class.
- class XAcousticCacst

  An acoustic reception (CACST) record.
- class XAcousticPosition

  Class representing an acoustic position X-Message.
- class XAcousticWindow

  An acoustic listening window.
- class XAlamoBit

  Class representing the BIT test of an ALAMO float.
- class XAlamoBit2

  The ALAMO Built-in-Test (BIT) message, version 2.

- class XAlamoEngineering

  Abstract class representing a version controlled engineering message for ALAMO-type instruments.
- class XAlamoMissionConfiguration

  Class representing an ALAMO Mission Configuration message.
- class XArgo

  Class representing Argo X message.
- class XCompositeAuxTemp

  The composite auxiliary temperature class.
- class XCompositeDrift

  Class representing the aggregate drift data for a single dive, composed from one or more drift messages.
- class XCompositeFall

  Class representing the aggregate fall time-series data for a single dive, composed from one or more fall time-series messages.
- class XCompositeHiResProfile

  Class representing the aggregate raw/high-resolution/unbinned profile data for a single dive, composed from one or more raw profile data messages.
- class XCompositeIridiumPosition

  Class representing the aggregate Iridium position for a single dive, composed from one or more Iridium message positions.
- class XCompositeProfile

  Class representing the aggregate bin-averaged profile data for a single dive, composed from one or more bin-averaged profile data messages.
- class XCompositePump

  Class representing the aggregate pump time-series data for a single dive, composed from one or more pump time-series messages.
- class XCompositeRise

  Class representing the aggregate pump data for a single dive, composed from one or more pump data messages.
- class XCompositeSurfaceData

  Class representing the aggregate surface pressure data for a single dive, composed from one or more surface pressure messages.
- class XCompositeValve

  The composite valve data class.
- class XDriftPressure

  Class representing a drift pressure time-series X-Message.
- class XDriftSalinity

  Class representing a drift salinity time-series X-Message.
- class XDriftTemperature

  Class reprenting a drift temperature X-Message.
- class XEngAbort

  Class representing an abort/beacon mode engineering X-Message.
- class XEngAscent

  Class representing an ascend state engineering X-Message.
- class XEngBIT

  The ALAMO Built-in-Test (BIT) engineering message.
- class XEngBITFail

  Class representing an engineering startup message for BIT failed.
- class XEngBITPass

  Class representing an engineering startup message for BIT passed.
- class XEngDescent

  Class representing an descend state engineering X-Message.
- class XEngDiagnostic

  Class representing a diagnostic dive engineering message.
- class XEngDrift

  Class representing an drift/park state engineering X-Message.
- class XEngIce

  The ALAMO engineering (ice) message class.
- class XEngStandard

  Class representing an engineering message for a standard dive cycle.
- class XEngSurface

  Class representing an surface state engineering X-Message.
- class XFall

  Class representing a fall time-series data X-Message.
- class XGPS

  Class representing a GPS type X-Message.
- class XHiResPressure

Class representing high-resolution/raw/unbinned profile pressure X-Message.

- class XHiResSalinity

  Class representing high-resolution/raw/unbinned profile salinity X-Message.
- class XHiResTemperature

  Class representing high-resolution/raw/unbinned profile temperature X-Message.
- class XMessage

  Class representing a message following the X format specification.
- class XMessageIndexable

  Class representing an indexable X-Message.
- class XMfaMissionCfg

  The ALAMO mission configuration (mission parameters) message class.
- class XMissionCmdEcho

  Class representing a ground station command echo-back X-Message.
- class XMissionConfiguration

  Class representing a mission configuration X-Message.
- class XPresCodeCounts

  Class representing a raw pressure measurement and phase code for a rise or fall data X-Message.
- class XPresCounts

  Class representing a raw pressure measurement for a rise or fall data X-Message.
- class XProfilePressure

  Class representing a profile pressure data X-Message.
- class XProfileSalinity

  Class representing a profile salinity X-Message.
- class XProfileTemperature

  Class representing a profile temperature X-Message.
- class XPump

  Class representing a pump data X-Message.
- class XPumpCounts

  Class representing a single pump data measurement for a pump data time-series X-Message.
- class XRise

  Class representing a rise data X-Message.
- class XSensorTripletCodeCounts

  The sensor triplet and phase code class.
- class XSurfaceData

  The surface time-series data X-Message class.
- class XValve

  The valve data message class.
- class XValveCounts

  The valve counts class.
- class XWave

  Class representing measured ocean surface wave data X message.
- class XWaveRawSample

  Class representing a single raw motion measurement in the surface time series wave data X-message.
- class XWaveSpectralSample

  The wave spectral sample class.

Enumerations

- enum **XAlamoBIT2Type_t** {
  UNKNOWN = -1 ,
  NO_SKY_VIEW = 0 ,
  SKY_VIEW = 1 }
- enum XFallRiseDataPackFormat_t {
  XRISEFALL_FMT_LEGACY = 0 ,
  XRISEFALL_FMT_STNDRD = 1 ,
  XRISEFALL_FMT_STNDRD_WITH_TEMP_AND_SALN = 2 ,
  XRISEFALL_FMT_UNKNOWN = 0xFF }

  Packing format type enumeration for rise and fall data X-Messages.

- enum XMsgTypeId_t {
  XMSG_TYPE_ID_GPS_DIAGNOSTIC = 0x00 ,
  XMSG_TYPE_ID_GPS_STARTOFDIVE = 0x01 ,
  XMSG_TYPE_ID_GPS_ENDOFDIVE = 0x02 ,
  XMSG_TYPE_ID_GPS_ABORT = 0x03 ,
  XMSG_TYPE_ID_GPS_BITEST = 0x05 ,
  XMSG_TYPE_ID_PRES0 = 0x10 ,
  XMSG_TYPE_ID_PRES1 = 0x11 ,
  XMSG_TYPE_ID_PRES2 = 0x12 ,
  XMSG_TYPE_ID_PRES3 = 0x13 ,

9.22.1 Detailed Description

The X-Message utility namespace.

9.22.2 Enumeration Type Documentation

9.22.2.1 XFallRiseDataPackFormat_t

`enum util::xmsg::XFallRiseDataPackFormat_t`

Packing format type enumeration for rise and fall data X-Messages.

Enumerator

XRISEFALL_FMT_LEGACY	The legacy 4-byte packing format. **Note** This format is only used by instrument previous to X-Message format version 2.0.
XRISEFALL_FMT_STNDRD	The standard 5-byte packing format. **Note** This packing format was add in X-Message version 2.0.

Enumerator

XRISEFALL_FMT_STNDRD_WITH_TEMP_AND_↩ SALN	The standard 9-byte packing format with temperature and salinity. **Note** This packing format was add in X-Message version 2.2.
XRISEFALL_FMT_UNKNOWN	Unknown, unset, or unspecified packing format.

9.22.2.2 XMsgTypeId_t

`enum util::xmsg::XMsgTypeId_t`

Enumeration of the unique X message identifiers.

Enumerator

XMSG_TYPE_ID_GPS_DIAGNOSTIC	GPS0.
XMSG_TYPE_ID_GPS_STARTOFDIVE	GPS1.
XMSG_TYPE_ID_GPS_ENDOFDIVE	GPS2.
XMSG_TYPE_ID_GPS_ABORT	GPS3.
XMSG_TYPE_ID_GPS_BITEST	GPS5.
XMSG_TYPE_ID_PRES0	PRES0.

XMSG_TYPE_ID_ENG_BIT_PASS	ENG_BIT_PASS.
XMSG_TYPE_ID_ENG_BIT_FAIL	ENG_BIT_FAIL.
XMSG_TYPE_ID_ARGO_DATA	ARGO_DATA.
XMSG_TYPE_ID_TEST	TEST.
XMSG_TYPE_ID_UNKNOWN	UNKNOWN.

9.22.2.3 XPhaseCode_t

```
enum util::xmsg::XPhaseCode_t
```

The X-message phase codes enumeration.

The phase code is used to indicate the context of a measurement i.e. what phase of the dive cycle the measurement was taken.

Enumerator

XPHASE_CODE_UNKNOWN	Phase code 0: unknown mission phase. This code is only used for instruments with an X-Message format previous to version 2.0.
XPHASE_CODE_START_OF_SINK	Phase code 1: start of the descent-from-surface phase of the dive cycle.
XPHASE_CODE_BUOYANCY_AT_100DBAR	Phase code 2: first pump (Tlastx) at 100 dBar.
XPHASE_CODE_SEEK	Phase code 3: seek during the descent-to-drift/park-pressure.
XPHASE_CODE_BEGINNING_OF_DRIFT	Phase code 4: the beginning of the drift phase of the dive cycle.
XPHASE_CODE_SEEK_DURING_DRIFT	Phase code 5: seek to drift/park pressure during the drift phase of the dive cycle.
XPHASE_CODE_BEGINING_OF_FALL_TO_PROFILE	Phase code 6: beginning of the descent from drift/park depth to profile depth.
XPHASE_CODE_START_OF_RISE	Phase code 7: start of the ascent/profile/rise phase of the dive cycle.
XPHASE_CODE_END_OF_RISE	Phase code 8: end of the ascent/profile/rise phase of the dive cycle.
XPHASE_CODE_ICE_TURNAROUND	Phase code 9: turn-around due to the ice detection algorithm.
XPHASE_CODE_SINKING	Phase code 10: the descent-from-surface phase of the dive cycle.
XPHASE_CODE_DRIFTING	Phase code 11: the drift phase of the dive cycle.
XPHASE_CODE_FALLING_TO_PROFILE	Phase code 12: the descent from drift/park depth to profile depth.
XPHASE_CODE_RISING	Phase code 13: the ascent/profile/rise phase of the dive cycle.
XPHASE_CODE_SURFACE	Phase code 14: the surface phase of the dive cycle.
XPHASE_CODE_INVALID	Phase code 15: invalid. This code is not used.

9.22.2.4 XPumpPackingFormat_t

`enum util::xmsg::XPumpPackingFormat_t`

Enumeration type definition of pump data X-Message packing formats.

Enumerator

XPUMP_PACK_LEGACY	X-Message pump data packing format 0: The legacy packing format identifier.
XPUMP_PACK_STANDARD	X-Message pump data packing format 1: The standard packing format identifier.
XPUMP_PACK_STANDARD2	X-Message pump data packing format 2: The (tentative) packing format identifier.
XPUMP_PACK_UNKNOWN	X-Message pump data packing format 99: The unknown/unset/invalid packing format identifier.

9.22.2.5 XSensorDataFormat_t

`enum util::xmsg::XSensorDataFormat_t`

The X-Message sensor data packing format enumeration.

This type enumerates the different packing format types that may be used by the class AbstractXSensorData and the classes that inherit from it. The manner in which the sensor data is decoded is determined by the data packing formats enumerated here.

Enumerator

XSENS_FMT_DIFFERENCE	The X-Message sensor data packing format 0: Legacy first-difference packing format.
XSENS_FMT_CURVATURE	The X-Message sensor data packing format 1: Standard curvature packing format. **Note** The packing format was added in X version 2.0.
XSENS_FMT_UNKNOWN	The X-Message sensor data packing format 255: Unknown packing format.

9.22.2.6 XWaveMode_t

`enum util::xmsg::XWaveMode_t`

Wave data modes enumeration.

Note

Currently, only raw wave motion measurements are supported.

Enumerator

XWAVE_MODE_RAW	Raw data mode.
XWAVE_MODE_SPECTRAL	Spectral data mode.
XWAVE_MODE_UNKNOWN	Unknown/invalid data mode.

9.23 vmime Namespace Reference

VMime library namespace.

Classes

- class shared_ptr

  Dummy template class used for configuring Doxygen to interpret vmime::shared_ptr objects as plain pointers.

9.23.1 Detailed Description

VMime library namespace.

Chapter 10

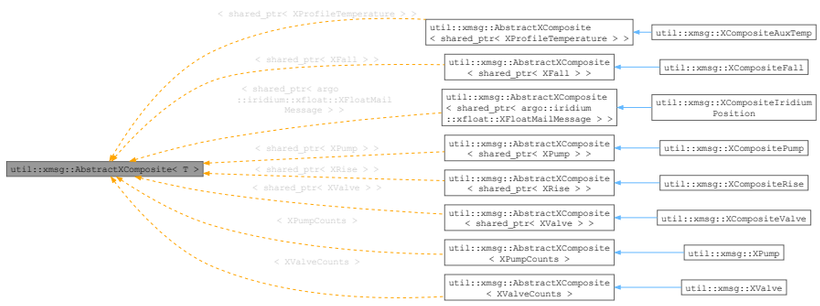
Class Documentation

10.1 util::xmsg::AbstractXComposite< T > Class Template Reference

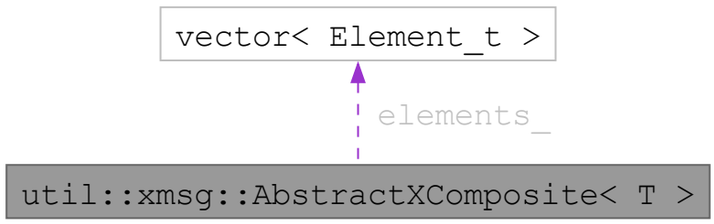
An abstract class representing XFloat dive data that consists of multiple X-Messages.

`#include <AbstractXComposite.h>`

Inheritance diagram for util::xmsg::AbstractXComposite< T >:



Collaboration diagram for util::xmsg::AbstractXComposite< T >:



Public Member Functions

- AbstractXComposite ()

  The default constructor.
- virtual ~AbstractXComposite ()

  The destructor.
- template<int I>
  void AppendAllElements (const static_vector< Element_t, I > &elements)

  Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.
- virtual void AssignElement (const Element_t &element)

  Assign an element to this composite object.
- const vector< Element_t > & elements () const

  Get the vector of individual X-Messages elements that compose this composite object.
- virtual bool **IsEmpty** () const
- virtual size_t num_elements () const

  Get the number of individual elements that compose this composite object.

Protected Member Functions

- void AppendAllElements (const vector< Element_t > &elements)

  Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.
- void AppendElement (const Element_t &element)

  Append one element to the vector of individual X-Messages elements that compose this composite object.

Private Types

- typedef T Element_t

  Type definition for the element aggregated by this object.
- typedef ElementVec_t::const_iterator **ElementConstIter_t**
- typedef ElementVec_t::iterator **ElementIter_t**
- typedef vector< Element_t > **ElementVec_t**

Private Attributes

- ElementVec_t elements_

  The vector of individual X-Messages elements that compose this composite object.

10.1.1 Detailed Description

template<typename T>
class util::xmsg::AbstractXComposite< T >

An abstract class representing XFloat dive data that consists of multiple X-Messages.

10.1.2 Member Typedef Documentation

10.1.2.1 Element_t

```
template<typename T >
typedef T util::xmsg::AbstractXComposite< T >::Element_t  [private]
```

Type definition for the element aggregated by this object.

10.1.3 Constructor & Destructor Documentation

10.1.3.1 AbstractXComposite()

```
template<typename T >
util::xmsg::AbstractXComposite< T >::AbstractXComposite ()  [inline]
```

The default constructor.

10.1.3.2 ~AbstractXComposite()

```
template<typename T >
virtual util::xmsg::AbstractXComposite< T >::~AbstractXComposite ()  [inline], [virtual]
```

The destructor.

10.1.4 Member Function Documentation

10.1.4.1 AppendAllElements() [1/2]

```
template<typename T >
template<int I>
void util::xmsg::AbstractXComposite< T >::AppendAllElements (
            const static_vector< Element_t, I > & elements)  [inline]
```

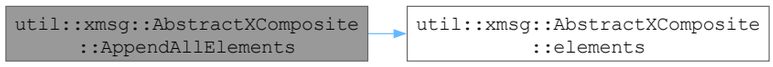
Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*elements*	The vector of elements to append.

References util::xmsg::AbstractXComposite< T >::elements(), and util::xmsg::AbstractXComposite< T >::elements_.

Here is the call graph for this function:



10.1.4.2 AppendAllElements() [2/2]

```
template<typename T >
void util::xmsg::AbstractXComposite< T >::AppendAllElements (
            const vector< Element_t > & elements)  [inline], [protected]
```

Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*elements*	The vector of elements to append.

References util::xmsg::AbstractXComposite< T >::elements(), and util::xmsg::AbstractXComposite< T >::elements_.

Here is the call graph for this function:

10.1.4.3 AppendElement()

```
template<typename T >
void util::xmsg::AbstractXComposite< T >::AppendElement (
            const Element_t & element)  [inline], [protected]
```

Append one element to the vector of individual X-Messages elements that compose this composite object.

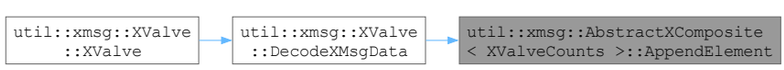
Parameters

in	*element*	The element to append.

References util::xmsg::AbstractXComposite< T >::elements_.

Referenced by util::xmsg::AbstractXComposite< T >::AssignElement().

Here is the caller graph for this function:



10.1.4.4 AssignElement()

```
template<typename T >
virtual void util::xmsg::AbstractXComposite< T >::AssignElement (
            const Element_t & element)  [inline], [virtual]
```

Assign an element to this composite object.

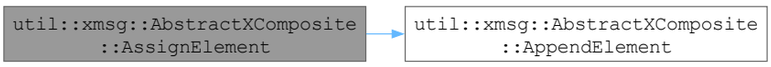
The default implementation appends the element; derived classes may override it to insert elements in order or reject duplicates.

Parameters

in	*element*	The element to assign.

References util::xmsg::AbstractXComposite< T >::AppendElement().

Here is the call graph for this function:



10.1.4.5 elements()

```
template<typename T >
const vector< Element_t > & util::xmsg::AbstractXComposite< T >::elements () const  [inline]
```

Get the vector of individual X-Messages elements that compose this composite object.

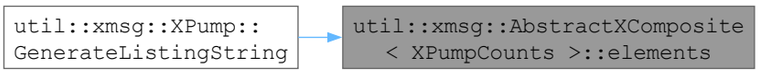
Returns

The vector of individual X-Messages elements that compose this composite object.

References util::xmsg::AbstractXComposite< T >::elements_.

Referenced by util::xmsg::AbstractXComposite< T >::AppendAllElements(), and util::xmsg::AbstractXComposite< T >::AppendAllEleme

Here is the caller graph for this function:



10.1.4.6 num_elements()

```
template<typename T >
virtual size_t util::xmsg::AbstractXComposite< T >::num_elements () const  [inline], [virtual]
```

Get the number of individual elements that compose this composite object.

Returns

The number of individual elements that compose this composite object.

References util::xmsg::AbstractXComposite< T >::elements_.

10.1.5 Member Data Documentation

10.1.5.1 elements_

```
template<typename T >
ElementVec_t util::xmsg::AbstractXComposite< T >::elements_  [private]
```

The vector of individual X-Messages elements that compose this composite object.

Referenced by util::xmsg::AbstractXComposite< T >::AppendAllElements(), util::xmsg::AbstractXComposite< T >::AppendAllElements(), util::xmsg::AbstractXComposite< T >::AppendElement(), util::xmsg::AbstractXComposite< T >::elements(), and util::xmsg::AbstractXComposite< T >::num_elements().

The documentation for this class was generated from the following file:

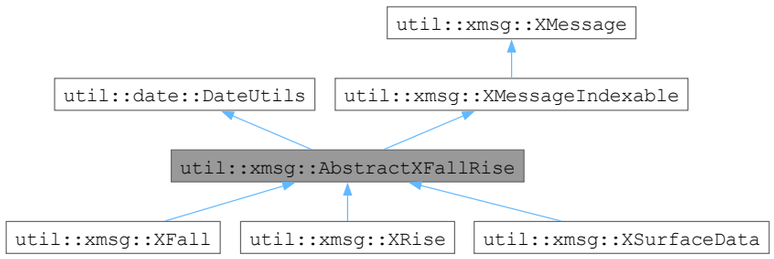
- data/xmsg/AbstractXComposite.h

10.2 util::xmsg::AbstractXFallRise Class Reference

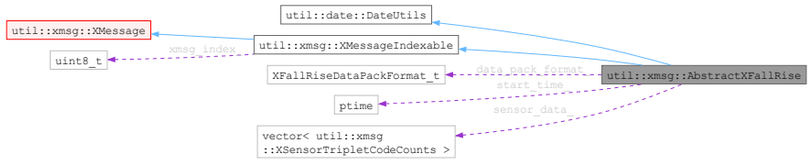
An abstract class representing a fall, rise, or surface pressure time-series data X-message.

`#include <AbstractXFallRise.h>`

Inheritance diagram for util::xmsg::AbstractXFallRise:



Collaboration diagram for util::xmsg::AbstractXFallRise:



Public Member Functions

- AbstractXFallRise (int16_t dive, uint16_t whoi, const vector< uint8_t > &data) ATTR_NO_EXCEPTIONS

  The parameterized constructor.
- virtual ~AbstractXFallRise ()

  The destructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)

  Check the X-message for the correct ID, minimum size, and message terminator.
- XFallRiseDataPackFormat_t data_pack_format () const

  Get the enumerated data packing format type.
- virtual void DecodeXMsgData (const vector< uint8_t > &data)=0

  Decode the X message.
- int16_t id_dive () const

  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const

  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const

  Get the enumerated X-Message type identifier.
- size_t num_samples () const

  Get the number of samples in this message.
- const vector< XSensorTripletCodeCounts > & sensor_data () const

  Get the vector of sensor data triplets.
- const ptime & start_time () const

  Get the start time of this message.
- uint8_t xmsg_index () const

  Get the index of this X-Message.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Static Public Member Functions

- static string GenerateCurrentUtcTimeIso8601String ()

  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- static string GenerateIso8601String (const ptime &p, bool extended=true)

  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)

  Convert a date/time to fractional days since a reference date/time.
- static const string GenerateListingComment ()

  Get the listing entry comment string.
- static ptime GetCurrentUtcTime ()

  Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Protected Member Functions

- void set_data_pack_format (XFallRiseDataPackFormat_t data_pack_format)

  Set the enumerated data packing format value for this message.
- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_start_time (const ptime &start_time)

  Set the start time of this message.
- void set_xmsg_index (uint8_t xmsg_index)

  Set the index of this X-Message.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.
- vector< XSensorTripletCodeCounts > UnpackData (const vector< uint8_t > &data)

  Unpack the fall/rise data from the binary message.

Private Attributes

- XFallRiseDataPackFormat_t data_pack_format_

  The packing format type identifier.
- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- vector< XSensorTripletCodeCounts > sensor_data_

  The raw counts of measured fall, rise, or surface time-series data.
- ptime start_time_

  The start time reference.
- uint8_t xmsg_index_

  The index of this X-Message.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.2.1 Detailed Description

An abstract class representing a fall, rise, or surface pressure time-series data X-message.

10.2.2 Constructor & Destructor Documentation

10.2.2.1 AbstractXFallRise()

```
util::xmsg::AbstractXFallRise::AbstractXFallRise (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

The parameterized constructor.

Parameters

in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	Binary X-message data to decode.

Exceptions

None.	Never throws.

10.2.2.2 ~AbstractXFallRise()

```
virtual util::xmsg::AbstractXFallRise::~AbstractXFallRise ()  [inline], [virtual]
```

The destructor.

10.2.3 Member Function Documentation

10.2.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::XMessage::set_xmsg_size_byte
u16, and util::xmsg::XMessage::xmsg_size_bytes().

Referenced by util::xmsg::XAcousticPosition::DecodeXMsgData(), util::xmsg::XArgo::DecodeXMsgData(), util::xmsg::XDriftPressure::Deco
util::xmsg::XDriftSalinity::DecodeXMsgData(), util::xmsg::XDriftTemperature::DecodeXMsgData(), util::xmsg::XEngAbort::DecodeXMsgDa
util::xmsg::XEngAscent::DecodeXMsgData(), util::xmsg::XEngBIT::DecodeXMsgData(), util::xmsg::XEngDescent::DecodeXMsgData(),
util::xmsg::XEngDiagnostic::DecodeXMsgData(), util::xmsg::XEngDrift::DecodeXMsgData(), util::xmsg::XEngIce::DecodeXMsgData(),

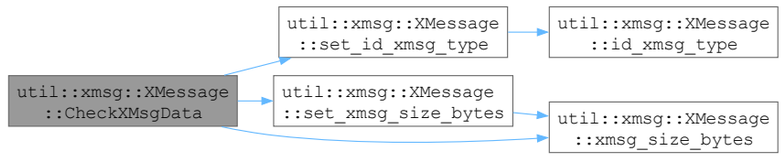
util::xmsg::XProfileSalinity::DecodeXMsgData(), util::xmsg::XProfileTemperature::DecodeXMsgData(), util::xmsg::XPump::DecodeXMsgD
util::xmsg::XValve::DecodeXMsgData(), util::xmsg::XWave::DecodeXMsgData(), and UnpackData().

Here is the call graph for this function:



10.2.3.2 data_pack_format()

```
XFallRiseDataPackFormat_t util::xmsg::AbstractXFallRise::data_pack_format () const  [inline]
```

Get the enumerated data packing format type.

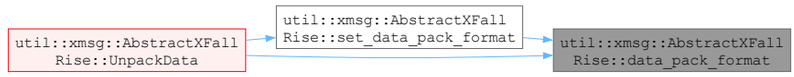
Returns

The enumerated data packing format type.

References data_pack_format_.

Referenced by set_data_pack_format(), and UnpackData().

Here is the caller graph for this function:



10.2.3.3 DecodeXMsgData()

```
virtual void util::xmsg::AbstractXFallRise::DecodeXMsgData (
            const vector< uint8_t > & data)  [pure virtual]
```

Decode the X message.

Parameters

in	*data*	The encoded X message to decode.

Exceptions

util::log::MessageException	if • an invalid X-Message type identifier is encountered. • the message is of insufficient length, • an invalid packing format is encountered, or • the message terminator is in an invalid location.

Implements util::xmsg::XMessageIndexable.

Implemented in util::xmsg::XFall, util::xmsg::XRise, and util::xmsg::XSurfaceData.

10.2.3.4 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

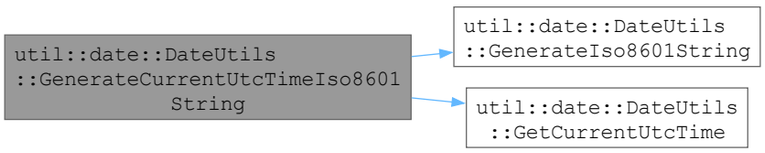
Returns

An ISO8601 format date/time string representation of the current time.

References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:

10.2.3.5 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), util::xmsg::XEngIce::XEngIce

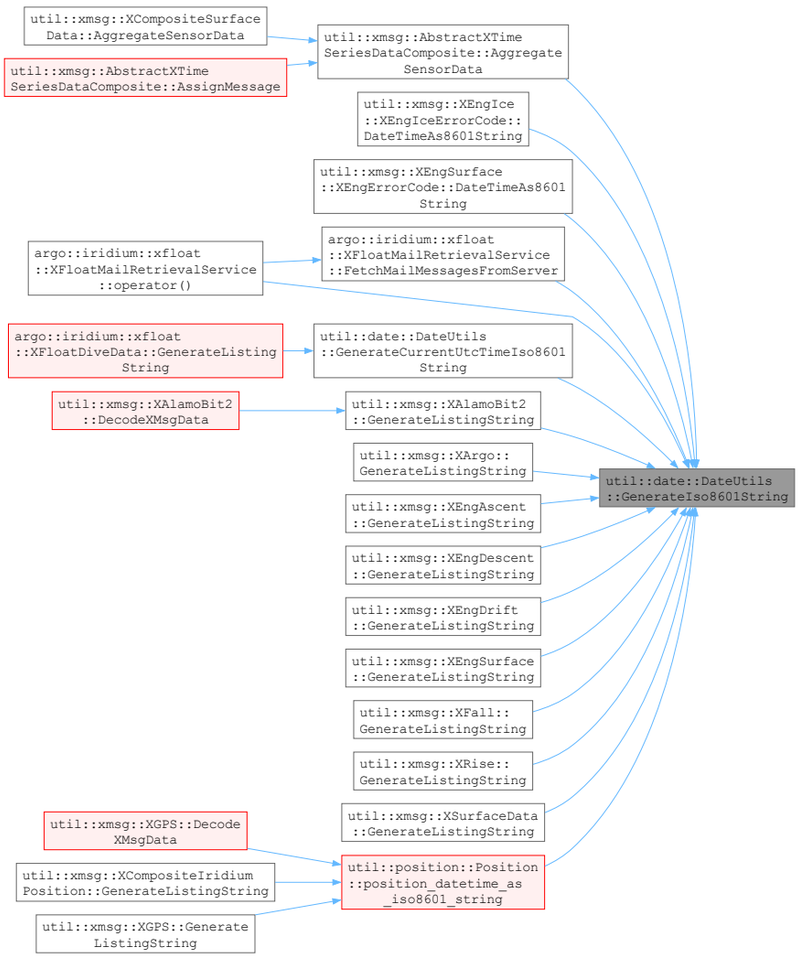
Here is the caller graph for this function:



10.2.3.6 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref*↩ *_dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.2.3.7 GenerateListingComment()

```
static const string util::xmsg::AbstractXFallRise::GenerateListingComment ()  [inline], [static]
```

Get the listing entry comment string.

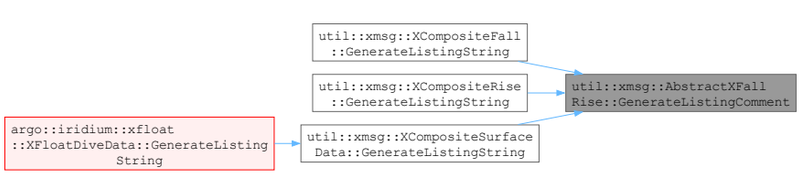
Returns

The listing entry comment string.

References CATCH_BLOCK.

Referenced by util::xmsg::XCompositeFall::GenerateListingString(), util::xmsg::XCompositeRise::GenerateListingString(), and util::xmsg::XCompositeSurfaceData::GenerateListingString().

Here is the caller graph for this function:



10.2.3.8 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

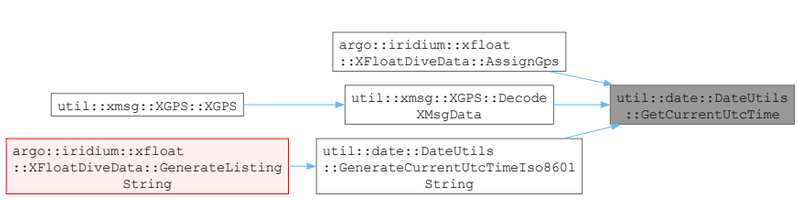
Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

Here is the caller graph for this function:



10.2.3.9 id_dive()

```
int16_t util::xmsg::XMessage::id_dive () const  [inline], [inherited]
```

Get the dive or cycle number of this X-Message.

Returns

The dive or cycle number of this X-Message.

References util::xmsg::XMessage::id_dive_.

Referenced by util::xmsg::XGPS::DeleteFromDatabase(), util::xmsg::XArgo::GenerateListingString(), util::xmsg::XEngAscent::GenerateLis

Here is the caller graph for this function:

10.2.3.13 sensor_data()

```
const vector< XSensorTripletCodeCounts > & util::xmsg::AbstractXFallRise::sensor_data () const
[inline]
```

Get the vector of sensor data triplets.

Returns

The vector of sensor data triplets.

References sensor_data_.

Referenced by util::xmsg::XFall::GenerateListingString(), util::xmsg::XRise::GenerateListingString(), and util::xmsg::XSurfaceData::Genera

Here is the caller graph for this function:

10.2.3.14 set_data_pack_format()

```
void util::xmsg::AbstractXFallRise::set_data_pack_format (
            XFallRiseDataPackFormat_t data_pack_format)  [inline], [protected]
```

Set the enumerated data packing format value for this message.

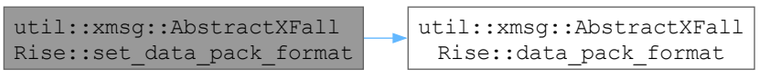
Parameters

in	*data_pack_format*	The enumerated data packing format value for this message to set.

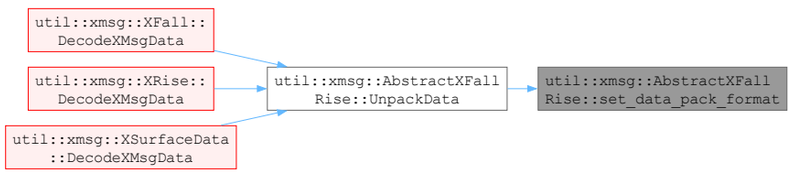
References data_pack_format(), and data_pack_format_.

Referenced by UnpackData().

Here is the call graph for this function:



Here is the caller graph for this function:



10.2.3.15 set_id_dive()

```
void util::xmsg::XMessage::set_id_dive (
            int16_t id_dive)  [inline], [protected], [inherited]
```

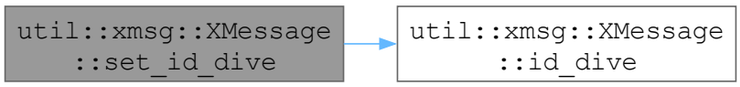
Set the dive or cycle number of this message.

Parameters

in	*id_dive*	The dive or cycle number of this message to set.

References util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::id_dive_.

Here is the call graph for this function:



10.2.3.16 set_id_instrument()

```
void util::xmsg::XMessage::set_id_instrument (
            uint16_t id_instrument)  [inline], [protected], [inherited]
```

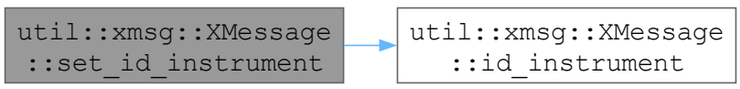
Set the unique instrument identifier.

Parameters

in	*id_instrument*	The unique instrument identifier to set.

References util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::id_instrument_.

Here is the call graph for this function:



10.2.3.17 set_id_xmsg_type()

```
void util::xmsg::XMessage::set_id_xmsg_type (
            XMsgTypeId_t id_xmsg_type)  [inline], [protected], [inherited]
```

Set the X-Message type identifier.

Parameters

in	*id_xmsg_type*	The X-Message type identifier to set.

References util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::id_xmsg_type_.

```
vector< XSensorTripletCodeCounts > util::xmsg::AbstractXFallRise::UnpackData (
            const vector< uint8_t > & data)  [inline], [protected]
```

Unpack the fall/rise data from the binary message.

Parameters

in	*data*	The binary message to unpack.

Exceptions

util::log::MessageException	if • the message is of insufficient length, • an invalid packing format is encountered, or • the message terminator is in an invalid location.

Returns

The raw counts of measured fall or rise time-series data.

10.2.4 Member Data Documentation

10.2.4.1 data_pack_format_

```
XFallRiseDataPackFormat_t util::xmsg::AbstractXFallRise::data_pack_format_  [private]
```

The packing format type identifier.

Referenced by data_pack_format(), and set_data_pack_format().

10.2.4.2 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.2.4.3 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.2.4.4 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.2.4.5 sensor_data_

```
vector<XSensorTripletCodeCounts> util::xmsg::AbstractXFallRise::sensor_data_  [private]
```

The raw counts of measured fall, rise, or surface time-series data.

Referenced by num_samples(), sensor_data(), and UnpackData().

10.2.4.6 start_time_

```
ptime util::xmsg::AbstractXFallRise::start_time_  [private]
```

The start time reference.

Referenced by set_start_time(), and start_time().

10.2.4.7 xmsg_index_

```
uint8_t util::xmsg::XMessageIndexable::xmsg_index_  [private], [inherited]
```

The index of this X-Message.

Referenced by util::xmsg::XMessageIndexable::set_xmsg_index(), and util::xmsg::XMessageIndexable::xmsg_index().

10.2.4.8 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

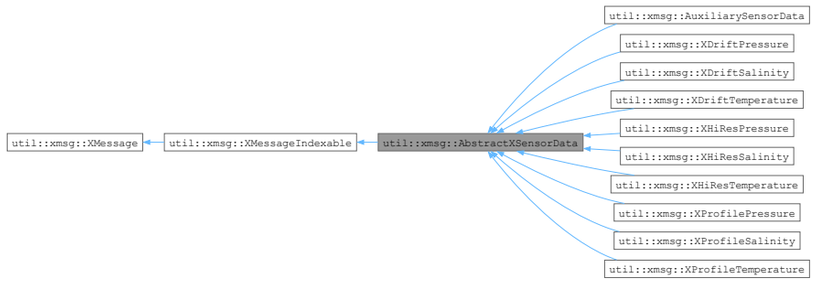
10.3 util::xmsg::AbstractXSensorData Class Reference

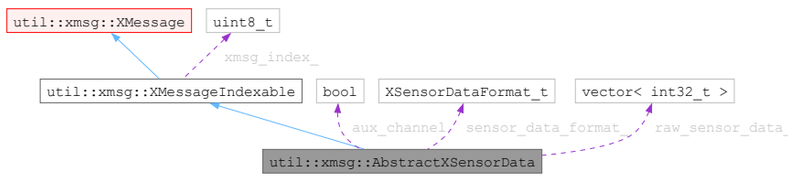
The abstract sensor data class.

`#include <AbstractXSensorData.h>`

Inheritance diagram for util::xmsg::AbstractXSensorData:



Collaboration diagram for util::xmsg::AbstractXSensorData:



Public Member Functions

- AbstractXSensorData (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)

  Parameterized constructor.
- virtual ~AbstractXSensorData ()

  Destructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)

  Check the X-message for the correct ID, minimum size, and message terminator.
- virtual void DecodeXMsgData (const vector< uint8_t > &data)=0

  Decode the X message.
- int16_t id_dive () const

  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const

  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const

  Get the enumerated X-Message type identifier.
- bool **is_aux_channel** () const
- size_t num_samples () const

  Get the number of samples in this message.
- const vector< int32_t > & raw_sensor_data () const

  Get the raw sensor data vector.
- int32_t Sample (size_t i) const

  Get the raw integer value of the i^{th} sample.
- template<typename T = double>
  T SampleValue (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} sensor value in scientific units.
- template<typename T = double>
  T SampleValueAsPressure (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} pressure sensor value, in dBar.
- template<typename T = double>
  T SampleValueAsSalinity (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} salinity sensor value, in PSU.

- template<typename T = double>
  T SampleValueAsTemperature (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} temperature sensor value, in degC.
- XSensorDataFormat_t sensor_data_format () const

  Get the enumerated sensor data format value.
- uint8_t xmsg_index () const

  Get the index of this X-Message.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Protected Member Functions

- AbstractXSensorData ()

  Default constructor.
- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_raw_sensor_data (const vector< int32_t > &raw_sensor_data)

  Set raw integer counts of the measured sensor data.
- void set_sensor_data_format (XSensorDataFormat_t sensor_data_format)

  Set the sensor data format.
- void set_xmsg_index (uint8_t xmsg_index)

  Set the index of this X-Message.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.
- virtual vector< int32_t > UnpackSensorData (const vector< uint8_t > &data)

  Unpack the sensor data from the binary message.

Protected Attributes

- bool **aux_channel**
- vector< int32_t > raw_sensor_data_

  The raw integer counts of the measured sensor data.
- XSensorDataFormat_t sensor_data_format_

  The enumerated sensor data packing format.

Private Attributes

- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint8_t xmsg_index_

  The index of this X-Message.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.3.1 Detailed Description

The abstract sensor data class.

The abstract sensor data class provides the functionality to decode sensor data messages using either first-difference or curvature encoding. It is used to decode and represent the sensor data returned from the instrument that is contained within a single message.

The classes that inherit from this class represent profile or drift data taken from a single sensor e.g. pressure, temperature, or salinity. The sensor data is stored in a vector of raw integer counts, raw_sensor_data_. The data from the sensor is recovered in scientific units by applying the appropriate offset and gain corrections, as specified in the Argo data message.

10.3.2 Constructor & Destructor Documentation

10.3.2.1 AbstractXSensorData() [1/2]

```
util::xmsg::AbstractXSensorData::AbstractXSensorData (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

Parameterized constructor.

Parameters

in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	Binary X-message data to decode.

Exceptions

util::log::MessageException	if • an invalid X-Message type identifier is encountered. • the message is of insufficient length, • an invalid packing format is encountered, or • the message terminator is in an invalid location.

10.3.2.2 ~AbstractXSensorData()

```
virtual util::xmsg::AbstractXSensorData::~AbstractXSensorData ()  [inline], [virtual]
```

Destructor.

10.3.2.3 AbstractXSensorData() [2/2]

```
util::xmsg::AbstractXSensorData::AbstractXSensorData ()  [inline], [protected]
```

Default constructor.

Constructs an empty sensor data message with an unknown sensor data format.

10.3.3 Member Function Documentation

10.3.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::XMessage::set_xmsg_size_byte u16, and util::xmsg::XMessage::xmsg_size_bytes().

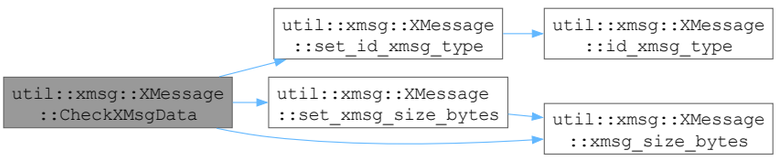
Here is the call graph for this function:



10.3.3.2 DecodeXMsgData()

```
virtual void util::xmsg::AbstractXSensorData::DecodeXMsgData (
            const vector< uint8_t > & data)  [pure virtual]
```

Decode the X message.

Parameters

in	*data*	The encoded X message to decode.

Implements util::xmsg::XMessageIndexable.

Implemented in util::xmsg::XDriftPressure, util::xmsg::XDriftSalinity, util::xmsg::XDriftTemperature, util::xmsg::XHiResPressure, util::xmsg::XHiResSalinity, util::xmsg::XHiResTemperature, util::xmsg::XProfilePressure, util::xmsg::XProfileSalinity, and util::xmsg::XProfileTemperature.

10.3.3.3 id_dive()

```
int16_t util::xmsg::XMessage::id_dive () const  [inline], [inherited]
```

Get the dive or cycle number of this X-Message.

Returns

The dive or cycle number of this X-Message.

References util::xmsg::XMessage::id_dive_.

10.3.3.6 num_samples()

```
size_t util::xmsg::AbstractXSensorData::num_samples () const  [inline]
```

Get the number of samples in this message.

Returns

The number of samples in this message.

References raw_sensor_data_.

10.3.3.7 raw_sensor_data()

```
const vector< int32_t > & util::xmsg::AbstractXSensorData::raw_sensor_data () const  [inline]
```

Get the raw sensor data vector.

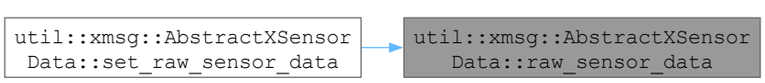
Returns

The raw sensor data vector.

References raw_sensor_data_.

Referenced by set_raw_sensor_data().

Here is the caller graph for this function:



10.3.3.8 Sample()

```
int32_t util::xmsg::AbstractXSensorData::Sample (
            size_t i) const  [inline]
```

Get the raw integer value of the i^{th} sample.

Parameters

in	*i*	The index of the sensor value.

Returns

The raw integer value of the i^{th} ith sample.

References raw_sensor_data_.

10.3.3.9 SampleValue()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValue (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline]
```

Get the i^{th} sensor value in scientific units.

Parameters

in	*i*	The index of the sensor value.
in	*gain*	The sensor sensitivity scale factor.
in	*offs*	The sensor offset.

Returns

The i^{th} sensor value in scientific units.

References CATCH_BLOCK, and raw_sensor_data_.

Referenced by SampleValueAsPressure(), SampleValueAsSalinity(), and SampleValueAsTemperature().

Here is the caller graph for this function:

10.3.3.21 UnpackSensorData()

```
virtual vector< int32_t > util::xmsg::AbstractXSensorData::UnpackSensorData (
            const vector< uint8_t > & data)  [inline], [protected], [virtual]
```

Unpack the sensor data from the binary message.

This field unpacks the encoded sensor data from the message and stores the decoded sensor values in raw_sensor_data_. First the function checks the size of the message, and the data packing format. The message data is decoded according to the packing format type. Both first-difference and curvature encoding are supported. The encoding method is determined from the value of the high nibble of byte `data`[1].

Once this function completes successfully, then the data may be recovered in scientific units from the raw sensor values by applying the appropriate sensor gain and offset values.

Parameters

in	*data*	The binary message to unpack, in a vector of unsigned bytes.

Warning

The function assumes the message data is valid. Message validity should be ensured before this function is called.

Exceptions

util::log::MessageException	if • an error occurs while decoding the message, • the message is of insufficient length, or • an invalid packing format is encountered.

Returns

The sensor data raw counts, in a vector of signed integers.

Reimplemented in util::xmsg::AuxiliarySensorData.

10.3.4 Member Data Documentation

10.3.4.1 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.3.4.2 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.3.4.3 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.3.4.4 raw_sensor_data_

```
vector<int32_t> util::xmsg::AbstractXSensorData::raw_sensor_data_  [protected]
```

The raw integer counts of the measured sensor data.

This vector of integers represents the "raw" sample values of the message. That is, by applying the appropriate gain and offset corrections, the sensor values may be recovered in scientific units. This data may represent pressure, temperature, salinity, or any other data that is recorded during the drift or profile phases of the dive cycle.

Referenced by num_samples(), raw_sensor_data(), Sample(), SampleValue(), set_raw_sensor_data(), UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

10.3.4.5 sensor_data_format_

```
XSensorDataFormat_t util::xmsg::AbstractXSensorData::sensor_data_format_  [protected]
```

The enumerated sensor data packing format.

This field indicates the format of encoded sensor data. The manner in which the sensor data is decoded is determined by the format of this field.

Referenced by sensor_data_format(), and set_sensor_data_format().

10.3.4.6 xmsg_index_

```
uint8_t util::xmsg::XMessageIndexable::xmsg_index_  [private], [inherited]
```

The index of this X-Message.

Referenced by util::xmsg::XMessageIndexable::set_xmsg_index(), and util::xmsg::XMessageIndexable::xmsg_index().

10.3.4.7 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

- virtual const string GenerateListingString (int id_inst, int id_dive, uint16_t pg, uint16_t po, uint16_t sg, uint16_t so, uint16_t tg, uint16_t to, float pc) const =0

  Generate a listing string representation of the this composite sensor data object.
- bool **HasAuxTempData** () const
- bool HasContiguousMessageIndices () const

  Do the sensor data messages assigned to this composite data object have contiguous message indices?
- bool is_aggregated_data_valid () const

Is the aggregated data valid?

- bool IsDataComplete () const

  Is the sensor data for this composite date message complete?

- bool IsEmpty () const

  Is this composite data object empty?

- bool LockObject (bool block)

  Lock the object.

- size_t max_num_samples () const

  Return the maximum of the number of pressure, temperature, or salinity sensor samples in the sensor data messages assigned to this composite sensor data object.

- size_t **num_aux_temp_samples** () const
- size_t num_pres_samples () const

  Get the total number of pressure sensor samples contained in the pressure data messages assigned to this composite data object.

- size_t num_saln_samples () const

  Get the total number of salinity sensor samples contained in the salinity data messages assigned to this composite data object.

- size_t num_temp_samples () const

  Get the total number of temperature sensor samples contained in the temperature data messages assigned to this composite data object.

- void Reset ()

  Remove the assigned pressure, temperature and salinity messages and their aggregated data.

- template<typename T = double>
  T **SampleAuxTempAsFloat** (size_t i, int16_t gain, int16_t offs) const
- int32_t SamplePres (size_t i) const

  Get the i^{th} pressure sensor value, in raw counts.

- template<typename T = double>
  T SamplePresAsFloat (size_t i, int16_t pg, int16_t po, float pc) const

  Get the i^{th} pressure sensor value, in dBar.

- int32_t SampleSaln (size_t i) const

  Get the i^{th} salinity sensor value, in raw counts.

- template<typename T = double>
  T SampleSalnAsFloat (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} salinity sensor value, in PSU.

- int32_t SampleTemp (size_t i) const

  Get the i^{th} temperature sensor value, in raw counts.

- template<typename T = double>
  T SampleTempAsFloat (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} temperature sensor value, in degC.

- void UnlockObject ()

  Unlock the object.

Protected Member Functions

- void AggregateSensorData () ATTR_NO_EXCEPTIONS

  Aggregate the sensor data for this composite sensor data object.

- void set_aggregated_data_valid (bool valid)

  Set the value of the aggregated_data_valid_ field.

Protected Attributes

- recursive_mutex mutex_

  Recursive mutual exclusion lock for synchronizing operations.

Private Types

- typedef shared_ptr< PRES_CLASS > PresMsgPtr_t

  Type definition for a shared pointer to the pressure data message.

- typedef static_vector< PresMsgPtr_t, MAX_MSGS > PresMsgVector_t

  Type definition for a static vector (of size MAX_MSGS) of shared pointers to the pressure data message.

- typedef shared_ptr< SALN_CLASS > SalnMsgPtr_t

  Type definition for a shared pointer to the salinity data message.

- typedef static_vector< SalnMsgPtr_t, MAX_MSGS > SalnMsgVector_t

  Type definition for a static vector (of size MAX_MSGS) of shared pointers to the salinity data message.

- typedef shared_ptr< TEMP_CLASS > TempMsgPtr_t

  Type definition for a shared pointer to the temperature data message.

- typedef static_vector< TempMsgPtr_t, MAX_MSGS > TempMsgVector_t

  Type definition for a static vector (of size MAX_MSGS) of shared pointers to the temperature data message.

Private Attributes

- vector< int32_t > **aggregated_aux_temp_data_**
- bool aggregated_data_valid_

  The aggregated data is valid flag.
- vector< int32_t > aggregated_pres_data_

  A vector of the aggregated pressure data samples, in raw counts.
- vector< int32_t > aggregated_saln_data_

  A vector of the aggregated salinity data samples, in raw counts.
- vector< int32_t > aggregated_temp_data_

  A vector of the aggregated temperature data samples, in raw counts.
- TempMsgVector_t **aux_temp_messages_**
- PresMsgVector_t pres_messages_

  A static vector (of size MAX_MSGS) containing pointers the pressure sensor data messages assigned to this composite object.
- SalnMsgVector_t saln_messages_

  A static vector (of size MAX_MSGS) containing pointers the salinity sensor data messages assigned to this composite object.
- TempMsgVector_t temp_messages_

  A static vector (of size MAX_MSGS) containing pointers the temperature sensor data messages assigned to this composite object.

10.4.1 Detailed Description

template<class PRES_CLASS, class SALN_CLASS, class TEMP_CLASS, unsigned int MAX_MSGS>
class util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >

The AbstractXSensorDataComposite class.

This abstract, template class represents the composite sensor data for a single dive cycle. It provided the functionality for aggregating sensor data messages into a single object.

10.4.2 Member Typedef Documentation

10.4.2.1 PresMsgPtr_t

```
template<class PRES_CLASS , class SALN_CLASS , class TEMP_CLASS , unsigned int MAX_MSGS>
typedef shared_ptr<PRES_CLASS> util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS,
TEMP_CLASS, MAX_MSGS >::PresMsgPtr_t  [private]
```

Type definition for a shared pointer to the pressure data message.

10.4.2.2 PresMsgVector_t

```
template<class PRES_CLASS , class SALN_CLASS , class TEMP_CLASS , unsigned int MAX_MSGS>
typedef static_vector<PresMsgPtr_t, MAX_MSGS> util::xmsg::AbstractXSensorDataComposite< PRES_↩
CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::PresMsgVector_t  [private]
```

Type definition for a static vector (of size MAX_MSGS) of shared pointers to the pressure data message.

10.4.2.3 SalnMsgPtr_t

```
template<class PRES_CLASS , class SALN_CLASS , class TEMP_CLASS , unsigned int MAX_MSGS>
typedef shared_ptr<SALN_CLASS> util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS,
TEMP_CLASS, MAX_MSGS >::SalnMsgPtr_t  [private]
```

Type definition for a shared pointer to the salinity data message.

10.4.2.4 SalnMsgVector_t

```
template<class PRES_CLASS , class SALN_CLASS , class TEMP_CLASS , unsigned int MAX_MSGS>
typedef static_vector<SalnMsgPtr_t, MAX_MSGS> util::xmsg::AbstractXSensorDataComposite< PRES_↩
CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::SalnMsgVector_t  [private]
```

Type definition for a static vector (of size MAX_MSGS) of shared pointers to the salinity data message.

10.4.2.5 TempMsgPtr_t

```
template<class PRES_CLASS , class SALN_CLASS , class TEMP_CLASS , unsigned int MAX_MSGS>
typedef shared_ptr<TEMP_CLASS> util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS,
TEMP_CLASS, MAX_MSGS >::TempMsgPtr_t  [private]
```

Type definition for a shared pointer to the temperature data message.

10.4.2.6 TempMsgVector_t

```
template<class PRES_CLASS , class SALN_CLASS , class TEMP_CLASS , unsigned int MAX_MSGS>
typedef static_vector<TempMsgPtr_t, MAX_MSGS> util::xmsg::AbstractXSensorDataComposite< PRES_↩
CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::TempMsgVector_t  [private]
```

Type definition for a static vector (of size MAX_MSGS) of shared pointers to the temperature data message.

10.4.3 Constructor & Destructor Documentation

10.4.3.1 AbstractXSensorDataComposite()

```
template<class PRES_CLASS , class SALN_CLASS , class TEMP_CLASS , unsigned int MAX_MSGS>
util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::↩
AbstractXSensorDataComposite ()  [inline]
```

The constructor.

The field aggregated_data_valid_ initialized to FALSE, and the aggregated sensor data vectors reserve XMSG_INIT_SAM_N_RESERVE samples.

References util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::aggregated_p
util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::aggregated_saln_data_,
util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::aggregated_temp_data_,
and XMSG_INIT_SAM_N_RESERVE.

10.4.3.2 ~AbstractXSensorDataComposite()

```
template<class PRES_CLASS , class SALN_CLASS , class TEMP_CLASS , unsigned int MAX_MSGS>
virtual util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS
>::~AbstractXSensorDataComposite ()  [inline], [virtual]
```

The destructor.

10.4.4 Member Function Documentation

10.4.4.1 AggregateSensorData()

```
template<class PRES_CLASS , class SALN_CLASS , class TEMP_CLASS , unsigned int MAX_MSGS>
void util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::↩
AggregateSensorData ()  [inline], [protected]
```

Aggregate the sensor data for this composite sensor data object.

This function iterates over each of the sensor data messages assigned to this composite data object, and copies of the sensor data values into the corresponding sensor data vector.

If aggregated_data_valid_ is TRUE, then this function will have no effect. Otherwise, each of the aggregegated sensor data vectors will be cleared and the appropriate number of samples will be reserved.

Then, the sensor data message will be iterated over in order of increasing message indices, and the sensor data values will be copied into the corresponding sensor data vector in the appropriate order.

Finally, aggregated_data_valid_ will be set to FALSE to ensure that subsequent calls to this function will have no effect, until another sensor data message object is assigned to this composite object and aggregated_data_valid_ is set to TRUE.

Exceptions

util::log::MessageException	if an error occurs while aggregating the sensor data.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

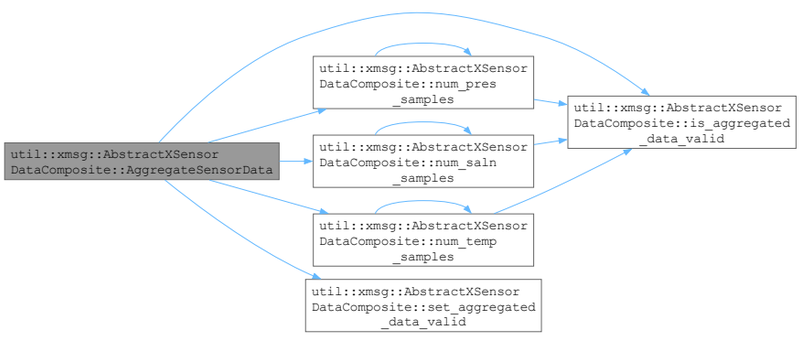
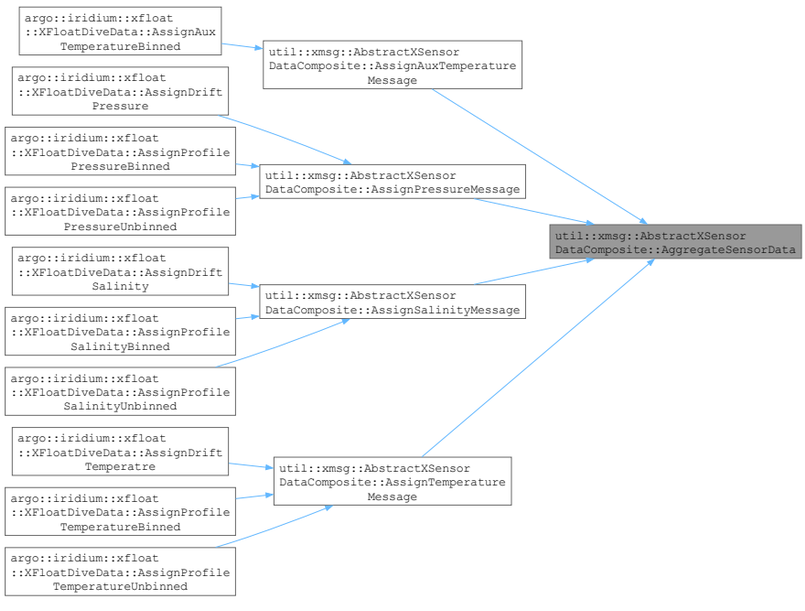
and util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AssignTemperatureM

Here is the call graph for this function:



Here is the caller graph for this function:



10.4.4.2 AssignAuxTemperatureMessage()

```
template<class PRES_CLASS , class SALN_CLASS , class TEMP_CLASS , unsigned int MAX_MSGS>
void util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::↩
AssignAuxTemperatureMessage (
            const TempMsgPtr_t & x)  [inline]
```

Assign an auxiliary-channel temperature message and re-aggregate the sensor data.

The message is inserted in order of message index, and the aggregated sensor data is rebuilt.

Parameters

in	*x*	The auxiliary-channel temperature message to assign.

Exceptions

util::log::MessageException	if x is NULL or an auxiliary temperature message with the same index has already been assigned.

References util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AggregateSer

10.4.4.3 AssignPressureMessage()

```
template<class PRES_CLASS , class SALN_CLASS , class TEMP_CLASS , unsigned int MAX_MSGS>
void util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::↩
AssignPressureMessage (
            const PresMsgPtr_t & x)  [inline]
```

Assign a pressure data message to this composite data object.

The pressure data message will be emplaced into the sensor data message vector in order of increasing message indices. If a message with the same index is as x is already contained in the vector, then an exception will be thrown.

Parameters

in	*x*	A shared pointer to the pressure data message.

Exceptions

util::log::MessageException	if x is a null pointer, a duplicate message index is encountered, or any other error occurs.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

10.4.4.4 AssignSalinityMessage()

```
template<class PRES_CLASS , class SALN_CLASS , class TEMP_CLASS , unsigned int MAX_MSGS>
void util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::↩
AssignSalinityMessage (
            const SalnMsgPtr_t & x)  [inline]
```

Assign a salinity data message to this composite data object.

The salinity data message will be emplaced into the sensor data message vector in order of increasing message indices. If a message with the same index is as x is already contained in the vector, then an exception will be thrown.

Parameters

in	*x*	A shared pointer to the salinity data message.

Exceptions

util::log::MessageException	if x is a null pointer, a duplicate message index is encountered, or any other error occurs.

Note

This object will be locked for the scope of the execution of this function. 10.4.4.6 GenerateListingString()

```
template<class PRES_CLASS , class SALN_CLASS , class TEMP_CLASS , unsigned int MAX_MSGS>
virtual const string util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_↩
CLASS, MAX_MSGS >::GenerateListingString (
            int id_inst,
            int id_dive,
            uint16_t pg,
            uint16_t po,
            uint16_t sg,
            uint16_t so,
            uint16_t tg,
            uint16_t to,
            float pc) const  [pure virtual]
```

Generate a listing string representation of the this composite sensor data object.

Parameters

in	*id_inst*	The unique instrument identifier for this composite sensor data object.
in	*id_dive*	The dive or cycle number for this composite data object.
in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*sg*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*so*	The salinity sensor offset, in PSU.
in	*tg*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*to*	The temperature sensor offset, in degC.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Exceptions

log::MessageException	if an error occurs while generating the listing string.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

A listing string representation of this composite sensor data object.

Implemented in util::xmsg::XCompositeDrift, util::xmsg::XCompositeHiResProfile, and util::xmsg::XCompositeProfile.

10.4.4.7 HasContiguousMessageIndices()

```
template<class PRES_CLASS , class SALN_CLASS , class TEMP_CLASS , unsigned int MAX_MSGS>
bool util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::↩
HasContiguousMessageIndices () const  [inline]
```

Do the sensor data messages assigned to this composite data object have contiguous message indices?

This function is used, in part, to determine the sensor data is complete.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

TRUE if the sensor data messages have contiguous message indices or if there is less than two of each sensor data message, or FALSE otherwise.

References CATCH_BLOCK, ldbg, util::thread::RecursiveLockable::mutex_, util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::saln_messages_, and util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::temp_messages_.

10.4.4.8 is_aggregated_data_valid()

```
template<class PRES_CLASS , class SALN_CLASS , class TEMP_CLASS , unsigned int MAX_MSGS>
bool util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >↩
::is_aggregated_data_valid () const  [inline]
```

Is the aggregated data valid?

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

TRUE if the aggregated sensor is valid, or FALSE otherwise.

```
template<class PRES_CLASS , class SALN_CLASS , class TEMP_CLASS , unsigned int MAX_MSGS>
bool util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::↩
IsDataComplete () const  [inline]
```

Is the sensor data for this composite date message complete?

This function returns true if

- this composite sensor data object is not empty,
- the sensor data messages assigned to this composite data object have contiguous message indices,
- this sensor data object contains the same number of temperature and pressure sensor values, and
- the number of salinity data samples is either zero or equal to the number of pressure data samples.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

TRUE if the sensor data is complete, or FALSE otherwise.

10.4.5 Member Data Documentation

10.4.5.1 aggregated_data_valid_

```
template<class PRES_CLASS , class SALN_CLASS , class TEMP_CLASS , unsigned int MAX_MSGS>
bool util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >↩
::aggregated_data_valid_  [private]
```

The aggregated data is valid flag.

This flag indicates the status of the aggregated sensor data. It is used to ensure the composite sensor data is aggregated only once following each assignment of sensor data to the composite data message.

This field is set to FALSE during initialization, and is set to FALSE each time a sensor data message is assigned to the composite data message. Each time AggregateSensorData() is called, the data will be aggregated, and this field will be set to TRUE.

Referenced by util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::is_aggrega and util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::set_aggregated_data_

10.4.5.2 aggregated_pres_data_

```
template<class PRES_CLASS , class SALN_CLASS , class TEMP_CLASS , unsigned int MAX_MSGS>
vector<int32_t> util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS,
MAX_MSGS >::aggregated_pres_data_  [private]
```

A vector of the aggregated pressure data samples, in raw counts.

Each time the data is aggregated, the sensor data samples from the sensor data messages assigned to this composite objects are stored in this vector.

Referenced by util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AbstractXS

- template<typename T = float>
  T **PresMinAsFloat** (uint16_t gain, uint16_t offs, float pres_correction=0) const
- void Reset ()

  Remove all assigned messages and clear the aggregated data.
- void ResetAggregatedData ()

  Clear the aggregated time series and its derived pressure statistics.
- virtual size_t **SampleCount** () const

- int32_t SamplePres (size_t i) const

  Get the i^{th} pressure sensor value, in raw counts.
- template<typename T = float>
  T SamplePresAsFloat (size_t i, int16_t pg, int16_t po, float pc) const

  Get the i^{th} pressure sensor value, in dBar.
- int32_t SampleSaln (size_t i) const

  Get the i^{th} salinity sensor value, in raw counts.
- template<typename T = float>
  T SampleSalnAsFloat (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} salinity sensor value, in PSU.
- int32_t SampleTemp (size_t i) const

  Get the i^{th} temperature sensor value, in raw counts.
- template<typename T = float>
  T SampleTempAsFloat (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} temperature sensor value, in degC.

10.5.1 Detailed Description

template<class MSG_CLASS>
class util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >

The abstract time-series data composite class template.

This template aggregates the indexed time-series X-messages of type `MSG_CLASS` received for a single dive into one time series. It is used for the surface time-series data (see XCompositeSurfaceData).

10.5.2 Member Function Documentation

10.5.2.1 AggregateSensorData()

```
template<class MSG_CLASS >
virtual void util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData ()
[inline], [protected], [virtual]
```

Combine the assigned time-series messages into one aggregated time series.

Does nothing if the aggregated data is already valid. Otherwise the aggregated data is cleared and rebuilt from the messages, in message-index order: the pressure counts and phase codes, plus temperature and salinity counts for messages in the XRISEFALL_FMT_STNDRD_WITH_TEMP_AND_SALN format. Salinity data is dropped if it contains no valid samples (temperature-only instruments).

The pressure maximum, minimum and mean are computed from the valid samples (ignoring XMSG_SENS_BAD and 0xFFFF), after applying the static gain (derived_fields_static_gain_exp). The aggregated data is marked valid only if there is at least one valid pressure sample.

Exceptions

util::log::MessageException	if no messages are assigned or the message format is unsupported.

Reimplemented in util::xmsg::XCompositeSurfaceData.

References CATCH_BLOCK, EXC_THROW, util::date::DateUtils::GenerateIso8601String(), util::xmsg::AbstractXTimeSeriesDataCompos
ldbg, lwrn, util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::ResetAggregatedData(), util::xmsg::AbstractXTimeSeriesD
XMSG_SENS_BAD, util::xmsg::XRISEFALL_FMT_LEGACY, util::xmsg::XRISEFALL_FMT_STNDRD, util::xmsg::XRISEFALL_FMT_STN
and util::xmsg::XRISEFALL_FMT_UNKNOWN.

10.5.2.2 AssignMessage()

```
template<class MSG_CLASS >
virtual void util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AssignMessage (
            const MsgPtr_t & x)  [inline], [virtual]
```

Assign a time-series message to this composite and re-aggregate the time series.

The message is inserted in order of message index, and AggregateSensorData() is called to rebuild the combined time series.

Parameters

in	*x*	The time-series message to assign.

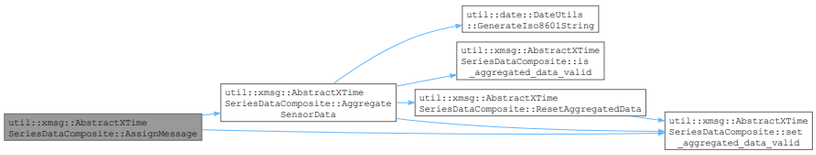
Exceptions

util::log::MessageException	if x is NULL or a message with the same index has already been assigned.

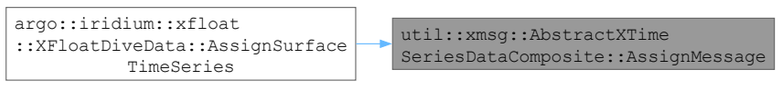
References util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), CATCH_BLOCK, EXC_THROW, ldbg, and util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::set_aggregated_data_valid().

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignSurfaceTimeSeries().

Here is the call graph for this function:



Here is the caller graph for this function:



10.5.2.3 is_aggregated_data_valid()

```
template<class MSG_CLASS >
bool util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::is_aggregated_data_valid () const
[inline]
```

Is the aggregated data valid?

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

TRUE if the aggregated sensor is valid, or FALSE otherwise.

References util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::aggregated_data_valid_.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData().

Here is the caller graph for this function:

10.5.2.4 IsEmpty()

```
template<class MSG_CLASS >
bool util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::IsEmpty () const  [inline]
```

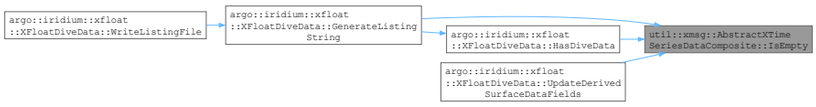
Is this composite data object empty?

Returns

TRUE if empty, or FALSE otherwise.

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString(), argo::iridium::xfloat::XFloatDiveData::HasDiveData(), and argo::iridium::xfloat::XFloatDiveData::UpdateDerivedSurfaceDataFields().

Here is the caller graph for this function:



10.5.2.5 Reset()

```
template<class MSG_CLASS >
void util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::Reset ()  [inline]
```

Remove all assigned messages and clear the aggregated data.

Exceptions

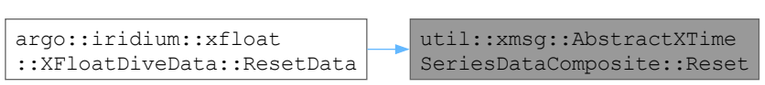
util::log::MessageException	if an error occurs.

References CATCH_BLOCK, and util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::ResetAggregatedData().

Referenced by argo::iridium::xfloat::XFloatDiveData::ResetData().

Here is the call graph for this function:

Here is the caller graph for this function:



10.5.2.6 ResetAggregatedData()

```
template<class MSG_CLASS >
void util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::ResetAggregatedData ()  [inline]
```

Clear the aggregated time series and its derived pressure statistics.

The assigned messages are kept; the next call to `AggregateSensorData()` rebuilds the aggregated data from them.

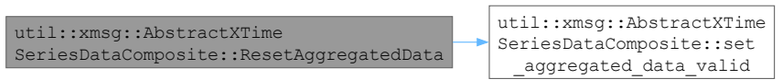
Exceptions

util::log::MessageException	if an error occurs.

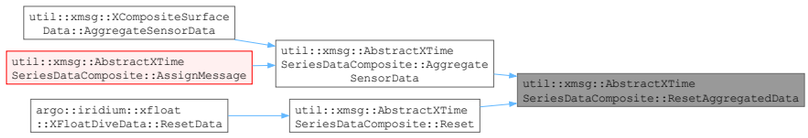
References CATCH_BLOCK, util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::set_aggregated_data_valid(), and XMSG_SENS_BAD.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), and util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::Reset().

Here is the call graph for this function:



Here is the caller graph for this function:



10.5.2.7 SamplePres()

```
template<class MSG_CLASS >
int32_t util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::SamplePres (
            size_t i) const  [inline]
```

Get the i^{th} pressure sensor value, in raw counts.

Parameters

in	*i*	The index of the pressure sensor sample to return. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD will be returned.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} pressure sensor value, in raw counts, or XMSG_SENS_BAD if the index `i` exceeds the number of pressure sensor samples in the aggregated data vector.

References XMSG_SENS_BAD.

10.5.2.8 SamplePresAsFloat()

```
template<class MSG_CLASS >
template<typename T = float>
T util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::SamplePresAsFloat (
            size_t i,
            int16_t pg,
            int16_t po,
            float pc) const  [inline]
```

Get the i^{th} pressure sensor value, in dBar.

Parameters

in	*i*	The index of the sensor value. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_PRES will be returned.
in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} pressure sensor value, in dBar. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_PRES will be returned.

References CATCH_BLOCK, XMSG_SENS_BAD_PRES, and XMSG_SENS_MAX_PRES.

10.5.2.9 SampleSaln()

```
template<class MSG_CLASS >
int32_t util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::SampleSaln (
            size_t i) const  [inline]
```

Get the i^{th} salinity sensor value, in raw counts.

Parameters

in	*i*	The index of the salinity sensor sample to return. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD will be returned.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} salinity sensor value, in raw counts, or XMSG_SENS_BAD if the index `i` exceeds the number of pressure sensor samples in the aggregated data vector.

References XMSG_SENS_BAD.

10.5.2.10 SampleSalnAsFloat()

```
template<class MSG_CLASS >
template<typename T = float>
T util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::SampleSalnAsFloat (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline]
```

Get the i^{th} salinity sensor value, in PSU.

Parameters

in	*i*	The index of the sensor value. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_SALN will be returned.
in	*gain*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*offs*	The salinity sensor offset, in PSU.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} salinity sensor value, in PSU. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_SALN will be returned.

References CATCH_BLOCK, XMSG_SENS_BAD_SALN, and XMSG_SENS_MAX_SALN.

10.5.2.11 SampleTemp()

```
template<class MSG_CLASS >
int32_t util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::SampleTemp (
            size_t i) const  [inline]
```

Get the i^{th} temperature sensor value, in raw counts.

Parameters

in	*i*	The index of the temperature sensor sample to return. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD will be returned.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} temperature sensor value, in raw counts, or XMSG_SENS_BAD if the index `i` exceeds the number of pressure sensor samples in the aggregated data vector.

References XMSG_SENS_BAD.

10.5.2.12 SampleTempAsFloat()

```
template<class MSG_CLASS >
template<typename T = float>
T util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::SampleTempAsFloat (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline]
```

Get the i^{th} temperature sensor value, in degC.

Parameters

in	*i*	The index of the sensor value. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_SALN will be returned.
in	*gain*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*offs*	The temperature sensor offset, in degC.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} temperature sensor value, in degC. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_TEMP will be returned.

References CATCH_BLOCK, XMSG_SENS_BAD_TEMP, and XMSG_SENS_MAX_TEMP.

10.5.2.13 set_aggregated_data_valid()

```
template<class MSG_CLASS >
void util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::set_aggregated_data_valid (
            bool valid)  [inline], [protected]
```

Set the value of the aggregated_data_valid_ field.

Parameters

in	*valid*	TRUE if the aggregated data is valid, or FALSE otherwise.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

10.5.3 Member Data Documentation

10.5.3.1 aggregated_data_valid_

```
template<class MSG_CLASS >
bool util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::aggregated_data_valid_  [private]
```

The aggregated data is valid flag.

This flag indicates the status of the aggregated sensor data. It is used to ensure the composite sensor data is aggregated only once following each assignment of sensor data to the composite data message.

This field is set to FALSE during initialization, and is set to FALSE each time a sensor data message is assigned to the composite data message. Each time `AggregateSensorData()` is called, the data will be aggregated, and this field will be set to TRUE.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::is_aggregated_data_valid(), and util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::set_aggregated_data_valid().

The documentation for this class was generated from the following file:

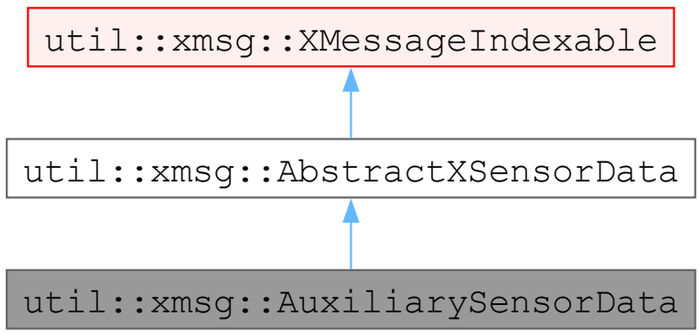
10.6 util::xmsg::AuxiliarySensorData Class Reference

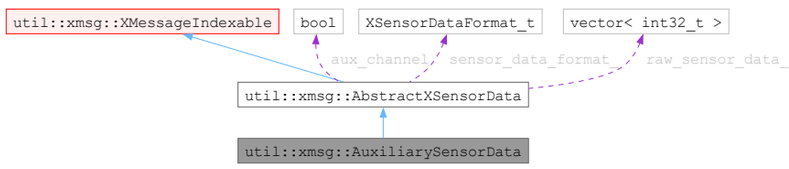
The auxiliary sensor data class.

`#include <AuxiliarySensorData.h>`

Inheritance diagram for util::xmsg::AuxiliarySensorData:



Collaboration diagram for util::xmsg::AuxiliarySensorData:



Public Member Functions

- AuxiliarySensorData ()
  Default constructor.
- virtual ~AuxiliarySensorData ()
  Destructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)
  Check the X-message for the correct ID, minimum size, and message terminator.
- virtual void DecodeXMsgData (const vector< uint8_t > &data)=0
  Decode the X message.
- int16_t id_dive () const
  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const
  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const
  Get the enumerated X-Message type identifier.
- bool **is_aux_channel** () const
- size_t num_samples () const
  Get the number of samples in this message.
- const vector< int32_t > & raw_sensor_data () const
  Get the raw sensor data vector.
- int32_t Sample (size_t i) const
  Get the raw integer value of the i^{th} sample.
- template<typename T = double>
  T SampleValue (size_t i, int16_t gain, int16_t offs) const
  Get the i^{th} sensor value in scientific units.
- template<typename T = double>
  T SampleValueAsPressure (size_t i, int16_t gain, int16_t offs) const

Get the i^{th} pressure sensor value, in dBar.

- template<typename T = double>
  T SampleValueAsSalinity (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} salinity sensor value, in PSU.
- template<typename T = double>
  T SampleValueAsTemperature (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} temperature sensor value, in degC.
- XSensorDataFormat_t sensor_data_format () const

  Get the enumerated sensor data format value.
- uint8_t xmsg_index () const

  Get the index of this X-Message.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Protected Member Functions

- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_raw_sensor_data (const vector< int32_t > &raw_sensor_data)

  Set raw integer counts of the measured sensor data.
- void set_sensor_data_format (XSensorDataFormat_t sensor_data_format)

  Set the sensor data format.
- void set_xmsg_index (uint8_t xmsg_index)

  Set the index of this X-Message.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.
- vector< int32_t > UnpackSensorData (const vector< uint8_t > &data)

  Unpack the sensor data from the binary message.

Protected Attributes

- bool **aux_channel**
- vector< int32_t > raw_sensor_data_

  The raw integer counts of the measured sensor data.
- XSensorDataFormat_t sensor_data_format_

  The enumerated sensor data packing format.

Private Attributes

- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint8_t xmsg_index_

  The index of this X-Message.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.6.1 Detailed Description

The auxiliary sensor data class.

An instance of this class represents sensor data from an instrument's auxiliary sensor channel, decoded in the same way as the primary sensor data (see AbstractXSensorData).

10.6.2 Constructor & Destructor Documentation

10.6.2.1 AuxiliarySensorData()

```
util::xmsg::AuxiliarySensorData::AuxiliarySensorData ()  [inline]
```

Default constructor.

10.6.2.2 ~AuxiliarySensorData()

```
virtual util::xmsg::AuxiliarySensorData::~AuxiliarySensorData ()  [inline], [virtual]
```

Destructor.

10.6.3 Member Function Documentation

10.6.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::XMessage::set_xmsg_size_byte
u16, and util::xmsg::XMessage::xmsg_size_bytes().

10.6.3.2 DecodeXMsgData()

```
virtual void util::xmsg::AbstractXSensorData::DecodeXMsgData (
            const vector< uint8_t > & data)  [pure virtual], [inherited]
```

Decode the X message.

Parameters

in	*data*	The encoded X message to decode.

Implements util::xmsg::XMessageIndexable.

Implemented in util::xmsg::XDriftPressure, util::xmsg::XDriftSalinity, util::xmsg::XDriftTemperature, util::xmsg::XHiResPressure, util::xmsg::XHiResSalinity, util::xmsg::XHiResTemperature, util::xmsg::XProfilePressure, util::xmsg::XProfileSalinity, and util::xmsg::XProfileTemperature.

10.6.3.3 id_dive()

```
int16_t util::xmsg::XMessage::id_dive () const  [inline], [inherited]
```

Get the dive or cycle number of this X-Message.

Returns

The dive or cycle number of this X-Message.

References util::xmsg::XMessage::id_dive_.

Here is the caller graph for this function:

10.6.3.6 num_samples()

```
size_t util::xmsg::AbstractXSensorData::num_samples () const  [inline], [inherited]
```

Get the number of samples in this message.

Returns

The number of samples in this message.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

10.6.3.7 raw_sensor_data()

```
const vector< int32_t > & util::xmsg::AbstractXSensorData::raw_sensor_data () const  [inline],
[inherited]
```

Get the raw sensor data vector.

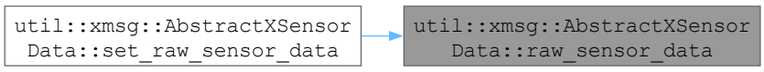
Returns

The raw sensor data vector.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

Referenced by util::xmsg::AbstractXSensorData::set_raw_sensor_data().

Here is the caller graph for this function:



10.6.3.8 Sample()

```
int32_t util::xmsg::AbstractXSensorData::Sample (
            size_t i) const  [inline], [inherited]
```

Get the raw integer value of the i^{th} sample.

Parameters

in	*i*	The index of the sensor value.

Returns

The raw integer value of the i^{th} ith sample.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

10.6.3.9 SampleValue()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValue (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} sensor value in scientific units.

Parameters

in	*i*	The index of the sensor value.
in	*gain*	The sensor sensitivity scale factor.
in	*offs*	The sensor offset.

Returns

The i^{th} sensor value in scientific units.

References CATCH_BLOCK, and util::xmsg::AbstractXSensorData::raw_sensor_data_.

Referenced by util::xmsg::AbstractXSensorData::SampleValueAsPressure(), util::xmsg::AbstractXSensorData::SampleValueAsSalinity(), and util::xmsg::AbstractXSensorData::SampleValueAsTemperature().

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValueAsPressure (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} pressure sensor value, in dBar.

Parameters

in	*i*	The index of the sensor value.
in	*gain*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*offs*	The pressure sensor offset, in dBar.

Returns

The i^{th} pressure sensor value, in dBar.

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValueAsSalinity (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} salinity sensor value, in PSU.

Parameters

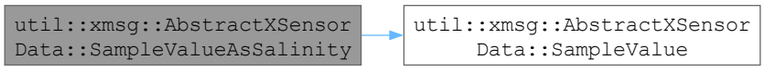
in	*i*	The index of the sensor value.
in	*gain*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*offs*	The salinity sensor offset, in PSU.

Returns

The i^{th} salinity sensor value, in PSU.

References util::xmsg::AbstractXSensorData::SampleValue(), XMSG_SENS_BAD_SALN, and XMSG_SENS_MAX_SALN.

Here is the call graph for this function:



10.6.3.12 SampleValueAsTemperature()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValueAsTemperature (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} temperature sensor value, in degC.

Parameters

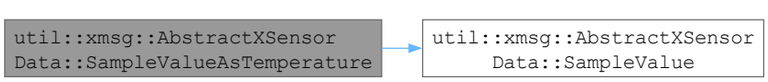
in	*i*	The index of the sensor value.
in	*gain*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*offs*	The temperature sensor offset, in degC.

Returns

The i^{th} temperature sensor value, in degC.

References util::xmsg::AbstractXSensorData::SampleValue(), XMSG_SENS_BAD_TEMP, and XMSG_SENS_MAX_TEMP.

Here is the call graph for this function:



10.6.3.13 sensor_data_format()

```
XSensorDataFormat_t util::xmsg::AbstractXSensorData::sensor_data_format () const  [inline], [inherited]
```

Get the enumerated sensor data format value.

Returns

The enumerated sensor data format value.

References util::xmsg::AbstractXSensorData::sensor_data_format_.

Referenced by util::xmsg::AbstractXSensorData::set_sensor_data_format().

10.6.3.14 set_id_dive()

```
void util::xmsg::XMessage::set_id_dive (
            int16_t id_dive)  [inline], [protected], [inherited]
```

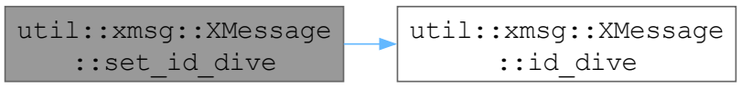
Set the dive or cycle number of this message.

Parameters

in	*id_dive*	The dive or cycle number of this message to set.

References util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::id_dive_.

Here is the call graph for this function:



10.6.3.15 set_id_instrument()

```
void util::xmsg::XMessage::set_id_instrument (
            uint16_t id_instrument)  [inline], [protected], [inherited]
```

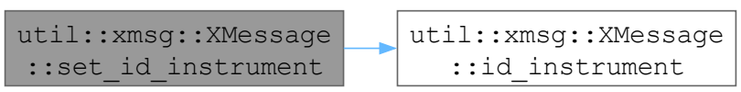
Set the unique instrument identifier.

Parameters

in	*id_instrument*	The unique instrument identifier to set.

References util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::id_instrument_.

Here is the call graph for this function:



10.6.3.16 set_id_xmsg_type()

```
void util::xmsg::XMessage::set_id_xmsg_type (
            XMsgTypeId_t id_xmsg_type)  [inline], [protected], [inherited]
```

Set the X-Message type identifier.

Parameters

in	*id_xmsg_type*	The X-Message type identifier to set.

References util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::id_xmsg_type_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), util::xmsg::AbstractXSensorData::UnpackSensorData(), and UnpackSensorData().

10.6.3.20 set_xmsg_size_bytes()

```
void util::xmsg::XMessage::set_xmsg_size_bytes (
            uint16_t xmsg_size_bytes)  [inline], [protected], [inherited]
```

Set the size of the X-Message, in bytes.

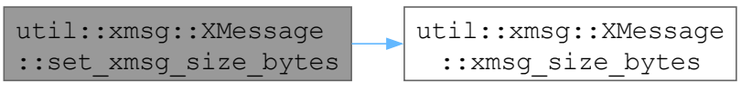
Parameters

in	*xmsg_size_bytes*	The size of the X-Message to set, in bytes.

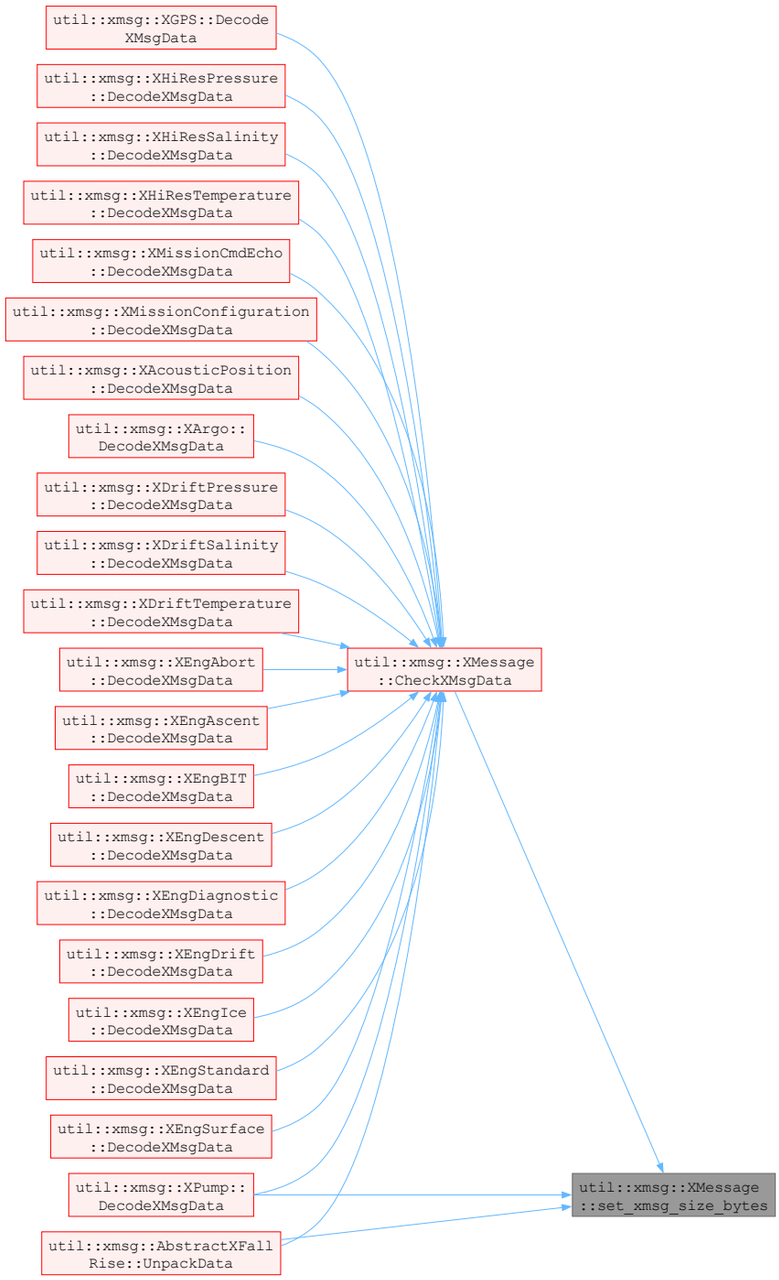
References util::xmsg::XMessage::xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), util::xmsg::XPump::DecodeXMsgData(), and util::xmsg::AbstractXFallRise::Unpa

Here is the call graph for this function:



Here is the caller graph for this function:



10.6.3.21 UnpackSensorData()

```
vector< int32_t > util::xmsg::AuxiliarySensorData::UnpackSensorData (
            const vector< uint8_t > & data)  [inline], [protected], [virtual]
```

Unpack the sensor data from the binary message.

This field unpacks the encoded sensor data from the message and stores the decoded sensor values in raw_sensor_data_. First the function checks the size of the message, and the data packing format. The message data is decoded according to the packing format type. Both first-difference and curvature encoding are supported. The encoding method is determined from the value of the high nibble of byte `data`[1].

Once this function completes successfully, then the data may be recovered in scientific units from the raw sensor values by applying the appropriate sensor gain and offset values.

Parameters

in	*data*	The binary message to unpack, in a vector of unsigned bytes.

Warning

The function assumes the message data is valid. Message validity should be ensured before this function is called.

Exceptions

util::log::MessageException	if • an error occurs while decoding the message, • the message is of insufficient length, or • an invalid packing format is encountered.

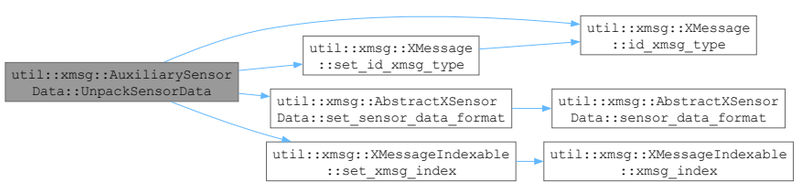
Returns

The sensor data raw counts, in a vector of signed integers.

Reimplemented from util::xmsg::AbstractXSensorData.

References CATCH_BLOCK, CATCH_NOTHROW, EXC_THROW, i24, util::xmsg::XMessage::id_xmsg_type(), ldbg, util::xmsg::AbstractXSensorData::raw_sensor_data_, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::AbstractXSensorData::set_s util::xmsg::XMessageIndexable::set_xmsg_index(), u16, u24, XMSG_SENS_MAX_SUB, util::xmsg::XMSG_TYPE_ID_PRES0, util::xmsg::XMSG_TYPE_ID_PRES_DRIFT8, util::xmsg::XMSG_TYPE_ID_PRES_HI_RES0, util::xmsg::XMSG_TYPE_ID_SALN0, util::xmsg::XMSG_TYPE_ID_SALN_DRIFT8, util::xmsg::XMSG_TYPE_ID_SALN_HI_RES0, util::xmsg::XMSG_TYPE_ID_TEMP0, util::xmsg::XMSG_TYPE_ID_TEMP_DRIFT8, util::xmsg::XMSG_TYPE_ID_TEMP_HI_RES0, util::xmsg::XSENS_FMT_CURVATURE, and util::xmsg::XSENS_FMT_DIFFERENCE.

Here is the call graph for this function:



10.6.3.22 xmsg_index()

```
uint8_t util::xmsg::XMessageIndexable::xmsg_index () const  [inline], [inherited]
```

Get the index of this X-Message.

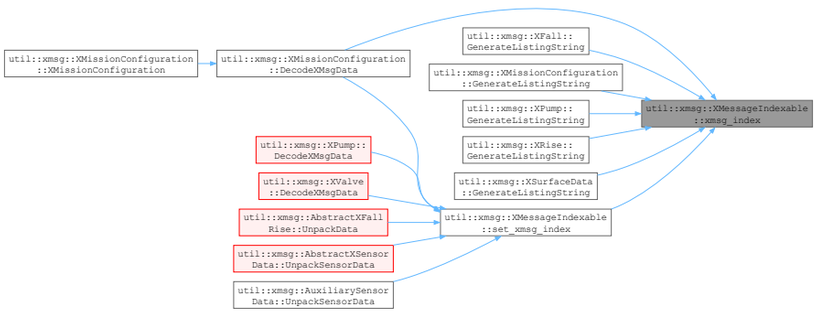
Returns

The index of this X-Message.

References util::xmsg::XMessageIndexable::xmsg_index_.

Referenced by util::xmsg::XMissionConfiguration::DecodeXMsgData(), util::xmsg::XFall::GenerateListingString(), util::xmsg::XMissionConfiguration::GenerateListingString(), util::xmsg::XPump::GenerateListingString(), util::xmsg::XRise::GenerateListing util::xmsg::XSurfaceData::GenerateListingString(), and util::xmsg::XMessageIndexable::set_xmsg_index().

Here is the caller graph for this function:



10.6.3.23 xmsg_size_bytes()

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes () const  [inline], [inherited]
```

Get the size of the X-Message, in bytes.

Returns

The size of the X-Message, in bytes.

References util::xmsg::XMessage::xmsg_size_bytes_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), util::xmsg::XArgo::DecodeXMsgData(), util::xmsg::XEngDescent::DecodeXMsgI util::xmsg::XEngIce::DecodeXMsgData(), util::xmsg::XEngSurface::DecodeXMsgData(), util::xmsg::XPump::DecodeXMsgData(), util::xmsg::XValve::DecodeXMsgData(), util::xmsg::XWave::DecodeXMsgData(), util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::AbstractXFallRise::UnpackData().

10.6.4 Member Data Documentation

10.6.4.1 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.6.4.2 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.6.4.3 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.6.4.4 raw_sensor_data_

```
vector<int32_t> util::xmsg::AbstractXSensorData::raw_sensor_data_  [protected], [inherited]
```

The raw integer counts of the measured sensor data.

This vector of integers represents the "raw" sample values of the message. That is, by applying the appropriate gain and offset corrections, the sensor values may be recovered in scientific units. This data may represent pressure, temperature, salinity, or any other data that is recorded during the drift or profile phases of the dive cycle.

Referenced by util::xmsg::AbstractXSensorData::num_samples(), util::xmsg::AbstractXSensorData::raw_sensor_data(), util::xmsg::AbstractXSensorData::Sample(), util::xmsg::AbstractXSensorData::SampleValue(), util::xmsg::AbstractXSensorData::set_raw_ util::xmsg::AbstractXSensorData::UnpackSensorData(), and UnpackSensorData().

10.6.4.5 sensor_data_format_

```
XSensorDataFormat_t util::xmsg::AbstractXSensorData::sensor_data_format_  [protected], [inherited]
```

The enumerated sensor data packing format.

This field indicates the format of encoded sensor data. The manner in which the sensor data is decoded is determined by the format of this field.

Referenced by util::xmsg::AbstractXSensorData::sensor_data_format(), and util::xmsg::AbstractXSensorData::set_sensor_data_format().

10.6.4.6 xmsg_index_

```
uint8_t util::xmsg::XMessageIndexable::xmsg_index_  [private], [inherited]
```

The index of this X-Message.

Referenced by util::xmsg::XMessageIndexable::set_xmsg_index(), and util::xmsg::XMessageIndexable::xmsg_index().

10.6.4.7 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

- data/xmsg/AuxiliarySensorData.h

10.7 util::mysql::Column_bool< C > Class Template Reference

Template column description class for value of type bool.

```

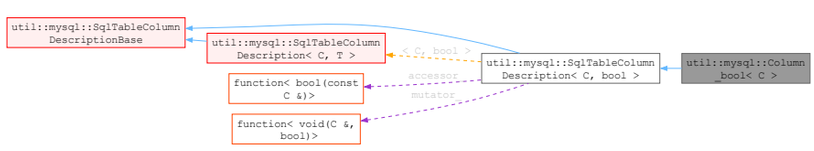
Inheritance diagram for util::mysql::Column_bool< C >:

Collaboration diagram for util::mysql::Column_bool< C >:



Public Member Functions

- Column_bool (string column_name, bool(C::*accessor)() const =NULL, void(C::*mutator)(bool)=NULL, bool is_primary_key=false)

  The parameterized constructor.
- size_t column_index () const

  Get the index of the SQL table column.
- const string & column_name () const

  Get the name of the SQL table column.
- string column_select_name () const

  Get the name of the SQL table column to be used in a `SELECT` query.
- ColumDataType_t data_type () const

  Get the the enumerated SQL column data type.
- bool is_primary_key () const

  Is this column a primary key for the corresponding SQL database table?
- void set_column_index (size_t idx)

  Set the index of this SQL table column.
- void SetObjectValueFromResultSet (C &obj, const ResultSet &results) const

  Set the value in the field of the corresponding object from an SQL ResultSet Object.
- void SetPreparedStatementValueFromObject (const C &obj, PreparedStatement &stmt) const

  Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Protected Member Functions

- bool GetValueFromObject (const C &obj) const

  Get the object member value from the object.
- void SetObjectValue (C &obj, const bool &value) const

  Set the object member value.

Private Attributes

- function< bool(const C &)> accessor_

  The accessor function object wrapper.
- size_t column_index_

  The index of the SQL table column.
- string column_name_

  The name of the SQL table column.
- ColumDataType_t data_type_

  The enumerated SQL table column data type.
- bool is_primary_key_

  Indicates whether the column is part of the primary key for the SQL table.
- function< void(C &, bool)> mutator_

  The mutator function object wrapper.

10.7.1 Detailed Description

template<class C>
class util::mysql::Column_bool< C >

Template column description class for value of type bool.

10.7.2 Constructor & Destructor Documentation

10.7.2.1 Column_bool()

```
template<class C >
util::mysql::Column_bool< C >::Column_bool (
            string column_name,
            bool(C::* accessor )() const = NULL,
            void(C::* mutator )(bool) = NULL,
            bool is_primary_key = false)  [inline]
```

The parameterized constructor.

Parameters

in	*column_name*	The name of the SQL table column.
in	*accessor*	A pointer to the accessor method for acquiring the value of the corresponding object field.
in	*mutator*	A pointer to the mutator method for setting the value of the corresponding object field.
in	*is_primary_key*	TRUE if this column is a primary key for the SQL table, or FALSE otherwise.

10.7.3 Member Function Documentation

10.7.3.1 column_index()

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index () const  [inline], [inherited]
```

Get the index of the SQL table column.

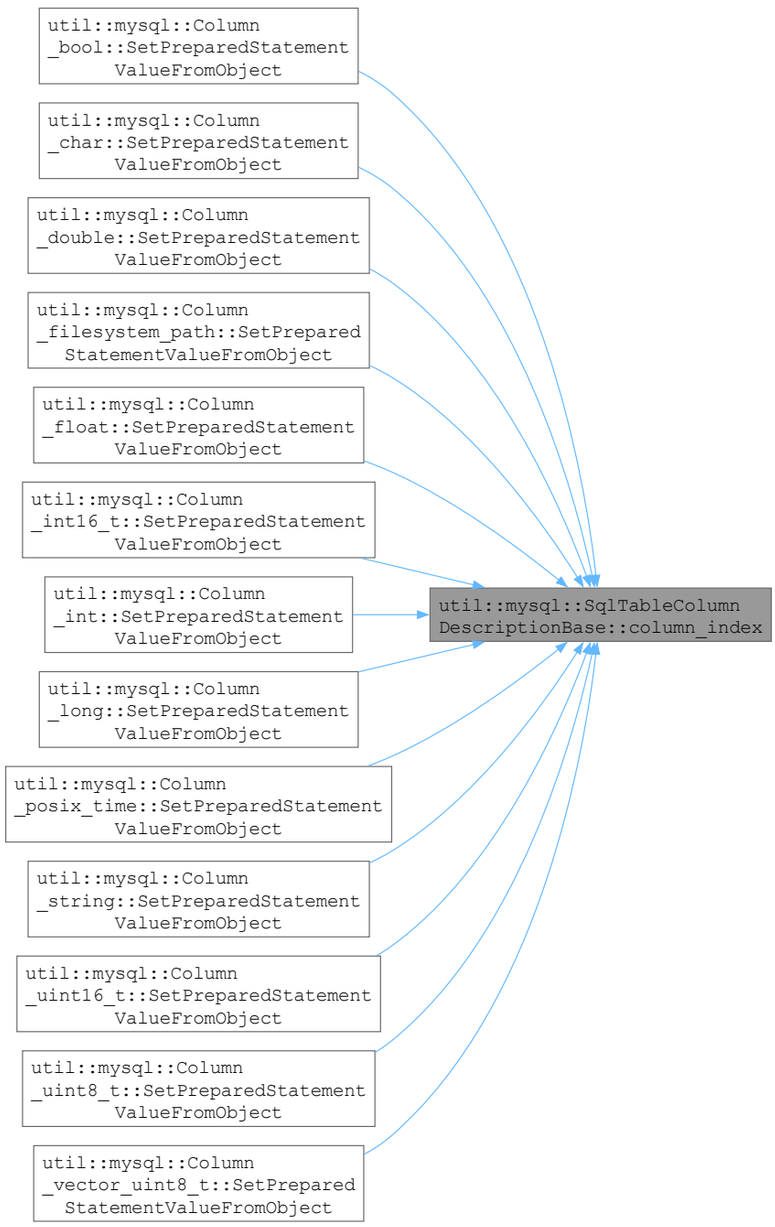
Returns

The index of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

Referenced by util::mysql::Column_bool< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_char< C >::SetPreparedS
util::mysql::Column_double< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_filesystem_path< C >::SetPreparedS
util::mysql::Column_float< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_int16_t< C >::SetPreparedStatementVa
util::mysql::Column_int< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_long< C >::SetPreparedStatementValueF
util::mysql::Column_posix_time< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_string< C >::SetPreparedStateme
util::mysql::Column_uint16_t< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_uint8_t< C >::SetPreparedStatemer
and util::mysql::Column_vector_uint8_t< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.7.3.2 column_name()

```
const string & util::mysql::SqlTableColumnDescriptionBase::column_name () const  [inline], [inherited]
```

Get the name of the SQL table column.

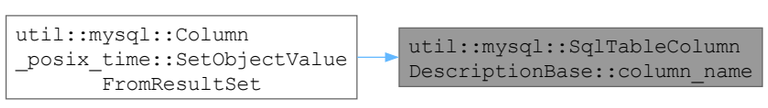
Returns

The name of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_name_.

Referenced by util::mysql::Column_posix_time< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.7.3.3 column_select_name()

```
string util::mysql::SqlTableColumnDescriptionBase::column_select_name () const  [inline], [inherited]
```

Get the name of the SQL table column to be used in a `SELECT` query.

Returns

The name of the SQL table column to be used in a `SELECT` query.

References util::mysql::SqlTableColumnDescriptionBase::column_name_, and util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.7.3.4 data_type()

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type () const  [inline], [inherited]
```

Get the the enumerated SQL column data type.

Returns

The the enumerated SQL column data type.

References util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.7.3.5 GetValueFromObject()

```
bool util::mysql::SqlTableColumnDescription< C, bool >::GetValueFromObject (
            const C & obj) const  [inline], [protected], [inherited]
```

Get the object member value from the object.

Parameters

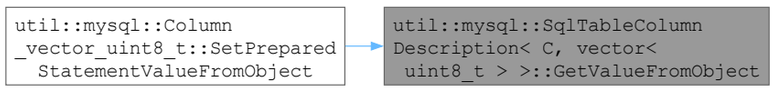
in	*obj*	The object of type `C`.

Returns

The value of type `T` of the object member corresponding to this SQL column.

Referenced by util::mysql::Column_bool< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.7.3.6 is_primary_key()

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key () const  [inline], [inherited]
```

Is this column a primary key for the corresponding SQL database table?

Returns

TRUE if this column is a primary key for the corresponding SQL database table, or FALSE otherwise.

References util::mysql::SqlTableColumnDescriptionBase::is_primary_key_.

10.7.3.7 set_column_index()

```
void util::mysql::SqlTableColumnDescriptionBase::set_column_index (
            size_t idx)  [inline], [inherited]
```

Set the index of this SQL table column.

Parameters

in	*idx*	The index to set.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

10.7.3.8 SetObjectValue()

```
void util::mysql::SqlTableColumnDescription< C, bool >::SetObjectValue (
            C & obj,
            const bool & value) const  [inline], [protected], [inherited]
```

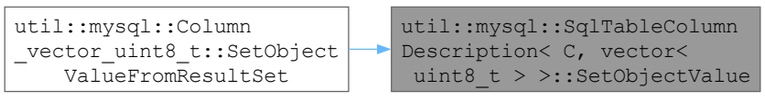
Set the object member value.

Parameters

in	*obj*	The object of type C.
in	*value*	The value of type T, to set.

Referenced by util::mysql::Column_bool< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.7.3.9 SetObjectValueFromResultSet()

```
template<class C >
void util::mysql::Column_bool< C >::SetObjectValueFromResultSet (
            C & obj,
            const ResultSet & results) const  [inline]
```

Set the value in the field of the corresponding object from an SQL ResultSet Object.

Parameters

in,out	*obj*	A reference to the object whose field value will be set.
in	*results*	A reference to the ResultSet object.

References util::mysql::SqlTableColumnDescription< C, bool >::SetObjectValue().

Here is the call graph for this function:

10.7.3.10 SetPreparedStatementValueFromObject()

```
template<class C >
void util::mysql::Column_bool< C >::SetPreparedStatementValueFromObject (
            const C & obj,
            PreparedStatement & stmt) const  [inline]
```

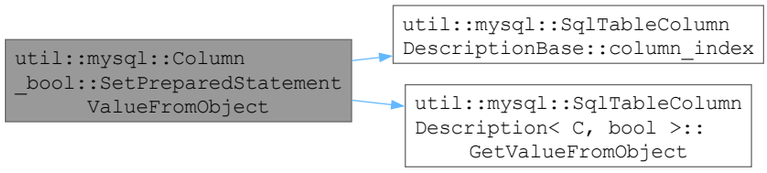
Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Parameters

in	*obj*	A reference to the object whose field value will be read.
in,out	*stmt*	A reference to the SQL PreparedStatement object whose column value will be set.

References util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescription< C, bool >::GetVa

Here is the call graph for this function:



10.7.4 Member Data Documentation

10.7.4.1 accessor_

`function<bool(const C&)> util::mysql::SqlTableColumnDescription< C, bool >::accessor_ [private], [inherited]`

The accessor function object wrapper.

This object is used as a wrapper for the accessor method of the template class C. It is used to retrieve the value of the SQL table column from the object for generating an INSERT or UPDATE statement.

10.7.4.2 column_index_

`size_t util::mysql::SqlTableColumnDescriptionBase::column_index_ [private], [inherited]`

The index of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescriptionBase::set_colum

10.7.4.3 column_name_

`string util::mysql::SqlTableColumnDescriptionBase::column_name_ [private], [inherited]`

The name of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_name(), and util::mysql::SqlTableColumnDescriptionBase::column_s

10.7.4.4 data_type_

`ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type_ [private], [inherited]`

The enumerated SQL table column data type.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_select_name(), and util::mysql::SqlTableColumnDescriptionBase::da

10.7.4.5 is_primary_key_

`bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key_ [private], [inherited]`

Indicates whether the column is part of the primary key for the SQL table.

Referenced by util::mysql::SqlTableColumnDescriptionBase::is_primary_key().

10.7.4.6 mutator_

`function<void(C&, bool)> util::mysql::SqlTableColumnDescription< C, bool >::mutator_ [private], [inherited]`

The mutator function object wrapper.

This object is used as a wrapper for the mutator method of the template class C. It is used to set the value of an object from the result set of an SQL SELECT query statement.

The documentation for this class was generated from the following file:

- utility/SqlTableColumnDescription.h

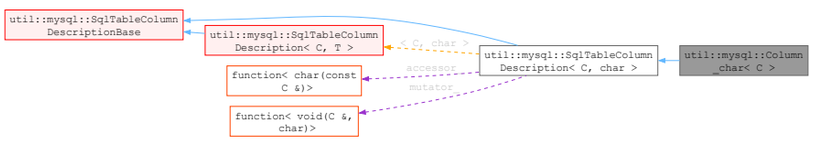
10.8 util::mysql::Column_char< C > Class Template Reference

Template column description class for value of type double.

`#include <SqlTableColumnDescription.h>`

Inheritance diagram for util::mysql::Column_char< C >:

Collaboration diagram for util::mysql::Column_char< C >:



Public Member Functions

- Column_char (string column_name, double(C::∗accessor)() const =NULL, void(C::∗mutator)(double)=NULL, bool is_primary_key=false)

  The parameterized constructor.
- size_t column_index () const

  Get the index of the SQL table column.
- const string & column_name () const

  Get the name of the SQL table column.
- string column_select_name () const

  Get the name of the SQL table column to be used in a `SELECT` query.
- ColumDataType_t data_type () const

  Get the the enumerated SQL column data type.
- bool is_primary_key () const

  Is this column a primary key for the corresponding SQL database table?
- void set_column_index (size_t idx)

  Set the index of this SQL table column.
- void SetObjectValueFromResultSet (C &obj, const ResultSet &results) const

  Set the value in the field of the corresponding object from an SQL ResultSet Object.
- void SetPreparedStatementValueFromObject (const C &obj, PreparedStatement &stmt) const

  Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Protected Member Functions

- char GetValueFromObject (const C &obj) const

  Get the object member value from the object.
- void SetObjectValue (C &obj, const char &value) const

  Set the object member value.

Private Attributes

- function< char(const C &)> accessor_

  The accessor function object wrapper.
- size_t column_index_

  The index of the SQL table column.
- string column_name_

  The name of the SQL table column.
- ColumDataType_t data_type_

  The enumerated SQL table column data type.
- bool is_primary_key_

  Indicates whether the column is part of the primary key for the SQL table.
- function< void(C &, char)> mutator_

  The mutator function object wrapper.

10.8.1 Detailed Description

template<class C>
class util::mysql::Column_char< C >

Template column description class for value of type double.

10.8.2 Constructor & Destructor Documentation

10.8.2.1 Column_char()

```
template<class C >
util::mysql::Column_char< C >::Column_char (
            string column_name,
            double(C::* accessor )() const = NULL,
            void(C::* mutator )(double) = NULL,
            bool is_primary_key = false)  [inline]
```

The parameterized constructor.

Parameters

in	*column_name*	The name of the SQL table column.
in	*accessor*	A pointer to the accessor method for acquiring the value of the corresponding object field.
in	*mutator*	A pointer to the mutator method for setting the value of the corresponding object field.
in	*is_primary_key*	TRUE if this column is a primary key for the SQL table, or FALSE otherwise.

10.8.3 Member Function Documentation

10.8.3.1 column_index()

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index () const  [inline], [inherited]
```

Get the index of the SQL table column.

Returns

The index of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

Referenced by util::mysql::Column_bool< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_char< C >::SetPreparedS

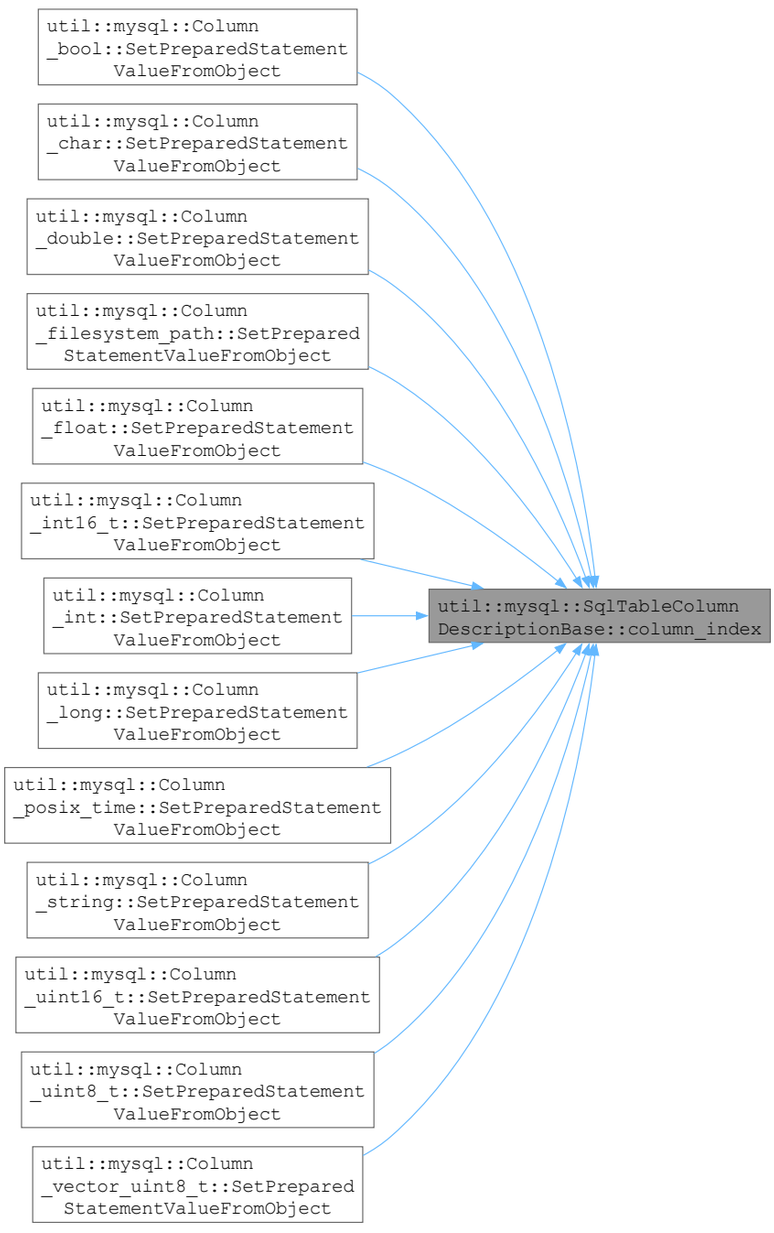
Here is the caller graph for this function:



10.8.3.2 column_name()

```
const string & util::mysql::SqlTableColumnDescriptionBase::column_name () const  [inline], [inherited]
```

Get the name of the SQL table column.

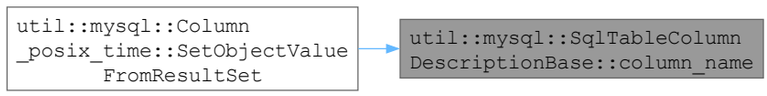
Returns

The name of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_name_.

Referenced by util::mysql::Column_posix_time< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.8.3.3 column_select_name()

```
string util::mysql::SqlTableColumnDescriptionBase::column_select_name () const  [inline], [inherited]
```

Get the name of the SQL table column to be used in a `SELECT` query.

Returns

The name of the SQL table column to be used in a `SELECT` query.

References util::mysql::SqlTableColumnDescriptionBase::column_name_, and util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.8.3.4 data_type()

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type () const  [inline], [inherited]
```

Get the the enumerated SQL column data type.

Returns

The the enumerated SQL column data type.

References util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.8.3.5 GetValueFromObject()

```
char util::mysql::SqlTableColumnDescription< C, char >::GetValueFromObject (
            const C & obj) const  [inline], [protected], [inherited]
```

Get the object member value from the object.

Parameters

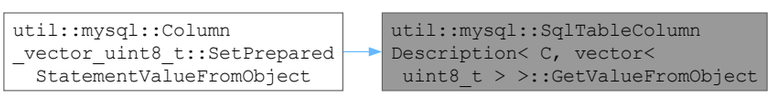
in	*obj*	The object of type C.

Returns

The value of type T of the object member corresponding to this SQL column.

Referenced by util::mysql::Column_char< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.8.3.6 is_primary_key()

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key () const  [inline], [inherited]
```

Is this column a primary key for the corresponding SQL database table?

Returns

TRUE if this column is a primary key for the corresponding SQL database table, or FALSE otherwise.

References util::mysql::SqlTableColumnDescriptionBase::is_primary_key_.

10.8.3.7 set_column_index()

```
void util::mysql::SqlTableColumnDescriptionBase::set_column_index (
            size_t idx)  [inline], [inherited]
```

Set the index of this SQL table column.

Parameters

in	*idx*	The index to set.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

10.8.3.8 SetObjectValue()

```
void util::mysql::SqlTableColumnDescription< C, char >::SetObjectValue (
            C & obj,
            const char & value) const  [inline], [protected], [inherited]
```

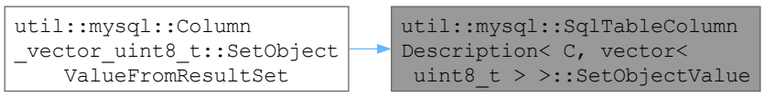
Set the object member value.

Parameters

in	*obj*	The object of type C.
in	*value*	The value of type T, to set.

Referenced by util::mysql::Column_char< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.8.3.9 SetObjectValueFromResultSet()

```
template<class C >
void util::mysql::Column_char< C >::SetObjectValueFromResultSet (
            C & obj,
            const ResultSet & results) const  [inline]
```

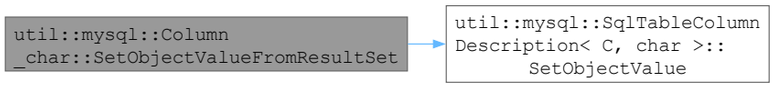
Set the value in the field of the corresponding object from an SQL ResultSet Object.

Parameters

in,out	*obj*	A reference to the object whose field value will be set.
in	*results*	A reference to the ResultSet object.

References util::mysql::SqlTableColumnDescription< C, char >::SetObjectValue().

Here is the call graph for this function:



10.8.3.10 SetPreparedStatementValueFromObject()

```
template<class C >
void util::mysql::Column_char< C >::SetPreparedStatementValueFromObject (
            const C & obj,
            PreparedStatement & stmt) const  [inline]
```

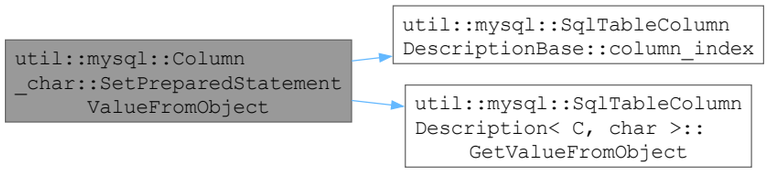
Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Parameters

in	*obj*	A reference to the object whose field value will be read.
in,out	*stmt*	A reference to the SQL PreparedStatement object whose column value will be set.

References util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescription< C, char >::GetVa

Here is the call graph for this function:



10.8.4 Member Data Documentation

10.8.4.1 accessor_

```
function<char(const C&)> util::mysql::SqlTableColumnDescription< C, char >::accessor_  [private],
[inherited]
```

The accessor function object wrapper.

This object is used as a wrapper for the accessor method of the template class C. It is used to retrieve the value of the SQL table column from the object for generating an INSERT or UPDATE statement.

10.8.4.2 column_index_

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index_  [private], [inherited]
```

The index of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescriptionBase::set_colum

10.8.4.3 column_name_

```
string util::mysql::SqlTableColumnDescriptionBase::column_name_  [private], [inherited]
```

The name of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_name(), and util::mysql::SqlTableColumnDescriptionBase::column_s

10.8.4.4 data_type_

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type_  [private], [inherited]
```

The enumerated SQL table column data type.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_select_name(), and util::mysql::SqlTableColumnDescriptionBase::da

10.8.4.5 is_primary_key_

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key_  [private], [inherited]
```

Indicates whether the column is part of the primary key for the SQL table.

Referenced by util::mysql::SqlTableColumnDescriptionBase::is_primary_key().

10.8.4.6 mutator_

```
function<void(C&, char)> util::mysql::SqlTableColumnDescription< C, char >::mutator_  [private],
[inherited]
```

The mutator function object wrapper.

This object is used as a wrapper for the mutator method of the template class C. It is used to set the value of an object from the result set of an SQL SELECT query statement.

The documentation for this class was generated from the following file:

- utility/SqlTableColumnDescription.h

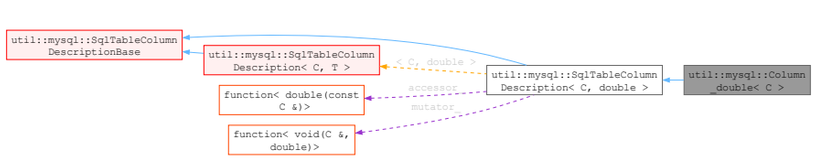
10.9 util::mysql::Column_double< C > Class Template Reference

Template column description class for value of type double.

```
#include <SqlTableColumnDescription.h>
```

Inheritance diagram for util::mysql::Column_double< C >:

Collaboration diagram for util::mysql::Column_double< C >:



Public Member Functions

- Column_double (string column_name, double(C::∗accessor)() const =NULL, void(C::∗mutator)(double)=NULL, bool is_primary_key=false)

  The parameterized constructor.
- size_t column_index () const

  Get the index of the SQL table column.
- const string & column_name () const

  Get the name of the SQL table column.
- string column_select_name () const

  Get the name of the SQL table column to be used in a `SELECT` query.
- ColumDataType_t data_type () const

  Get the the enumerated SQL column data type.
- bool is_primary_key () const

  Is this column a primary key for the corresponding SQL database table?
- void set_column_index (size_t idx)

  Set the index of this SQL table column.
- void SetObjectValueFromResultSet (C &obj, const ResultSet &results) const

  Set the value in the field of the corresponding object from an SQL ResultSet Object.
- void SetPreparedStatementValueFromObject (const C &obj, PreparedStatement &stmt) const

  Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Protected Member Functions

- double GetValueFromObject (const C &obj) const

  Get the object member value from the object.
- void SetObjectValue (C &obj, const double &value) const

  Set the object member value.

Private Attributes

- function< double(const C &)> accessor_

  The accessor function object wrapper.
- size_t column_index_

  The index of the SQL table column.
- string column_name_

  The name of the SQL table column.
- ColumDataType_t data_type_

  The enumerated SQL table column data type.
- bool is_primary_key_

  Indicates whether the column is part of the primary key for the SQL table.
- function< void(C &, double)> mutator_

  The mutator function object wrapper.

10.9.1 Detailed Description

template<class C>
class util::mysql::Column_double< C >

Template column description class for value of type double.

10.9.2 Constructor & Destructor Documentation

10.9.2.1 Column_double()

```
template<class C >
util::mysql::Column_double< C >::Column_double (
            string column_name,
            double(C::* accessor )() const = NULL,
            void(C::* mutator )(double) = NULL,
            bool is_primary_key = false)  [inline]
```

The parameterized constructor.

Parameters

in	*column_name*	The name of the SQL table column.
in	*accessor*	A pointer to the accessor method for acquiring the value of the corresponding object field.
in	*mutator*	A pointer to the mutator method for setting the value of the corresponding object field.
in	*is_primary_key*	TRUE if this column is a primary key for the SQL table, or FALSE otherwise.

10.9.3 Member Function Documentation

10.9.3.1 column_index()

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index () const  [inline], [inherited]
```

Get the index of the SQL table column.

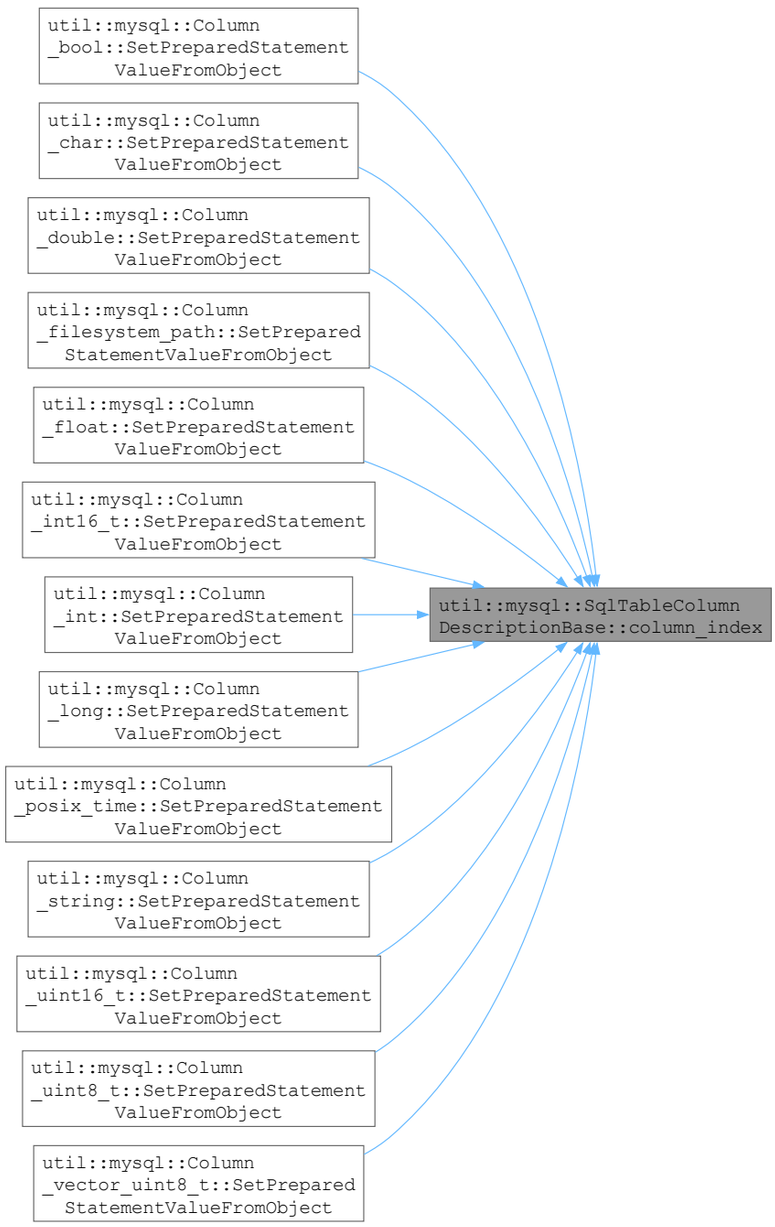
Returns

The index of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

Referenced by util::mysql::Column_bool< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_char< C >::SetPreparedS
util::mysql::Column_double< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_filesystem_path< C >::SetPreparedS
util::mysql::Column_float< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_int16_t< C >::SetPreparedStatementVa
util::mysql::Column_int< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_long< C >::SetPreparedStatementValueF
util::mysql::Column_posix_time< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_string< C >::SetPreparedStateme
util::mysql::Column_uint16_t< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_uint8_t< C >::SetPreparedStatemer
and util::mysql::Column_vector_uint8_t< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.9.3.2 column_name()

```
const string & util::mysql::SqlTableColumnDescriptionBase::column_name () const  [inline], [inherited]
```

Get the name of the SQL table column.

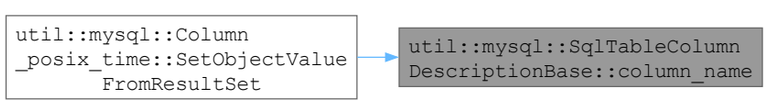
Returns

The name of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_name_.

Referenced by util::mysql::Column_posix_time< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.9.3.3 column_select_name()

```
string util::mysql::SqlTableColumnDescriptionBase::column_select_name () const  [inline], [inherited]
```

Get the name of the SQL table column to be used in a SELECT query.

Returns

The name of the SQL table column to be used in a SELECT query.

References util::mysql::SqlTableColumnDescriptionBase::column_name_, and util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.9.3.4 data_type()

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type () const  [inline], [inherited]
```

Get the the enumerated SQL column data type.

Returns

The the enumerated SQL column data type.

References util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.9.3.5 GetValueFromObject()

```
double util::mysql::SqlTableColumnDescription< C, double >::GetValueFromObject (
            const C & obj) const  [inline], [protected], [inherited]
```

Get the object member value from the object.

Parameters

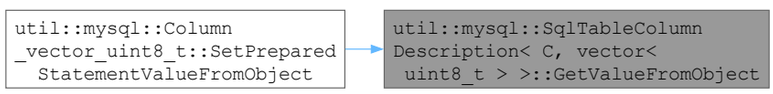
in	*obj*	The object of type C.

Returns

The value of type T of the object member corresponding to this SQL column.

Referenced by util::mysql::Column_double< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.9.3.6 is_primary_key()

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key () const  [inline], [inherited]
```

Is this column a primary key for the corresponding SQL database table?

Returns

TRUE if this column is a primary key for the corresponding SQL database table, or FALSE otherwise.

References util::mysql::SqlTableColumnDescriptionBase::is_primary_key_.

10.9.3.7 set_column_index()

```
void util::mysql::SqlTableColumnDescriptionBase::set_column_index (
            size_t idx)  [inline], [inherited]
```

Set the index of this SQL table column.

Parameters

in	*idx*	The index to set.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

10.9.3.8 SetObjectValue()

```
void util::mysql::SqlTableColumnDescription< C, double >::SetObjectValue (
            C & obj,
            const double & value) const  [inline], [protected], [inherited]
```

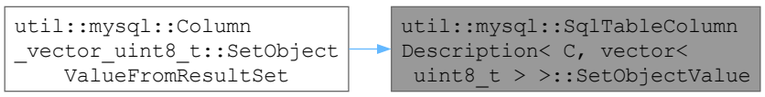
Set the object member value.

Parameters

in	*obj*	The object of type C.
in	*value*	The value of type T, to set.

Referenced by util::mysql::Column_double< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.9.3.9 SetObjectValueFromResultSet()

```
template<class C >
void util::mysql::Column_double< C >::SetObjectValueFromResultSet (
            C & obj,
            const ResultSet & results) const  [inline]
```

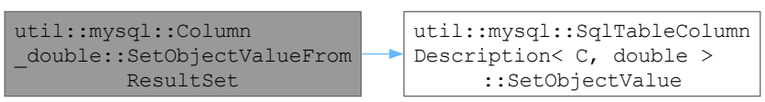
Set the value in the field of the corresponding object from an SQL ResultSet Object.

Parameters

in,out	*obj*	A reference to the object whose field value will be set.
in	*results*	A reference to the ResultSet object.

References util::mysql::SqlTableColumnDescription< C, double >::SetObjectValue().

Here is the call graph for this function:



10.9.3.10 SetPreparedStatementValueFromObject()

```
template<class C >
void util::mysql::Column_double< C >::SetPreparedStatementValueFromObject (
            const C & obj,
            PreparedStatement & stmt) const  [inline]
```

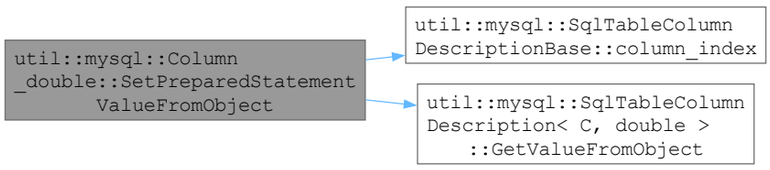
Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Parameters

in	*obj*	A reference to the object whose field value will be read.
in,out	*stmt*	A reference to the SQL PreparedStatement object whose column value will be set.

References util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescription< C, double >::Get

Here is the call graph for this function:



10.9.4 Member Data Documentation

10.9.4.1 accessor_

function<double(const C&)> util::mysql::SqlTableColumnDescription< C, double >::accessor_↩
[private], [inherited]

The accessor function object wrapper.

This object is used as a wrapper for the accessor method of the template class C. It is used to retrieve the value of the SQL table column from the object for generating an INSERT or UPDATE statement.

10.9.4.2 column_index_

size_t util::mysql::SqlTableColumnDescriptionBase::column_index_ [private], [inherited]

The index of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescriptionBase::set_colum

10.9.4.3 column_name_

string util::mysql::SqlTableColumnDescriptionBase::column_name_ [private], [inherited]

The name of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_name(), and util::mysql::SqlTableColumnDescriptionBase::column_s

10.9.4.4 data_type_

ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type_ [private], [inherited]

The enumerated SQL table column data type.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_select_name(), and util::mysql::SqlTableColumnDescriptionBase::da

10.9.4.5 is_primary_key_

bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key_ [private], [inherited]

Indicates whether the column is part of the primary key for the SQL table.

Referenced by util::mysql::SqlTableColumnDescriptionBase::is_primary_key().

10.9.4.6 mutator_

`function<void(C&, double)> util::mysql::SqlTableColumnDescription< C, double >::mutator_ [private], [inherited]`

The mutator function object wrapper.

This object is used as a wrapper for the mutator method of the template class C. It is used to set the value of an object from the result set of an SQL SELECT query statement.

The documentation for this class was generated from the following file:

- utility/SqlTableColumnDescription.h

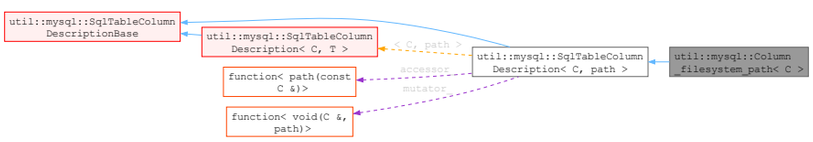
10.10 util::mysql::Column_filesystem_path< C > Class Template Reference

Template column description class for value of type path.

`#include <SqlTableColumnDescription.h>`

Inheritance diagram for util::mysql::Column_filesystem_path< C >:

Collaboration diagram for util::mysql::Column_filesystem_path< C >:



Public Member Functions

- Column_filesystem_path (string column_name, const path &(C::∗accessor)() const =NULL, void(C::∗mutator)(const path &)=NULL, bool is_primary_key=false)

  The parameterized constructor.
- Column_filesystem_path (string column_name, path(C::∗accessor)() const =NULL, void(C::∗mutator)(const path &)=NULL, bool is_primary_key=false)

  The parameterized constructor.
- size_t column_index () const

  Get the index of the SQL table column.
- const string & column_name () const

  Get the name of the SQL table column.
- string column_select_name () const

  Get the name of the SQL table column to be used in a `SELECT` query.
- ColumDataType_t data_type () const

  Get the the enumerated SQL column data type.
- bool is_primary_key () const

  Is this column a primary key for the corresponding SQL database table?
- void set_column_index (size_t idx)

  Set the index of this SQL table column.
- void SetObjectValueFromResultSet (C &obj, const ResultSet &results) const

  Set the value in the field of the corresponding object from an SQL ResultSet Object.
- void SetPreparedStatementValueFromObject (const C &obj, PreparedStatement &stmt) const

  Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Protected Member Functions

- path GetValueFromObject (const C &obj) const
  Get the object member value from the object.
- void SetObjectValue (C &obj, const path &value) const
  Set the object member value.

Private Attributes

- function< path(const C &)> accessor_
  The accessor function object wrapper.
- size_t column_index_
  The index of the SQL table column.
- string column_name_
  The name of the SQL table column.
- ColumDataType_t data_type_
  The enumerated SQL table column data type.
- bool is_primary_key_
  Indicates whether the column is part of the primary key for the SQL table.
- function< void(C &, path)> mutator_
  The mutator function object wrapper.

10.10.1 Detailed Description

template<class C>
class util::mysql::Column_filesystem_path< C >

Template column description class for value of type path.

10.10.2 Constructor & Destructor Documentation

10.10.2.1 Column_filesystem_path() [1/2]

```
template<class C >
util::mysql::Column_filesystem_path< C >::Column_filesystem_path (
            string column_name,
            const path &(C::* accessor )() const = NULL,
            void(C::* mutator )(const path &) = NULL,
            bool is_primary_key = false)  [inline]
```

The parameterized constructor.

Parameters

in	*column_name*	The name of the SQL table column.
in	*accessor*	A pointer to the accessor method for acquiring the value of the corresponding object field.
in	*mutator*	A pointer to the mutator method for setting the value of the corresponding object field.
in	*is_primary_key*	TRUE if this column is a primary key for the SQL table, or FALSE otherwise.

10.10.2.2 Column_filesystem_path() [2/2]

```
template<class C >
util::mysql::Column_filesystem_path< C >::Column_filesystem_path (
            string column_name,
            path(C::* accessor )() const = NULL,
            void(C::* mutator )(const path &) = NULL,
            bool is_primary_key = false)  [inline]
```

The parameterized constructor.

Parameters

in	*column_name*	The name of the SQL table column.
in	*accessor*	A pointer to the accessor method for acquiring the value of the corresponding object field.
in	*mutator*	A pointer to the mutator method for setting the value of the corresponding object field.
in	*is_primary_key*	TRUE if this column is a primary key for the SQL table, or FALSE otherwise.

10.10.3 Member Function Documentation

10.10.3.1 column_index()

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index () const  [inline], [inherited]
```

Get the index of the SQL table column.

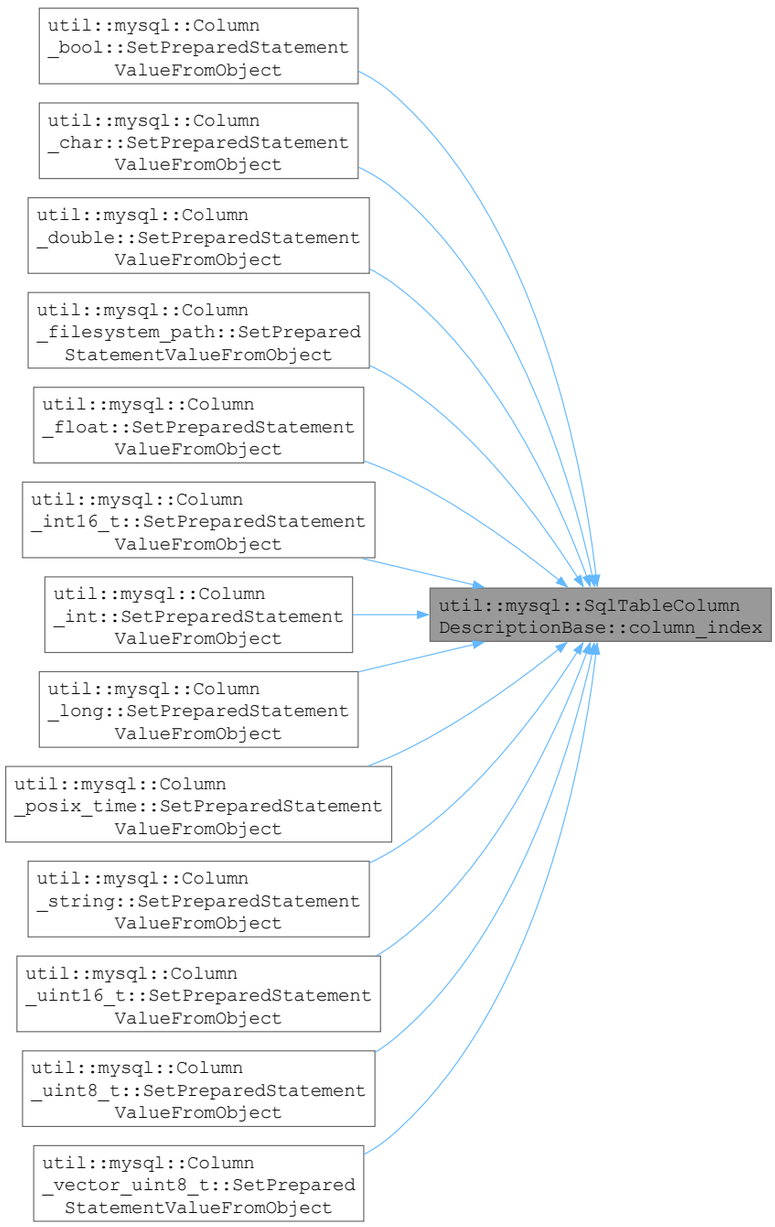
Returns

The index of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

Referenced by util::mysql::Column_bool< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_char< C >::SetPreparedS
util::mysql::Column_double< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_filesystem_path< C >::SetPreparedS
util::mysql::Column_float< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_int16_t< C >::SetPreparedStatementVa
util::mysql::Column_int< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_long< C >::SetPreparedStatementValueF
util::mysql::Column_posix_time< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_string< C >::SetPreparedStateme
util::mysql::Column_uint16_t< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_uint8_t< C >::SetPreparedStatemer
and util::mysql::Column_vector_uint8_t< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.10.3.2 column_name()

```
const string & util::mysql::SqlTableColumnDescriptionBase::column_name () const  [inline], [inherited]
```

Get the name of the SQL table column.

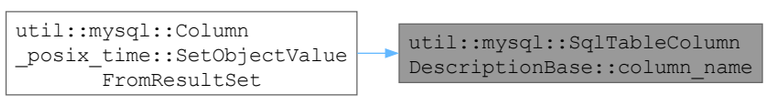
Returns

The name of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_name_.

Referenced by util::mysql::Column_posix_time< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.10.3.3 column_select_name()

```
string util::mysql::SqlTableColumnDescriptionBase::column_select_name () const  [inline], [inherited]
```

Get the name of the SQL table column to be used in a `SELECT` query.

Returns

The name of the SQL table column to be used in a `SELECT` query.

References util::mysql::SqlTableColumnDescriptionBase::column_name_, and util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.10.3.4 data_type()

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type () const  [inline], [inherited]
```

Get the the enumerated SQL column data type.

Returns

The the enumerated SQL column data type.

References util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.10.3.5 GetValueFromObject()

```
path util::mysql::SqlTableColumnDescription< C, path >::GetValueFromObject (
            const C & obj) const  [inline], [protected], [inherited]
```

Get the object member value from the object.

Parameters

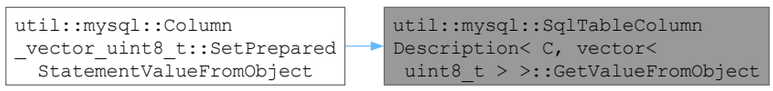
in	*obj*	The object of type `C`.

Returns

The value of type `T` of the object member corresponding to this SQL column.

Referenced by util::mysql::Column_filesystem_path< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.10.3.6 is_primary_key()

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key () const  [inline], [inherited]
```

Is this column a primary key for the corresponding SQL database table?

Returns

TRUE if this column is a primary key for the corresponding SQL database table, or FALSE otherwise.

References util::mysql::SqlTableColumnDescriptionBase::is_primary_key_.

10.10.3.7 set_column_index()

```
void util::mysql::SqlTableColumnDescriptionBase::set_column_index (
            size_t idx)  [inline], [inherited]
```

Set the index of this SQL table column.

Parameters

in	*idx*	The index to set.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

10.10.3.8 SetObjectValue()

```
void util::mysql::SqlTableColumnDescription< C, path >::SetObjectValue (
            C & obj,
            const path & value) const  [inline], [protected], [inherited]
```

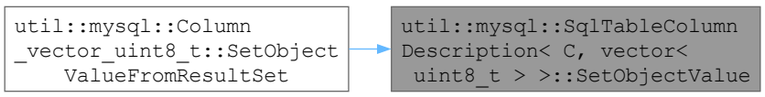
Set the object member value.

Parameters

in	*obj*	The object of type C.
in	*value*	The value of type T, to set.

Referenced by util::mysql::Column_filesystem_path< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.10.3.9 SetObjectValueFromResultSet()

```
template<class C >
void util::mysql::Column_filesystem_path< C >::SetObjectValueFromResultSet (
            C & obj,
            const ResultSet & results) const  [inline]
```

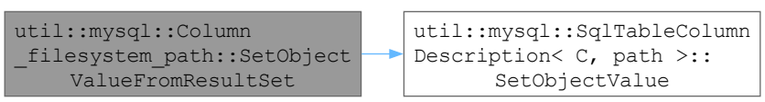
Set the value in the field of the corresponding object from an SQL ResultSet Object.

Parameters

in,out	*obj*	A reference to the object whose field value will be set.
in	*results*	A reference to the ResultSet object.

References util::mysql::SqlTableColumnDescription< C, path >::SetObjectValue().

Here is the call graph for this function:



10.10.3.10 SetPreparedStatementValueFromObject()

```
template<class C >
void util::mysql::Column_filesystem_path< C >::SetPreparedStatementValueFromObject (
            const C & obj,
            PreparedStatement & stmt) const  [inline]
```

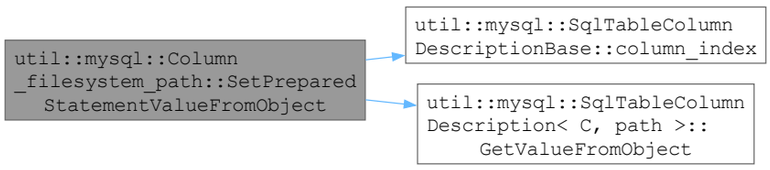
Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Parameters

in	*obj*	A reference to the object whose field value will be read.
in,out	*stmt*	A reference to the SQL PreparedStatement object whose column value will be set.

References util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescription< C, path >::GetVa

Here is the call graph for this function:



10.10.4 Member Data Documentation

10.10.4.1 accessor_

```
function<path(const C&)> util::mysql::SqlTableColumnDescription< C, path >::accessor_  [private],
[inherited]
```

The accessor function object wrapper.

This object is used as a wrapper for the accessor method of the template class C. It is used to retrieve the value of the SQL table column from the object for generating an INSERT or UPDATE statement.

10.10.4.2 column_index_

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index_  [private], [inherited]
```

The index of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescriptionBase::set_colum

10.10.4.3 column_name_

```
string util::mysql::SqlTableColumnDescriptionBase::column_name_  [private], [inherited]
```

The name of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_name(), and util::mysql::SqlTableColumnDescriptionBase::column_s

10.10.4.4 data_type_

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type_  [private], [inherited]
```

The enumerated SQL table column data type.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_select_name(), and util::mysql::SqlTableColumnDescriptionBase::da

10.10.4.5 is_primary_key_

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key_  [private], [inherited]
```

Indicates whether the column is part of the primary key for the SQL table.

Referenced by util::mysql::SqlTableColumnDescriptionBase::is_primary_key().

10.10.4.6 mutator_

`function<void(C&, path)> util::mysql::SqlTableColumnDescription< C, path >::mutator_ [private], [inherited]`

The mutator function object wrapper.

This object is used as a wrapper for the mutator method of the template class C. It is used to set the value of an object from the result set of an SQL SELECT query statement.

The documentation for this class was generated from the following file:

- utility/SqlTableColumnDescription.h

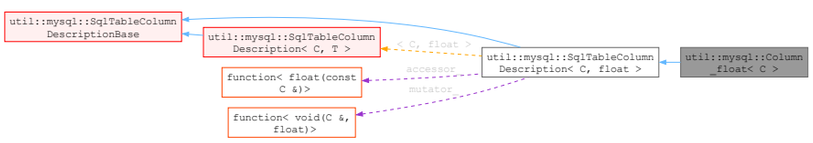
10.11 util::mysql::Column_float< C > Class Template Reference

Template column description class for value of type float.

`#include <SqlTableColumnDescription.h>`

Inheritance diagram for util::mysql::Column_float< C >:

Collaboration diagram for util::mysql::Column_float< C >:



Public Member Functions

- Column_float (string column_name, float(C::∗accessor)() const =NULL, void(C::∗mutator)(float)=NULL, bool is_primary_key=false)

  The parameterized constructor.
- size_t column_index () const

  Get the index of the SQL table column.
- const string & column_name () const

  Get the name of the SQL table column.
- string column_select_name () const

  Get the name of the SQL table column to be used in a `SELECT` query.
- ColumDataType_t data_type () const

  Get the the enumerated SQL column data type.
- bool is_primary_key () const

  Is this column a primary key for the corresponding SQL database table?
- void set_column_index (size_t idx)

  Set the index of this SQL table column.
- void SetObjectValueFromResultSet (C &obj, const ResultSet &results) const

  Set the value in the field of the corresponding object from an SQL ResultSet Object.
- void SetPreparedStatementValueFromObject (const C &obj, PreparedStatement &stmt) const

  Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Protected Member Functions

- float GetValueFromObject (const C &obj) const

  Get the object member value from the object.
- void SetObjectValue (C &obj, const float &value) const

  Set the object member value.

Private Attributes

- function< float(const C &)> accessor_

  The accessor function object wrapper.
- size_t column_index_

  The index of the SQL table column.
- string column_name_

  The name of the SQL table column.
- ColumDataType_t data_type_

  The enumerated SQL table column data type.
- bool is_primary_key_

  Indicates whether the column is part of the primary key for the SQL table.
- function< void(C &, float)> mutator_

  The mutator function object wrapper.

10.11.1 Detailed Description

template<class C>
class util::mysql::Column_float< C >

Template column description class for value of type float.

10.11.2 Constructor & Destructor Documentation

10.11.2.1 Column_float()

```
template<class C >
util::mysql::Column_float< C >::Column_float (
            string column_name,
            float(C::* accessor )() const = NULL,
            void(C::* mutator )(float) = NULL,
            bool is_primary_key = false)  [inline]
```

The parameterized constructor.

Parameters

in	*column_name*	The name of the SQL table column.
in	*accessor*	A pointer to the accessor method for acquiring the value of the corresponding object field.
in	*mutator*	A pointer to the mutator method for setting the value of the corresponding object field.
in	*is_primary_key*	TRUE if this column is a primary key for the SQL table, or FALSE otherwise.

10.11.3 Member Function Documentation

10.11.3.1 column_index()

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index () const  [inline], [inherited]
```

Get the index of the SQL table column.

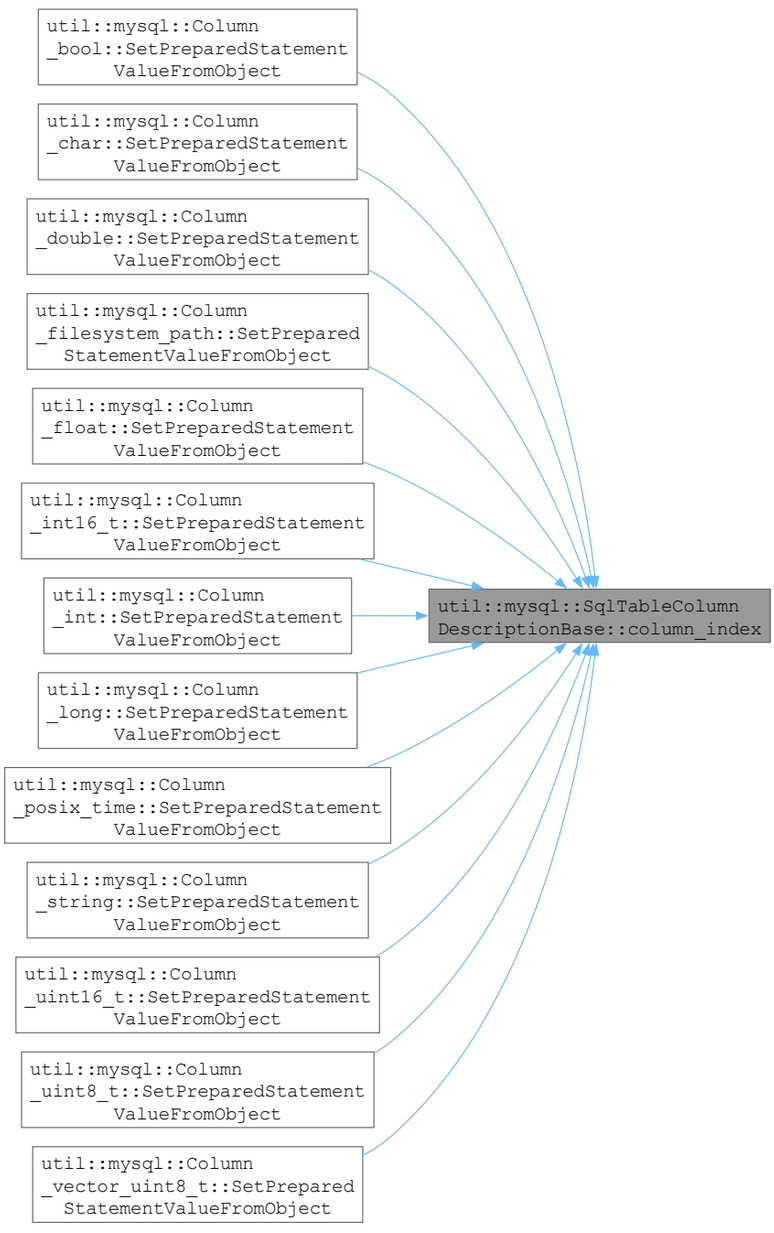
Returns

The index of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

Referenced by util::mysql::Column_bool< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_char< C >::SetPreparedS
util::mysql::Column_double< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_filesystem_path< C >::SetPreparedS
util::mysql::Column_float< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_int16_t< C >::SetPreparedStatementVa
util::mysql::Column_int< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_long< C >::SetPreparedStatementValueF
util::mysql::Column_posix_time< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_string< C >::SetPreparedStateme
util::mysql::Column_uint16_t< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_uint8_t< C >::SetPreparedStatemer
and util::mysql::Column_vector_uint8_t< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.11.3.2 column_name()

```
const string & util::mysql::SqlTableColumnDescriptionBase::column_name () const  [inline], [inherited]
```

Get the name of the SQL table column.

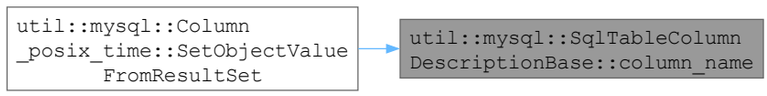
Returns

The name of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_name_.

Referenced by util::mysql::Column_posix_time< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.11.3.3 column_select_name()

```
string util::mysql::SqlTableColumnDescriptionBase::column_select_name () const  [inline], [inherited]
```

Get the name of the SQL table column to be used in a `SELECT` query.

Returns

The name of the SQL table column to be used in a `SELECT` query.

References util::mysql::SqlTableColumnDescriptionBase::column_name_, and util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.11.3.4 data_type()

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type () const  [inline], [inherited]
```

Get the the enumerated SQL column data type.

Returns

The the enumerated SQL column data type.

References util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.11.3.5 GetValueFromObject()

```
float util::mysql::SqlTableColumnDescription< C, float >::GetValueFromObject (
            const C & obj) const  [inline], [protected], [inherited]
```

Get the object member value from the object.

Parameters

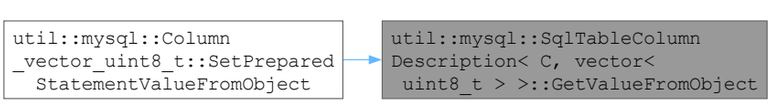
in	*obj*	The object of type C.

Returns

The value of type T of the object member corresponding to this SQL column.

Referenced by util::mysql::Column_float< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.11.3.6 is_primary_key()

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key () const  [inline], [inherited]
```

Is this column a primary key for the corresponding SQL database table?

Returns

TRUE if this column is a primary key for the corresponding SQL database table, or FALSE otherwise.

References util::mysql::SqlTableColumnDescriptionBase::is_primary_key_.

10.11.3.7 set_column_index()

```
void util::mysql::SqlTableColumnDescriptionBase::set_column_index (
            size_t idx)  [inline], [inherited]
```

Set the index of this SQL table column.

Parameters

in	*idx*	The index to set.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

10.11.3.8 SetObjectValue()

```
void util::mysql::SqlTableColumnDescription< C, float >::SetObjectValue (
            C & obj,
            const float & value) const  [inline], [protected], [inherited]
```

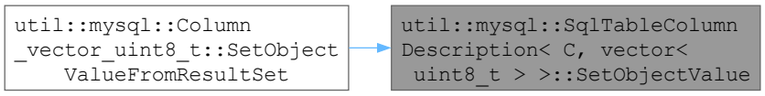
Set the object member value.

Parameters

in	*obj*	The object of type C.
in	*value*	The value of type T, to set.

Referenced by util::mysql::Column_float< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.11.3.9 SetObjectValueFromResultSet()

```
template<class C >
void util::mysql::Column_float< C >::SetObjectValueFromResultSet (
            C & obj,
            const ResultSet & results) const  [inline]
```

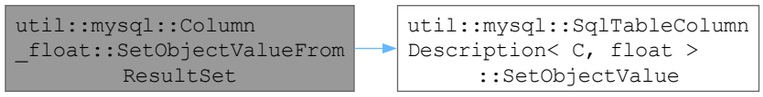
Set the value in the field of the corresponding object from an SQL ResultSet Object.

Parameters

in,out	*obj*	A reference to the object whose field value will be set.
in	*results*	A reference to the ResultSet object.

References util::mysql::SqlTableColumnDescription< C, float >::SetObjectValue().

Here is the call graph for this function:



10.11.3.10 SetPreparedStatementValueFromObject()

```
template<class C >
void util::mysql::Column_float< C >::SetPreparedStatementValueFromObject (
            const C & obj,
            PreparedStatement & stmt) const  [inline]
```

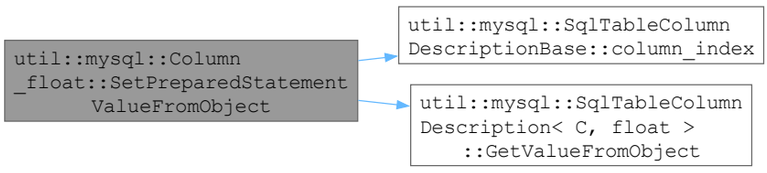
Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Parameters

in	*obj*	A reference to the object whose field value will be read.
in,out	*stmt*	A reference to the SQL PreparedStatement object whose column value will be set.

References util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescription< C, float >::GetVa

Here is the call graph for this function:



10.11.4 Member Data Documentation

10.11.4.1 accessor_

```
function<float(const C&)> util::mysql::SqlTableColumnDescription< C, float >::accessor_  [private],
[inherited]
```

The accessor function object wrapper.

This object is used as a wrapper for the accessor method of the template class C. It is used to retrieve the value of the SQL table column from the object for generating an INSERT or UPDATE statement.

10.11.4.2 column_index_

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index_  [private], [inherited]
```

The index of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescriptionBase::set_colum

10.11.4.3 column_name_

```
string util::mysql::SqlTableColumnDescriptionBase::column_name_  [private], [inherited]
```

The name of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_name(), and util::mysql::SqlTableColumnDescriptionBase::column_s

10.11.4.4 data_type_

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type_  [private], [inherited]
```

The enumerated SQL table column data type.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_select_name(), and util::mysql::SqlTableColumnDescriptionBase::da

10.11.4.5 is_primary_key_

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key_  [private], [inherited]
```

Indicates whether the column is part of the primary key for the SQL table.

Referenced by util::mysql::SqlTableColumnDescriptionBase::is_primary_key().

10.11.4.6 mutator_

```
function<void(C&, float)> util::mysql::SqlTableColumnDescription< C, float >::mutator_  [private],
[inherited]
```

The mutator function object wrapper.

This object is used as a wrapper for the mutator method of the template class C. It is used to set the value of an object from the result set of an SQL SELECT query statement.

The documentation for this class was generated from the following file:

- utility/SqlTableColumnDescription.h

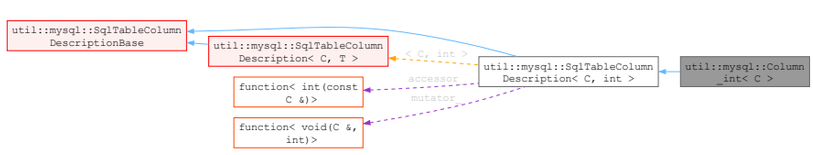
10.12 util::mysql::Column_int< C > Class Template Reference

Template column description class for value of type int.

```
#include <SqlTableColumnDescription.h>
```

Inheritance diagram for util::mysql::Column_int< C >:

Collaboration diagram for util::mysql::Column_int< C >:



Public Member Functions

- Column_int (string column_name, int(C::∗accessor)() const =NULL, void(C::∗mutator)(int)=NULL, bool is_primary_key=false)
  The parameterized constructor.
- size_t column_index () const
  Get the index of the SQL table column.
- const string & column_name () const
  Get the name of the SQL table column.
- string column_select_name () const
  Get the name of the SQL table column to be used in a `SELECT` query.
- ColumDataType_t data_type () const
  Get the the enumerated SQL column data type.
- bool is_primary_key () const
  Is this column a primary key for the corresponding SQL database table?
- void set_column_index (size_t idx)
  Set the index of this SQL table column.
- void SetObjectValueFromResultSet (C &obj, const ResultSet &results) const
  Set the value in the field of the corresponding object from an SQL ResultSet Object.
- void SetPreparedStatementValueFromObject (const C &obj, PreparedStatement &stmt) const
  Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Protected Member Functions

- int GetValueFromObject (const C &obj) const
  Get the object member value from the object.
- void SetObjectValue (C &obj, const int &value) const
  Set the object member value.

Private Attributes

- function< int(const C &)> accessor_
  The accessor function object wrapper.
- size_t column_index_
  The index of the SQL table column.
- string column_name_
  The name of the SQL table column.
- ColumDataType_t data_type_
  The enumerated SQL table column data type.
- bool is_primary_key_
  Indicates whether the column is part of the primary key for the SQL table.
- function< void(C &, int)> mutator_
  The mutator function object wrapper.

10.12.1 Detailed Description

template<class C>
class util::mysql::Column_int< C >

Template column description class for value of type int.

10.12.2 Constructor & Destructor Documentation

10.12.2.1 Column_int()

```
template<class C >
util::mysql::Column_int< C >::Column_int (
            string column_name,
            int(C::* accessor )() const = NULL,
            void(C::* mutator )(int) = NULL,
            bool is_primary_key = false)  [inline]
```

The parameterized constructor.

Parameters

in	*column_name*	The name of the SQL table column.
in	*accessor*	A pointer to the accessor method for acquiring the value of the corresponding object field.
in	*mutator*	A pointer to the mutator method for setting the value of the corresponding object field.
in	*is_primary_key*	TRUE if this column is a primary key for the SQL table, or FALSE otherwise.

10.12.3 Member Function Documentation

10.12.3.1 column_index()

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index () const  [inline], [inherited]
```

Get the index of the SQL table column.

Returns

The index of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

Referenced by util::mysql::Column_bool< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_char< C >::SetPreparedS
util::mysql::Column_double< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_filesystem_path< C >::SetPreparedS

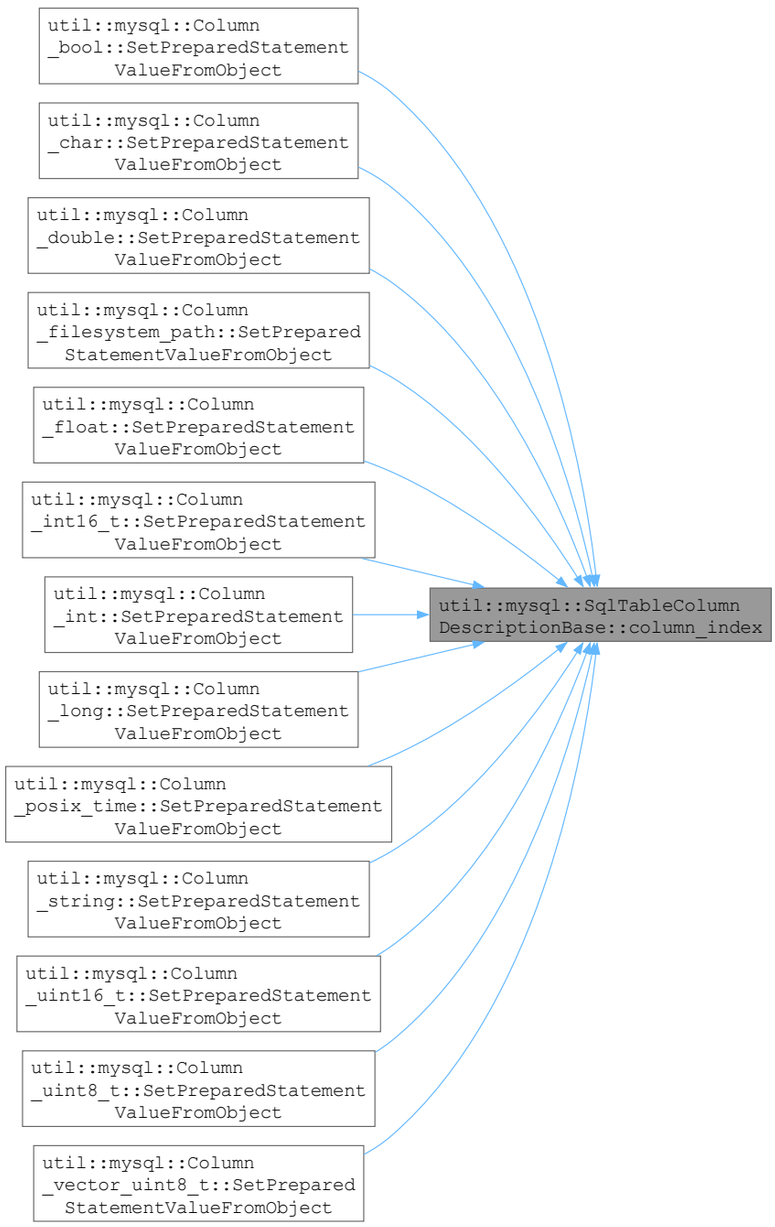
util::mysql::Column_posix_time< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_string< C >::SetPreparedStateme
util::mysql::Column_uint16_t< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_uint8_t< C >::SetPreparedStatemer
and util::mysql::Column_vector_uint8_t< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.12.3.2 column_name()

```
const string & util::mysql::SqlTableColumnDescriptionBase::column_name () const  [inline], [inherited]
```

Get the name of the SQL table column.

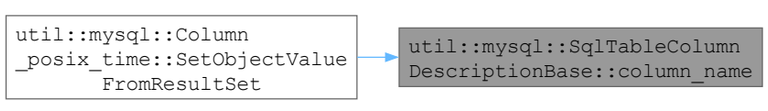
Returns

The name of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_name_.

Referenced by util::mysql::Column_posix_time< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.12.3.3 column_select_name()

```
string util::mysql::SqlTableColumnDescriptionBase::column_select_name () const  [inline], [inherited]
```

Get the name of the SQL table column to be used in a SELECT query.

Returns

The name of the SQL table column to be used in a SELECT query.

References util::mysql::SqlTableColumnDescriptionBase::column_name_, and util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.12.3.4 data_type()

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type () const  [inline], [inherited]
```

Get the the enumerated SQL column data type.

Returns

The the enumerated SQL column data type.

References util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.12.3.5 GetValueFromObject()

```
int util::mysql::SqlTableColumnDescription< C, int >::GetValueFromObject (
            const C & obj) const  [inline], [protected], [inherited]
```

Get the object member value from the object.

Parameters

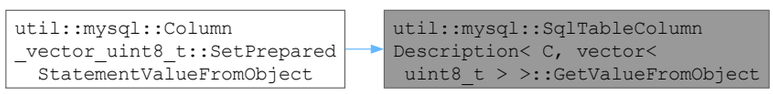
in	*obj*	The object of type C.

Returns

The value of type T of the object member corresponding to this SQL column.

Referenced by util::mysql::Column_int< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.12.3.6 is_primary_key()

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key () const  [inline], [inherited]
```

Is this column a primary key for the corresponding SQL database table?

Returns

TRUE if this column is a primary key for the corresponding SQL database table, or FALSE otherwise.

References util::mysql::SqlTableColumnDescriptionBase::is_primary_key_.

10.12.3.7 set_column_index()

```
void util::mysql::SqlTableColumnDescriptionBase::set_column_index (
            size_t idx)  [inline], [inherited]
```

Set the index of this SQL table column.

Parameters

in	*idx*	The index to set.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

10.12.3.8 SetObjectValue()

```
void util::mysql::SqlTableColumnDescription< C, int >::SetObjectValue (
            C & obj,
            const int & value) const  [inline], [protected], [inherited]
```

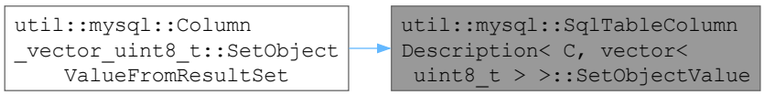
Set the object member value.

Parameters

in	*obj*	The object of type C.
in	*value*	The value of type T, to set.

Referenced by util::mysql::Column_int< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.12.3.9 SetObjectValueFromResultSet()

```
template<class C >
void util::mysql::Column_int< C >::SetObjectValueFromResultSet (
            C & obj,
            const ResultSet & results) const  [inline]
```

Set the value in the field of the corresponding object from an SQL ResultSet Object.

Parameters

in,out	*obj*	A reference to the object whose field value will be set.
in	*results*	A reference to the ResultSet object.

References util::mysql::SqlTableColumnDescription< C, int >::SetObjectValue().

Here is the call graph for this function:

10.12.3.10 SetPreparedStatementValueFromObject()

```
template<class C >
void util::mysql::Column_int< C >::SetPreparedStatementValueFromObject (
            const C & obj,
            PreparedStatement & stmt) const  [inline]
```

Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Parameters

in	*obj*	A reference to the object whose field value will be read.
in,out	*stmt*	A reference to the SQL PreparedStatement object whose column value will be set.

References util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescription< C, int >::GetValu

10.12.4 Member Data Documentation

10.12.4.1 accessor_

```
function<int(const C&)> util::mysql::SqlTableColumnDescription< C, int >::accessor_  [private],
[inherited]
```

The accessor function object wrapper.

This object is used as a wrapper for the accessor method of the template class C. It is used to retrieve the value of the SQL table column from the object for generating an INSERT or UPDATE statement.

10.12.4.2 column_index_

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index_  [private], [inherited]
```

The index of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescriptionBase::set_colum

10.12.4.3 column_name_

```
string util::mysql::SqlTableColumnDescriptionBase::column_name_  [private], [inherited]
```

The name of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_name(), and util::mysql::SqlTableColumnDescriptionBase::column_s

10.12.4.4 data_type_

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type_  [private], [inherited]
```

The enumerated SQL table column data type.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_select_name(), and util::mysql::SqlTableColumnDescriptionBase::da

10.12.4.5 is_primary_key_

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key_  [private], [inherited]
```

Indicates whether the column is part of the primary key for the SQL table.

Referenced by util::mysql::SqlTableColumnDescriptionBase::is_primary_key().

10.12.4.6 mutator_

`function<void(C&, int)> util::mysql::SqlTableColumnDescription< C, int >::mutator_ [private], [inherited]`

The mutator function object wrapper.

This object is used as a wrapper for the mutator method of the template class C. It is used to set the value of an object from the result set of an SQL SELECT query statement.

The documentation for this class was generated from the following file:

- utility/SqlTableColumnDescription.h

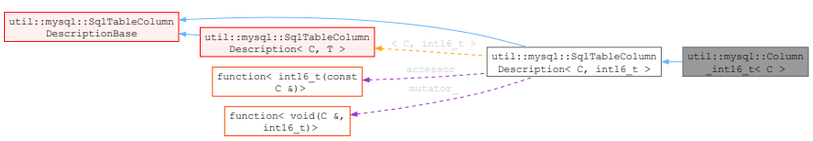
10.13 util::mysql::Column_int16_t< C > Class Template Reference

Template column description class for value of type int16_t.

`#include <SqlTableColumnDescription.h>`

Inheritance diagram for util::mysql::Column_int16_t< C >:

Collaboration diagram for util::mysql::Column_int16_t< C >:



Public Member Functions

- Column_int16_t (string column_name, int16_t(C::∗accessor)() const =NULL, void(C::∗mutator)(int16_t)=NULL, bool is_primary_key=false)

  The parameterized constructor.
- size_t column_index () const

  Get the index of the SQL table column.
- const string & column_name () const

  Get the name of the SQL table column.
- string column_select_name () const

  Get the name of the SQL table column to be used in a `SELECT` query.
- ColumDataType_t data_type () const

  Get the the enumerated SQL column data type.
- bool is_primary_key () const

  Is this column a primary key for the corresponding SQL database table?
- void set_column_index (size_t idx)

  Set the index of this SQL table column.
- void SetObjectValueFromResultSet (C &obj, const ResultSet &results) const

  Set the value in the field of the corresponding object from an SQL ResultSet Object.
- void SetPreparedStatementValueFromObject (const C &obj, PreparedStatement &stmt) const

  Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Protected Member Functions

- int16_t GetValueFromObject (const C &obj) const

  Get the object member value from the object.
- void SetObjectValue (C &obj, const int16_t &value) const

  Set the object member value.

Private Attributes

- function< int16_t(const C &)> accessor_

  The accessor function object wrapper.
- size_t column_index_

  The index of the SQL table column.
- string column_name_

  The name of the SQL table column.
- ColumDataType_t data_type_

  The enumerated SQL table column data type.
- bool is_primary_key_

  Indicates whether the column is part of the primary key for the SQL table.
- function< void(C &, int16_t)> mutator_

  The mutator function object wrapper.

10.13.1 Detailed Description

template<class C>
class util::mysql::Column_int16_t< C >

Template column description class for value of type int16_t.

10.13.2 Constructor & Destructor Documentation

10.13.2.1 Column_int16_t()

```
template<class C >
util::mysql::Column_int16_t< C >::Column_int16_t (
            string column_name,
            int16_t(C::* accessor )() const = NULL,
            void(C::* mutator )(int16_t) = NULL,
            bool is_primary_key = false)  [inline]
```

The parameterized constructor.

Parameters

in	*column_name*	The name of the SQL table column.
in	*accessor*	A pointer to the accessor method for acquiring the value of the corresponding object field.
in	*mutator*	A pointer to the mutator method for setting the value of the corresponding object field.
in	*is_primary_key*	TRUE if this column is a primary key for the SQL table, or FALSE otherwise.

10.13.3 Member Function Documentation

10.13.3.1 column_index()

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index () const  [inline], [inherited]
```

Get the index of the SQL table column.

Returns

The index of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

Referenced by util::mysql::Column_bool< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_char< C >::SetPreparedS
util::mysql::Column_double< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_filesystem_path< C >::SetPreparedS

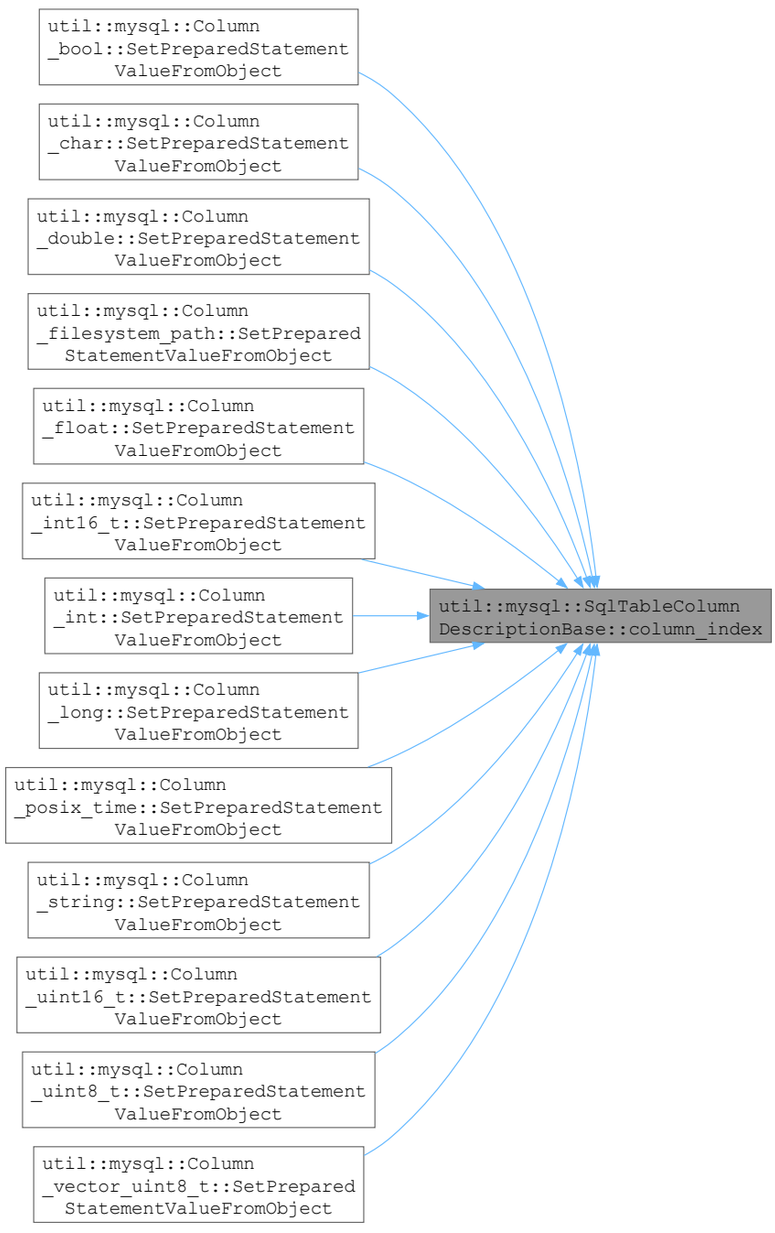
util::mysql::Column_posix_time< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_string< C >::SetPreparedStateme
util::mysql::Column_uint16_t< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_uint8_t< C >::SetPreparedStatemer
and util::mysql::Column_vector_uint8_t< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.13.3.2 column_name()

```
const string & util::mysql::SqlTableColumnDescriptionBase::column_name () const  [inline], [inherited]
```

Get the name of the SQL table column.

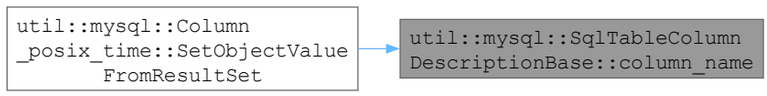
Returns

The name of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_name_.

Referenced by util::mysql::Column_posix_time< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.13.3.3 column_select_name()

```
string util::mysql::SqlTableColumnDescriptionBase::column_select_name () const  [inline], [inherited]
```

Get the name of the SQL table column to be used in a SELECT query.

Returns

The name of the SQL table column to be used in a SELECT query.

References util::mysql::SqlTableColumnDescriptionBase::column_name_, and util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.13.3.4 data_type()

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type () const  [inline], [inherited]
```

Get the the enumerated SQL column data type.

Returns

The the enumerated SQL column data type.

References util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.13.3.5 GetValueFromObject()

```
int16_t util::mysql::SqlTableColumnDescription< C, int16_t >::GetValueFromObject (
            const C & obj) const  [inline], [protected], [inherited]
```

Get the object member value from the object.

Parameters

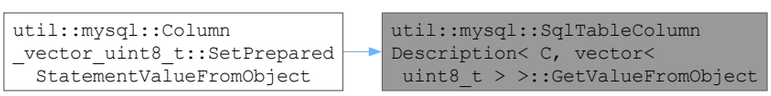
in	*obj*	The object of type C.

Returns

The value of type T of the object member corresponding to this SQL column.

Referenced by util::mysql::Column_int16_t< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.13.3.6 is_primary_key()

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key () const  [inline], [inherited]
```

Is this column a primary key for the corresponding SQL database table?

Returns

TRUE if this column is a primary key for the corresponding SQL database table, or FALSE otherwise.

References util::mysql::SqlTableColumnDescriptionBase::is_primary_key_.

10.13.3.7 set_column_index()

```
void util::mysql::SqlTableColumnDescriptionBase::set_column_index (
            size_t idx)  [inline], [inherited]
```

Set the index of this SQL table column.

Parameters

in	*idx*	The index to set.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

10.13.3.8 SetObjectValue()

```
void util::mysql::SqlTableColumnDescription< C, int16_t >::SetObjectValue (
            C & obj,
            const int16_t & value) const  [inline], [protected], [inherited]
```

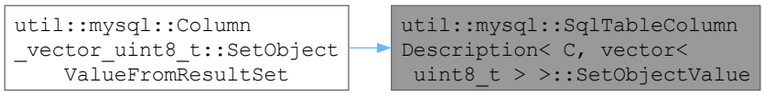
Set the object member value.

Parameters

in	*obj*	The object of type C.
in	*value*	The value of type T, to set.

Referenced by util::mysql::Column_int16_t< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.13.3.9 SetObjectValueFromResultSet()

```
template<class C >
void util::mysql::Column_int16_t< C >::SetObjectValueFromResultSet (
            C & obj,
            const ResultSet & results) const  [inline]
```

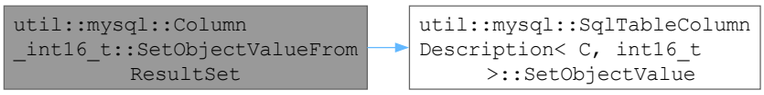
Set the value in the field of the corresponding object from an SQL ResultSet Object.

Parameters

in,out	*obj*	A reference to the object whose field value will be set.
in	*results*	A reference to the ResultSet object.

References util::mysql::SqlTableColumnDescription< C, int16_t >::SetObjectValue().

Here is the call graph for this function:



10.13.3.10 SetPreparedStatementValueFromObject()

```
template<class C >
void util::mysql::Column_int16_t< C >::SetPreparedStatementValueFromObject (
            const C & obj,
            PreparedStatement & stmt) const  [inline]
```

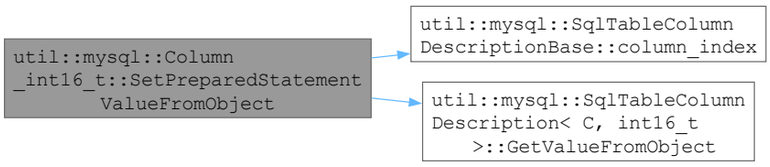
Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Parameters

in	*obj*	A reference to the object whose field value will be read.
in,out	*stmt*	A reference to the SQL PreparedStatement object whose column value will be set.

References util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescription< C, int16_t >::Get

Here is the call graph for this function:



10.13.4 Member Data Documentation

10.13.4.1 accessor_

```
function<int16_t(const C&)> util::mysql::SqlTableColumnDescription< C, int16_t >::accessor_↩
[private], [inherited]
```

The accessor function object wrapper.

This object is used as a wrapper for the accessor method of the template class C. It is used to retrieve the value of the SQL table column from the object for generating an INSERT or UPDATE statement.

10.13.4.2 column_index_

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index_  [private], [inherited]
```

The index of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescriptionBase::set_colum

10.13.4.3 column_name_

```
string util::mysql::SqlTableColumnDescriptionBase::column_name_  [private], [inherited]
```

The name of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_name(), and util::mysql::SqlTableColumnDescriptionBase::column_s

10.13.4.4 data_type_

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type_  [private], [inherited]
```

The enumerated SQL table column data type.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_select_name(), and util::mysql::SqlTableColumnDescriptionBase::da

10.13.4.5 is_primary_key_

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key_  [private], [inherited]
```

Indicates whether the column is part of the primary key for the SQL table.

Referenced by util::mysql::SqlTableColumnDescriptionBase::is_primary_key().

10.13.4.6 mutator_

```
function<void(C&, int16_t)> util::mysql::SqlTableColumnDescription< C, int16_t >::mutator_↩
[private], [inherited]
```

The mutator function object wrapper.

This object is used as a wrapper for the mutator method of the template class C. It is used to set the value of an object from the result set of an SQL SELECT query statement.

The documentation for this class was generated from the following file:

- utility/SqlTableColumnDescription.h

10.14 util::mysql::Column_long< C > Class Template Reference

Template column description class for value of type long.

```
#include <SqlTableColumnDescription.h>
```

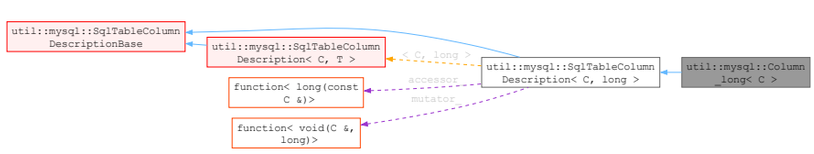
Collaboration diagram for util::mysql::Column_long< C >:



Public Member Functions

- Column_long (string column_name, long(C::*accessor)() const =NULL, void(C::*mutator)(long)=NULL, bool is_primary_key=false)
  The parameterized constructor.
- size_t column_index () const
  Get the index of the SQL table column.
- const string & column_name () const
  Get the name of the SQL table column.
- string column_select_name () const
  Get the name of the SQL table column to be used in a `SELECT` query.
- ColumDataType_t data_type () const
  Get the the enumerated SQL column data type.
- bool is_primary_key () const
  Is this column a primary key for the corresponding SQL database table?
- void set_column_index (size_t idx)
  Set the index of this SQL table column.
- void SetObjectValueFromResultSet (C &obj, const ResultSet &results) const
  Set the value in the field of the corresponding object from an SQL ResultSet Object.
- void SetPreparedStatementValueFromObject (const C &obj, PreparedStatement &stmt) const
  Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Protected Member Functions

- long GetValueFromObject (const C &obj) const
  Get the object member value from the object.
- void SetObjectValue (C &obj, const long &value) const
  Set the object member value.

Private Attributes

- function< long(const C &)> accessor_
  The accessor function object wrapper.
- size_t column_index_
  The index of the SQL table column.
- string column_name_
  The name of the SQL table column.
- ColumDataType_t data_type_
  The enumerated SQL table column data type.
- bool is_primary_key_
  Indicates whether the column is part of the primary key for the SQL table.
- function< void(C &, long)> mutator_
  The mutator function object wrapper.

10.14.1 Detailed Description

template<class C>
class util::mysql::Column_long< C >

Template column description class for value of type long.

10.14.2 Constructor & Destructor Documentation

10.14.2.1 Column_long()

```
template<class C >
util::mysql::Column_long< C >::Column_long (
            string column_name,
            long(C::* accessor )() const = NULL,
            void(C::* mutator )(long) = NULL,
            bool is_primary_key = false)  [inline]
```

The parameterized constructor.

Parameters

in	*column_name*	The name of the SQL table column.
in	*accessor*	A pointer to the accessor method for acquiring the value of the corresponding object field.
in	*mutator*	A pointer to the mutator method for setting the value of the corresponding object field.
in	*is_primary_key*	TRUE if this column is a primary key for the SQL table, or FALSE otherwise.

10.14.3 Member Function Documentation

10.14.3.1 column_index()

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index () const  [inline], [inherited]
```

Get the index of the SQL table column.

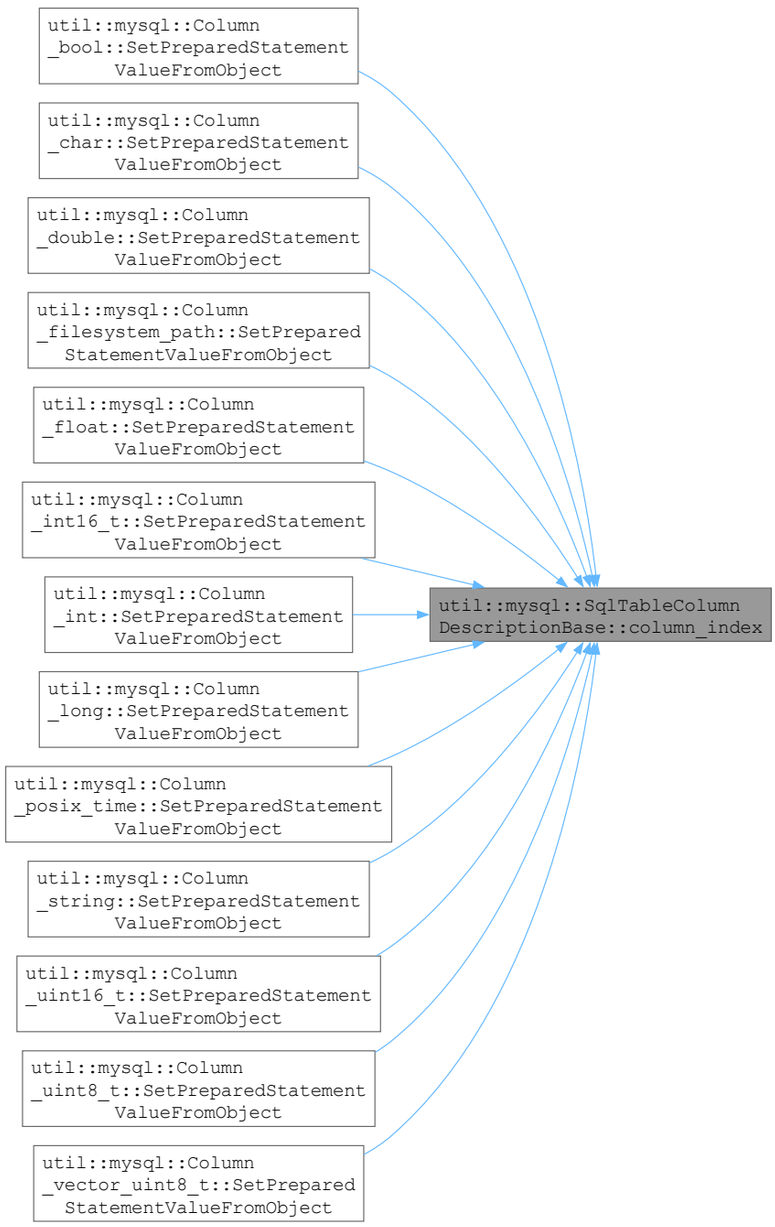
Returns

The index of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

Referenced by util::mysql::Column_bool< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_char< C >::SetPreparedS
util::mysql::Column_double< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_filesystem_path< C >::SetPreparedS
util::mysql::Column_float< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_int16_t< C >::SetPreparedStatementVa
util::mysql::Column_int< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_long< C >::SetPreparedStatementValueF
util::mysql::Column_posix_time< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_string< C >::SetPreparedStateme
util::mysql::Column_uint16_t< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_uint8_t< C >::SetPreparedStatemer
and util::mysql::Column_vector_uint8_t< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.14.3.2 column_name()

```
const string & util::mysql::SqlTableColumnDescriptionBase::column_name () const  [inline], [inherited]
```

Get the name of the SQL table column.

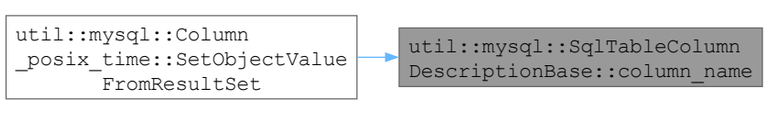
Returns

The name of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_name_.

Referenced by util::mysql::Column_posix_time< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.14.3.3 column_select_name()

```
string util::mysql::SqlTableColumnDescriptionBase::column_select_name () const  [inline], [inherited]
```

Get the name of the SQL table column to be used in a `SELECT` query.

Returns

The name of the SQL table column to be used in a `SELECT` query.

References util::mysql::SqlTableColumnDescriptionBase::column_name_, and util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.14.3.4 data_type()

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type () const  [inline], [inherited]
```

Get the the enumerated SQL column data type.

Returns

The the enumerated SQL column data type.

References util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.14.3.5 GetValueFromObject()

```
long util::mysql::SqlTableColumnDescription< C, long >::GetValueFromObject (
            const C & obj) const  [inline], [protected], [inherited]
```

Get the object member value from the object.

Parameters

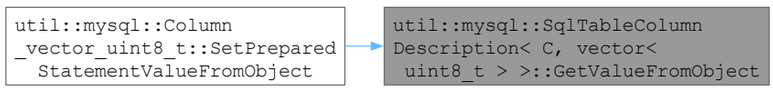
in	*obj*	The object of type `C`.

Returns

The value of type `T` of the object member corresponding to this SQL column.

Referenced by util::mysql::Column_long< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.14.3.6 is_primary_key()

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key () const  [inline], [inherited]
```

Is this column a primary key for the corresponding SQL database table?

Returns

TRUE if this column is a primary key for the corresponding SQL database table, or FALSE otherwise.

References util::mysql::SqlTableColumnDescriptionBase::is_primary_key_.

10.14.3.7 set_column_index()

```
void util::mysql::SqlTableColumnDescriptionBase::set_column_index (
            size_t idx)  [inline], [inherited]
```

Set the index of this SQL table column.

Parameters

in	*idx*	The index to set.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

10.14.3.8 SetObjectValue()

```
void util::mysql::SqlTableColumnDescription< C, long >::SetObjectValue (
            C & obj,
            const long & value) const  [inline], [protected], [inherited]
```

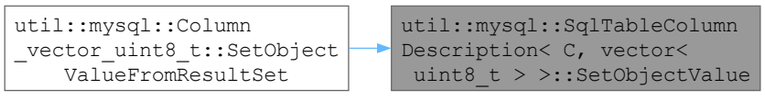
Set the object member value.

Parameters

in	*obj*	The object of type C.
in	*value*	The value of type T, to set.

Referenced by util::mysql::Column_long< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.14.3.9 SetObjectValueFromResultSet()

```
template<class C >
void util::mysql::Column_long< C >::SetObjectValueFromResultSet (
            C & obj,
            const ResultSet & results) const  [inline]
```

Set the value in the field of the corresponding object from an SQL ResultSet Object.

Parameters

in,out	*obj*	A reference to the object whose field value will be set.
in	*results*	A reference to the ResultSet object.

References util::mysql::SqlTableColumnDescription< C, long >::SetObjectValue().

Here is the call graph for this function:

10.14.3.10 SetPreparedStatementValueFromObject()

```
template<class C >
void util::mysql::Column_long< C >::SetPreparedStatementValueFromObject (
            const C & obj,
            PreparedStatement & stmt) const  [inline]
```

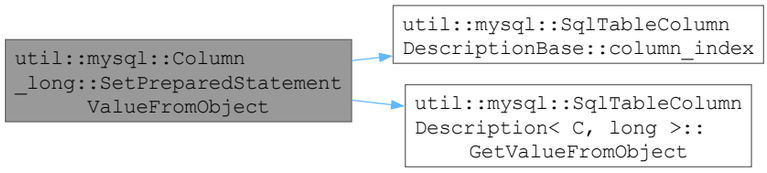
Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Parameters

in	*obj*	A reference to the object whose field value will be read.
in,out	*stmt*	A reference to the SQL PreparedStatement object whose column value will be set.

References util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescription< C, long >::GetVa

Here is the call graph for this function:



10.14.4 Member Data Documentation

10.14.4.1 accessor_

```
function<long(const C&)> util::mysql::SqlTableColumnDescription< C, long >::accessor_  [private],
[inherited]
```

The accessor function object wrapper.

This object is used as a wrapper for the accessor method of the template class C. It is used to retrieve the value of the SQL table column from the object for generating an INSERT or UPDATE statement.

10.14.4.2 column_index_

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index_  [private], [inherited]
```

The index of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescriptionBase::set_colum

10.14.4.3 column_name_

```
string util::mysql::SqlTableColumnDescriptionBase::column_name_  [private], [inherited]
```

The name of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_name(), and util::mysql::SqlTableColumnDescriptionBase::column_s

10.14.4.4 data_type_

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type_  [private], [inherited]
```

The enumerated SQL table column data type.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_select_name(), and util::mysql::SqlTableColumnDescriptionBase::da

10.14.4.5 is_primary_key_

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key_  [private], [inherited]
```

Indicates whether the column is part of the primary key for the SQL table.

Referenced by util::mysql::SqlTableColumnDescriptionBase::is_primary_key().

10.14.4.6 mutator_

`function<void(C&, long)> util::mysql::SqlTableColumnDescription< C, long >::mutator_ [private], [inherited]`

The mutator function object wrapper.

This object is used as a wrapper for the mutator method of the template class C. It is used to set the value of an object from the result set of an SQL SELECT query statement.

The documentation for this class was generated from the following file:

- utility/SqlTableColumnDescription.h

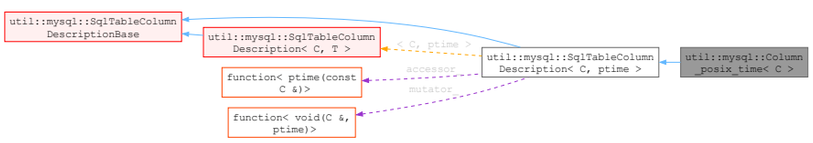
10.15 util::mysql::Column_posix_time< C > Class Template Reference

Template column description class for value of type boost::posix_time::ptime.

`#include <SqlTableColumnDescription.h>`

Inheritance diagram for util::mysql::Column_posix_time< C >:

Collaboration diagram for util::mysql::Column_posix_time< C >:



Public Member Functions

- Column_posix_time (string column_name, const ptime &(C::∗accessor)() const =NULL, void(C::∗mutator)(const ptime &)=NULL, bool is_primary_key=false)

  The parameterized constructor.
- Column_posix_time (string column_name, ptime(C::∗accessor)() const =NULL, void(C::∗mutator)(const ptime &)=NULL, bool is_primary_key=false)

  The parameterized constructor.
- size_t column_index () const

  Get the index of the SQL table column.
- const string & column_name () const

  Get the name of the SQL table column.
- string column_select_name () const

  Get the name of the SQL table column to be used in a `SELECT` query.
- ColumDataType_t data_type () const

  Get the the enumerated SQL column data type.
- bool is_primary_key () const

  Is this column a primary key for the corresponding SQL database table?
- void set_column_index (size_t idx)

  Set the index of this SQL table column.
- void SetObjectValueFromResultSet (C &obj, const ResultSet &results) const

  Set the value in the field of the corresponding object from an SQL ResultSet Object.
- void SetPreparedStatementValueFromObject (const C &obj, PreparedStatement &stmt) const

  Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Protected Member Functions

- ptime GetValueFromObject (const C &obj) const

  Get the object member value from the object.
- void SetObjectValue (C &obj, const ptime &value) const

  Set the object member value.

Private Attributes

- function< ptime(const C &)> accessor_

  The accessor function object wrapper.
- size_t column_index_

  The index of the SQL table column.
- string column_name_

  The name of the SQL table column.
- ColumDataType_t data_type_

  The enumerated SQL table column data type.
- bool is_primary_key_

  Indicates whether the column is part of the primary key for the SQL table.
- function< void(C &, ptime)> mutator_

  The mutator function object wrapper.

10.15.1 Detailed Description

template<class C>
class util::mysql::Column_posix_time< C >

Template column description class for value of type boost::posix_time::ptime.

10.15.2 Constructor & Destructor Documentation

10.15.2.1 Column_posix_time() [1/2]

```
template<class C >
util::mysql::Column_posix_time< C >::Column_posix_time (
            string column_name,
            ptime(C::* accessor )() const = NULL,
            void(C::* mutator )(const ptime &) = NULL,
            bool is_primary_key = false)  [inline]
```

The parameterized constructor.

Parameters

in	*column_name*	The name of the SQL table column.
in	*accessor*	A pointer to the accessor method for acquiring the value of the corresponding object field.
in	*mutator*	A pointer to the mutator method for setting the value of the corresponding object field.
in	*is_primary_key*	TRUE if this column is a primary key for the SQL table, or FALSE otherwise.

10.15.2.2 Column_posix_time() [2/2]

```
template<class C >
util::mysql::Column_posix_time< C >::Column_posix_time (
            string column_name,
            const ptime &(C::* accessor )() const = NULL,
            void(C::* mutator )(const ptime &) = NULL,
            bool is_primary_key = false)  [inline]
```

The parameterized constructor.

Parameters

in	*column_name*	The name of the SQL table column.
in	*accessor*	A pointer to the accessor method for acquiring the value of the corresponding object field.
in	*mutator*	A pointer to the mutator method for setting the value of the corresponding object field.
in	*is_primary_key*	TRUE if this column is a primary key for the SQL table, or FALSE otherwise.

10.15.3 Member Function Documentation

10.15.3.1 column_index()

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index () const  [inline], [inherited]
```

Get the index of the SQL table column.

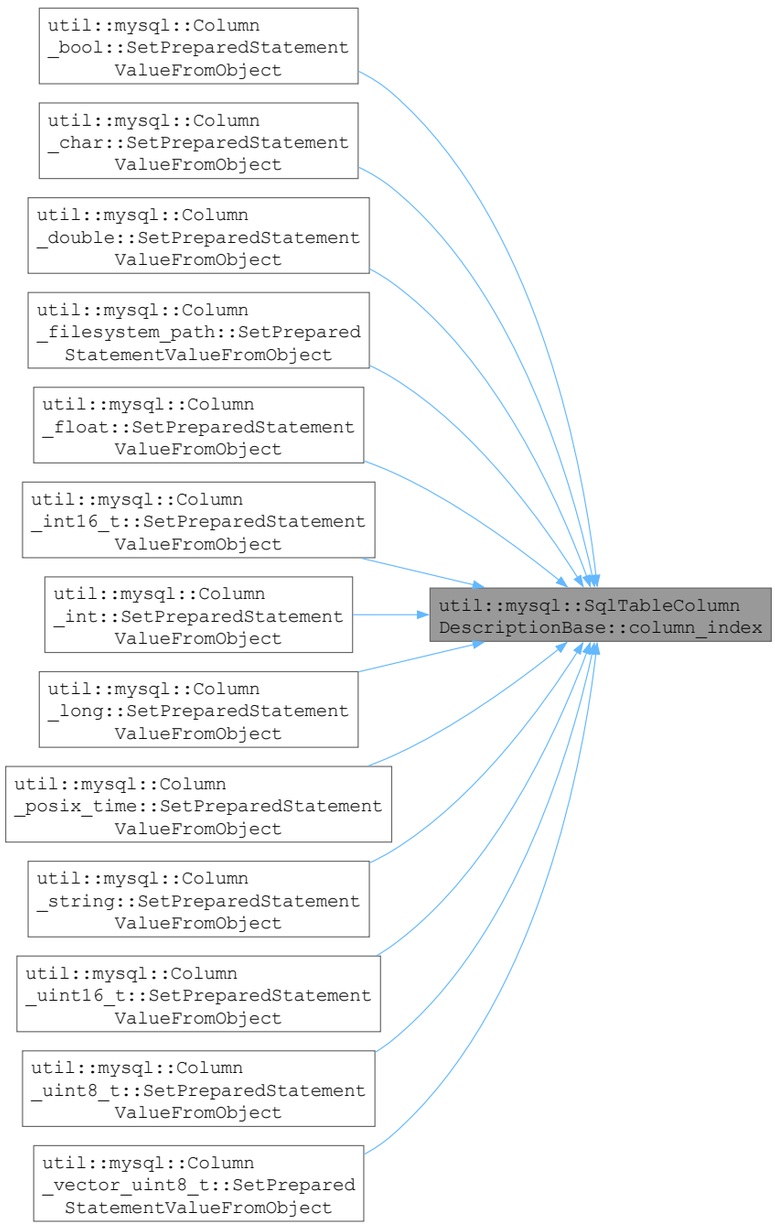
Returns

The index of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

Referenced by util::mysql::Column_bool< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_char< C >::SetPreparedS
util::mysql::Column_double< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_filesystem_path< C >::SetPreparedS
util::mysql::Column_float< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_int16_t< C >::SetPreparedStatementVa
util::mysql::Column_int< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_long< C >::SetPreparedStatementValueF
util::mysql::Column_posix_time< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_string< C >::SetPreparedStateme
util::mysql::Column_uint16_t< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_uint8_t< C >::SetPreparedStatemer
and util::mysql::Column_vector_uint8_t< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.15.3.2 column_name()

```
const string & util::mysql::SqlTableColumnDescriptionBase::column_name () const  [inline], [inherited]
```

Get the name of the SQL table column.

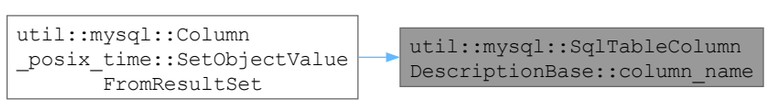
Returns

The name of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_name_.

Referenced by util::mysql::Column_posix_time< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.15.3.3 column_select_name()

```
string util::mysql::SqlTableColumnDescriptionBase::column_select_name () const  [inline], [inherited]
```

Get the name of the SQL table column to be used in a SELECT query.

Returns

The name of the SQL table column to be used in a SELECT query.

References util::mysql::SqlTableColumnDescriptionBase::column_name_, and util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.15.3.4 data_type()

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type () const  [inline], [inherited]
```

Get the the enumerated SQL column data type.

Returns

The the enumerated SQL column data type.

References util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.15.3.5 GetValueFromObject()

```
ptime util::mysql::SqlTableColumnDescription< C, ptime >::GetValueFromObject (
            const C & obj) const  [inline], [protected], [inherited]
```

Get the object member value from the object.

Parameters

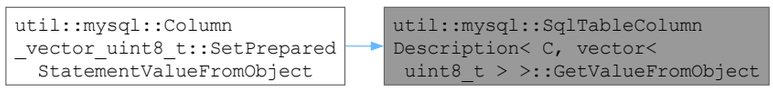
in	*obj*	The object of type C.

Returns

The value of type T of the object member corresponding to this SQL column.

Referenced by util::mysql::Column_posix_time< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.15.3.6 is_primary_key()

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key () const  [inline], [inherited]
```

Is this column a primary key for the corresponding SQL database table?

Returns

TRUE if this column is a primary key for the corresponding SQL database table, or FALSE otherwise.

References util::mysql::SqlTableColumnDescriptionBase::is_primary_key_.

10.15.3.7 set_column_index()

```
void util::mysql::SqlTableColumnDescriptionBase::set_column_index (
            size_t idx)  [inline], [inherited]
```

Set the index of this SQL table column.

Parameters

in	*idx*	The index to set.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

10.15.3.8 SetObjectValue()

```
void util::mysql::SqlTableColumnDescription< C, ptime >::SetObjectValue (
            C & obj,
            const ptime & value) const  [inline], [protected], [inherited]
```

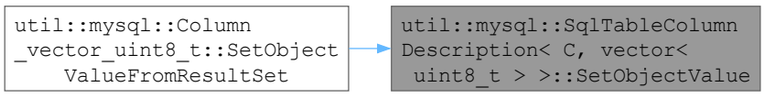
Set the object member value.

Parameters

in	*obj*	The object of type C.
in	*value*	The value of type T, to set.

Referenced by util::mysql::Column_posix_time< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.15.3.9 SetObjectValueFromResultSet()

```
template<class C >
void util::mysql::Column_posix_time< C >::SetObjectValueFromResultSet (
            C & obj,
            const ResultSet & results) const  [inline]
```

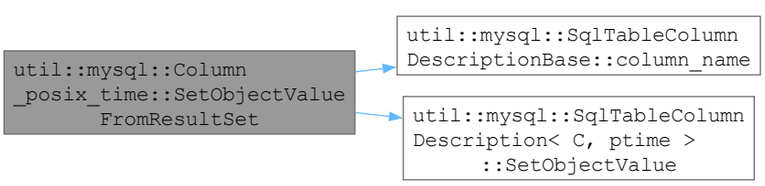
Set the value in the field of the corresponding object from an SQL ResultSet Object.

Parameters

in,out	*obj*	A reference to the object whose field value will be set.
in	*results*	A reference to the ResultSet object.

References util::mysql::SqlTableColumnDescriptionBase::column_name(), and util::mysql::SqlTableColumnDescription< C, ptime >::SetO

Here is the call graph for this function:



10.15.3.10 SetPreparedStatementValueFromObject()

```
template<class C >
void util::mysql::Column_posix_time< C >::SetPreparedStatementValueFromObject (
            const C & obj,
            PreparedStatement & stmt) const  [inline]
```

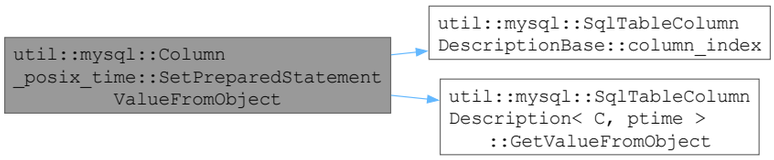
Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Parameters

in	*obj*	A reference to the object whose field value will be read.
in,out	*stmt*	A reference to the SQL PreparedStatement object whose column value will be set.

References util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescription< C, ptime >::GetV

Here is the call graph for this function:



10.15.4 Member Data Documentation

10.15.4.1 accessor_

function<ptime(const C&)> util::mysql::SqlTableColumnDescription< C, ptime >::accessor_ [private], [inherited]

The accessor function object wrapper.

This object is used as a wrapper for the accessor method of the template class C. It is used to retrieve the value of the SQL table column from the object for generating an INSERT or UPDATE statement.

10.15.4.2 column_index_

size_t util::mysql::SqlTableColumnDescriptionBase::column_index_ [private], [inherited]

The index of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescriptionBase::set_colum

10.15.4.3 column_name_

string util::mysql::SqlTableColumnDescriptionBase::column_name_ [private], [inherited]

The name of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_name(), and util::mysql::SqlTableColumnDescriptionBase::column_s

10.15.4.4 data_type_

ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type_ [private], [inherited]

The enumerated SQL table column data type.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_select_name(), and util::mysql::SqlTableColumnDescriptionBase::da

10.15.4.5 is_primary_key_

bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key_ [private], [inherited]

Indicates whether the column is part of the primary key for the SQL table.

Referenced by util::mysql::SqlTableColumnDescriptionBase::is_primary_key().

10.15.4.6 mutator_

`function<void(C&, ptime)> util::mysql::SqlTableColumnDescription< C, ptime >::mutator_ [private], [inherited]`

The mutator function object wrapper.

This object is used as a wrapper for the mutator method of the template class C. It is used to set the value of an object from the result set of an SQL SELECT query statement.

The documentation for this class was generated from the following file:

- utility/SqlTableColumnDescription.h

10.16 util::mysql::Column_string< C > Class Template Reference

Template column description class for value of type string.

  Set the value in the field of the corresponding object from an SQL ResultSet Object.
- void SetPreparedStatementValueFromObject (const C &obj, PreparedStatement &stmt) const

  Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Protected Member Functions

- string GetValueFromObject (const C &obj) const
  Get the object member value from the object.
- void SetObjectValue (C &obj, const string &value) const
  Set the object member value.

Private Attributes

- function< string(const C &)> accessor_
  The accessor function object wrapper.
- size_t column_index_
  The index of the SQL table column.
- string column_name_
  The name of the SQL table column.
- ColumDataType_t data_type_
  The enumerated SQL table column data type.
- bool is_primary_key_
  Indicates whether the column is part of the primary key for the SQL table.
- function< void(C &, string)> mutator_
  The mutator function object wrapper.

10.16.1 Detailed Description

template<class C>
class util::mysql::Column_string< C >

Template column description class for value of type string.

10.16.2 Constructor & Destructor Documentation

10.16.2.1 Column_string() [1/2]

```
template<class C >
util::mysql::Column_string< C >::Column_string (
            string column_name,
            string(C::* accessor )() const = NULL,
            void(C::* mutator )(const string &) = NULL,
            bool is_primary_key = false)  [inline]
```

The parameterized constructor.

Parameters

in	*column_name*	The name of the SQL table column.
in	*accessor*	A pointer to the accessor method for acquiring the value of the corresponding object field.
in	*mutator*	A pointer to the mutator method for setting the value of the corresponding object field.
in	*is_primary_key*	TRUE if this column is a primary key for the SQL table, or FALSE otherwise.

10.16.2.2 Column_string() [2/2]

```
template<class C >
util::mysql::Column_string< C >::Column_string (
            string column_name,
            const string &(C::* accessor )() const = NULL,
            void(C::* mutator )(const string &) = NULL,
            bool is_primary_key = false)  [inline]
```

The parameterized constructor.

Parameters

in	*column_name*	The name of the SQL table column.
in	*accessor*	A pointer to the accessor method for acquiring the value of the corresponding object field.
in	*mutator*	A pointer to the mutator method for setting the value of the corresponding object field.
in	*is_primary_key*	TRUE if this column is a primary key for the SQL table, or FALSE otherwise.

10.16.3 Member Function Documentation

10.16.3.1 column_index()

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index () const  [inline], [inherited]
```

Get the index of the SQL table column.

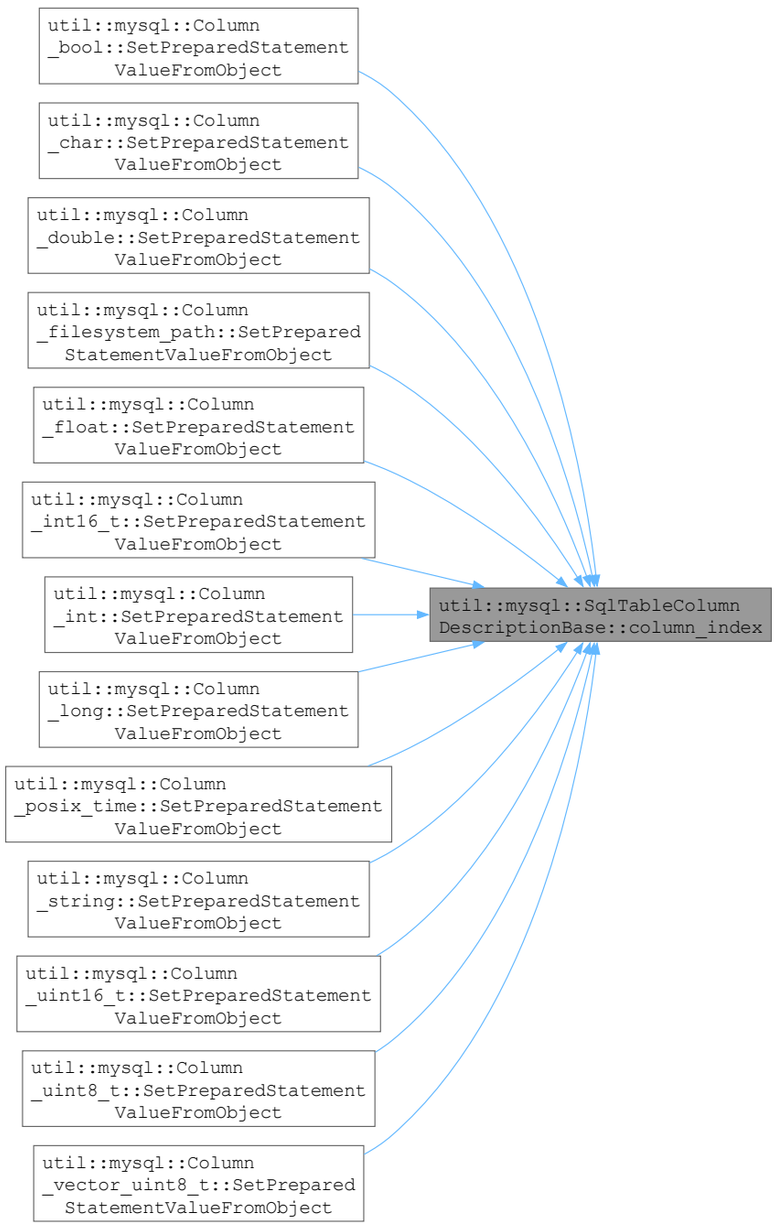
Returns

The index of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

Referenced by util::mysql::Column_bool< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_char< C >::SetPreparedS
util::mysql::Column_double< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_filesystem_path< C >::SetPreparedS
util::mysql::Column_float< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_int16_t< C >::SetPreparedStatementVa
util::mysql::Column_int< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_long< C >::SetPreparedStatementValueF
util::mysql::Column_posix_time< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_string< C >::SetPreparedStateme
util::mysql::Column_uint16_t< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_uint8_t< C >::SetPreparedStatemer
and util::mysql::Column_vector_uint8_t< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.16.3.2 column_name()

```
const string & util::mysql::SqlTableColumnDescriptionBase::column_name () const  [inline], [inherited]
```

Get the name of the SQL table column.

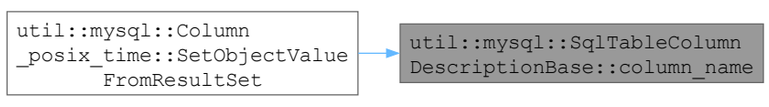
Returns

The name of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_name_.

Referenced by util::mysql::Column_posix_time< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.16.3.3 column_select_name()

```
string util::mysql::SqlTableColumnDescriptionBase::column_select_name () const  [inline], [inherited]
```

Get the name of the SQL table column to be used in a `SELECT` query.

Returns

The name of the SQL table column to be used in a `SELECT` query.

References util::mysql::SqlTableColumnDescriptionBase::column_name_, and util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.16.3.4 data_type()

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type () const  [inline], [inherited]
```

Get the the enumerated SQL column data type.

Returns

The the enumerated SQL column data type.

References util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.16.3.5 GetValueFromObject()

```
string util::mysql::SqlTableColumnDescription< C, string >::GetValueFromObject (
            const C & obj) const  [inline], [protected], [inherited]
```

Get the object member value from the object.

Parameters

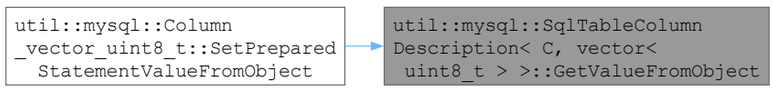
in	*obj*	The object of type C.

Returns

The value of type T of the object member corresponding to this SQL column.

Referenced by util::mysql::Column_string< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.16.3.6 is_primary_key()

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key () const  [inline], [inherited]
```

Is this column a primary key for the corresponding SQL database table?

Returns

TRUE if this column is a primary key for the corresponding SQL database table, or FALSE otherwise.

References util::mysql::SqlTableColumnDescriptionBase::is_primary_key_.

10.16.3.7 set_column_index()

```
void util::mysql::SqlTableColumnDescriptionBase::set_column_index (
            size_t idx)  [inline], [inherited]
```

Set the index of this SQL table column.

Parameters

in	*idx*	The index to set.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

10.16.3.8 SetObjectValue()

```
void util::mysql::SqlTableColumnDescription< C, string >::SetObjectValue (
            C & obj,
            const string & value) const  [inline], [protected], [inherited]
```

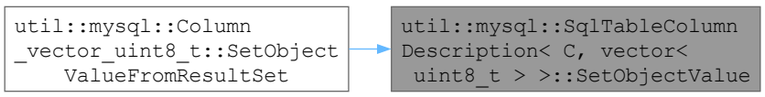
Set the object member value.

Parameters

in	*obj*	The object of type C.
in	*value*	The value of type T, to set.

Referenced by util::mysql::Column_string< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.16.3.9 SetObjectValueFromResultSet()

```
template<class C >
void util::mysql::Column_string< C >::SetObjectValueFromResultSet (
            C & obj,
            const ResultSet & results) const  [inline]
```

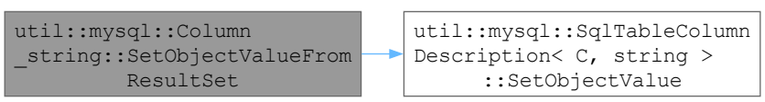
Set the value in the field of the corresponding object from an SQL ResultSet Object.

Parameters

in,out	*obj*	A reference to the object whose field value will be set.
in	*results*	A reference to the ResultSet object.

References util::mysql::SqlTableColumnDescription< C, string >::SetObjectValue().

Here is the call graph for this function:



10.16.3.10 SetPreparedStatementValueFromObject()

```
template<class C >
void util::mysql::Column_string< C >::SetPreparedStatementValueFromObject (
            const C & obj,
            PreparedStatement & stmt) const  [inline]
```

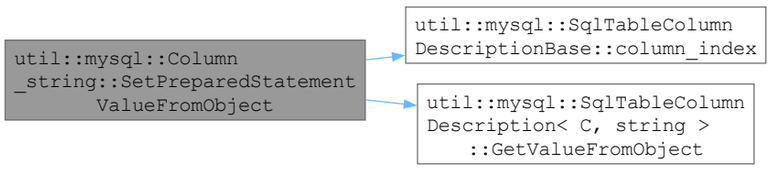
Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Parameters

in	*obj*	A reference to the object whose field value will be read.
in,out	*stmt*	A reference to the SQL PreparedStatement object whose column value will be set.

References util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescription< C, string >::GetV

Here is the call graph for this function:



10.16.4 Member Data Documentation

10.16.4.1 accessor_

```
function<string(const C&)> util::mysql::SqlTableColumnDescription< C, string >::accessor_↩
[private], [inherited]
```

The accessor function object wrapper.

This object is used as a wrapper for the accessor method of the template class C. It is used to retrieve the value of the SQL table column from the object for generating an INSERT or UPDATE statement.

10.16.4.2 column_index_

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index_ [private], [inherited]
```

The index of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescriptionBase::set_colum

10.16.4.3 column_name_

```
string util::mysql::SqlTableColumnDescriptionBase::column_name_ [private], [inherited]
```

The name of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_name(), and util::mysql::SqlTableColumnDescriptionBase::column_s

10.16.4.4 data_type_

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type_ [private], [inherited]
```

The enumerated SQL table column data type.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_select_name(), and util::mysql::SqlTableColumnDescriptionBase::da

10.16.4.5 is_primary_key_

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key_ [private], [inherited]
```

Indicates whether the column is part of the primary key for the SQL table.

Referenced by util::mysql::SqlTableColumnDescriptionBase::is_primary_key().

10.16.4.6 mutator_

`function<void(C&, string)> util::mysql::SqlTableColumnDescription< C, string >::mutator_ [private], [inherited]`

The mutator function object wrapper.

This object is used as a wrapper for the mutator method of the template class C. It is used to set the value of an object from the result set of an SQL SELECT query statement.

The documentation for this class was generated from the following file:

- utility/SqlTableColumnDescription.h

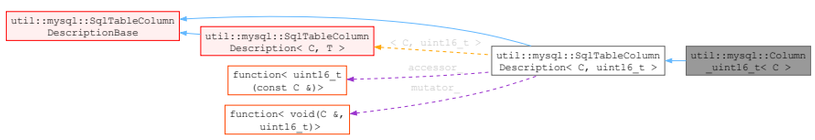
10.17 util::mysql::Column_uint16_t< C > Class Template Reference

Template column description class for value of type uint16_t.

`#include <SqlTableColumnDescription.h>`

Inheritance diagram for util::mysql::Column_uint16_t< C >:

Collaboration diagram for util::mysql::Column_uint16_t< C >:



Public Member Functions

- Column_uint16_t (string column_name, uint16_t(C::∗accessor)() const =NULL, void(C::∗mutator)(uint16_t)=NULL, bool is_primary_key=false)

  The parameterized constructor.
- size_t column_index () const

  Get the index of the SQL table column.
- const string & column_name () const

  Get the name of the SQL table column.
- string column_select_name () const

  Get the name of the SQL table column to be used in a `SELECT` query.
- ColumDataType_t data_type () const

  Get the the enumerated SQL column data type.
- bool is_primary_key () const

  Is this column a primary key for the corresponding SQL database table?
- void set_column_index (size_t idx)

  Set the index of this SQL table column.
- void SetObjectValueFromResultSet (C &obj, const ResultSet &results) const

  Set the value in the field of the corresponding object from an SQL ResultSet Object.
- void SetPreparedStatementValueFromObject (const C &obj, PreparedStatement &stmt) const

  Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Protected Member Functions

- uint16_t GetValueFromObject (const C &obj) const

  Get the object member value from the object.
- void SetObjectValue (C &obj, const uint16_t &value) const

  Set the object member value.

Private Attributes

- function< uint16_t(const C &)> accessor_

  The accessor function object wrapper.
- size_t column_index_

  The index of the SQL table column.
- string column_name_

  The name of the SQL table column.
- ColumDataType_t data_type_

  The enumerated SQL table column data type.
- bool is_primary_key_

  Indicates whether the column is part of the primary key for the SQL table.
- function< void(C &, uint16_t)> mutator_

  The mutator function object wrapper.

10.17.1 Detailed Description

template<class C>
class util::mysql::Column_uint16_t< C >

Template column description class for value of type uint16_t.

10.17.2 Constructor & Destructor Documentation

10.17.2.1 Column_uint16_t()

```
template<class C >
util::mysql::Column_uint16_t< C >::Column_uint16_t (
            string column_name,
            uint16_t(C::* accessor )() const = NULL,
            void(C::* mutator )(uint16_t) = NULL,
            bool is_primary_key = false)  [inline]
```

The parameterized constructor.

Parameters

in	*column_name*	The name of the SQL table column.
in	*accessor*	A pointer to the accessor method for acquiring the value of the corresponding object field.
in	*mutator*	A pointer to the mutator method for setting the value of the corresponding object field.
in	*is_primary_key*	TRUE if this column is a primary key for the SQL table, or FALSE otherwise.

10.17.3 Member Function Documentation

10.17.3.1 column_index()

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index () const  [inline], [inherited]
```

Get the index of the SQL table column.

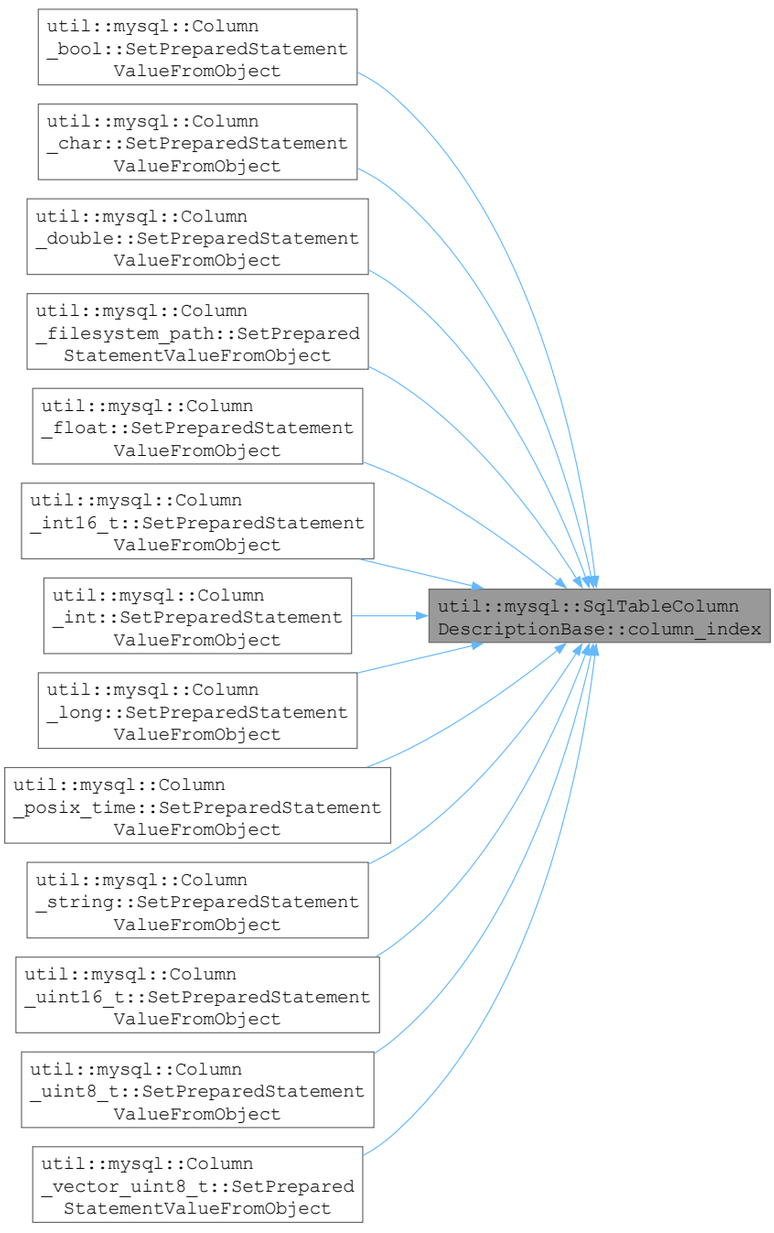
Returns

The index of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

Referenced by util::mysql::Column_bool< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_char< C >::SetPreparedS
util::mysql::Column_double< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_filesystem_path< C >::SetPreparedS
util::mysql::Column_float< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_int16_t< C >::SetPreparedStatementVa
util::mysql::Column_int< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_long< C >::SetPreparedStatementValueF
util::mysql::Column_posix_time< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_string< C >::SetPreparedStateme
util::mysql::Column_uint16_t< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_uint8_t< C >::SetPreparedStatemer
and util::mysql::Column_vector_uint8_t< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.17.3.2 column_name()

```
const string & util::mysql::SqlTableColumnDescriptionBase::column_name () const  [inline], [inherited]
```

Get the name of the SQL table column.

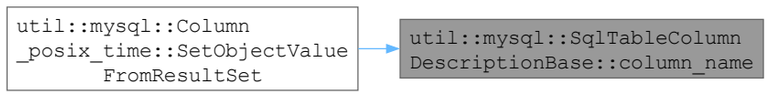
Returns

The name of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_name_.

Referenced by util::mysql::Column_posix_time< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.17.3.3 column_select_name()

```
string util::mysql::SqlTableColumnDescriptionBase::column_select_name () const  [inline], [inherited]
```

Get the name of the SQL table column to be used in a `SELECT` query.

Returns

The name of the SQL table column to be used in a `SELECT` query.

References util::mysql::SqlTableColumnDescriptionBase::column_name_, and util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.17.3.4 data_type()

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type () const  [inline], [inherited]
```

Get the the enumerated SQL column data type.

Returns

The the enumerated SQL column data type.

References util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.17.3.5 GetValueFromObject()

```
uint16_t util::mysql::SqlTableColumnDescription< C, uint16_t >::GetValueFromObject (
            const C & obj) const  [inline], [protected], [inherited]
```

Get the object member value from the object.

Parameters

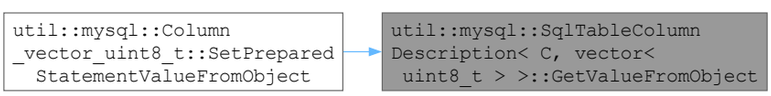
in	*obj*	The object of type `C`.

Returns

The value of type `T` of the object member corresponding to this SQL column.

Referenced by util::mysql::Column_uint16_t< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.17.3.6 is_primary_key()

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key () const  [inline], [inherited]
```

Is this column a primary key for the corresponding SQL database table?

Returns

TRUE if this column is a primary key for the corresponding SQL database table, or FALSE otherwise.

References util::mysql::SqlTableColumnDescriptionBase::is_primary_key_.

10.17.3.7 set_column_index()

```
void util::mysql::SqlTableColumnDescriptionBase::set_column_index (
            size_t idx)  [inline], [inherited]
```

Set the index of this SQL table column.

Parameters

in	*idx*	The index to set.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

10.17.3.8 SetObjectValue()

```
void util::mysql::SqlTableColumnDescription< C, uint16_t >::SetObjectValue (
            C & obj,
            const uint16_t & value) const  [inline], [protected], [inherited]
```

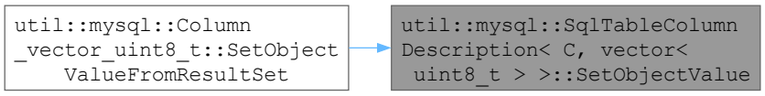
Set the object member value.

Parameters

in	*obj*	The object of type C.
in	*value*	The value of type T, to set.

Referenced by util::mysql::Column_uint16_t< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.17.3.9 SetObjectValueFromResultSet()

```
template<class C >
void util::mysql::Column_uint16_t< C >::SetObjectValueFromResultSet (
            C & obj,
            const ResultSet & results) const  [inline]
```

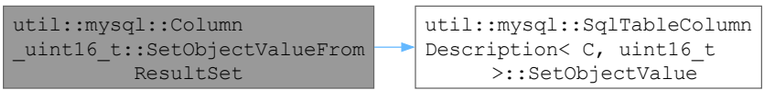
Set the value in the field of the corresponding object from an SQL ResultSet Object.

Parameters

in,out	*obj*	A reference to the object whose field value will be set.
in	*results*	A reference to the ResultSet object.

References util::mysql::SqlTableColumnDescription< C, uint16_t >::SetObjectValue().

Here is the call graph for this function:



10.17.3.10 SetPreparedStatementValueFromObject()

```
template<class C >
void util::mysql::Column_uint16_t< C >::SetPreparedStatementValueFromObject (
            const C & obj,
            PreparedStatement & stmt) const  [inline]
```

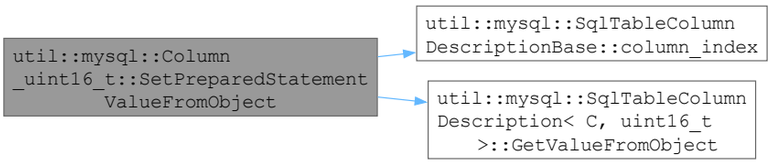
Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Parameters

in	*obj*	A reference to the object whose field value will be read.
in,out	*stmt*	A reference to the SQL PreparedStatement object whose column value will be set.

References util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescription< C, uint16_t >::G

Here is the call graph for this function:



10.17.4 Member Data Documentation

10.17.4.1 accessor_

```
function<uint16_t(const C&)> util::mysql::SqlTableColumnDescription< C, uint16_t >::accessor_↩
[private], [inherited]
```

The accessor function object wrapper.

This object is used as a wrapper for the accessor method of the template class C. It is used to retrieve the value of the SQL table column from the object for generating an INSERT or UPDATE statement.

10.17.4.2 column_index_

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index_  [private], [inherited]
```

The index of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescriptionBase::set_colum

10.17.4.3 column_name_

```
string util::mysql::SqlTableColumnDescriptionBase::column_name_  [private], [inherited]
```

The name of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_name(), and util::mysql::SqlTableColumnDescriptionBase::column_s

10.17.4.4 data_type_

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type_  [private], [inherited]
```

The enumerated SQL table column data type.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_select_name(), and util::mysql::SqlTableColumnDescriptionBase::da

10.17.4.5 is_primary_key_

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key_  [private], [inherited]
```

Indicates whether the column is part of the primary key for the SQL table.

Referenced by util::mysql::SqlTableColumnDescriptionBase::is_primary_key().

10.17.4.6 mutator_

```
function<void(C&, uint16_t)> util::mysql::SqlTableColumnDescription< C, uint16_t >::mutator_↩
[private], [inherited]
```

The mutator function object wrapper.

This object is used as a wrapper for the mutator method of the template class C. It is used to set the value of an object from the result set of an SQL SELECT query statement.

The documentation for this class was generated from the following file:

- utility/SqlTableColumnDescription.h

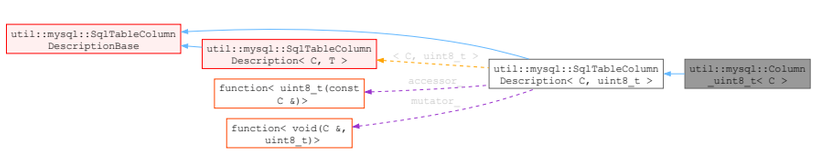
10.18 util::mysql::Column_uint8_t< C > Class Template Reference

Template column description class for value of type uint8_t.

```
#include <SqlTableColumnDescription.h>
```

Inheritance diagram for util::mysql::Column_uint8_t< C >:

Collaboration diagram for util::mysql::Column_uint8_t< C >:



Public Member Functions

- Column_uint8_t (string column_name, uint8_t(C::∗accessor)() const =NULL, void(C::∗mutator)(uint8_t)=NULL, bool is_primary_key=false)

  The parameterized constructor.
- size_t column_index () const

  Get the index of the SQL table column.
- const string & column_name () const

  Get the name of the SQL table column.
- string column_select_name () const

  Get the name of the SQL table column to be used in a `SELECT` query.
- ColumDataType_t data_type () const

  Get the the enumerated SQL column data type.
- bool is_primary_key () const

  Is this column a primary key for the corresponding SQL database table?
- void set_column_index (size_t idx)

  Set the index of this SQL table column.
- void SetObjectValueFromResultSet (C &obj, const ResultSet &results) const

  Set the value in the field of the corresponding object from an SQL ResultSet Object.
- void SetPreparedStatementValueFromObject (const C &obj, PreparedStatement &stmt) const

  Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Protected Member Functions

- uint8_t GetValueFromObject (const C &obj) const

  Get the object member value from the object.
- void SetObjectValue (C &obj, const uint8_t &value) const

  Set the object member value.

Private Attributes

- function< uint8_t(const C &)> accessor_

  The accessor function object wrapper.
- size_t column_index_

  The index of the SQL table column.
- string column_name_

  The name of the SQL table column.
- ColumDataType_t data_type_

  The enumerated SQL table column data type.
- bool is_primary_key_

  Indicates whether the column is part of the primary key for the SQL table.
- function< void(C &, uint8_t)> mutator_

  The mutator function object wrapper.

10.18.1 Detailed Description

template<class C>
class util::mysql::Column_uint8_t< C >

Template column description class for value of type uint8_t.

10.18.2 Constructor & Destructor Documentation

10.18.2.1 Column_uint8_t()

```
template<class C >
util::mysql::Column_uint8_t< C >::Column_uint8_t (
            string column_name,
            uint8_t(C::* accessor )() const = NULL,
            void(C::* mutator )(uint8_t) = NULL,
            bool is_primary_key = false)  [inline]
```

The parameterized constructor.

Parameters

in	*column_name*	The name of the SQL table column.
in	*accessor*	A pointer to the accessor method for acquiring the value of the corresponding object field.
in	*mutator*	A pointer to the mutator method for setting the value of the corresponding object field.
in	*is_primary_key*	TRUE if this column is a primary key for the SQL table, or FALSE otherwise.

10.18.3 Member Function Documentation

10.18.3.1 column_index()

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index () const  [inline], [inherited]
```

Get the index of the SQL table column.

Returns

The index of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

Referenced by util::mysql::Column_bool< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_char< C >::SetPreparedS
util::mysql::Column_double< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_filesystem_path< C >::SetPreparedS
util::mysql::Column_float< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_int16_t< C >::SetPreparedStatementVa
util::mysql::Column_int< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_long< C >::SetPreparedStatementValueF
util::mysql::Column_posix_time< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_string< C >::SetPreparedStateme

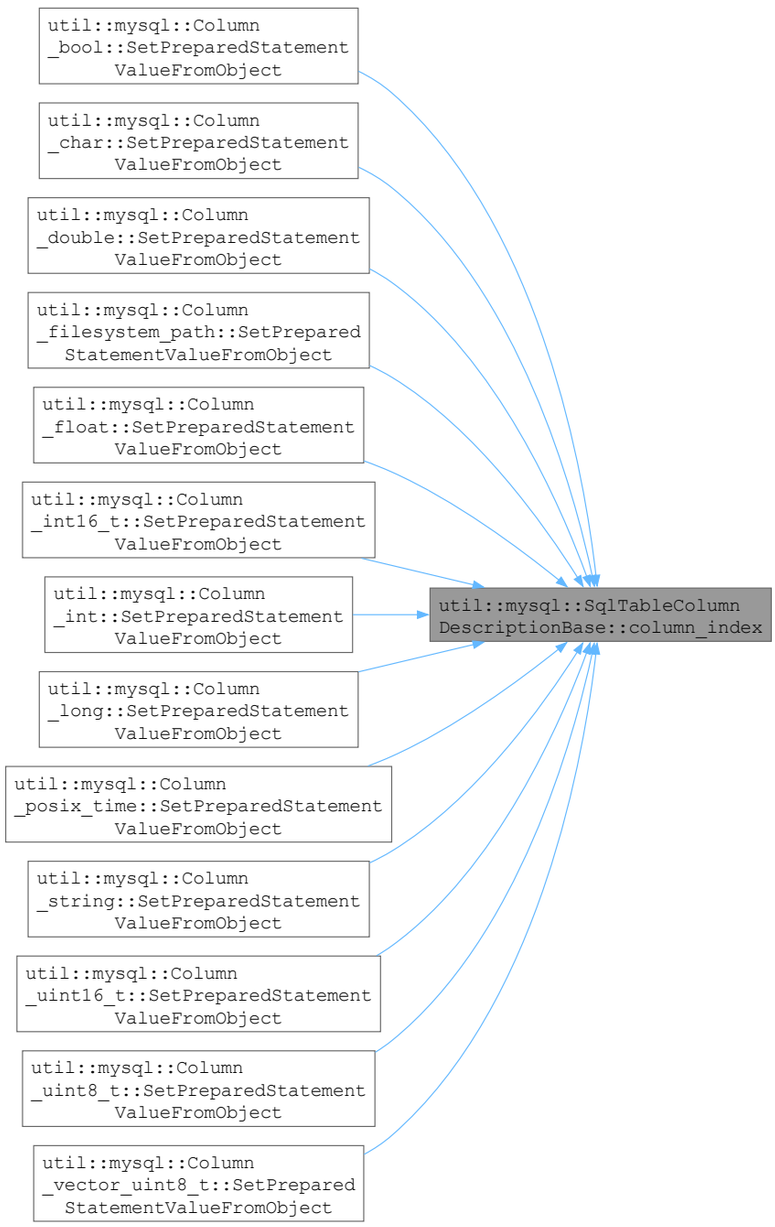
and util::mysql::Column_vector_uint8_t< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.18.3.2 column_name()

```
const string & util::mysql::SqlTableColumnDescriptionBase::column_name () const  [inline], [inherited]
```

Get the name of the SQL table column.

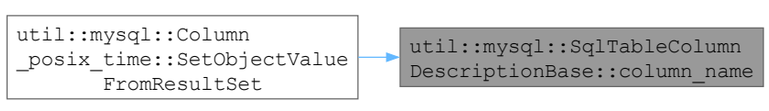
Returns

The name of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_name_.

Referenced by util::mysql::Column_posix_time< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.18.3.3 column_select_name()

```
string util::mysql::SqlTableColumnDescriptionBase::column_select_name () const  [inline], [inherited]
```

Get the name of the SQL table column to be used in a SELECT query.

Returns

The name of the SQL table column to be used in a SELECT query.

References util::mysql::SqlTableColumnDescriptionBase::column_name_, and util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.18.3.4 data_type()

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type () const  [inline], [inherited]
```

Get the the enumerated SQL column data type.

Returns

The the enumerated SQL column data type.

References util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.18.3.5 GetValueFromObject()

```
uint8_t util::mysql::SqlTableColumnDescription< C, uint8_t >::GetValueFromObject (
            const C & obj) const  [inline], [protected], [inherited]
```

Get the object member value from the object.

Parameters

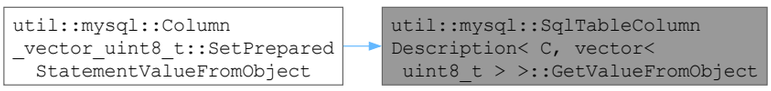
in	*obj*	The object of type C.

Returns

The value of type T of the object member corresponding to this SQL column.

Referenced by util::mysql::Column_uint8_t< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.18.3.6 is_primary_key()

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key () const  [inline], [inherited]
```

Is this column a primary key for the corresponding SQL database table?

Returns

TRUE if this column is a primary key for the corresponding SQL database table, or FALSE otherwise.

References util::mysql::SqlTableColumnDescriptionBase::is_primary_key_.

10.18.3.7 set_column_index()

```
void util::mysql::SqlTableColumnDescriptionBase::set_column_index (
            size_t idx)  [inline], [inherited]
```

Set the index of this SQL table column.

Parameters

in	*idx*	The index to set.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

10.18.3.8 SetObjectValue()

```
void util::mysql::SqlTableColumnDescription< C, uint8_t >::SetObjectValue (
            C & obj,
            const uint8_t & value) const  [inline], [protected], [inherited]
```

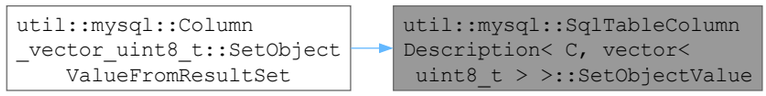
Set the object member value.

Parameters

in	*obj*	The object of type C.
in	*value*	The value of type T, to set.

Referenced by util::mysql::Column_uint8_t< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.18.3.9 SetObjectValueFromResultSet()

```
template<class C >
void util::mysql::Column_uint8_t< C >::SetObjectValueFromResultSet (
            C & obj,
            const ResultSet & results) const  [inline]
```

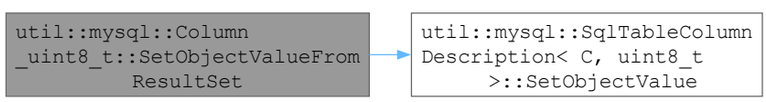
Set the value in the field of the corresponding object from an SQL ResultSet Object.

Parameters

in,out	*obj*	A reference to the object whose field value will be set.
in	*results*	A reference to the ResultSet object.

References util::mysql::SqlTableColumnDescription< C, uint8_t >::SetObjectValue().

Here is the call graph for this function:



10.18.3.10 SetPreparedStatementValueFromObject()

```
template<class C >
void util::mysql::Column_uint8_t< C >::SetPreparedStatementValueFromObject (
            const C & obj,
            PreparedStatement & stmt) const  [inline]
```

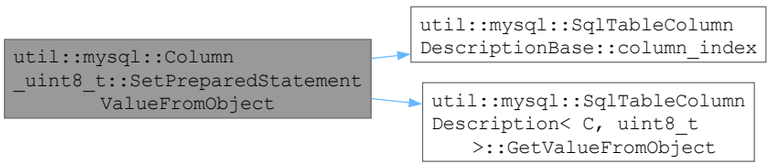
Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Parameters

in	*obj*	A reference to the object whose field value will be read.
in,out	*stmt*	A reference to the SQL PreparedStatement object whose column value will be set.

References util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescription< C, uint8_t >::Get

Here is the call graph for this function:



10.18.4 Member Data Documentation

10.18.4.1 accessor_

function<uint8_t(const C&)> util::mysql::SqlTableColumnDescription< C, uint8_t >::accessor_↩
[private], [inherited]

The accessor function object wrapper.

This object is used as a wrapper for the accessor method of the template class C. It is used to retrieve the value of the SQL table column from the object for generating an INSERT or UPDATE statement.

10.18.4.2 column_index_

size_t util::mysql::SqlTableColumnDescriptionBase::column_index_ [private], [inherited]

The index of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescriptionBase::set_colum

10.18.4.3 column_name_

string util::mysql::SqlTableColumnDescriptionBase::column_name_ [private], [inherited]

The name of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_name(), and util::mysql::SqlTableColumnDescriptionBase::column_s

10.18.4.4 data_type_

ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type_ [private], [inherited]

The enumerated SQL table column data type.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_select_name(), and util::mysql::SqlTableColumnDescriptionBase::da

10.18.4.5 is_primary_key_

bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key_ [private], [inherited]

Indicates whether the column is part of the primary key for the SQL table.

Referenced by util::mysql::SqlTableColumnDescriptionBase::is_primary_key().

10.18.4.6 mutator_

`function<void(C&, uint8_t)> util::mysql::SqlTableColumnDescription< C, uint8_t >::mutator_↩ [private], [inherited]`

The mutator function object wrapper.

This object is used as a wrapper for the mutator method of the template class C. It is used to set the value of an object from the result set of an SQL SELECT query statement.

The documentation for this class was generated from the following file:

- utility/SqlTableColumnDescription.h

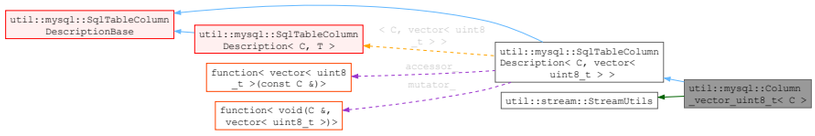
10.19 util::mysql::Column_vector_uint8_t< C > Class Template Reference

Template column description class for value of type vector<uint8_t>.

`#include <SqlTableColumnDescription.h>`

Inheritance diagram for util::mysql::Column_vector_uint8_t< C >:

Collaboration diagram for util::mysql::Column_vector_uint8_t< C >:



Public Member Functions

- Column_vector_uint8_t (string column_name, vector< uint8_t >(C::∗accessor)() const =NULL, void(C↩ ::∗mutator)(const vector< uint8_t > &)=NULL, bool is_primary_key=false)

  The parameterized constructor.
- size_t column_index () const

  Get the index of the SQL table column.
- const string & column_name () const

  Get the name of the SQL table column.
- string column_select_name () const

  Get the name of the SQL table column to be used in a `SELECT` query.
- ColumDataType_t data_type () const

  Get the the enumerated SQL column data type.
- bool is_primary_key () const

  Is this column a primary key for the corresponding SQL database table?
- void set_column_index (size_t idx)

  Set the index of this SQL table column.
- void SetObjectValueFromResultSet (C &obj, const ResultSet &results) const

  Set the value in the field of the corresponding object from an SQL ResultSet Object.
- void SetPreparedStatementValueFromObject (const C &obj, PreparedStatement &stmt) const

  Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Protected Member Functions

- vector< uint8_t > GetValueFromObject (const C &obj) const

  Get the object member value from the object.
- void SetObjectValue (C &obj, const vector< uint8_t > &value) const

  Set the object member value.

Static Protected Member Functions

- static uint8_t htoi (char c)

  Get the integer value of a hexadecimal character.

Private Attributes

- function< vector< uint8_t >(const C &)> accessor_

  The accessor function object wrapper.
- size_t column_index_

  The index of the SQL table column.
- string column_name_

  The name of the SQL table column.
- ColumDataType_t data_type_

  The enumerated SQL table column data type.
- bool is_primary_key_

  Indicates whether the column is part of the primary key for the SQL table.
- function< void(C &, vector< uint8_t >)> mutator_

  The mutator function object wrapper.

10.19.1 Detailed Description

template<class C>
class util::mysql::Column_vector_uint8_t< C >

Template column description class for value of type vector<uint8_t>.

10.19.2 Constructor & Destructor Documentation

10.19.2.1 Column_vector_uint8_t()

```
template<class C >
util::mysql::Column_vector_uint8_t< C >::Column_vector_uint8_t (
            string column_name,
            vector< uint8_t >(C::* accessor )() const = NULL,
            void(C::* mutator )(const vector< uint8_t > &) = NULL,
            bool is_primary_key = false)  [inline]
```

The parameterized constructor.

Parameters

in	*column_name*	The name of the SQL table column.
in	*accessor*	A pointer to the accessor method for acquiring the value of the corresponding object field.
in	*mutator*	A pointer to the mutator method for setting the value of the corresponding object field.
in	*is_primary_key*	TRUE if this column is a primary key for the SQL table, or FALSE otherwise.

10.19.3 Member Function Documentation

10.19.3.1 column_index()

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index () const  [inline], [inherited]
```

Get the index of the SQL table column.

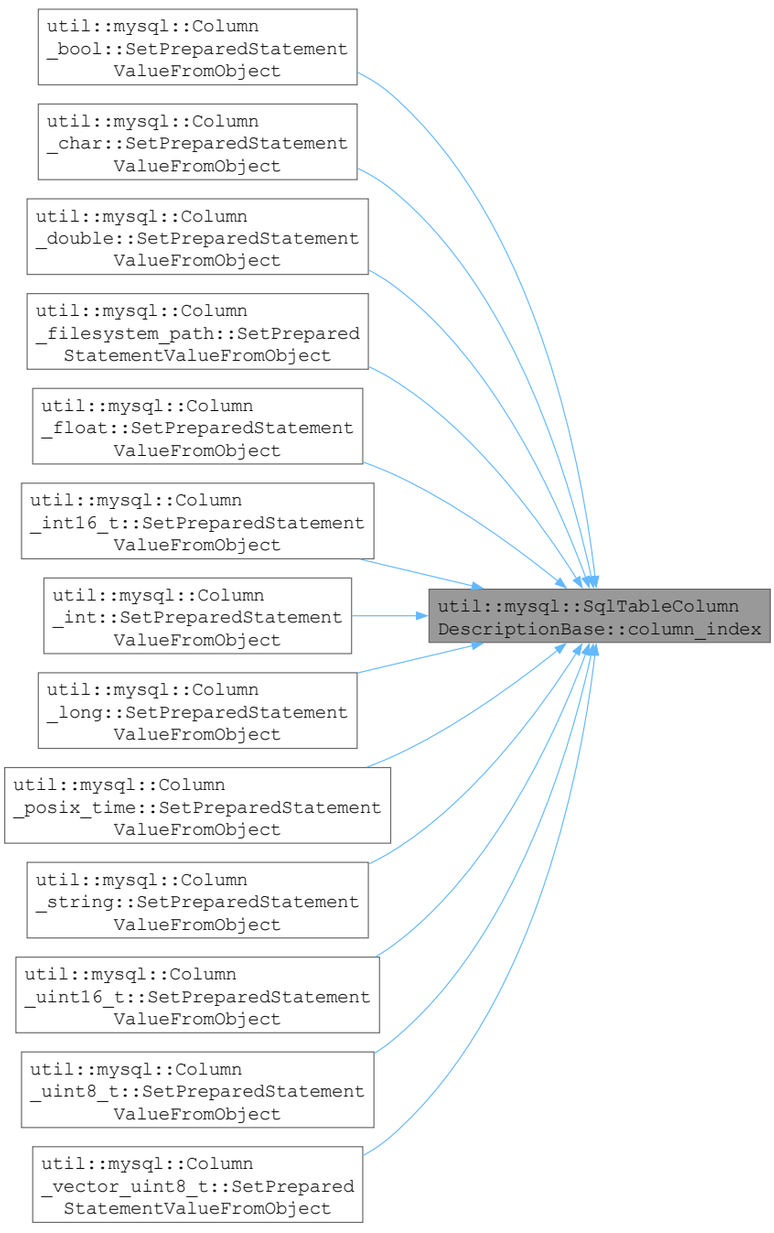
Returns

The index of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

Referenced by util::mysql::Column_bool< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_char< C >::SetPreparedS
util::mysql::Column_double< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_filesystem_path< C >::SetPreparedS
util::mysql::Column_float< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_int16_t< C >::SetPreparedStatementVa
util::mysql::Column_int< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_long< C >::SetPreparedStatementValueF
util::mysql::Column_posix_time< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_string< C >::SetPreparedStateme
util::mysql::Column_uint16_t< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_uint8_t< C >::SetPreparedStatemer
and util::mysql::Column_vector_uint8_t< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.19.3.2 column_name()

```
const string & util::mysql::SqlTableColumnDescriptionBase::column_name () const  [inline], [inherited]
```

Get the name of the SQL table column.

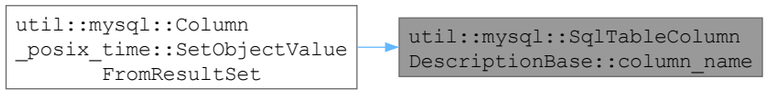
Returns

The name of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_name_.

Referenced by util::mysql::Column_posix_time< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.19.3.3 column_select_name()

```
string util::mysql::SqlTableColumnDescriptionBase::column_select_name () const  [inline], [inherited]
```

Get the name of the SQL table column to be used in a SELECT query.

Returns

The name of the SQL table column to be used in a SELECT query.

References util::mysql::SqlTableColumnDescriptionBase::column_name_, and util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.19.3.4 data_type()

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type () const  [inline], [inherited]
```

Get the the enumerated SQL column data type.

Returns

The the enumerated SQL column data type.

References util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.19.3.5 GetValueFromObject()

```
vector< uint8_t > util::mysql::SqlTableColumnDescription< C, vector< uint8_t > >::GetValueFrom↩
Object (
            const C & obj) const  [inline], [protected], [inherited]
```

Get the object member value from the object.

Parameters

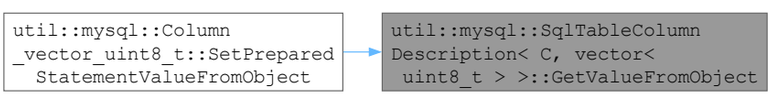
in	*obj*	The object of type C.

Returns

The value of type T of the object member corresponding to this SQL column.

Referenced by util::mysql::Column_vector_uint8_t< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.19.3.6 htoi()

```
static uint8_t util::stream::StreamUtils::htoi (
            char c)  [inline], [static], [inherited]
```

Get the integer value of a hexadecimal character.

Parameters

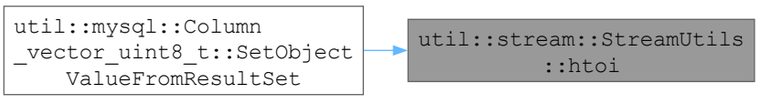
in	*c*	The hexadecimal character.

Returns

The integer value of a hexadecimal character, or 0 if c is not a hexadecimal character.

Referenced by util::mysql::Column_vector_uint8_t< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.19.3.7 is_primary_key()

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key () const  [inline], [inherited]
```

Is this column a primary key for the corresponding SQL database table?

Returns

TRUE if this column is a primary key for the corresponding SQL database table, or FALSE otherwise.

References util::mysql::SqlTableColumnDescriptionBase::is_primary_key_.

10.19.3.8 set_column_index()

```
void util::mysql::SqlTableColumnDescriptionBase::set_column_index (
            size_t idx)  [inline], [inherited]
```

Set the index of this SQL table column.

Parameters

in	*idx*	The index to set.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

10.19.3.9 SetObjectValue()

```
void util::mysql::SqlTableColumnDescription< C, vector< uint8_t > >::SetObjectValue (
            C & obj,
            const vector< uint8_t > & value) const  [inline], [protected], [inherited]
```

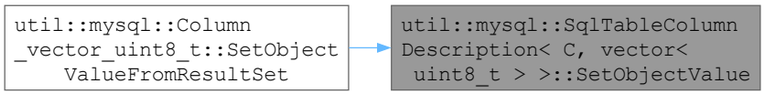
Set the object member value.

Parameters

in	*obj*	The object of type C.
in	*value*	The value of type T, to set.

Referenced by util::mysql::Column_vector_uint8_t< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.19.3.10 SetObjectValueFromResultSet()

```
template<class C >
void util::mysql::Column_vector_uint8_t< C >::SetObjectValueFromResultSet (
            C & obj,
            const ResultSet & results) const  [inline]
```

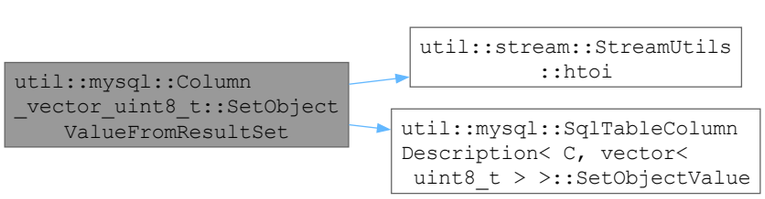
Set the value in the field of the corresponding object from an SQL ResultSet Object.

Parameters

in,out	*obj*	A reference to the object whose field value will be set.
in	*results*	A reference to the ResultSet object.

References util::stream::StreamUtils::htoi(), and util::mysql::SqlTableColumnDescription< C, vector< uint8_t > >::SetObjectValue().

Here is the call graph for this function:



10.19.3.11 SetPreparedStatementValueFromObject()

```
template<class C >
void util::mysql::Column_vector_uint8_t< C >::SetPreparedStatementValueFromObject (
            const C & obj,
            PreparedStatement & stmt) const  [inline]
```

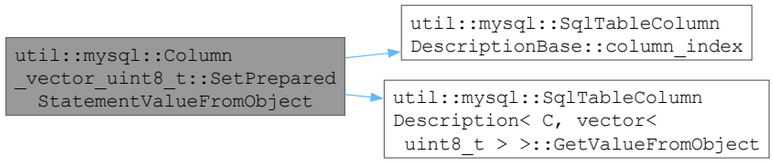
Set the value for the SQL PreparedStatement object from the value of the field of the corresponding object.

Parameters

in	*obj*	A reference to the object whose field value will be read.
in,out	*stmt*	A reference to the SQL PreparedStatement object whose column value will be set.

References util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescription< C, vector< uint8_

Here is the call graph for this function:



10.19.4 Member Data Documentation

10.19.4.1 accessor_

function<vector< uint8_t >(const C&)> util::mysql::SqlTableColumnDescription< C, vector< uint8_t > >::accessor_ [private], [inherited]

The accessor function object wrapper.

This object is used as a wrapper for the accessor method of the template class C. It is used to retrieve the value of the SQL table column from the object for generating an INSERT or UPDATE statement.

10.19.4.2 column_index_

size_t util::mysql::SqlTableColumnDescriptionBase::column_index_ [private], [inherited]

The index of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescriptionBase::set_colum

10.19.4.3 column_name_

string util::mysql::SqlTableColumnDescriptionBase::column_name_ [private], [inherited]

The name of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_name(), and util::mysql::SqlTableColumnDescriptionBase::column_s

10.19.4.4 data_type_

ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type_ [private], [inherited]

The enumerated SQL table column data type.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_select_name(), and util::mysql::SqlTableColumnDescriptionBase::da

10.19.4.5 is_primary_key_

bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key_ [private], [inherited]

Indicates whether the column is part of the primary key for the SQL table.

Referenced by util::mysql::SqlTableColumnDescriptionBase::is_primary_key().

10.19.4.6 mutator_

```
function<void(C&, vector< uint8_t >)> util::mysql::SqlTableColumnDescription< C, vector< uint8_t >
_t > >::mutator_  [private], [inherited]
```

The mutator function object wrapper.

This object is used as a wrapper for the mutator method of the template class C. It is used to set the value of an object from the result set of an SQL SELECT query statement.

The documentation for this class was generated from the following file:

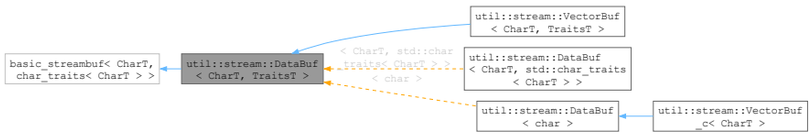
- utility/SqlTableColumnDescription.h

10.20 util::stream::DataBuf< CharT, TraitsT > Class Template Reference

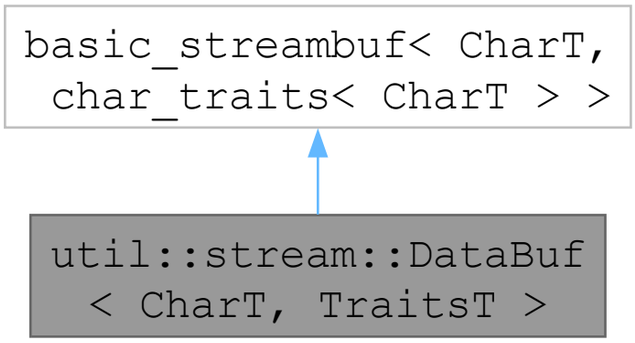
Template class for wrapping an arbitrary contiguous section of data as a std::basic_streambuf object.

```
#include <DataBuf.h>
```

Inheritance diagram for util::stream::DataBuf< CharT, TraitsT >:



Collaboration diagram for util::stream::DataBuf< CharT, TraitsT >:



Public Member Functions

- DataBuf (const CharT *data, size_t size)

  Parameterized constructor.

10.20.1 Detailed Description

template<typename CharT, typename TraitsT = char_traits<CharT>>
class util::stream::DataBuf< CharT, TraitsT >

Template class for wrapping an arbitrary contiguous section of data as a std::basic_streambuf object.

10.20.2 Constructor & Destructor Documentation

10.20.2.1 DataBuf()

```
template<typename CharT , typename TraitsT = char_traits<CharT>>
util::stream::DataBuf< CharT, TraitsT >::DataBuf (
            const CharT * data,
            size_t size)  [inline]
```

Parameterized constructor.

Parameters

in	*data*	A pointer to the start of the memory section of interest.
in	*size*	The size of the memory section, in bytes.

The documentation for this class was generated from the following file:

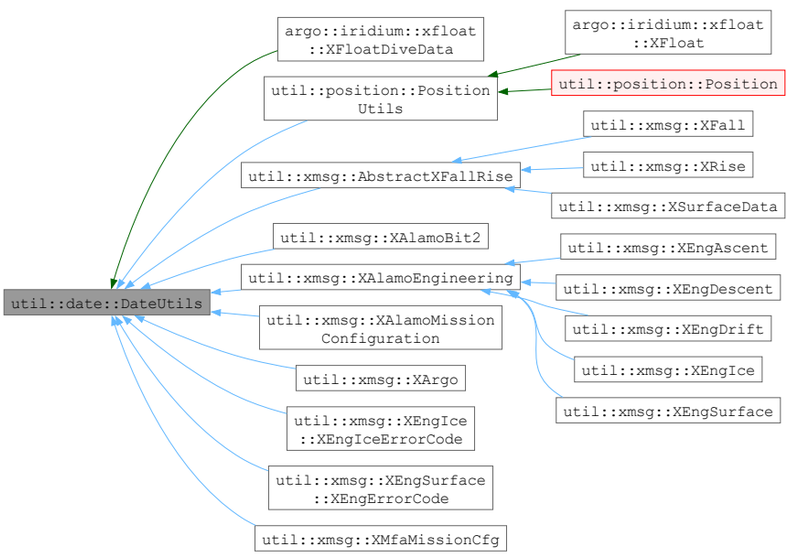
- utility/DataBuf.h

10.21 util::date::DateUtils Class Reference

Class providing library of useful date and time functions.

`#include <DateUtils.h>`

Inheritance diagram for util::date::DateUtils:



Static Public Member Functions

- static string GenerateCurrentUtcTimeIso8601String ()

  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- static string GenerateIso8601String (const ptime &p, bool extended=true)

  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)

  Convert a date/time to fractional days since a reference date/time.
- static ptime GetCurrentUtcTime ()

  Generate a POSIX time object representing the current date and time (rounded to the nearest second).

10.21.1 Detailed Description

Class providing library of useful date and time functions.

10.21.2 Member Function Documentation

10.21.2.1 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

Returns

An ISO8601 format date/time string representation of the current time.

References GenerateIso8601String(), and GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:

Here is the caller graph for this function:

10.21.2.2 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), util::xmsg::XEngIce::XEngIce
util::xmsg::XEngSurface::XEngErrorCode::DateTimeAs8601String(), argo::iridium::xfloat::XFloatMailRetrievalService::FetchMailMessages
GenerateCurrentUtcTimeIso8601String(), util::xmsg::XAlamoBit2::GenerateListingString(), util::xmsg::XArgo::GenerateListingString(),

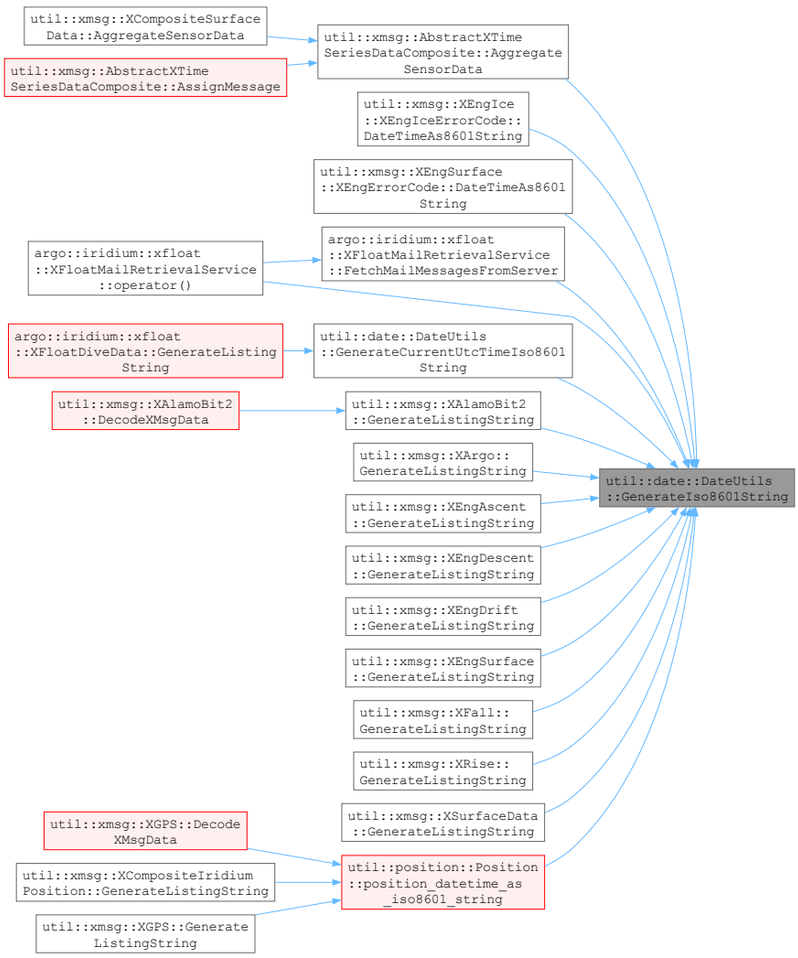
util::position::Position::position_datetime_as_iso8601_string().

Here is the caller graph for this function:



10.21.2.3 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref*↩ *_dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.21.2.4 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static]
```

Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and GenerateCurrentUtcTimeIso8601String().

Here is the caller graph for this function:

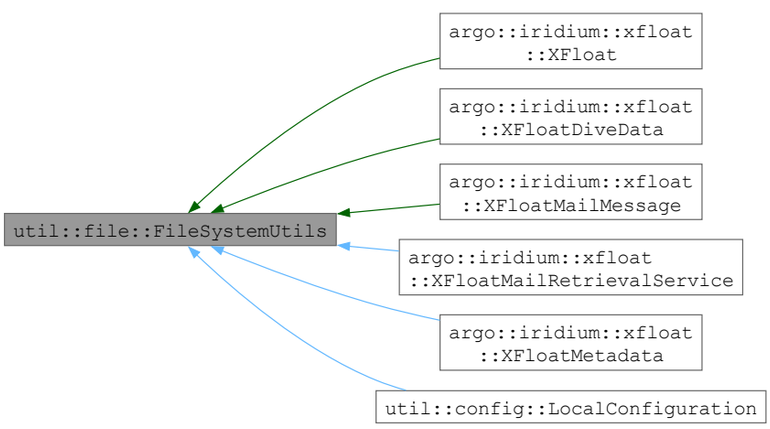
10.22 util::file::FileSystemUtils Class Reference

Class providing library of useful filesystem functions.

```
#include <FileSystemUtils.h>
```

Inheritance diagram for util::file::FileSystemUtils:



Static Public Member Functions

- static const path & GetDirectoryPath (const path &dir, bool create=false)
  Get a directory path.
- static path GetDirectoryPathFromString (const string &dir, bool create=false)
  Generate a boost::filesystem::path object from the directory path string.
- static vector< path > ListDirectories (const path &dir)
  List all directories contained in the given directory.
- static vector< path > ListFiles (path dir, size_t n=0)
  List all regular files contained in the given directory.
- static path MoveFileToDirectory (const path &file, const path &dir_dst, bool create_dir=false)
  Copy a file into a directory.

10.22.1 Detailed Description

Class providing library of useful filesystem functions.

10.22.2 Member Function Documentation

10.22.2.1 GetDirectoryPath()

```
static const path & util::file::FileSystemUtils::GetDirectoryPath (
            const path & dir,
            bool create = false)  [inline], [static]
```

Get a directory path.

Exceptions

MessageException	if create == FALSE and the directory specified by path does not exist.

Parameters

in	*dir*	Directory path.
in	*create*	If TRUE, the directory specified by path will be created if it does not already exists. If FALSE, an exception will be thrown if the directory does not exist.

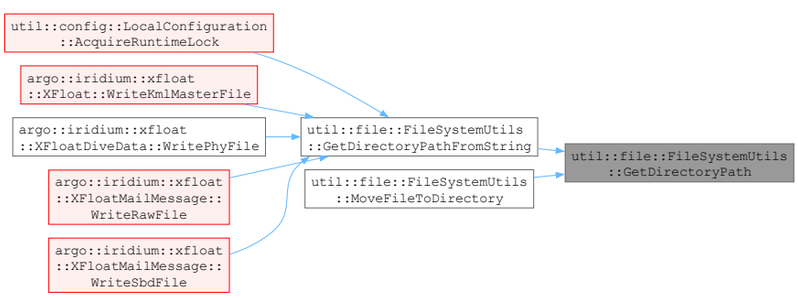
Returns

dir

References CATCH_BLOCK, EXC_THROW, and ldbg.

Referenced by GetDirectoryPathFromString(), and MoveFileToDirectory().

Here is the caller graph for this function:



10.22.2.2 GetDirectoryPathFromString()

```
static path util::file::FileSystemUtils::GetDirectoryPathFromString (
            const string & dir,
            bool create = false)  [inline], [static]
```

Generate a boost::filesystem::path object from the directory path string.

Exceptions

MessageException	if create == FALSE and the directory specified by path does not exist.

Parameters

in	*dir*	Directory path string.
in	*create*	If TRUE, the directory specified by path will be created if it does not already exists. If FALSE, an exception will be thrown if the directory does not exist.

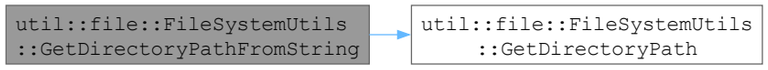
Returns

A boost::filesystem::path object from the directory path string.

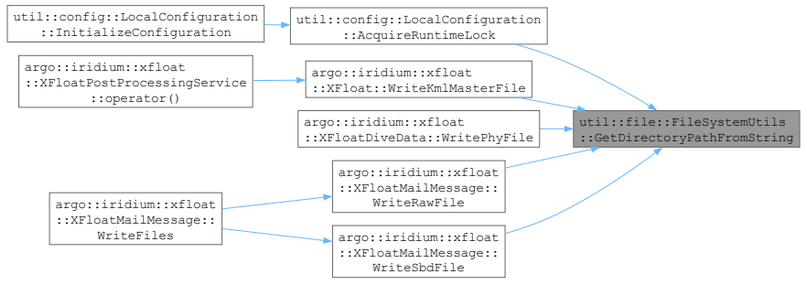
References CATCH_BLOCK, and GetDirectoryPath().

Referenced by util::config::LocalConfiguration::AcquireRuntimeLock(), argo::iridium::xfloat::XFloat::WriteKmlMasterFile(), argo::iridium::xfloat::XFloatDiveData::WritePhyFile(), argo::iridium::xfloat::XFloatMailMessage::WriteRawFile(), and argo::iridium::xfloat::XFloatMailMessage::WriteSbdFile().

Here is the call graph for this function:



Here is the caller graph for this function:



10.22.2.3 ListDirectories()

```
static vector< path > util::file::FileSystemUtils::ListDirectories (
            const path & dir)  [inline], [static]
```

List all directories contained in the given directory.

Parameters

in	*dir*	The path to the directory of interest.

Exceptions

log::MessageException	if the directory does not exist, is not a directory, or an error occurs.

Returns

A vector of paths to all the directories contained in the given directory.

References CATCH_BLOCK, and EXC_THROW.

10.22.2.4 ListFiles()

```
static vector< path > util::file::FileSystemUtils::ListFiles (
            path dir,
            size_t n = 0)  [inline], [static]
```

List all regular files contained in the given directory.

Parameters

in	*dir*	The path to the directory of interest.
in	*n*	If n>0, the maximum number of paths to return, else no effect.

Exceptions

log::MessageException	if the directory does not exist, is not a directory, or an error occurs.

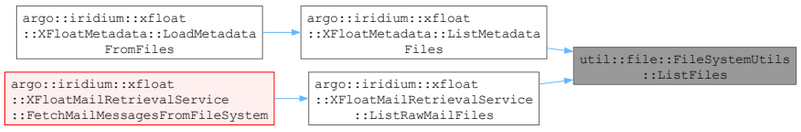
Returns

A vector of paths to all the regular files contained in the given directory.

References CATCH_BLOCK, and EXC_THROW.

Referenced by argo::iridium::xfloat::XFloatMetadata::ListMetadataFiles(), and argo::iridium::xfloat::XFloatMailRetrievalService::ListRawMa

Here is the caller graph for this function:



10.22.2.5 MoveFileToDirectory()

```
static path util::file::FileSystemUtils::MoveFileToDirectory (
            const path & file,
            const path & dir_dst,
            bool create_dir = false)  [inline], [static]
```

Copy a file into a directory.

Warning

Despite its name, this function copies the file and does not remove the source. If a file with the same name already exists in the destination directory, it is left unchanged. It is not currently called.

Parameters

in	*file*	The file to copy.
in	*dir_dst*	The destination directory.
in	*create_dir*	If TRUE, create the destination directory if it does not exist.

Exceptions

util::log::MessageException	if the file does not exist, is not a regular file, or cannot be copied.

Returns

The path of the file in the destination directory.

References CATCH_BLOCK, EXC_THROW, and GetDirectoryPath().

Here is the call graph for this function:

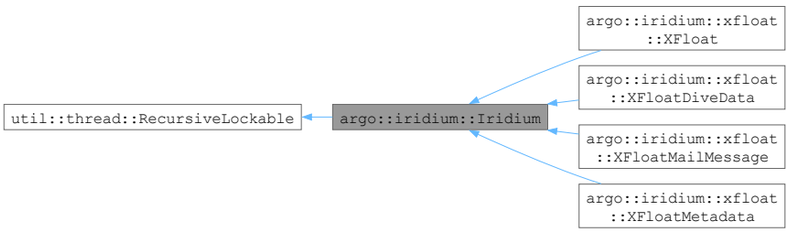
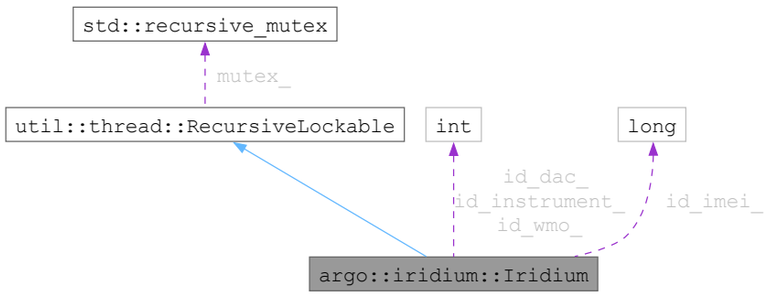
Inheritance diagram for argo::iridium::Iridium:



Collaboration diagram for argo::iridium::Iridium:



Public Member Functions

- Iridium (int whoi, long imei=IRI_ID_UNKNOWN, int wmo=IRI_ID_UNKNOWN, int dac=IRI_ID_UNKNOWN)

  The parameterized constructor.
- virtual ~Iridium ()

  The destructor.
- int id_dac () const

  Get the unique Data Assembly Center (DAC) identifier.
- long id_imei () const

  Get the unique International Mobile Equipment Identifier (IMEI).
- int id_instrument () const

  Get the unique instrument identifier or instrument serial number.
- int id_wmo () const

  Get the unique World Meteorological Organization (WMO) identifier.
- bool LockObject (bool block)

  Lock the object.
- void UnlockObject ()

  Unlock the object.

Protected Member Functions

- Iridium ()

  The default constructor.
- void set_id_dac (int id_dac)

  Set the unique Data Assembly Center (DAC) identifier.
- void set_id_imei (long id_imei)

  Set the unique International Mobile Equipment Identifier (IMEI).
- void set_id_instrument (int id_instrument)

  Set the unique instrument identifier or instrument serial number.
- void set_id_wmo (int id_wmo)

  Set the unique World Meteorological Organization (WMO) identifier.

Protected Attributes

- recursive_mutex mutex_

  Recursive mutual exclusion lock for synchronizing operations.

Private Attributes

- int id_dac_

  The unique Data Assembly Center (DAC) identifier.
- long id_imei_

  The unique International Mobile Equipment Identifier (IMEI).
- int id_instrument_

  The unique instrument identifier or instrument serial number.
- int id_wmo_

  The unique World Meteorological Organization (WMO) identifier.

10.24.1 Detailed Description

The Iridium instrument class.

This class represents an individual instrument and its associated unique identifiers. This class is not used explicitly. Rather, all other classes that are associated with an instrument's unique identifiers inherit from this class.

Note

This object is lockable. It contains a recursive mutual exclusion (mutex) lock in order to synchronize access to and modification of objects of this type by various worker threads. Once the object is locked, any other thread that attempts to access or modify the object will block until the initial lock is released. Since the mutex is recursive, the object may be locked multiple times by the same thread without causing the thread to block indefinitely.

10.24.2 Constructor & Destructor Documentation

10.24.2.1 Iridium() [1/2]

```
argo::iridium::Iridium::Iridium ()  [inline], [protected]
```

The default constructor.

10.24.2.2 Iridium() [2/2]

```
argo::iridium::Iridium::Iridium (
            int whoi,
            long imei = IRI_ID_UNKNOWN,
            int wmo = IRI_ID_UNKNOWN,
            int dac = IRI_ID_UNKNOWN)  [inline]
```

The parameterized constructor.

Parameters

in	*imei*	The unique International Mobile Equipment Identifier (IMEI).
in	*whoi*	The unique WHOI identifier.
in	*wmo*	The unique World Meteorological Organization (WMO) identifier.
in	*dac*	The unique Data Assembly Center (DAC) identifier.

10.24.2.3 ~Iridium()

```
virtual argo::iridium::Iridium::~Iridium ()  [inline], [virtual]
```

The destructor.

10.24.3 Member Function Documentation

10.24.3.1 id_dac()

```
int argo::iridium::Iridium::id_dac () const  [inline]
```

Get the unique Data Assembly Center (DAC) identifier.

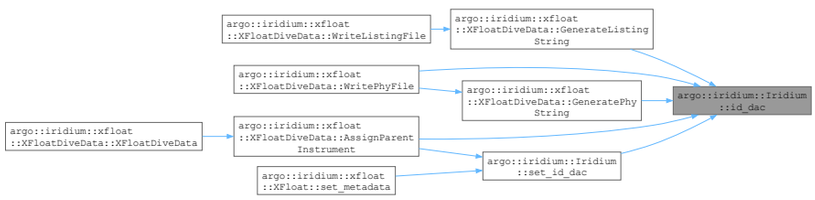
Returns

The unique Data Assembly Center (DAC) identifier.

References id_dac_, and util::thread::RecursiveLockable::mutex_.

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignParentInstrument(), argo::iridium::xfloat::XFloatDiveData::GenerateListingStrir argo::iridium::xfloat::XFloatDiveData::GeneratePhyString(), set_id_dac(), and argo::iridium::xfloat::XFloatDiveData::WritePhyFile().

Here is the caller graph for this function:



10.24.3.2 id_imei()

```
long argo::iridium::Iridium::id_imei () const  [inline]
```

Get the unique International Mobile Equipment Identifier (IMEI).

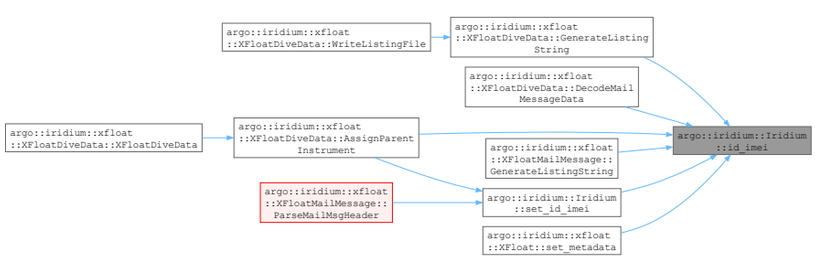
Returns

The unique International Mobile Equipment Identifier (IMEI).

References id_imei_, and util::thread::RecursiveLockable::mutex_.

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignParentInstrument(), argo::iridium::xfloat::XFloatDiveData::DecodeMailMessag argo::iridium::xfloat::XFloatDiveData::GenerateListingString(), argo::iridium::xfloat::XFloatMailMessage::GenerateListingString(), set_id_imei(), and argo::iridium::xfloat::XFloat::set_metadata().

Here is the caller graph for this function:



10.24.3.3 id_instrument()

```
int argo::iridium::Iridium::id_instrument () const  [inline]
```

Get the unique instrument identifier or instrument serial number.

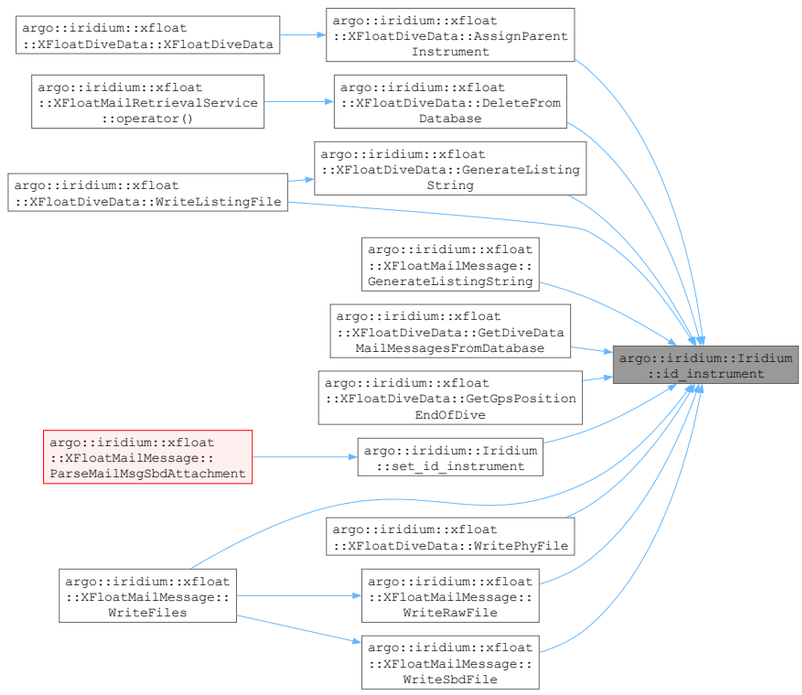
Returns

The unique instrument identifier or instrument serial number.

References id_instrument_, and util::thread::RecursiveLockable::mutex_.

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignParentInstrument(), argo::iridium::xfloat::XFloatDiveData::DeleteFromDatabas argo::iridium::xfloat::XFloatDiveData::GenerateListingString(), argo::iridium::xfloat::XFloatMailMessage::GenerateListingString(), argo::iridium::xfloat::XFloatDiveData::GetDiveDataMailMessagesFromDatabase(), argo::iridium::xfloat::XFloatDiveData::GetGpsPositionE set_id_instrument(), argo::iridium::xfloat::XFloatMailMessage::WriteFiles(), argo::iridium::xfloat::XFloatDiveData::WriteListingFile(), argo::iridium::xfloat::XFloatDiveData::WritePhyFile(), argo::iridium::xfloat::XFloatMailMessage::WriteRawFile(), and argo::iridium::xfloat::XFloatMailMessage::WriteSbdFile().

Here is the caller graph for this function:



10.24.3.4 id_wmo()

```
int argo::iridium::Iridium::id_wmo () const  [inline]
```

Get the unique World Meteorological Organization (WMO) identifier.

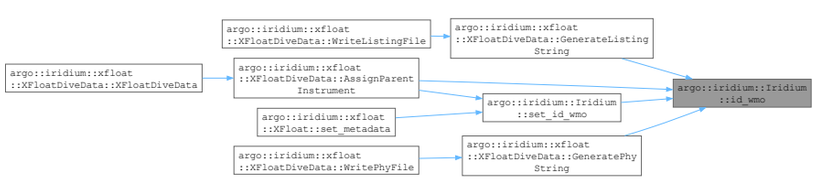
Returns

The unique World Meteorological Organization (WMO) identifier.

References id_wmo_, and util::thread::RecursiveLockable::mutex_.

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignParentInstrument(), argo::iridium::xfloat::XFloatDiveData::GenerateListingStrir argo::iridium::xfloat::XFloatDiveData::GeneratePhyString(), and set_id_wmo().

Here is the caller graph for this function:



10.24.3.5 LockObject()

```
bool util::thread::RecursiveLockable::LockObject (
            bool block)  [inline], [inherited]
```

Lock the object.

Parameters

in	*block*	If TRUE, then the calling thread will block until the lock becomes available.

Exceptions

util::log::MessageException	if an error occurs.

Returns

TRUE if the lock was successfully obtained, or FALSE if block is FALSE and another thread owns the lock on the mutex.

References CATCH_BLOCK, and util::thread::RecursiveLockable::mutex_.

10.24.3.6 set_id_dac()

```
void argo::iridium::Iridium::set_id_dac (
            int id_dac)  [inline], [protected]
```

Set the unique Data Assembly Center (DAC) identifier.

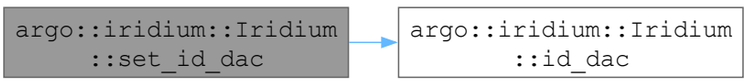
Parameters

in	*id_dac*	The unique Data Assembly Center (DAC) identifier.

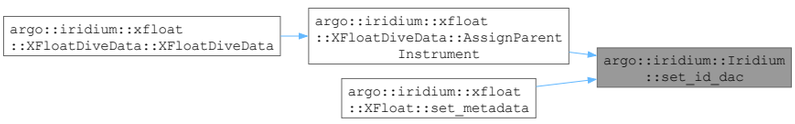
References id_dac(), id_dac_, and util::thread::RecursiveLockable::mutex_.

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignParentInstrument(), and argo::iridium::xfloat::XFloat::set_metadata().

Here is the call graph for this function:



Here is the caller graph for this function:



10.24.3.7 set_id_imei()

```
void argo::iridium::Iridium::set_id_imei (
            long id_imei)  [inline], [protected]
```

Set the unique International Mobile Equipment Identifier (IMEI).

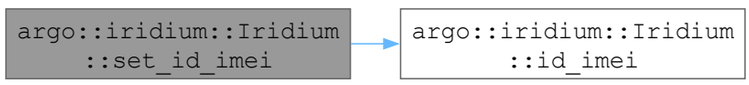
Parameters

in	*id_imei*	The unique International Mobile Equipment Identifier (IMEI).

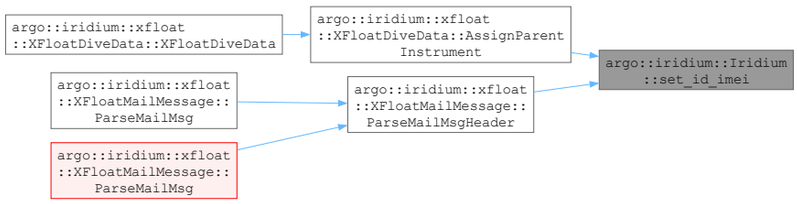
References id_imei(), id_imei_, and util::thread::RecursiveLockable::mutex_.

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignParentInstrument(), and argo::iridium::xfloat::XFloatMailMessage::ParseMailM

Here is the call graph for this function:



Here is the caller graph for this function:



10.24.3.8 set_id_instrument()

```
void argo::iridium::Iridium::set_id_instrument (
            int id_instrument)  [inline], [protected]
```

Set the unique instrument identifier or instrument serial number.

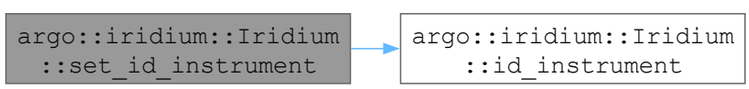
Parameters

in	*id_instrument*	The unique instrument identifier or instrument serial number

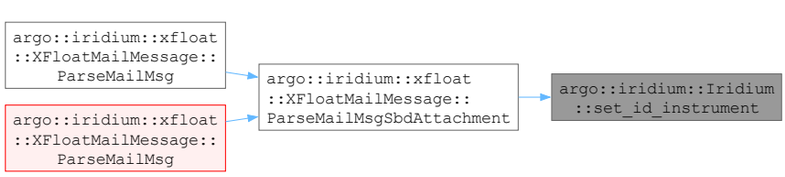
References id_instrument(), id_instrument_, and util::thread::RecursiveLockable::mutex_.

Referenced by argo::iridium::xfloat::XFloatMailMessage::ParseMailMsgSbdAttachment().

Here is the call graph for this function:



Here is the caller graph for this function:



10.24.3.9 set_id_wmo()

```
void argo::iridium::Iridium::set_id_wmo (
            int id_wmo)  [inline], [protected]
```

Set the unique World Meteorological Organization (WMO) identifier.

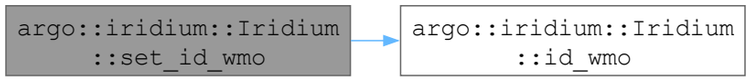
Parameters

in	*id_wmo*	The unique World Meteorological Organization (WMO) identifier.

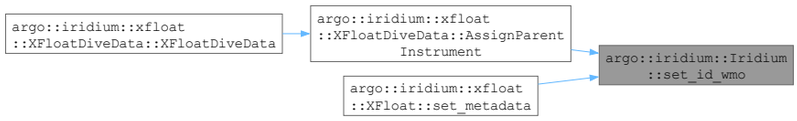
References id_wmo(), id_wmo_, and util::thread::RecursiveLockable::mutex_.

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignParentInstrument(), and argo::iridium::xfloat::XFloat::set_metadata().

Here is the call graph for this function:



Here is the caller graph for this function:



10.24.3.10 UnlockObject()

```
void util::thread::RecursiveLockable::UnlockObject ()  [inline], [inherited]
```

Unlock the object.

Exceptions

util::log::MessageException	if an error occurs.

References CATCH_BLOCK, and util::thread::RecursiveLockable::mutex_.

10.24.4 Member Data Documentation

10.24.4.1 id_dac_

```
int argo::iridium::Iridium::id_dac_  [private]
```

The unique Data Assembly Center (DAC) identifier.

Referenced by id_dac(), and set_id_dac().

10.24.4.2 id_imei_

```
long argo::iridium::Iridium::id_imei_  [private]
```

The unique International Mobile Equipment Identifier (IMEI).

Referenced by id_imei(), and set_id_imei().

10.24.4.3 id_instrument_

```
int argo::iridium::Iridium::id_instrument_  [private]
```

The unique instrument identifier or instrument serial number.

Referenced by id_instrument(), and set_id_instrument().

10.24.4.4 id_wmo_

```
int argo::iridium::Iridium::id_wmo_  [private]
```

The unique World Meteorological Organization (WMO) identifier.

Referenced by id_wmo(), and set_id_wmo().

10.24.4.5 mutex_

```
recursive_mutex util::thread::RecursiveLockable::mutex_  [mutable], [protected], [inherited]
```

Recursive mutual exclusion lock for synchronizing operations.

The documentation for this class was generated from the following file:

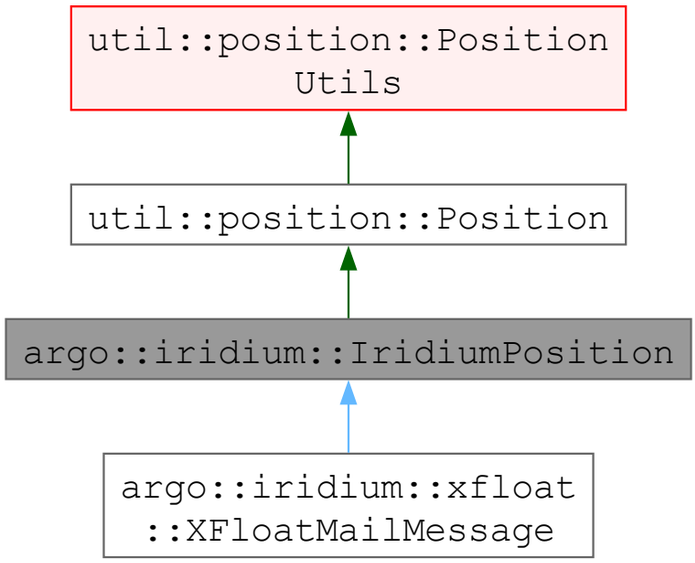
- data/Iridium.h

10.25 argo::iridium::IridiumPosition Class Reference

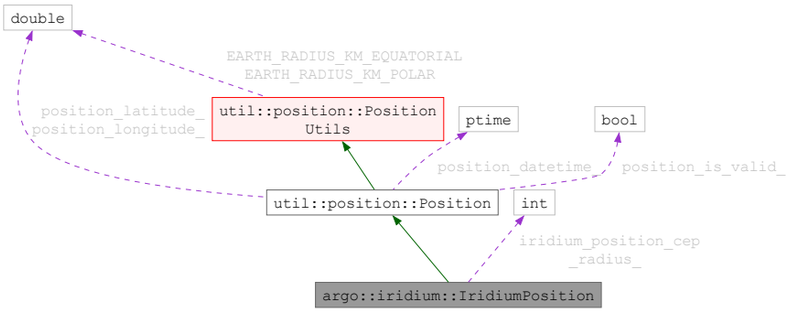
The Iridium position class.

`#include <IridiumPosition.h>`

Inheritance diagram for argo::iridium::IridiumPosition:



Collaboration diagram for argo::iridium::IridiumPosition:



Public Member Functions

- IridiumPosition ()

  The default constructor.
- ~IridiumPosition ()

  The destructor.
- string iridium_position_as_iso6709_string () const

  Get a formatted string representing the Iridium position composed using the ISO 6709 standard.
- int iridium_position_cep_radius () const

  Get the Iridium position Circular Error Probable (CEP) radius, in kilometers.
- ptime iridium_position_datetime () const

  Get the Iridium position date/time.
- string iridium_position_datetime_as_iso8601_string () const

  Get a formatted string representing the Iridium position date/time composed using the ISO 8601 standard.
- bool iridium_position_is_valid () const

  Get the Iridium position is valid flag.
- double iridium_position_latitude () const

  Get the Iridium position latitude.
- double iridium_position_longitude () const

  Get the Iridium position longitude.

Protected Member Functions

- ptime position_datetime () const

  Get the date/time of the position.
- string position_datetime_as_iso8601_string () const

  Get a formatted string representing the position date/time composed using the ISO 8601 standard.
- bool position_is_valid () const

  Is the position valid?
- double position_latitude () const

  Get the latitude of the position, in decimal degrees.
- double position_longitude () const

  Get the longitude of the position, in decimal degrees.
- string postition_as_iso6709_string () const

  Get a formatted string representing the position composed using the ISO 6709 standard.
- void set_gps_position_datetime (unsigned int gpsWeek, unsigned int gpsDay, unsigned int gpsHour=0, unsigned int gpsMinute=0, unsigned int gpsSecond=0)

  Set the date and time of this position from the given GPS week, day, and time.
- void set_iridium_position_cep_radius (int iridium_position_cep_radius)

  Set the Iridium position Circular Error Probable (CEP) radius, in kilometers.
- void set_iridium_position_datetime (const ptime &iridium_position_datetime)

  Set the Iridium position date/time.
- void set_iridium_position_is_valid (bool iridium_position_is_valid)

  Set the Iridium position is valid flag.
- void set_iridium_position_latitude (double iridium_position_latitude)

  Set the Iridium position latitude, in decimal degrees.
- void set_iridium_position_longitude (double iridium_position_longitude)

  Set the Iridium position longitude, in decimal degrees.
- void set_position_datetime (const ptime &datetime)

  Set the date/time of the position.
- void set_position_is_valid (bool is_valid=true)

  Set the position is valid flag.
- void set_position_latitude (double lat)

  Set the latitude of the position, in decimal degrees.
- void set_position_longitude (double lon)

  Set the longitude of the position, in decimal degrees.

Static Protected Member Functions

- static float **bitcastUint32ToFloat** (uint32_t u)
- template<typename T >
  static double CalculateEllipsoidHeight (T lat)

  Get the approximate surface altitude or height of earth for a given latitude, in kilometers.
- template<typename T >
  static double CalculateGeographicDistance (T lat1, T lon1, T lat0, T lon0)

  Get the geographical distance between two position, in kilometers, from the positions' locations, in decimal degrees.
- template<typename T >
  static double degToRad (T deg)

  Convert angular units from from degrees to decimal radians.
- static string GenerateCurrentUtcTimeIso8601String ()

  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- template<typename T >
  static std::string GenerateIso6709String (T lat, T lon)

  Generate an IS06709 string representation of the position given by (`lat`, `lon`).
- static string GenerateIso8601String (const ptime &p, bool extended=true)

  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)

  Convert a date/time to fractional days since a reference date/time.
- static ptime GetCurrentUtcTime ()

  Generate a POSIX time object representing the current date and time (rounded to the nearest second).
- template<typename T >
  static bool IsPositionValid (T lat, T lon)

  Check position validity.

Private Attributes

- int iridium_position_cep_radius_

  Iridium position Circular Error Probable (CEP) radius, in kilometers.
- ptime position_datetime_

  The date and time of the position.
- bool position_is_valid_

  The valid position indicator.
- double position_latitude_

  The latitude of the position, in decimal degrees.
- double position_longitude_

  The longitude of the position, in decimal degrees.

Static Private Attributes

- static const double EARTH_RADIUS_KM_EQUATORIAL = 6378.1

  The equatorial radius of the earth, in kilometers.
- static const double EARTH_RADIUS_KM_POLAR = 6356.1

  The polar radius of the earth, in kilometers.

10.25.1 Detailed Description

The Iridium position class.

This class represents a position that was acquired through the Iridium system. It represents an estimate of the position of the instrument and is provided in the body of an email message received from the Iridium system along the an Iridium Short Burst Data (SBD) message attachment.

10.25.2 Constructor & Destructor Documentation

10.25.2.1 IridiumPosition()

```
argo::iridium::IridiumPosition::IridiumPosition ()  [inline]
```

The default constructor.

10.25.2.2 ~IridiumPosition()

```
argo::iridium::IridiumPosition::~IridiumPosition ()  [inline]
```

The destructor.

10.25.3 Member Function Documentation

10.25.3.1 CalculateEllipsoidHeight()

```
template<typename T >
static double util::position::PositionUtils::CalculateEllipsoidHeight (
            T lat)  [inline], [static], [inherited]
```

Get the approximate surface altitude or height of earth for a given latitude, in kilometers.

Warning

This method provides approximate surface height estimates only! This approximation is calculated from a reference ellipsoid – a mathematically-defined surface that approximates the geoid, the truer figure of the Earth.

Parameters

in	*lat*	The geographic latitude of interest, in decimal degrees.

Returns

The approximate surface altitude or height of earth for the given latitude, in kilometers.

References util::math::MathUtils::degToRad(), util::position::PositionUtils::EARTH_RADIUS_KM_EQUATORIAL, and util::position::PositionUtils::EARTH_RADIUS_KM_POLAR.

Referenced by util::position::PositionUtils::CalculateGeographicDistance().

Here is the caller graph for this function:

10.25.3.2 CalculateGeographicDistance()

```
template<typename T >
static double util::position::PositionUtils::CalculateGeographicDistance (
            T lat1,
            T lon1,
            T lat0,
            T lon0)  [inline], [static], [inherited]
```

Get the geographical distance between two position, in kilometers, from the positions' locations, in decimal degrees.

Warning

This method provides approximate geographic estimates only! This approximation is calculated from a reference ellipsoid – a mathematically-defined surface that approximates the geoid, the truer figure of the Earth.

Note

This method uses the 'haversine' formula to calculate the great-circle distance between two points – that is, the shortest distance over the earth's surface – giving an 'as-the-crow-flies' distance between the points (ignoring any hills they fly over, of course!).

Parameters

in	*lat1*	The latitude of the geographic final position, in decimal degrees North.
in	*lon1*	The longitude of the geographic final position, in decimal degrees East.
in	*lat0*	The latitude of the geographic initial position, in decimal degrees North.
in	*lon0*	The longitude of the geographic initial position, in decimal degrees East.

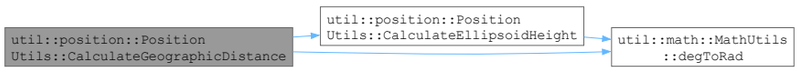
Returns

The geographical distance between the two given positions, in kilometers.

References util::position::PositionUtils::CalculateEllipsoidHeight(), and util::math::MathUtils::degToRad().

Referenced by util::xmsg::XCompositeIridiumPosition::ComputeAverageIrdiumPosition().

Here is the call graph for this function:



Here is the caller graph for this function:

10.25.3.3 degToRad()

```
template<typename T >
static double util::math::MathUtils::degToRad (
            T deg)  [inline], [static], [inherited]
```

Convert angular units from from degrees to decimal radians.

Parameters

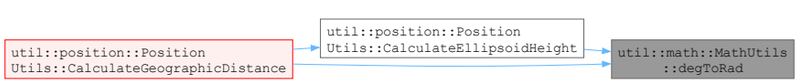
in	*deg*	Angle in integer or decimal degrees to convert to radians.

Returns

Angle in decimal radians.

Referenced by util::position::PositionUtils::CalculateEllipsoidHeight(), and util::position::PositionUtils::CalculateGeographicDistance().

Here is the caller graph for this function:



10.25.3.4 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

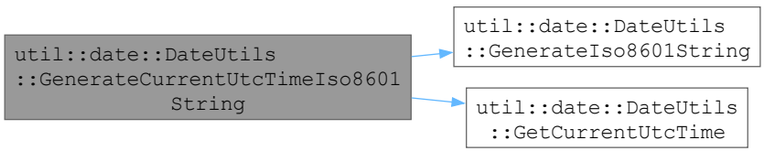
Returns

An ISO8601 format date/time string representation of the current time.

References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:

10.25.3.5 GenerateIso6709String()

```
template<typename T >
static std::string util::position::PositionUtils::GenerateIso6709String (
            T lat,
            T lon)  [inline], [static], [inherited]
```

Generate an IS06709 string representation of the position given by (`lat`, `lon`).

Parameters

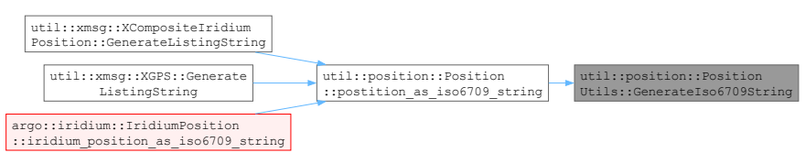
in	*lat*	The latitude of the position, in degrees North.
in	*lon*	The longitude of the position, in degrees East.

Returns

An IS06709 string representation of the position given by (`lat`, `lon`).

Referenced by util::position::Position::postition_as_iso6709_string().

Here is the caller graph for this function:



10.25.3.6 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

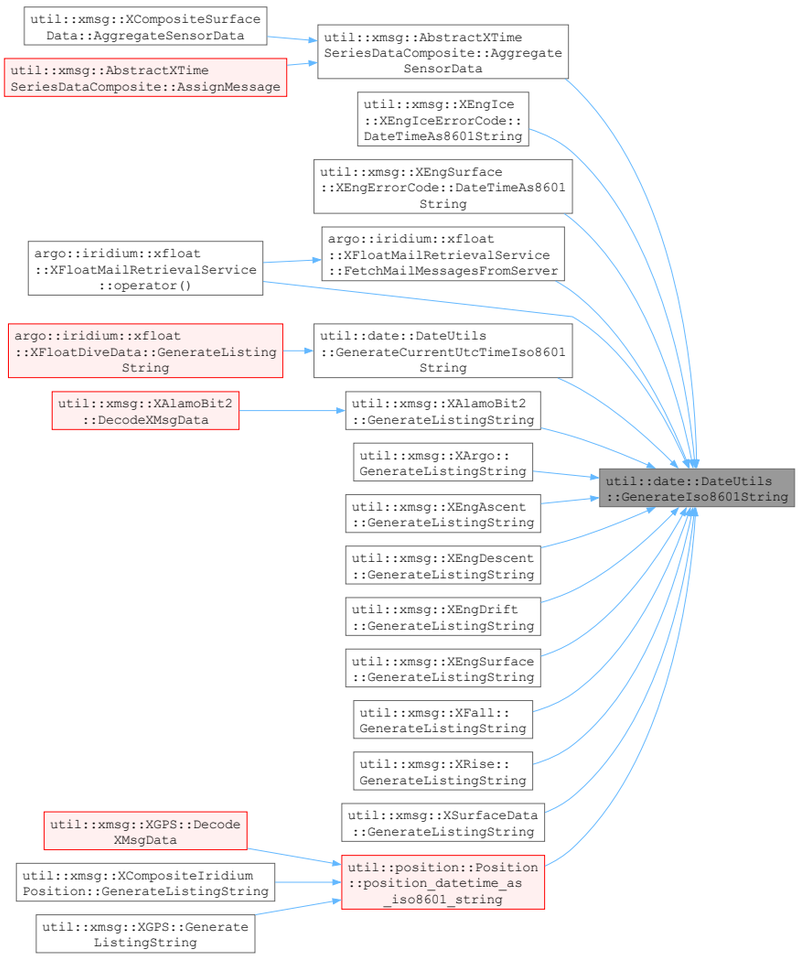
in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), util::xmsg::XEngIce::XEngIce util::xmsg::XEngSurface::XEngErrorCode::DateTimeAs8601String(), argo::iridium::xfloat::XFloatMailRetrievalService::FetchMailMessages util::date::DateUtils::GenerateCurrentUtcTimeIso8601String(), util::xmsg::XAlamoBit2::GenerateListingString(), util::xmsg::XArgo::Genera util::xmsg::XEngAscent::GenerateListingString(), util::xmsg::XEngDescent::GenerateListingString(), util::xmsg::XEngDrift::GenerateListing util::xmsg::XEngSurface::GenerateListingString(), util::xmsg::XFall::GenerateListingString(), util::xmsg::XRise::GenerateListingString(), util::xmsg::XSurfaceData::GenerateListingString(), argo::iridium::xfloat::XFloatMailRetrievalService::operator()(), and util::position::Position::position_datetime_as_iso8601_string().

Here is the caller graph for this function:



10.25.3.7 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref_dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.25.3.8 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

Here is the caller graph for this function:

10.25.3.15 iridium_position_longitude()

```
double argo::iridium::IridiumPosition::iridium_position_longitude () const  [inline]
```

Get the Iridium position longitude.

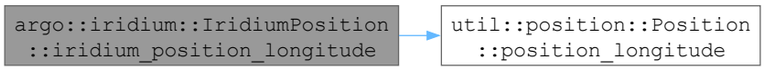
Returns

The Iridium position longitude.

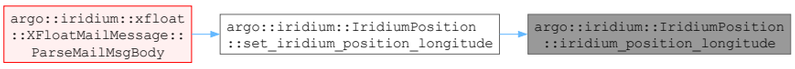
References util::position::Position::position_longitude().

Referenced by set_iridium_position_longitude().

Here is the call graph for this function:



Here is the caller graph for this function:



10.25.3.16 IsPositionValid()

```
template<typename T >
static bool util::position::PositionUtils::IsPositionValid (
            T lat,
            T lon)  [inline], [static], [inherited]
```

Check position validity.

Parameters

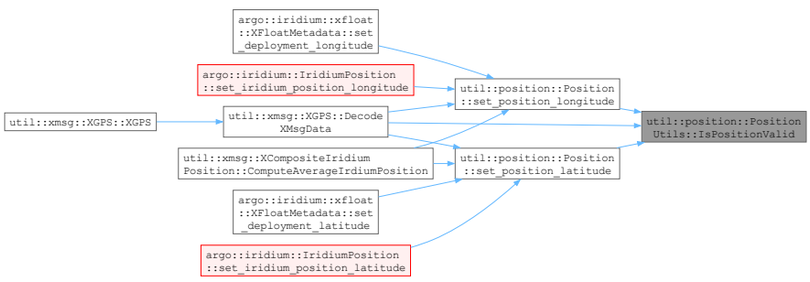
in	*lat*	Latitude of position.
in	*lon*	Longitude of position.

Returns

TRUE if (lat, lon) represents a valid geographical position, or FALSE otherwise.

Referenced by util::xmsg::XGPS::DecodeXMsgData(), util::position::Position::set_position_latitude(), and util::position::Position::set_positi

Here is the caller graph for this function:



10.25.3.17 position_datetime()

```
ptime util::position::Position::position_datetime () const  [inline], [inherited]
```

Get the date/time of the position.

Returns

The date/time of the position.

References util::position::Position::position_datetime_.

Referenced by util::xmsg::XGPS::DecodeXMsgData(), argo::iridium::xfloat::XFloatMetadata::deployment_datetime(), util::xmsg::XGPS::GeneratePhyString(), and iridium_position_datetime().

10.25.4.3 iridium_position_cep_radius_

```
int argo::iridium::IridiumPosition::iridium_position_cep_radius_  [private]
```

Iridium position Circular Error Probable (CEP) radius, in kilometers.

This field defines the estimate of an error of the Iridium position. It is provided by the Iridium system, along with the Iridium position, in the body of the email containing the Iridium SBD message.

Since multiple Iridium messages are transmitted for each dive cycle, a better estimate of the instrument position is provided by a composite position, constructed from two or more individual positions. To compute this composite position, each position is weighted proportionally to the inverse of the CEP radius.

Referenced by iridium_position_cep_radius(), and set_iridium_position_cep_radius().

10.25.4.4 position_datetime_

```
ptime util::position::Position::position_datetime_  [private], [inherited]
```

The date and time of the position.

Referenced by util::position::Position::position_datetime(), util::position::Position::position_datetime_as_iso8601_string(), and util::position::Position::set_position_datetime().

10.25.4.5 position_is_valid_

```
bool util::position::Position::position_is_valid_  [private], [inherited]
```

The valid position indicator.

Referenced by util::position::Position::position_is_valid(), and util::position::Position::set_position_is_valid().

10.25.4.6 position_latitude_

```
double util::position::Position::position_latitude_  [private], [inherited]
```

The latitude of the position, in decimal degrees.

Referenced by util::position::Position::position_latitude(), util::position::Position::postition_as_iso6709_string(), util::position::Position::set_position_latitude(), and util::position::Position::set_position_longitude().

10.25.4.7 position_longitude_

```
double util::position::Position::position_longitude_  [private], [inherited]
```

The longitude of the position, in decimal degrees.

Referenced by util::position::Position::position_longitude(), util::position::Position::postition_as_iso6709_string(), util::position::Position::set_position_latitude(), and util::position::Position::set_position_longitude().

The documentation for this class was generated from the following file:

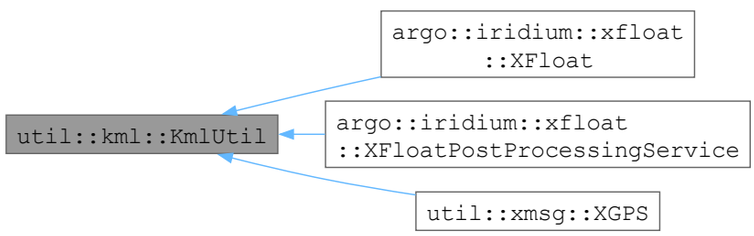
10.26 util::kml::KmlUtil Class Reference

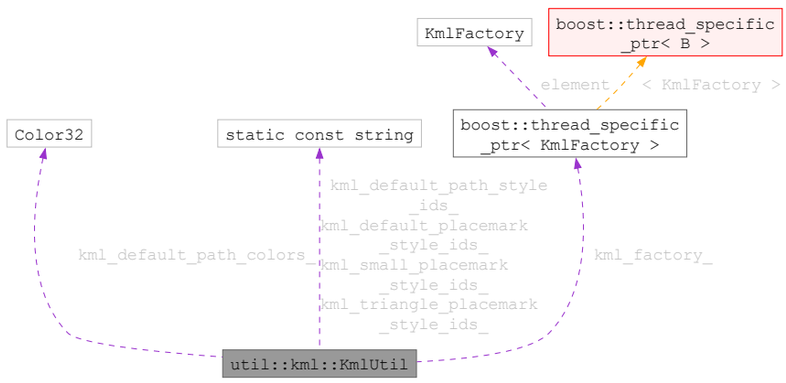
The KML utility class.

```
#include <KmlUtil.h>
```

Inheritance diagram for util::kml::KmlUtil:



Collaboration diagram for util::kml::KmlUtil:



Static Public Member Functions

- static void CloseKmlFactory ()

  Release this thread's KML factory pointer.
- static const Color32 & GetDefaltKmlPathColor (int id)

  Get the palette colour for an index (an instrument ID, for example), modulo the palette size.
- static const string & GetDefaltKmlPathStyleId (int id)

  Get the path (line) style ID for an index, modulo the palette size.
- static const string & GetDefaltKmlPlacemarkStyleId (int id)

  Get the large placemark style ID for an index, modulo the palette size.
- static thread_specific_ptr< KmlFactory > & GetKmlFactory ()

  Get the libkml factory, initializing it for this thread if necessary.
- static const string & GetSmallKmlPlacemarkStyleId (int id)

  Get the small placemark style ID for an index, modulo the palette size.
- static const string & GetTriangleKmlPlacemarkStyleId (int id)

  Get the triangle placemark style ID for an index, modulo the palette size.
- static void SetAllDefaultKmlSyles (const DocumentPtr &document)

  Add the default styles for every palette colour to a KML document.
- static void SetDefaultKmlStyle (const DocumentPtr &document, unsigned int style_idx)

  Add the four default styles for one palette colour to a KML document.

Static Private Attributes

- static const Color32 kml_default_path_colors_ [KML_NUM_DFLT_PATH_COLORS]

  The colour palette for instrument paths and placemarks, indexed by style index.
- static const string kml_default_path_style_ids_ [KML_NUM_DFLT_PATH_COLORS]

  The KML style IDs of the path (line) styles, one per palette colour.
- static const string kml_default_placemark_style_ids_ [KML_NUM_DFLT_PATH_COLORS]

  The KML style IDs of the large placemark styles, one per palette colour.
- static thread_specific_ptr< KmlFactory > kml_factory_

  The libkml factory used to create KML elements, held per thread.
- static const string kml_small_placemark_style_ids_ [KML_NUM_DFLT_PATH_COLORS]

  The KML style IDs of the small placemark styles, one per palette colour.
- static const string kml_triangle_placemark_style_ids_ [KML_NUM_DFLT_PATH_COLORS]

  The KML style IDs of the triangle placemark styles, one per palette colour.

10.26.1 Detailed Description

The KML utility class.

This class provides some useful functions for creating Google Earth KML files.

10.26.2 Member Function Documentation

10.26.2.1 CloseKmlFactory()

```
static void util::kml::KmlUtil::CloseKmlFactory ()  [inline], [static]
```

Release this thread's KML factory pointer.

Warning

This deletes libkml's shared factory (see kml_factory_). It is not currently called.

Exceptions

util::log::MessageException	if an error occurs.

References CATCH_BLOCK, and kml_factory_.

10.26.2.2 GetDefaltKmlPathColor()

```
static const Color32 & util::kml::KmlUtil::GetDefaltKmlPathColor (
            int id)  [inline], [static]
```

Get the palette colour for an index (an instrument ID, for example), modulo the palette size.

Parameters

in	*id*	The index.

Returns

The colour.

References kml_default_path_colors_.

Referenced by SetDefaultKmlStyle().

Here is the caller graph for this function:

10.26.2.3 GetDefaltKmlPathStyleId()

```
static const string & util::kml::KmlUtil::GetDefaltKmlPathStyleId (
            int id)  [inline], [static]
```

Get the path (line) style ID for an index, modulo the palette size.

Parameters

in	*id*	The index.

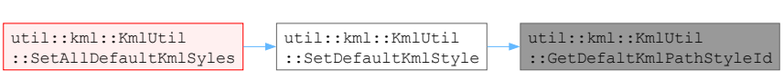
Returns

The KML style ID.

References kml_default_path_style_ids_.

Referenced by SetDefaultKmlStyle().

Here is the caller graph for this function:



10.26.2.4 GetDefaltKmlPlacemarkStyleId()

```
static const string & util::kml::KmlUtil::GetDefaltKmlPlacemarkStyleId (
            int id)  [inline], [static]
```

Get the large placemark style ID for an index, modulo the palette size.

Parameters

in	*id*	The index.

Returns

The KML style ID.

References kml_default_placemark_style_ids_.

Referenced by SetDefaultKmlStyle().

Here is the caller graph for this function:

10.26.2.5 GetKmlFactory()

```
static thread_specific_ptr< KmlFactory > & util::kml::KmlUtil::GetKmlFactory ()  [inline], [static]
```

Get the libkml factory, initializing it for this thread if necessary.

Exceptions

util::log::MessageException	if the factory cannot be obtained.

Returns

The thread's KML factory pointer (see kml_factory_).

References CATCH_BLOCK, and kml_factory_.

Referenced by argo::iridium::xfloat::XFloat::GenerateKmlMasterDocument(), argo::iridium::xfloat::XFloat::GenerateKmlMasterString(), and SetDefaultKmlStyle().

Here is the caller graph for this function:

10.26.2.6 GetSmallKmlPlacemarkStyleId()

```
static const string & util::kml::KmlUtil::GetSmallKmlPlacemarkStyleId (
            int id)  [inline], [static]
```

Get the small placemark style ID for an index, modulo the palette size.

Parameters

in	*id*	The index.

Returns

The KML style ID.

References kml_small_placemark_style_ids_.

Referenced by SetDefaultKmlStyle().

Here is the caller graph for this function:

10.26.2.7 GetTriangleKmlPlacemarkStyleId()

```
static const string & util::kml::KmlUtil::GetTriangleKmlPlacemarkStyleId (
            int id)  [inline], [static]
```

Get the triangle placemark style ID for an index, modulo the palette size.

Parameters

in	*id*	The index.

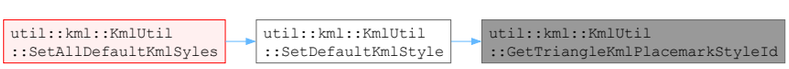
Returns

The KML style ID.

References kml_triangle_placemark_style_ids_.

Referenced by SetDefaultKmlStyle().

Here is the caller graph for this function:



10.26.2.8 SetAllDefaultKmlSyles()

```
static void util::kml::KmlUtil::SetAllDefaultKmlSyles (
            const DocumentPtr & document)  [inline], [static]
```

Add the default styles for every palette colour to a KML document.

Parameters

in	*document*	The KML document to add the styles to.

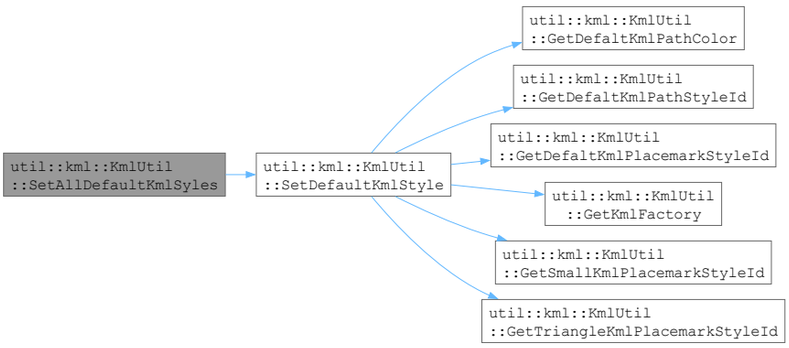
Exceptions

util::log::MessageException	if an error occurs.

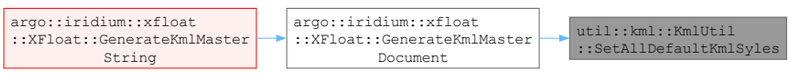
References CATCH_BLOCK, and SetDefaultKmlStyle().

Referenced by argo::iridium::xfloat::XFloat::GenerateKmlMasterDocument().

Here is the call graph for this function:



Here is the caller graph for this function:



10.26.2.9 SetDefaultKmlStyle()

```
static void util::kml::KmlUtil::SetDefaultKmlStyle (
            const DocumentPtr & document,
            unsigned int style_idx)  [inline], [static]
```

Add the four default styles for one palette colour to a KML document.

Adds a 5-pixel path (line) style, a large dot placemark style, a small dot placemark style and a triangle placemark style, all in the colour `style_idx` (modulo the palette size). The icons are loaded from `http://argo.whoi.edu/kml/img/`. Errors are logged, not thrown.

Parameters

in	*document*	The KML document to add the styles to.
in	*style_idx*	The palette index of the colour.

References CATCH_NOTHROW, GetDefaltKmlPathColor(), GetDefaltKmlPathStyleId(), GetDefaltKmlPlacemarkStyleId(), GetKmlFactory(), GetSmallKmlPlacemarkStyleId(), and GetTriangleKmlPlacemarkStyleId().

Referenced by SetAllDefaultKmlSyles().

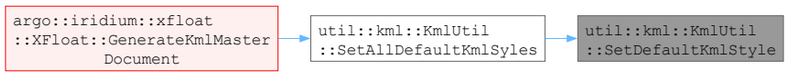
Here is the caller graph for this function:



10.26.3 Member Data Documentation

10.26.3.1 kml_default_path_colors_

```
const Color32 util::kml::KmlUtil::kml_default_path_colors_  [static], [private]
```

Initial value:

```
= {
        Color32(0xB0, 0xFF, 0x00, 0x00),
        Color32(0xB0, 0xFF, 0x80, 0x00),
        Color32(0xB0, 0xFF, 0xFF, 0x00),
        Color32(0xB0, 0x80, 0xFF, 0x00),
        Color32(0xB0, 0x00, 0xFF, 0x00),
        Color32(0xB0, 0x00, 0xFF, 0x80),
        Color32(0xB0, 0x00, 0xFF, 0xFF),
        Color32(0xB0, 0x00, 0x80, 0xFF),
        Color32(0xB0, 0x00, 0x00, 0xFF),
        Color32(0xB0, 0x80, 0x00, 0xFF),
        Color32(0xB0, 0xFF, 0x00, 0xFF),
        Color32(0xB0, 0xFF, 0x00, 0x80),
        Color32(0xB0, 0x80, 0x80, 0x080),
 }
```

The colour palette for instrument paths and placemarks, indexed by style index.

Referenced by GetDefaltKmlPathColor().

10.26.3.2 kml_default_path_style_ids_

```
const string util::kml::KmlUtil::kml_default_path_style_ids_  [static], [private]
```

Initial value:

```
= {
        "path1",
        "path2",
        "path3",
        "path4",
        "path5",
        "path6",
        "path7",
        "path8",
        "path9",
        "pathA",
        "pathB",
        "pathC",
        "pathD",}
```

The KML style IDs of the path (line) styles, one per palette colour.

Referenced by GetDefaltKmlPathStyleId().

10.26.3.3 kml_default_placemark_style_ids_

```
const string util::kml::KmlUtil::kml_default_placemark_style_ids_  [static], [private]
```

Initial value:

```
= {
        "dot1_1",
        "dot1_2",
        "dot1_3",
        "dot1_4",
        "dot1_5",
        "dot1_6",
        "dot1_7",
        "dot1_8",
        "dot1_9",
        "dot1_A",
        "dot1_B",
        "dot1_C",
        "dot1_D", }
```

The KML style IDs of the large placemark styles, one per palette colour.

Referenced by GetDefaltKmlPlacemarkStyleId().

10.26.3.4 kml_factory_

```
thread_specific_ptr< KmlFactory > util::kml::KmlUtil::kml_factory_  [static], [private]
```

The libkml factory used to create KML elements, held per thread.

Warning

This holds libkml's process-wide factory (`KmlFactory::GetFactory()`), and the default cleanup deletes it when the owning thread exits or CloseKmlFactory() is called. Only the post-processing thread uses KML, so this currently happens only at shutdown.

Referenced by CloseKmlFactory(), and GetKmlFactory().

10.26.3.5 kml_small_placemark_style_ids_

```
const string util::kml::KmlUtil::kml_small_placemark_style_ids_  [static], [private]
```

Initial value:

```
= {
        "dot1s_1",
        "dot1s_2",
        "dot1s_3",
        "dot1s_4",
        "dot1s_5",
        "dot1s_6",
        "dot1s_7",
        "dot1s_8",
        "dot1s_9",
        "dot1s_A",
        "dot1s_B",
        "dot1s_C",
        "dot1s_D", }
```

The KML style IDs of the small placemark styles, one per palette colour.

Referenced by GetSmallKmlPlacemarkStyleId().

10.26.3.6 kml_triangle_placemark_style_ids_

```
const string util::kml::KmlUtil::kml_triangle_placemark_style_ids_  [static], [private]
```

Initial value:

```
= {
        "tri1_1",
        "tri1_2",
        "tri1_3",
        "tri1_4",
        "tri1_5",
        "tri1_6",
        "tri1_7",
        "tri1_8",
        "tri1_9",
        "tri1_A",
        "tri1_B",
        "tri1_C",
        "tri1_D", }
```

The KML style IDs of the triangle placemark styles, one per palette colour.

Referenced by GetTriangleKmlPlacemarkStyleId().

The documentation for this class was generated from the following files:

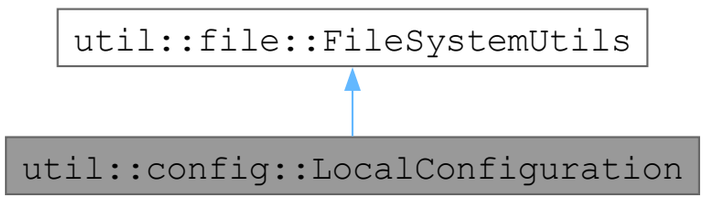
- utility/KmlUtil.h
- utility/KmlUtil.cpp

10.27 util::config::LocalConfiguration Class Reference

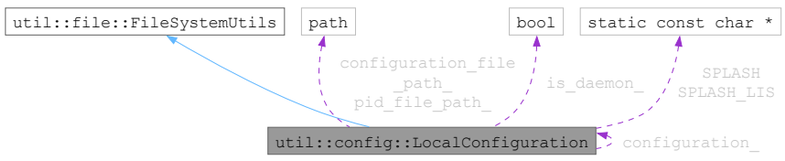
Class representing all program run-time configuration options.

`#include <LocalConfiguration.h>`

Inheritance diagram for util::config::LocalConfiguration:



Collaboration diagram for util::config::LocalConfiguration:



Public Member Functions

- LocalConfiguration ()
  The default constructor.
- ~LocalConfiguration ()
  The destructor.

Static Public Member Functions

- static __pid_t AcquireRuntimeLock () ATTR_NO_EXCEPTIONS
  Acquire a run-time lock.
- static void CheckRuntimeLock ()
  Check the run-time lock.
- static const LocalConfiguration & configuration ()
  Get the local configuration run-time settings object.
- static options_description GenerateCommandLineOptionsDescription () ATTR_NO_EXCEPTIONS
  Get the command-line interface configuration options' description.
- static options_description GenerateConfigurationFileOptionsDescription () ATTR_NO_EXCEPTIONS
  Get configuration file options' description.
- static const path & GetDirectoryPath (const path &dir, bool create=false)
  Get a directory path.
- static path GetDirectoryPathFromString (const string &dir, bool create=false)
  Generate a boost::filesystem::path object from the directory path string.
- static const LocalConfiguration & InitializeConfiguration (int argc, char **argv) ATTR_NO_EXCEPTIONS
  Configure the application run-time settings and acquire a run-time lock.
- static bool is_daemon ()
  Is the application configured to run as a daemon process?
- static vector< path > ListDirectories (const path &dir)
  List all directories contained in the given directory.
- static vector< path > ListFiles (path dir, size_t n=0)
  List all regular files contained in the given directory.
- static path MoveFileToDirectory (const path &file, const path &dir_dst, bool create_dir=false)
  Copy a file into a directory.
- static void ReleaseRuntimeLock ()
  Release the run-time lock.
- static const char * splash_lis ()
  Get the splash listing text string.

Private Member Functions

- void ParseProgramOptions (int argc, char **argv) ATTR_NO_EXCEPTIONS

  Parse the run-time configuration options from the command-line arguments and/or the configuration file.

Static Private Attributes

- static LocalConfiguration configuration_

  Statically-allocated global run-time configuration options object.
- static path configuration_file_path_

  Configuration file path string.
- static bool is_daemon_

  Indicates whether the program is to run as a daemon.
- static path pid_file_path_

  The path to the PID file on the local filesystem.
- static const char * SPLASH

  The splash string.
- static const char * SPLASH_LIS

  The listing splash string.

10.27.1 Detailed Description

Class representing all program run-time configuration options.

This class defines all run-time configuration options, descriptions, and default values. The boost::program_options library is used parse run-time configuration options from a configuration file and/or Command-Line Interface (CLI) arguments.

10.27.2 Constructor & Destructor Documentation

10.27.2.1 LocalConfiguration()

```
util::config::LocalConfiguration::LocalConfiguration () [inline]
```

The default constructor.

10.27.2.2 ~LocalConfiguration()

```
util::config::LocalConfiguration::~LocalConfiguration () [inline]
```

The destructor.

10.27.3 Member Function Documentation

10.27.3.1 AcquireRuntimeLock()

```
static __pid_t util::config::LocalConfiguration::AcquireRuntimeLock () [inline], [static]
```

Acquire a run-time lock.

A PID file is created upon successful acquisition of a run-time lock. This PID file is used to ensure that only a single instance of the program is running at any time. The file contains a single ASCII integer corresponding to the PID of the running instance. It is created during program initialization, and is removed upon termination. The file is checked periodically during execution to ensure that it still exists and that the PID is correct.

Exceptions

util::log::MessageException	if acquisition of the run-time lock fails e.g. another instance of the program has already acquired a run-time lock.

Note

To release the run-time lock, call the releaseRuntimeLock() function.

Returns

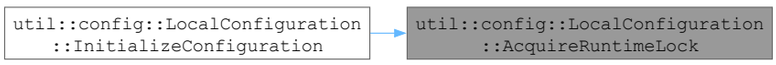
The PID of the process acquiring the run-time lock.

References CATCH_BLOCK, CheckRuntimeLock(), EXC_THROW, util::file::FileSystemUtils::GetDirectoryPathFromString(), and pid_file_path_.

Referenced by InitializeConfiguration().

Here is the call graph for this function:

Here is the caller graph for this function:



10.27.3.2 CheckRuntimeLock()

```
static void util::config::LocalConfiguration::CheckRuntimeLock ()  [inline], [static]
```

Check the run-time lock.

This method checks the run-time lock file to ensure that this instance of the program retains the run-time lock acquired using the acquireRuntimeLock() function. This means that the lock file exists, is accessible, and contains the PID of this instance of the program.

Exceptions

log::MessageException	if the run-time lock check fails e.g. the run-time lock file does not exist, is not accessible, or contains the incorrect PID.

References CATCH_BLOCK, EXC_THROW, and pid_file_path_.

Referenced by AcquireRuntimeLock().

Here is the caller graph for this function:

10.27.3.3 configuration()

```
static const LocalConfiguration & util::config::LocalConfiguration::configuration ()  [inline],
[static]
```

Get the local configuration run-time settings object.

Returns

The local configuration run-time settings object.

References configuration_.

10.27.3.4 GenerateCommandLineOptionsDescription()

```
options_description util::config::LocalConfiguration::GenerateCommandLineOptionsDescription ()
[static]
```

Get the command-line interface configuration options' description.

This function fully describes the configuration options that may be passed to the application via the command-line. It includes the short- and long-hand versions of the options, the value types and destinations, the default values, and a brief description of each option.

Exceptions

None.	Never throws.

Returns

Command-line interface configuration options description.

References CATCH_BLOCK, CFG_DEFAULT_ISDAEMON, CFG_DEFAULT_PATH, CFG_DEFAULT_REPROCESS_ALL, CFG_FMT_DESC_LEN, CFG_FMT_LINE_LEN, configuration_file_path_, and is_daemon_.

Referenced by ParseProgramOptions().

Here is the caller graph for this function:

10.27.3.5 GenerateConfigurationFileOptionsDescription()

```
options_description util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription
() [static]
```

Get configuration file options' description.

This function fully describes the configuration options that may be passed to the application via the configuration file. It includes the short- and long-hand versions of the options, the value types and destinations, the default values, and a brief description of each option.

Exceptions

None.	Never throws.

Returns

Configuration file options description.

References CATCH_BLOCK, CFG_DEFAULT_MAIL_CHK_DLY, CFG_DEFAULT_MAX_FETCH, CFG_DEFAULT_NDECO, CFG_DEFAULT_NPROC, CFG_DEFAULT_PATH_PID, CFG_FMT_DESC_LEN, CFG_FMT_LINE_LEN, CFG_MYSQL_DFLT_ADDRESS, CFG_MYSQL_DFLT_PORT, CFG_MYSQL_DFLT_PROTOCOL, CFG_MYSQL_DFLT_SCHEMA, pid_file_path_, XMAIL_DFLT_MSG_HEADER_VALID_SNDR_REGEX, XMAIL_DFLT_MSG_HEADER_VALID_SUBJ_REGEX, and XMAIL_DFLT_SBD_FILE_VALID_NAME_REGEX.

Referenced by ParseProgramOptions().

Here is the caller graph for this function:

10.27.3.6 GetDirectoryPath()

```
static const path & util::file::FileSystemUtils::GetDirectoryPath (
            const path & dir,
            bool create = false)  [inline], [static], [inherited]
```

Get a directory path.

Exceptions

MessageException	if create == FALSE and the directory specified by path does not exist.

Parameters

in	*dir*	Directory path.
in	*create*	If TRUE, the directory specified by path will be created if it does not already exists. If FALSE, an exception will be thrown if the directory does not exist.

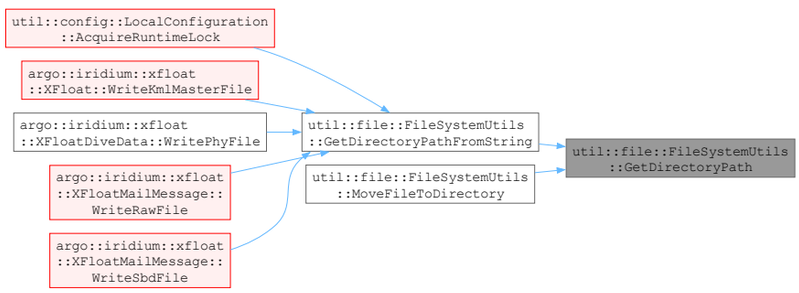
Returns

dir

References CATCH_BLOCK, EXC_THROW, and ldbg.

Referenced by util::file::FileSystemUtils::GetDirectoryPathFromString(), and util::file::FileSystemUtils::MoveFileToDirectory().

Here is the caller graph for this function:



10.27.3.7 GetDirectoryPathFromString()

```
static path util::file::FileSystemUtils::GetDirectoryPathFromString (
            const string & dir,
            bool create = false)  [inline], [static], [inherited]
```

Generate a boost::filesystem::path object from the directory path string.

Exceptions

MessageException	if create == FALSE and the directory specified by path does not exist.

Parameters

in	*dir*	Directory path string.
in	*create*	If TRUE, the directory specified by path will be created if it does not already exists. If FALSE, an exception will be thrown if the directory does not exist.

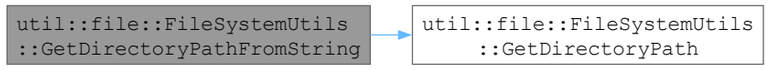
Returns

A boost::filesystem::path object from the directory path string.

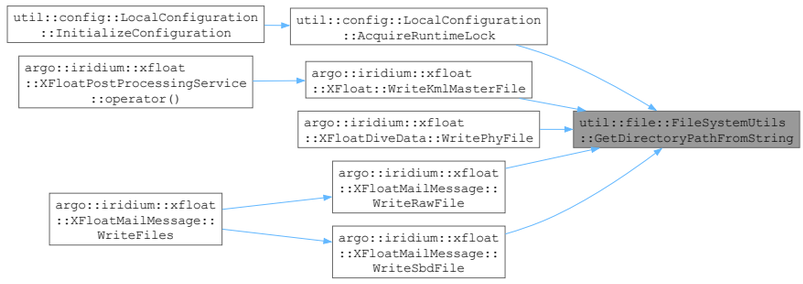
References CATCH_BLOCK, and util::file::FileSystemUtils::GetDirectoryPath().

Referenced by AcquireRuntimeLock(), argo::iridium::xfloat::XFloat::WriteKmlMasterFile(), argo::iridium::xfloat::XFloatDiveData::WritePhyF
argo::iridium::xfloat::XFloatMailMessage::WriteRawFile(), and argo::iridium::xfloat::XFloatMailMessage::WriteSbdFile().

Here is the call graph for this function:



Here is the caller graph for this function:



10.27.3.8 InitializeConfiguration()

```
static const LocalConfiguration & util::config::LocalConfiguration::InitializeConfiguration (
            int argc,
            char ** argv)  [inline], [static]
```

Configure the application run-time settings and acquire a run-time lock.

Parse the configuration options, then acquire a run-time lock. Verify the run-time lock before returning.

Parameters

in	*argc*	The number of command-line arguments.
in	*argv*	The command-line argument list.

Exceptions

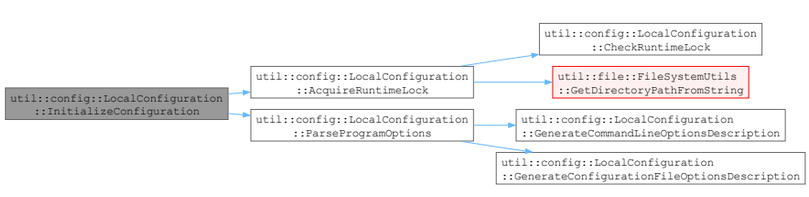
log::MessageException	if an error occurs while parsing the run-time configuration options or acquiring the run-time lock.

Returns

A const reference to the configuration_ object.

References AcquireRuntimeLock(), CATCH_BLOCK, configuration_, ParseProgramOptions(), and SPLASH.

Here is the call graph for this function:



10.27.3.9 is_daemon()

```
static bool util::config::LocalConfiguration::is_daemon ()  [inline], [static]
```

Is the application configured to run as a daemon process?

Returns

TRUE if the application is configured to run as a daemon process, or FALSE otherwise.

References is_daemon_.

10.27.3.10 ListDirectories()

```
static vector< path > util::file::FileSystemUtils::ListDirectories (
            const path & dir)  [inline], [static], [inherited]
```

List all directories contained in the given directory.

Parameters

in	*dir*	The path to the directory of interest.

Exceptions

log::MessageException	if the directory does not exist, is not a directory, or an error occurs.

Returns

A vector of paths to all the directories contained in the given directory.

References CATCH_BLOCK, and EXC_THROW.

10.27.3.11 ListFiles()

```
static vector< path > util::file::FileSystemUtils::ListFiles (
            path dir,
            size_t n = 0)  [inline], [static], [inherited]
```

List all regular files contained in the given directory.

Parameters

in	*dir*	The path to the directory of interest.
in	*n*	If n>0, the maximum number of paths to return, else no effect.

Exceptions

log::MessageException	if the directory does not exist, is not a directory, or an error occurs.

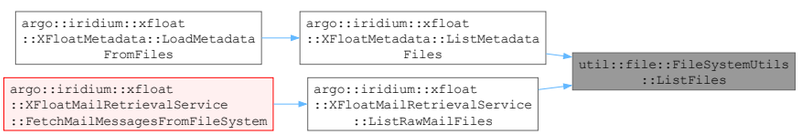
Returns

A vector of paths to all the regular files contained in the given directory.

References CATCH_BLOCK, and EXC_THROW.

Referenced by argo::iridium::xfloat::XFloatMetadata::ListMetadataFiles(), and argo::iridium::xfloat::XFloatMailRetrievalService::ListRawMa

Here is the caller graph for this function:



10.27.3.12 MoveFileToDirectory()

```
static path util::file::FileSystemUtils::MoveFileToDirectory (
            const path & file,
            const path & dir_dst,
            bool create_dir = false)  [inline], [static], [inherited]
```

Copy a file into a directory.

Warning

Despite its name, this function copies the file and does not remove the source. If a file with the same name already exists in the destination directory, it is left unchanged. It is not currently called.

Parameters

in	*file*	The file to copy.
in	*dir_dst*	The destination directory.
in	*create_dir*	If TRUE, create the destination directory if it does not exist.

Exceptions

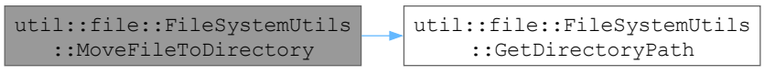
util::log::MessageException	if the file does not exist, is not a regular file, or cannot be copied.

Returns

The path of the file in the destination directory.

References CATCH_BLOCK, EXC_THROW, and util::file::FileSystemUtils::GetDirectoryPath().

Here is the call graph for this function:



10.27.3.13 ParseProgramOptions()

```
void util::config::LocalConfiguration::ParseProgramOptions (
            int argc,
            char ** argv)  [inline], [private]
```

Parse the run-time configuration options from the command-line arguments and/or the configuration file.

Populates the configuration options object.

Parameters

in	*argc*	The number of command-line arguments.
in	*argv*	The command-line argument list.

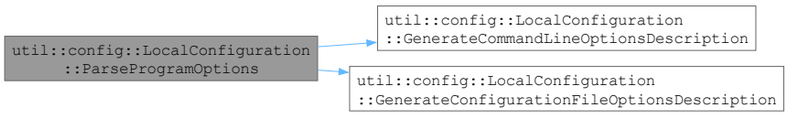
Exceptions

log::MessageException	if an error occurs while parsing the command-line arguments or the configuration file.

References CATCH_BLOCK, configuration_file_path_, DEFAULT_LOG_LEVEL, EXC_THROW, GenerateCommandLineOptionsDescriptio
GenerateConfigurationFileOptionsDescription(), util::log::LOG_DBG3, util::log::LOG_INF, and util::log::LOG_WRN.

Referenced by InitializeConfiguration().

Here is the call graph for this function:



Here is the caller graph for this function:

10.27.3.14 ReleaseRuntimeLock()

```
static void util::config::LocalConfiguration::ReleaseRuntimeLock ()  [inline], [static]
```

Release the run-time lock.

This method releases the run-time lock acquired by the AcquireRuntimeLock() function. It deletes the lock file from the local filesystem

References CATCH_BLOCK, EXC_THROW, ldbg, linf, lout, lwrn, and pid_file_path_.

10.27.3.15 splash_lis()

```
static const char * util::config::LocalConfiguration::splash_lis ()  [inline], [static]
```

Get the splash listing text string.

Returns

The splash listing text string.

References SPLASH_LIS.

10.27.4 Member Data Documentation

10.27.4.1 configuration_

```
LocalConfiguration util::config::LocalConfiguration::configuration_  [static], [private]
```

Statically-allocated global run-time configuration options object.

All program run-time configuration settings are stored here.

Referenced by configuration(), and InitializeConfiguration().

10.27.4.2 configuration_file_path_

```
path util::config::LocalConfiguration::configuration_file_path_  [static], [private]
```

Configuration file path string.

Referenced by GenerateCommandLineOptionsDescription(), and ParseProgramOptions().

10.27.4.3 is_daemon_

```
bool util::config::LocalConfiguration::is_daemon_  [static], [private]
```

Indicates whether the program is to run as a daemon.

Referenced by GenerateCommandLineOptionsDescription(), and is_daemon().

10.27.4.4 pid_file_path_

```
path util::config::LocalConfiguration::pid_file_path_  [static], [private]
```

The path to the PID file on the local filesystem.

This PID file is used to ensure that only a single instance of the program is running at any time. The file contains a single ASCII integer corresponding to the PID of the running instance. It is created during program initialization, and is removed upon termination. The file is checked periodically during execution to ensure that it still exists and that the PID is correct.

Referenced by AcquireRuntimeLock(), CheckRuntimeLock(), GenerateConfigurationFileOptionsDescription(), and ReleaseRuntimeLock().

10.27.4.5 SPLASH

```
const char * util::config::LocalConfiguration::SPLASH  [static], [private]
```

Initial value:
=

```
"================================================================================================\n"
"\n"
"  X-Message Mail-Telemetry Processing Service\n"
"  v" PROG_VERS " (built " BUILD_DATETIME ")\n"
"  Alexander K. Ekholm, Research Engineer, Float Group\n"
"  Physical Oceanography\n"
"  Woods Hole Oceanographic Institution\n"
"  Woods Hole, MA, USA\n"
"\n"
"================================================================================================\n"
""
```

The splash string.

This c-string is printed to standard output upon program startup,

Referenced by InitializeConfiguration().

10.27.4.6 SPLASH_LIS

```
const char * util::config::LocalConfiguration::SPLASH_LIS  [static], [private]
```

Initial value:

```
=
"#=============================================================================================================\n"
"#        _       ____   ______  ____   _________              __      ______\n"
"#       | |     / / / / / __ \\/  _/  / ____/ /___  ____ _/ /_    / ____/_________  __  ______\n"
"#       | | /| / / /_/ / / / // /    / /_   / / __ \\/ __ `/ __/   / / __/ ___/ __ \\/ / / / __ \\\n"
"#       | |/ |/ / __  / /_/ // /    / __/ / / /_/ / /_/ / /_    / /_/ / /  / /_/ / /_/ / /_/ /\n"
"#       |__/|__/_/ /_/\\____/___/   /_/    /_/\\____/\\__,_/\\__/    \\____/_/    \\____/\\__,_/  .___/\n"
"#                                                                                        /_/\n"
"#=============================================================================================================\n"
"#\n"
"# This data was produced and distributed as part of projects that were planned and executed by or\n"
"# in collaboration with the WHOI Float Group.\n"
"#\n"
"# This file was created by:\n"
"#\n"
"#   The X-Message Telemetry Processing Service (XMTPS)\n"
"#   version " PROG_VERS " (built " BUILD_DATETIME ")\n"
"#\n"
"# XMTPS was created and is maintained by:\n"
"#\n"
"#   Alexander K. Ekholm <aekholm@whoi.edu>\n"
"#   Research Engineer, Float Group\n"
"#   Department of Physical Oceanography\n"
"#   Woods Hole Oceanographic Institution\n"
"#   Woods Hole, MA, USA\n"
"#\n"
```

The listing splash string.

The file header for created ASCII files such as RAW mail messages, and intermediate listing files.

Referenced by splash_lis().

The documentation for this class was generated from the following files:

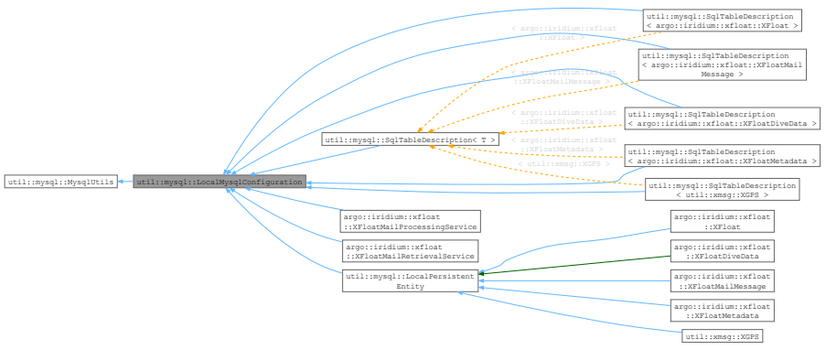
- config/LocalConfiguration.h
- config/LocalConfiguration.cpp
- Main.cpp

10.28 util::mysql::LocalMysqlConfiguration Class Reference

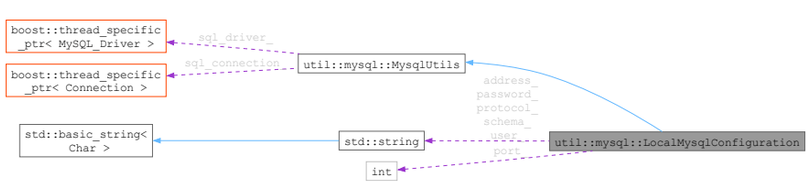
Class providing useful functions for accessing and manipulating the MySQL database, given the local run-time configuration settings.

`#include <LocalMysqlConfiguration.h>`

Inheritance diagram for util::mysql::LocalMysqlConfiguration:



Collaboration diagram for util::mysql::LocalMysqlConfiguration:



Public Member Functions

- LocalMysqlConfiguration ()
  Default constructor.
- virtual ~LocalMysqlConfiguration ()
  Destructor.

Static Public Member Functions

- static void CloseSqlConnection ()
  Close the thread-specific MySQL connection if it is currently open.
- static shared_ptr< sql::ResultSet > **executeDeleteQuery** (const string &from, const string &where="")
- static shared_ptr< ResultSet > ExecuteQuery (Connection *con, const string &query)
  Execute an SQL query and return a shared pointer to the ResultSet object.
- static shared_ptr< sql::ResultSet > executeQuery (const string &query)
  Execute an SQL query and return a shared pointer to the ResultSet object.
- static shared_ptr< sql::ResultSet > executeSelectQuery (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)
  Execute an SQL select query and return a shared pointer to the ResultSet object.
- static int ExecuteUpdate (Connection *con, const string &update)
  Execute an SQL update and return the status code.
- static int executeUpdate (const string &update)
  Execute an SQL update and return the status code.
- static shared_ptr< PreparedStatement > GeneratePreparedStatement (Connection *con, const string &statement)
  Generate a prepared SQL statement object for the given SQL statement.
- static shared_ptr< sql::PreparedStatement > generatePreparedStatement (const string &statement)
  Generate a prepared SQL statement object for the given SQL statement.
- static string GenerateSqlDeleteStr (const string &from, const string &where="")
  Generate an SQL DELETE statement.
- static string GenerateSqlSelectStr (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)
  Generate an SQL select statement.
- static thread_specific_ptr< Connection > & GetSqlConnection (string url, string user, string password, string schema)
  Get a thread-specific instance of a MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > & GetSqlDriver ()
  Get a thread-specific instance of a MySQL driver object.

Static Protected Member Functions

- static sql::Connection * getSqlConnection ()
  Generate a thread-specific instance of a MySQL connection object.

Static Private Member Functions

- static void CleanupSqlConnection (Connection *con)
  Cleanup an SQL connection.
- static void CleanupSqlDriver (MySQL_Driver *driver)
  Function for memory cleanup of MySQL driver on destruct.

Static Private Attributes

- static string address_
  The SQL server qualified name or IP address string.
- static string password_
  The SQL server account password string.
- static unsigned int port_
  The SQL server port number.
- static string protocol_
  The protocol to use in the SQL server connection e.g.
- static string schema_
  The SQL server schema name.
- static thread_specific_ptr< Connection > sql_connection_
  Tthe thread-specific pointer to MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > sql_driver_
  The thread-specific pointer to MySQL driver object.
- static string user_
  The SQL server account username string.

Friends

- class **config::LocalConfiguration**

10.28.1 Detailed Description

Class providing useful functions for accessing and manipulating the MySQL database, given the local run-time configuration settings.

10.28.2 Constructor & Destructor Documentation

10.28.2.1 LocalMysqlConfiguration()

```
util::mysql::LocalMysqlConfiguration::LocalMysqlConfiguration ()
```

Default constructor.

10.28.2.2 ~LocalMysqlConfiguration()

```
util::mysql::LocalMysqlConfiguration::~LocalMysqlConfiguration ()  [virtual]
```

Destructor.

10.28.3 Member Function Documentation

10.28.3.1 CleanupSqlConnection()

```
static void util::mysql::MysqlUtils::CleanupSqlConnection (
            Connection * con)  [inline], [static], [private], [inherited]
```

Cleanup an SQL connection.

This function for memory cleanup of the SQL connection on destruction. The thread-specific SQL connection object will be deleted if it exists.

Parameters

in	*con*	The SQL connection to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL connection object.

References CATCH_BLOCK.

10.28.3.2 CleanupSqlDriver()

```
static void util::mysql::MysqlUtils::CleanupSqlDriver (
            MySQL_Driver * driver)  [inline], [static], [private], [inherited]
```

Function for memory cleanup of MySQL driver on destruct.

Signals the SQL driver to end operation, if it exists.

Parameters

in	*driver*	Driver to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL driver object.

References CATCH_BLOCK.

10.28.3.3 CloseSqlConnection()

```
static void util::mysql::MysqlUtils::CloseSqlConnection ()  [inline], [static], [inherited]
```

Close the thread-specific MySQL connection if it is currently open.

If the thread local MySQL connection is not currently open, then this function will have no effect.

Note

The MySQL connection should be closed when idle to prevent the connection from timing out and throwing exceptions.

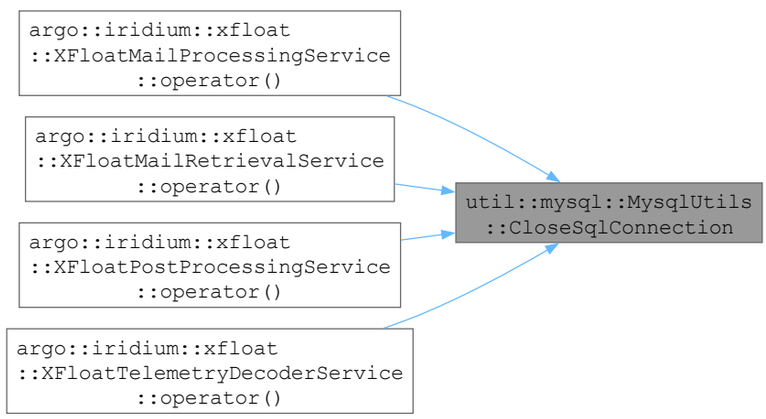
Exceptions

log::MessageException	if an error occurs while attempting to close the MySQL connection.

References CATCH_BLOCK, and util::mysql::MysqlUtils::sql_connection_.

Referenced by argo::iridium::xfloat::XFloatMailProcessingService::operator()(), argo::iridium::xfloat::XFloatMailRetrievalService::operator(
argo::iridium::xfloat::XFloatPostProcessingService::operator()(), and argo::iridium::xfloat::XFloatTelemetryDecoderService::operator()().

Here is the caller graph for this function:



10.28.3.4 ExecuteQuery()

```
static shared_ptr< ResultSet > util::mysql::MysqlUtils::ExecuteQuery (
            Connection * con,
            const string & query)  [inline], [static], [inherited]
```

Execute an SQL query and return a shared pointer to the ResultSet object.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*query*	The SQL query to execute. This must be a well-formatted SQL query string.

Exceptions

log::MessageException	if 'con' is null, 'query' is a malfored SQL string, or any other error occurs.

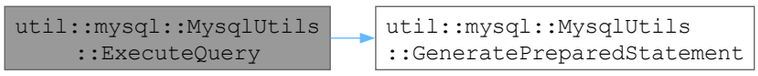
Returns

A shared pointer to the query ResultSet object.

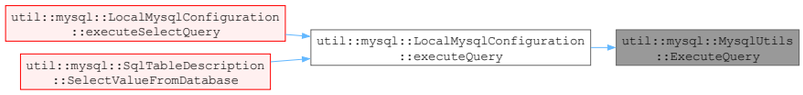
References CATCH_BLOCK, and util::mysql::MysqlUtils::GeneratePreparedStatement().

Referenced by executeQuery().

Here is the call graph for this function:



Here is the caller graph for this function:



10.28.3.5 executeQuery()

```
shared_ptr< sql::ResultSet > util::mysql::LocalMysqlConfiguration::executeQuery (
            const string & query)  [static]
```

Execute an SQL query and return a shared pointer to the ResultSet object.

Parameters

in	*query*	The SQL query to execute. This must be a well-formatted SQL query string.

Exceptions

log::MessageException	'query' is a malfored SQL string or any other error occurs while executing the query.

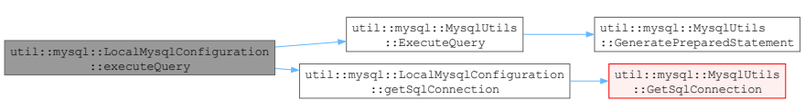
Returns

A shared pointer to the query ResultSet object.

References util::mysql::MysqlUtils::ExecuteQuery(), and getSqlConnection().

Referenced by executeSelectQuery(), and util::mysql::SqlTableDescription< T >::SelectValueFromDatabase().

Here is the call graph for this function:



Here is the caller graph for this function:

10.28.3.6 executeSelectQuery()

```
shared_ptr< sql::ResultSet > util::mysql::LocalMysqlConfiguration::executeSelectQuery (
            const string & what,
            const string & from,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [static]
```

Execute an SQL select query and return a shared pointer to the ResultSet object.

Parameters

in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table–references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Exceptions

log::MessageException	if an error occurs while executing the query.

Returns

A shared pointer to the ResultSet object.

References CATCH_BLOCK, executeQuery(), and util::mysql::MysqlUtils::GenerateSqlSelectStr().

Referenced by util::mysql::SqlTableDescription< T >::SelectObjectsFromDatabase().

Here is the call graph for this function:

Here is the caller graph for this function:

10.28.3.7 ExecuteUpdate()

```
static int util::mysql::MysqlUtils::ExecuteUpdate (
            Connection * con,
            const string & update)  [inline], [static], [inherited]
```

Execute an SQL update and return the status code.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*update*	The SQL update to execute. This must be a well-formatted SQL update string.

Exceptions

log::MessageException	if 'con' is null, 'update' is a malformed SQL string, or any other error occurs.

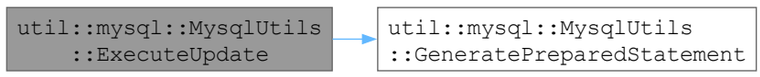
Returns

The update status code.

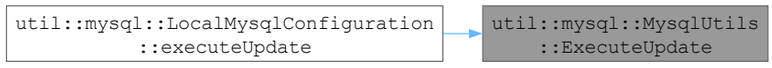
References CATCH_BLOCK, and util::mysql::MysqlUtils::GeneratePreparedStatement().

Referenced by executeUpdate().

Here is the call graph for this function:



Here is the caller graph for this function:



10.28.3.8 executeUpdate()

```
int util::mysql::LocalMysqlConfiguration::executeUpdate (
            const string & update)  [static]
```

Execute an SQL update and return the status code.

Parameters

in	*update*	The SQL update to execute. This must be a well-formatted SQL update string.

Exceptions

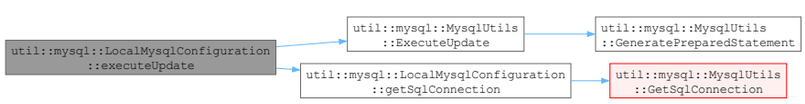
log::MessageException	if 'update' is a malformed SQL string, or any other error occurs while executing the update.

Returns

The update status code.

References util::mysql::MysqlUtils::ExecuteUpdate(), and getSqlConnection().

Here is the call graph for this function:



10.28.3.9 GeneratePreparedStatement()

```
static shared_ptr< PreparedStatement > util::mysql::MysqlUtils::GeneratePreparedStatement (
            Connection * con,
            const string & statement)  [inline], [static], [inherited]
```

Generate a prepared SQL statement object for the given SQL statement.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*statement*	The SQL statement to prepare. This must be a well-formed SQL string.

Exceptions

log::MessageException	if 'con' is NULL, 'statement' is not a valid SQL string, or if an error occurs.

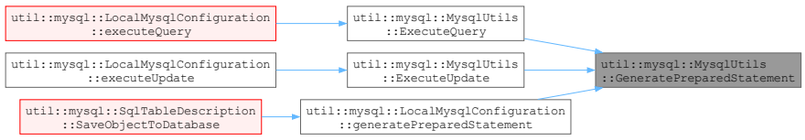
Returns

A prepared SQL statement object generated from the given SQL statement.

References CATCH_BLOCK, and EXC_THROW.

Referenced by util::mysql::MysqlUtils::ExecuteQuery(), util::mysql::MysqlUtils::ExecuteUpdate(), and generatePreparedStatement().

Here is the caller graph for this function:



10.28.3.10 generatePreparedStatement()

```
std::shared_ptr< sql::PreparedStatement > util::mysql::LocalMysqlConfiguration::generatePrepared↩
Statement (
            const string & statement)  [static]
```

Generate a prepared SQL statement object for the given SQL statement.

Parameters

in	*statement*	The SQL statement to prepare. This must be a well-formed SQL string.

Exceptions

log::MessageException	if 'statement' is not a valid SQL string or if an error occurs while generating the prepared statement object..

Returns

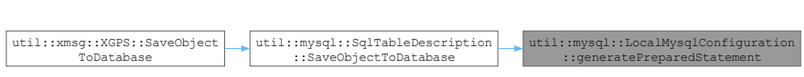
A prepared SQL statement object generated from the given SQL statement.

References util::mysql::MysqlUtils::GeneratePreparedStatement(), and getSqlConnection().

Referenced by util::mysql::SqlTableDescription< T >::SaveObjectToDatabase().

Here is the call graph for this function:

Here is the caller graph for this function:



10.28.3.11 GenerateSqlDeleteStr()

```
static string util::mysql::MysqlUtils::GenerateSqlDeleteStr (
            const string & from,
            const string & where = "")  [inline], [static], [inherited]
```

Generate an SQL DELETE statement.

Warning

Without a `where` clause, the statement deletes every row in the table.

Parameters

in	*from*	The name of the table to delete from.
in	*where*	The SQL "where-condition" clause (empty = all rows).

Returns

The SQL statement.

10.28.3.12 GenerateSqlSelectStr()

```
static string util::mysql::MysqlUtils::GenerateSqlSelectStr (
            const string & what,
            const string & from,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [inline], [static], [inherited]
```

Generate an SQL select statement.

Parameters

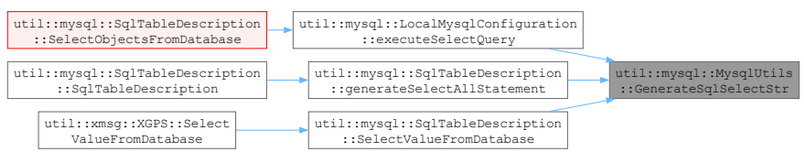
in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table-references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Returns

The SQL select statement.

Referenced by executeSelectQuery(), util::mysql::SqlTableDescription< T >::generateSelectAllStatement(), and util::mysql::SqlTableDescription< T >::SelectValueFromDatabase().

Here is the caller graph for this function:



10.28.3.13 GetSqlConnection()

```
static thread_specific_ptr< Connection > & util::mysql::MysqlUtils::GetSqlConnection (
            string url,
            string user,
            string password,
            string schema)  [inline], [static], [inherited]
```

Get a thread-specific instance of a MySQL connection object.

A new connection will be created, if necessary.

Parameters

in	*url*	The MySQL host server qualified address.
in	*user*	The MySQL account username.
in	*password*	The MySQL account password.
in	*schema*	The MySQL account schema name.

Exceptions

log::MessageException	if an error occurs while creating a new thread-specific instance of the SQL connection object

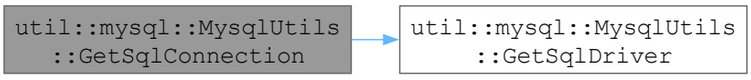
Returns

A thread-specific instance of a MySQL connection object.

References CATCH_BLOCK, util::mysql::MysqlUtils::GetSqlDriver(), and util::mysql::MysqlUtils::sql_connection_.

Referenced by getSqlConnection().

Here is the call graph for this function:



Here is the caller graph for this function:

10.28.3.14 getSqlConnection()

```
sql::Connection * util::mysql::LocalMysqlConfiguration::getSqlConnection ()  [static], [protected]
```

Generate a thread-specific instance of a MySQL connection object.

A new connection will be created, if necessary.

Exceptions

log::MessageException	if an error occurs while generating the SQL connection object.

Returns

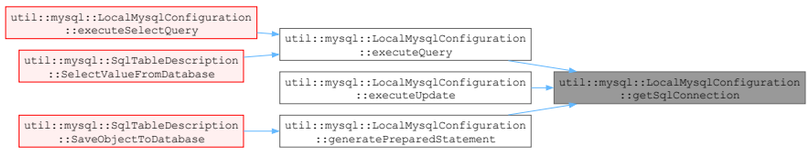
A thread-specific instance of a MySQL connection object.

References address_, CATCH_BLOCK, util::mysql::MysqlUtils::GetSqlConnection(), password_, port_, protocol_, schema_, and user_.

Referenced by executeQuery(), executeUpdate(), and generatePreparedStatement().

Here is the call graph for this function:

Here is the caller graph for this function:



10.28.3.15 GetSqlDriver()

```
static thread_specific_ptr< MySQL_Driver > & util::mysql::MysqlUtils::GetSqlDriver ()  [inline], [static], [inherited]
```

Get a thread-specific instance of a MySQL driver object.

A new driver will created, if necessary.

Exceptions

log::MessageException	if an error occurs while creating a new thread-specific instance of the SQL driver object

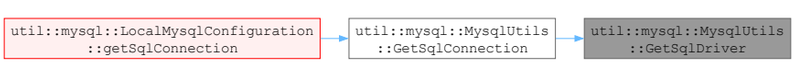
Returns

A thread-specific instance of a MySQL driver object.

References CATCH_BLOCK, and util::mysql::MysqlUtils::sql_driver_.

Referenced by util::mysql::MysqlUtils::GetSqlConnection().

Here is the caller graph for this function:



10.28.4 Member Data Documentation

10.28.4.1 address_

```
std::string util::mysql::LocalMysqlConfiguration::address_  [static], [private]
```

The SQL server qualified name or IP address string.

Referenced by getSqlConnection().

10.28.4.2 password_

`std::string util::mysql::LocalMysqlConfiguration::password_ [static], [private]`

The SQL server account password string.

Referenced by getSqlConnection().

10.28.4.3 port_

`unsigned int util::mysql::LocalMysqlConfiguration::port_ [static], [private]`

The SQL server port number.

Referenced by getSqlConnection().

10.28.4.4 protocol_

`std::string util::mysql::LocalMysqlConfiguration::protocol_ [static], [private]`

The protocol to use in the SQL server connection e.g.

"tcp".

Referenced by getSqlConnection().

10.28.4.5 schema_

`std::string util::mysql::LocalMysqlConfiguration::schema_ [static], [private]`

The SQL server schema name.

Referenced by getSqlConnection().

10.28.4.6 sql_connection_

`thread_specific_ptr<Connection> util::mysql::MysqlUtils::sql_connection_ [static], [private], [inherited]`

Tthe thread-specific pointer to MySQL connection object.

Thread-specific MySQL connection, released by `MysqlUtils::CleanupSqlConnection()` when the thread exits.

Referenced by util::mysql::MysqlUtils::CloseSqlConnection(), and util::mysql::MysqlUtils::GetSqlConnection().

10.28.4.7 sql_driver_

`thread_specific_ptr<MySQL_Driver> util::mysql::MysqlUtils::sql_driver_ [static], [private], [inherited]`

The thread-specific pointer to MySQL driver object.

Thread-specific reference to the MySQL driver.

Its cleanup function, `MysqlUtils::CleanupSqlDriver()`, does not delete the shared driver instance.

Referenced by util::mysql::MysqlUtils::GetSqlDriver().

10.28.4.8 user_

```
std::string util::mysql::LocalMysqlConfiguration::user_  [static], [private]
```

The SQL server account username string.

Referenced by getSqlConnection().

The documentation for this class was generated from the following files:

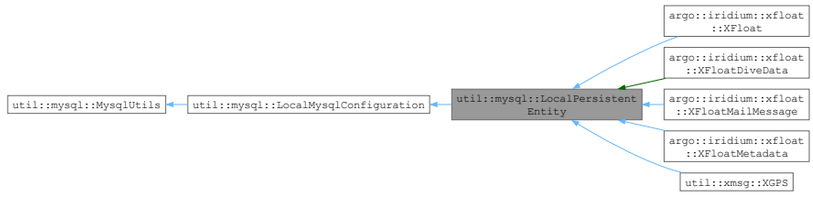
- config/LocalMysqlConfiguration.h
- config/LocalMysqlConfiguration.cpp

10.29 util::mysql::LocalPersistentEntity Class Reference

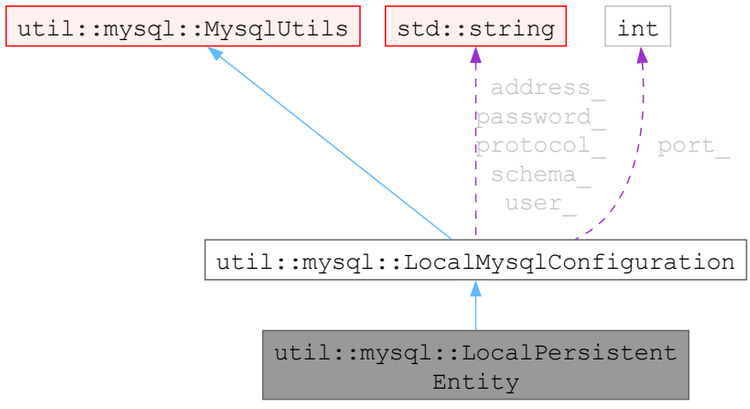
An abstract class representing a persistent database entity in the database defined by the config::LocalConfiguration.

```
#include <LocalPersistentEntity.h>
```

Inheritance diagram for util::mysql::LocalPersistentEntity:



Collaboration diagram for util::mysql::LocalPersistentEntity:



Public Member Functions

- LocalPersistentEntity ()

  Default constructor.
- virtual ~LocalPersistentEntity ()

  The destructor.
- virtual void SaveObjectToDatabase () const =0

  Persist this database entity.

Static Public Member Functions

- static void CloseSqlConnection ()

  Close the thread-specific MySQL connection if it is currently open.
- static shared_ptr< sql::ResultSet > **executeDeleteQuery** (const string &from, const string &where="")
- static shared_ptr< ResultSet > ExecuteQuery (Connection *con, const string &query)

  Execute an SQL query and return a shared pointer to the ResultSet object.
- static shared_ptr< sql::ResultSet > executeQuery (const string &query)

  Execute an SQL query and return a shared pointer to the ResultSet object.
- static shared_ptr< sql::ResultSet > executeSelectQuery (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)

  Execute an SQL select query and return a shared pointer to the ResultSet object.
- static int ExecuteUpdate (Connection *con, const string &update)

  Execute an SQL update and return the status code.
- static int executeUpdate (const string &update)

  Execute an SQL update and return the status code.
- static shared_ptr< PreparedStatement > GeneratePreparedStatement (Connection *con, const string &statement)

  Generate a prepared SQL statement object for the given SQL statement.
- static shared_ptr< sql::PreparedStatement > generatePreparedStatement (const string &statement)

  Generate a prepared SQL statement object for the given SQL statement.
- static string GenerateSqlDeleteStr (const string &from, const string &where="")

  Generate an SQL DELETE statement.
- static string GenerateSqlSelectStr (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)

  Generate an SQL select statement.
- static thread_specific_ptr< Connection > & GetSqlConnection (string url, string user, string password, string schema)

  Get a thread-specific instance of a MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > & GetSqlDriver ()

  Get a thread-specific instance of a MySQL driver object.

Static Protected Member Functions

- static sql::Connection * getSqlConnection ()

  Generate a thread-specific instance of a MySQL connection object.

Static Private Member Functions

- static void CleanupSqlConnection (Connection *con)

  Cleanup an SQL connection.
- static void CleanupSqlDriver (MySQL_Driver *driver)

  Function for memory cleanup of MySQL driver on destruct.

Static Private Attributes

- static string address_

  The SQL server qualified name or IP address string.
- static string password_

  The SQL server account password string.
- static unsigned int port_

  The SQL server port number.
- static string protocol_

  The protocol to use in the SQL server connection e.g.
- static string schema_

  The SQL server schema name.
- static thread_specific_ptr< Connection > sql_connection_

  Tthe thread-specific pointer to MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > sql_driver_

  The thread-specific pointer to MySQL driver object.
- static string user_

  The SQL server account username string.

10.29.1 Detailed Description

An abstract class representing a persistent database entity in the database defined by the config::LocalConfiguration.

10.29.2 Constructor & Destructor Documentation

10.29.2.1 LocalPersistentEntity()

```
util::mysql::LocalPersistentEntity::LocalPersistentEntity ()  [inline]
```

Default constructor.

10.29.2.2 ~LocalPersistentEntity()

```
virtual util::mysql::LocalPersistentEntity::~LocalPersistentEntity ()  [inline], [virtual]
```

The destructor.

10.29.3 Member Function Documentation

10.29.3.1 CleanupSqlConnection()

```
static void util::mysql::MysqlUtils::CleanupSqlConnection (
            Connection * con)  [inline], [static], [private], [inherited]
```

Cleanup an SQL connection.

This function for memory cleanup of the SQL connection on destruction. The thread-specific SQL connection object will be deleted if it exists.

Parameters

in	*con*	The SQL connection to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL connection object.

References CATCH_BLOCK.

10.29.3.2 CleanupSqlDriver()

```
static void util::mysql::MysqlUtils::CleanupSqlDriver (
            MySQL_Driver * driver)  [inline], [static], [private], [inherited]
```

Function for memory cleanup of MySQL driver on destruct.

Signals the SQL driver to end operation, if it exists.

Parameters

in	*driver*	Driver to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL driver object.

References CATCH_BLOCK.

10.29.3.3 CloseSqlConnection()

```
static void util::mysql::MysqlUtils::CloseSqlConnection ()  [inline], [static], [inherited]
```

Close the thread-specific MySQL connection if it is currently open.

If the thread local MySQL connection is not currently open, then this function will have no effect.

Note

The MySQL connection should be closed when idle to prevent the connection from timing out and throwing exceptions.

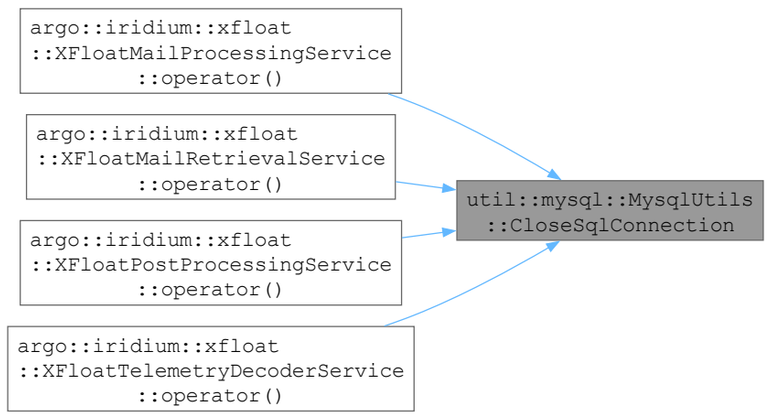
Exceptions

log::MessageException	if an error occurs while attempting to close the MySQL connection.

References CATCH_BLOCK, and util::mysql::MysqlUtils::sql_connection_.

Referenced by argo::iridium::xfloat::XFloatMailProcessingService::operator()(), argo::iridium::xfloat::XFloatMailRetrievalService::operator(
argo::iridium::xfloat::XFloatPostProcessingService::operator()(), and argo::iridium::xfloat::XFloatTelemetryDecoderService::operator()().

Here is the caller graph for this function:



10.29.3.4 ExecuteQuery()

```
static shared_ptr< ResultSet > util::mysql::MysqlUtils::ExecuteQuery (
            Connection * con,
            const string & query)  [inline], [static], [inherited]
```

Execute an SQL query and return a shared pointer to the ResultSet object.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*query*	The SQL query to execute. This must be a well-formatted SQL query string.

Exceptions

log::MessageException	if 'con' is null, 'query' is a malfored SQL string, or any other error occurs.

Returns

A shared pointer to the query ResultSet object.

References CATCH_BLOCK, and util::mysql::MysqlUtils::GeneratePreparedStatement().

Referenced by util::mysql::LocalMysqlConfiguration::executeQuery().

Here is the call graph for this function:

Here is the caller graph for this function:

10.29.3.5 executeQuery()

```
shared_ptr< sql::ResultSet > util::mysql::LocalMysqlConfiguration::executeQuery (
            const string & query)  [static], [inherited]
```

Execute an SQL query and return a shared pointer to the ResultSet object.

Parameters

in	*query*	The SQL query to execute. This must be a well-formatted SQL query string.

Exceptions

log::MessageException	'query' is a malfored SQL string or any other error occurs while executing the query.

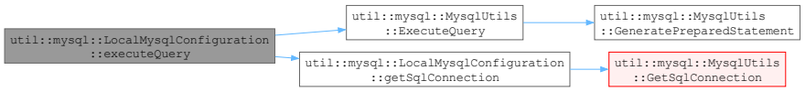
Returns

A shared pointer to the query ResultSet object.

References util::mysql::MysqlUtils::ExecuteQuery(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

Referenced by util::mysql::LocalMysqlConfiguration::executeSelectQuery(), and util::mysql::SqlTableDescription< T >::SelectValueFromD

Here is the call graph for this function:



Here is the caller graph for this function:

10.29.3.6 executeSelectQuery()

```
shared_ptr< sql::ResultSet > util::mysql::LocalMysqlConfiguration::executeSelectQuery (
            const string & what,
            const string & from,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [static], [inherited]
```

Execute an SQL select query and return a shared pointer to the ResultSet object.

Parameters

in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table–references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Exceptions

log::MessageException	if an error occurs while executing the query.

Returns

A shared pointer to the ResultSet object.

References CATCH_BLOCK, util::mysql::LocalMysqlConfiguration::executeQuery(), and util::mysql::MysqlUtils::GenerateSqlSelectStr().

Referenced by util::mysql::SqlTableDescription< T >::SelectObjectsFromDatabase().

Here is the call graph for this function:

Here is the caller graph for this function:

10.29.3.7 ExecuteUpdate()

```
static int util::mysql::MysqlUtils::ExecuteUpdate (
            Connection * con,
            const string & update)  [inline], [static], [inherited]
```

Execute an SQL update and return the status code.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*update*	The SQL update to execute. This must be a well-formatted SQL update string.

Exceptions

log::MessageException	if 'con' is null, 'update' is a malformed SQL string, or any other error occurs.

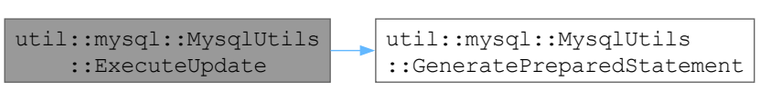
Returns

The update status code.

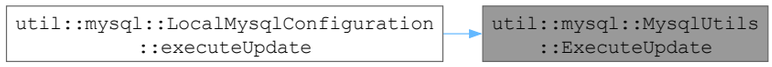
References CATCH_BLOCK, and util::mysql::MysqlUtils::GeneratePreparedStatement().

Referenced by util::mysql::LocalMysqlConfiguration::executeUpdate().

Here is the call graph for this function:



Here is the caller graph for this function:



10.29.3.8 executeUpdate()

```
int util::mysql::LocalMysqlConfiguration::executeUpdate (
            const string & update)  [static], [inherited]
```

Execute an SQL update and return the status code.

Parameters

in	*update*	The SQL update to execute. This must be a well-formatted SQL update string.

Exceptions

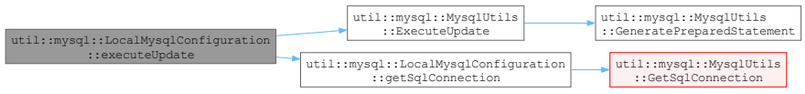
log::MessageException	if 'update' is a malformed SQL string, or any other error occurs while executing the update.

Returns

The update status code.

References util::mysql::MysqlUtils::ExecuteUpdate(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

Here is the call graph for this function:



10.29.3.9 GeneratePreparedStatement()

```
static shared_ptr< PreparedStatement > util::mysql::MysqlUtils::GeneratePreparedStatement (
            Connection * con,
            const string & statement)  [inline], [static], [inherited]
```

Generate a prepared SQL statement object for the given SQL statement.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*statement*	The SQL statement to prepare. This must be a well-formed SQL string.

Exceptions

log::MessageException	if 'con' is NULL, 'statement' is not a valid SQL string, or if an error occurs.

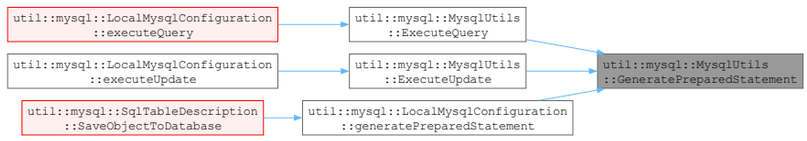
Returns

A prepared SQL statement object generated from the given SQL statement.

References CATCH_BLOCK, and EXC_THROW.

Referenced by util::mysql::MysqlUtils::ExecuteQuery(), util::mysql::MysqlUtils::ExecuteUpdate(), and util::mysql::LocalMysqlConfiguration:

Here is the caller graph for this function:



10.29.3.10 generatePreparedStatement()

```
std::shared_ptr< sql::PreparedStatement > util::mysql::LocalMysqlConfiguration::generatePrepared↩
Statement (
            const string & statement)  [static], [inherited]
```

Generate a prepared SQL statement object for the given SQL statement.

Parameters

in	*statement*	The SQL statement to prepare. This must be a well-formed SQL string.

Exceptions

log::MessageException	if 'statement' is not a valid SQL string or if an error occurs while generating the prepared statement object..

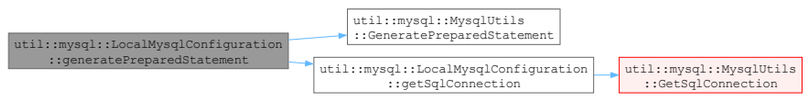
Returns

A prepared SQL statement object generated from the given SQL statement.

References util::mysql::MysqlUtils::GeneratePreparedStatement(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

Referenced by util::mysql::SqlTableDescription< T >::SaveObjectToDatabase().

Here is the call graph for this function:



Here is the caller graph for this function:

10.29.3.11 GenerateSqlDeleteStr()

```
static string util::mysql::MysqlUtils::GenerateSqlDeleteStr (
            const string & from,
            const string & where = "")  [inline], [static], [inherited]
```

Generate an SQL DELETE statement.

Warning

Without a `where` clause, the statement deletes every row in the table.

Parameters

in	*from*	The name of the table to delete from.
in	*where*	The SQL "where-condition" clause (empty = all rows).

Returns

The SQL statement.

10.29.3.12 GenerateSqlSelectStr()

```
static string util::mysql::MysqlUtils::GenerateSqlSelectStr (
            const string & what,
            const string & from,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [inline], [static], [inherited]
```

Generate an SQL select statement.

Parameters

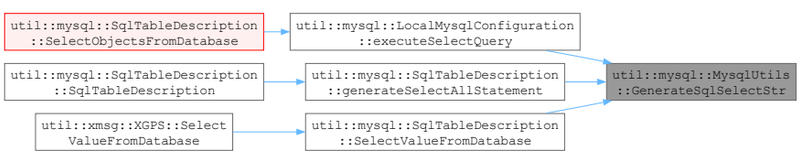
in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table-references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Returns

The SQL select statement.

Referenced by util::mysql::LocalMysqlConfiguration::executeSelectQuery(), util::mysql::SqlTableDescription< T >::generateSelectAllState
and util::mysql::SqlTableDescription< T >::SelectValueFromDatabase().

Here is the caller graph for this function:



10.29.3.13 GetSqlConnection()

```
static thread_specific_ptr< Connection > & util::mysql::MysqlUtils::GetSqlConnection (
            string url,
            string user,
            string password,
            string schema)  [inline], [static], [inherited]
```

Get a thread-specific instance of a MySQL connection object.

A new connection will be created, if necessary.

Parameters

in	*url*	The MySQL host server qualified address.
in	*user*	The MySQL account username.
in	*password*	The MySQL account password.
in	*schema*	The MySQL account schema name.

Exceptions

log::MessageException	if an error occurs while creating a new thread-specific instance of the SQL connection object

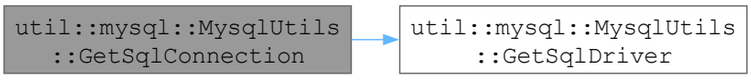
Returns

A thread-specific instance of a MySQL connection object.

References CATCH_BLOCK, util::mysql::MysqlUtils::GetSqlDriver(), and util::mysql::MysqlUtils::sql_connection_.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

Here is the call graph for this function:



Here is the caller graph for this function:

10.29.3.14 getSqlConnection()

`sql::Connection * util::mysql::LocalMysqlConfiguration::getSqlConnection () [static], [protected], [inherited]`

Generate a thread-specific instance of a MySQL connection object.

A new connection will be created, if necessary.

Exceptions

log::MessageException	if an error occurs while generating the SQL connection object.

Returns

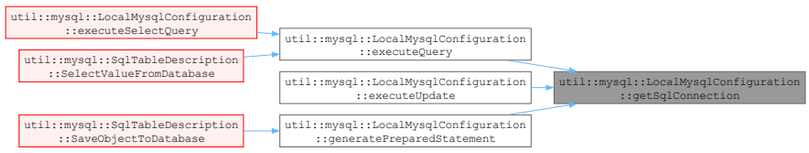
A thread-specific instance of a MySQL connection object.

References util::mysql::LocalMysqlConfiguration::address_, CATCH_BLOCK, util::mysql::MysqlUtils::GetSqlConnection(), util::mysql::LocalMysqlConfiguration::password_, util::mysql::LocalMysqlConfiguration::port_, util::mysql::LocalMysqlConfiguration::protoc util::mysql::LocalMysqlConfiguration::schema_, and util::mysql::LocalMysqlConfiguration::user_.

Referenced by util::mysql::LocalMysqlConfiguration::executeQuery(), util::mysql::LocalMysqlConfiguration::executeUpdate(), and util::mysql::LocalMysqlConfiguration::generatePreparedStatement().

Here is the call graph for this function:

Here is the caller graph for this function:



10.29.3.15 GetSqlDriver()

```
static thread_specific_ptr< MySQL_Driver > & util::mysql::MysqlUtils::GetSqlDriver ()  [inline], [static], [inherited]
```

Get a thread-specific instance of a MySQL driver object.

A new driver will created, if necessary.

Exceptions

log::MessageException	if an error occurs while creating a new thread-specific instance of the SQL driver object

Returns

A thread-specific instance of a MySQL driver object.

References CATCH_BLOCK, and util::mysql::MysqlUtils::sql_driver_.

Referenced by util::mysql::MysqlUtils::GetSqlConnection().

Here is the caller graph for this function:

10.29.3.16 SaveObjectToDatabase()

```
virtual void util::mysql::LocalPersistentEntity::SaveObjectToDatabase () const  [pure virtual]
```

Persist this database entity.

Implemented in argo::iridium::xfloat::XFloat, argo::iridium::xfloat::XFloatDiveData, argo::iridium::xfloat::XFloatMailMessage, argo::iridium::xfloat::XFloatMetadata, and util::xmsg::XGPS.

10.29.4 Member Data Documentation

10.29.4.1 address_

```
std::string util::mysql::LocalMysqlConfiguration::address_  [static], [private], [inherited]
```

The SQL server qualified name or IP address string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.29.4.2 password_

```
std::string util::mysql::LocalMysqlConfiguration::password_  [static], [private], [inherited]
```

The SQL server account password string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.29.4.3 port_

```
unsigned int util::mysql::LocalMysqlConfiguration::port_  [static], [private], [inherited]
```

The SQL server port number.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.29.4.4 protocol_

```
std::string util::mysql::LocalMysqlConfiguration::protocol_  [static], [private], [inherited]
```

The protocol to use in the SQL server connection e.g.

"tcp".

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.29.4.5 schema_

```
std::string util::mysql::LocalMysqlConfiguration::schema_  [static], [private], [inherited]
```

The SQL server schema name.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.29.4.6 sql_connection_

```
thread_specific_ptr<Connection> util::mysql::MysqlUtils::sql_connection_  [static], [private],
[inherited]
```

Tthe thread-specific pointer to MySQL connection object.

Thread-specific MySQL connection, released by `MysqlUtils::CleanupSqlConnection()` when the thread exits.

Referenced by util::mysql::MysqlUtils::CloseSqlConnection(), and util::mysql::MysqlUtils::GetSqlConnection().

10.29.4.7 sql_driver_

thread_specific_ptr<MySQL_Driver> util::mysql::MysqlUtils::sql_driver_ [static], [private], [inherited]

The thread-specific pointer to MySQL driver object.

Thread-specific reference to the MySQL driver.

Its cleanup function, MysqlUtils::CleanupSqlDriver(), does not delete the shared driver instance.

Referenced by util::mysql::MysqlUtils::GetSqlDriver().

10.29.4.8 user_

std::string util::mysql::LocalMysqlConfiguration::user_ [static], [private], [inherited]

The SQL server account username string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

The documentation for this class was generated from the following file:

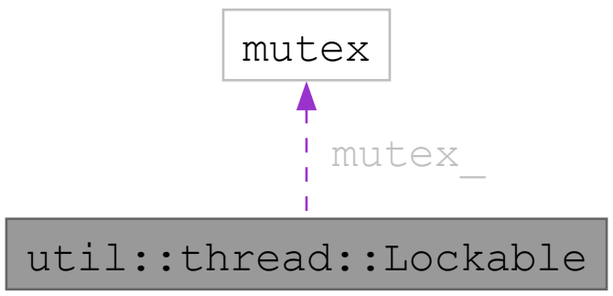
- config/LocalPersistentEntity.h

10.30 util::thread::Lockable Class Reference

A lockable class.

#include <Lockable.h>

Collaboration diagram for util::thread::Lockable:



Public Member Functions

- Lockable ()
  The constructor.
- virtual ~Lockable ()
  The destructor.
- bool LockObject (bool block)
  Lock the object.
- void UnlockObject ()
  Unlock the object.

Protected Attributes

- mutex mutex_

  Mutual exclusion lock for synchronizing operations.

10.30.1 Detailed Description

A lockable class.

Note

The mutex used for locking the object is not recursive, which means that it may be lock at most one time, even by the same thread.

10.30.2 Constructor & Destructor Documentation

10.30.2.1 Lockable()

```
util::thread::Lockable::Lockable ()  [inline]
```

The constructor.

10.30.2.2 ~Lockable()

```
virtual util::thread::Lockable::~Lockable ()  [virtual]
```

The destructor.

10.30.3 Member Function Documentation

10.30.3.1 LockObject()

```
bool util::thread::Lockable::LockObject (
            bool block)  [inline]
```

Lock the object.

Parameters

in	*block*	If TRUE, then the calling thread will block until the lock becomes available. The default value is TRUE.

Exceptions

util::log::MessageException	if an error occurs.

Returns

TRUE if the lock was successfully obtained, or FALSE if block is FALSE and the mutex is already locked.

References CATCH_BLOCK, and mutex_.

10.30.3.2 UnlockObject()

```
void util::thread::Lockable::UnlockObject ()  [inline]
```

Unlock the object.

Exceptions

util::log::MessageException	if an error occurs.

References CATCH_BLOCK, and mutex_.

10.30.4 Member Data Documentation

10.30.4.1 mutex_

```
mutex util::thread::Lockable::mutex_  [mutable], [protected]
```

Mutual exclusion lock for synchronizing operations.

Referenced by LockObject(), and UnlockObject().

The documentation for this class was generated from the following file:

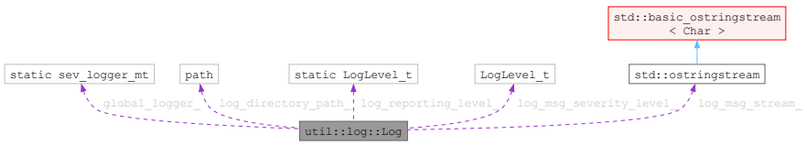
- utility/Lockable.h

10.31 util::log::Log Class Reference

The logger class.

```
#include <Log.h>
```

Collaboration diagram for util::log::Log:



Public Member Functions

- Log (LogLevel_t level) ATTR_NO_EXCEPTIONS
  The default constructor.
- ~Log ()
  The destructor.
- template<typename T = sev_logger_mt>
  ostream & Flush (LogLevel_t lev, T &log=global_logger_) ATTR_NO_EXCEPTIONS
  Flush the log's message buffer buffer.
- template<typename T = sev_logger_mt>
  ostream & Flush (T &log=global_logger_) ATTR_NO_EXCEPTIONS
  Flush the log's message buffer buffer.
- template<typename T >
  ostream & operator<< (const T &x) ATTR_NO_EXCEPTIONS
  The template input stream operator overload function.

Static Public Member Functions

- static void FlushGlobalLogger () ATTR_NO_EXCEPTIONS
  Flush the global logger object.
- static void InitializeLog () ATTR_NO_EXCEPTIONS
  Initialize the global logger.
- static LogLevel_t log_reporting_level ()
  Get the global logger message severity reporting level.

Static Private Member Functions

- static void set_log_reporting_level (LogLevel_t level)
  Set the reporting level of the global logger.

Private Attributes

- LogLevel_t log_msg_severity_level_
  The severity level of this log message.
- ostringstream log_msg_stream_
  The log message output stream.

Static Private Attributes

- static sev_logger_mt global_logger_
  The global severity logger object.
- static path log_directory_path_
  The log directory path.
- static LogLevel_t log_reporting_level_ = DEFAULT_LOG_LEVEL
  The global reporting level.

Friends

- class **config::LocalConfiguration**

10.31.1 Detailed Description

The logger class.

This class is a wrapper for the boost thread-safe severity logger object. It provides facilities for formatted console and file logging and supports filtering by message severity and other attributes.

10.31.2 Constructor & Destructor Documentation

10.31.2.1 Log()

```
util::log::Log::Log (
            LogLevel_t level)  [inline]
```

The default constructor.

Parameters

in	*level*	The message severity level.

10.31.2.2 ~Log()

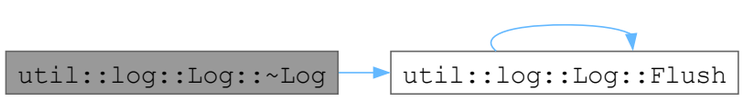
```
util::log::Log::~Log ()  [inline]
```

The destructor.

Flushes the global severity logger's output stream.

References Flush(), and log_msg_severity_level_.

Here is the call graph for this function:



10.31.3 Member Function Documentation

10.31.3.1 Flush() [1/2]

```
template<typename T = sev_logger_mt>
ostream & util::log::Log::Flush (
            LogLevel_t lev,
            T & log = global_logger_)  [inline]
```

Flush the log's message buffer buffer.

Exceptions

None.	Never throws.

Parameters

in	*lev*	The severity level at which to flush the log.
in	*log*	The logger.

Returns

A const reference to this log's output stream.

References exc_diag, util::log::LOG_DBG, util::log::LOG_DBG1, util::log::LOG_DBG2, util::log::LOG_DBG3, util::log::LOG_ERR, util::log::LOG_FAT, util::log::LOG_INF, util::log::LOG_LOG, log_msg_stream_, log_reporting_level_, and util::log::LOG_WRN.

10.31.3.2 Flush() [2/2]

```
template<typename T = sev_logger_mt>
ostream & util::log::Log::Flush (
            T & log = global_logger_)  [inline]
```

Flush the log's message buffer buffer.

Exceptions

None.	Never throws.

Parameters

in	*log*	The logger.

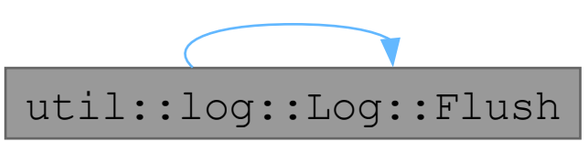
Returns

A const reference to this log's output stream.

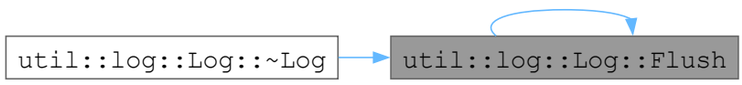
References Flush(), and log_msg_severity_level_.

Referenced by ~Log(), and Flush().

Here is the call graph for this function:



Here is the caller graph for this function:



10.31.3.3 FlushGlobalLogger()

```
static void util::log::Log::FlushGlobalLogger ()  [inline], [static]
```

Flush the global logger object.

Exceptions

None.	Never throws.

10.31.3.4 InitializeLog()

```
static void util::log::Log::InitializeLog ()  [inline], [static]
```

Initialize the global logger.

Adds common attributes to the global logger and defines the format of the log output.

Adds a log file at logPath/Y-m-d.%3N.log that is rotated at midnight (local time) or every time each log file exceeds 10MB.

Also adds a console log.

Adds a float-specific log file.

Exceptions

MessageException	if the directory specified by logPath does not exist, or an error occurs while initializing the global logger.

References CATCH_BLOCK, EXC_THROW, and log_directory_path_.

10.31.3.5 log_reporting_level()

```
static LogLevel_t util::log::Log::log_reporting_level ()  [inline], [static]
```

Get the global logger message severity reporting level.

Returns

The global logger message severity reporting level.

References log_reporting_level_.

10.31.3.6 operator<<()

```
template<typename T >
ostream & util::log::Log::operator<< (
            const T & x)  [inline]
```

The template input stream operator overload function.

Exceptions

None.	Never throws.

Parameters

in	*x*	A const reference to the object invoking the input stream operation. This may be any object that supports the input stream operation.

Returns

A const reference to this log's output stream.

References log_msg_stream_.

10.31.3.7 set_log_reporting_level()

```
static void util::log::Log::set_log_reporting_level (
            LogLevel_t level)  [inline], [static], [private]
```

Set the reporting level of the global logger.

Parameters

in	*level*	The reporting level of the global logger to set.

References log_reporting_level_.

10.31.4 Member Data Documentation

10.31.4.1 global_logger_

```
sev_logger_mt util::log::Log::global_logger_  [static], [private]
```

The global severity logger object.

This object is used as a global logger for all log messages generated by the application. It includes support for log message attributes that are used for filtering and formatting of the log messages. It automatically filters the destination (log files, standard output, etc.) of log messages, and handles daily rotation of log files.

10.31.4.2 log_directory_path_

```
path util::log::Log::log_directory_path_  [static], [private]
```

The log directory path.

Log files generated as an output of this application will be written to this directory as well as sub-directories of this directory.

This field is set as a result of parsing the configuration options during initialization. During initialization, the application checks to ensure that this directory exists, and throws an error if it does not. Thus, during the subsequent duration of execution of the application, this directory is assumed to exist on the local filesystem.

Referenced by InitializeLog().

10.31.4.3 log_msg_severity_level_

```
LogLevel_t util::log::Log::log_msg_severity_level_  [private]
```

The severity level of this log message.

Referenced by ~Log(), and Flush().

10.31.4.4 log_msg_stream_

```
ostringstream util::log::Log::log_msg_stream_  [private]
```

The log message output stream.

Referenced by Flush(), and operator<<().

10.31.4.5 log_reporting_level_

```
LogLevel_t util::log::Log::log_reporting_level_ = DEFAULT_LOG_LEVEL  [static], [private]
```

The global reporting level.

This field is used to filter the log messages by severity. Only log message with a severity that is less than or equal to this value will be reported by the global logger.

This field is set a result of parsing the configuration options during initialization of the application. If the log level is unspecified in the configuration options, then it will default to a value of DEFAULT_LOG_LEVEL.

Referenced by Flush(), log_reporting_level(), and set_log_reporting_level().

The documentation for this class was generated from the following files:

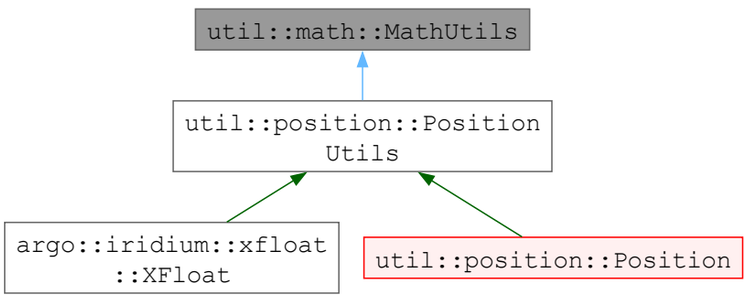
- utility/Log.h
- utility/Log.cpp

10.32 util::math::MathUtils Class Reference

Class containing commonly-used mathematical functions.

`#include <MathUtils.h>`

Inheritance diagram for util::math::MathUtils:



Static Public Member Functions

- static float **bitcastUint32ToFloat** (uint32_t u)
- template<typename T >
  static double degToRad (T deg)

  Convert angular units from from degrees to decimal radians.

10.32.1 Detailed Description

Class containing commonly-used mathematical functions.

10.32.2 Member Function Documentation

10.32.2.1 degToRad()

```
template<typename T >
static double util::math::MathUtils::degToRad (
            T deg)  [inline], [static]
```

Convert angular units from from degrees to decimal radians.

Parameters

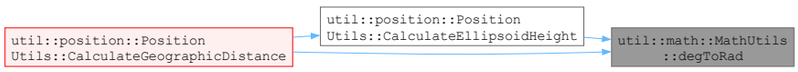
in	*deg*	Angle in integer or decimal degrees to convert to radians.

Returns

Angle in decimal radians.

Referenced by util::position::PositionUtils::CalculateEllipsoidHeight(), and util::position::PositionUtils::CalculateGeographicDistance().

Here is the caller graph for this function:



The documentation for this class was generated from the following file:

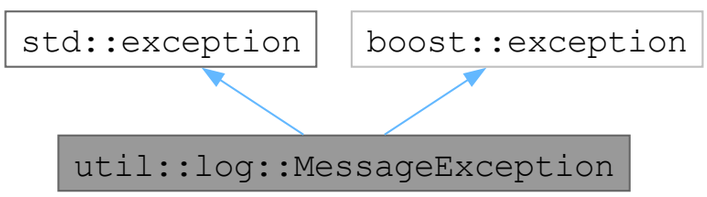
- utility/MathUtils.h

10.33 util::log::MessageException Class Reference

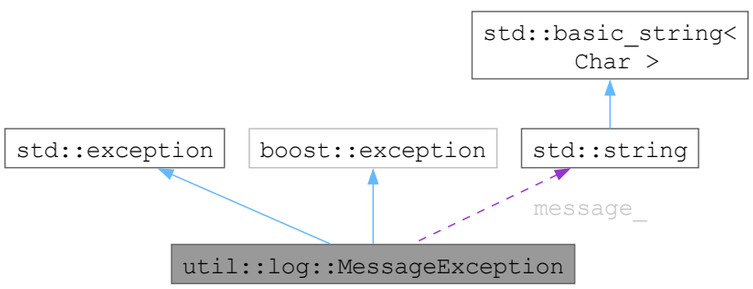
Exception class with associated message.

`#include <MessageException.h>`

Inheritance diagram for util::log::MessageException:



Collaboration diagram for util::log::MessageException:



Public Member Functions

- MessageException ()
  Default Constructor.
- MessageException (const ostringstream &message)
  Parameterized constructor.
- MessageException (const string &message)
  Parameterized constructor.
- virtual ~MessageException () ATTR_NO_EXCEPTIONS
  Destructor.
- virtual const char * what () const ATTR_NO_EXCEPTIONS
  Return C string representing message exception.

Private Attributes

- string message_
  The exception message.

10.33.1 Detailed Description

Exception class with associated message.

10.33.2 Constructor & Destructor Documentation

10.33.2.1 MessageException() [1/3]

```
util::log::MessageException::MessageException ()  [inline]
```

Default Constructor.

10.33.2.2 MessageException() [2/3]

```
util::log::MessageException::MessageException (
            const string & message)  [inline]
```

Parameterized constructor.

Parameters

in	*message*	Exception message string.

10.33.2.3 MessageException() [3/3]

```
util::log::MessageException::MessageException (
            const ostringstream & message)  [inline]
```

Parameterized constructor.

Parameters

in	*message*	Exception message string.

10.33.2.4 ~MessageException()

```
virtual util::log::MessageException::~MessageException ()  [inline], [virtual]
```

Destructor.

10.33.3 Member Function Documentation

10.33.3.1 what()

```
virtual const char * util::log::MessageException::what () const  [inline], [virtual]
```

Return C string representing message exception.

Returns

C string representing message exception.

References message_.

10.33.4 Member Data Documentation

10.33.4.1 message_

```
string util::log::MessageException::message_  [private]
```

The exception message.

Referenced by what().

The documentation for this class was generated from the following file:

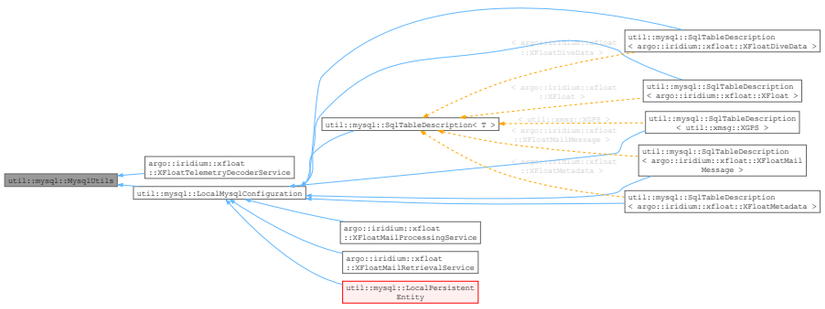
10.34 util::mysql::MysqlUtils Class Reference

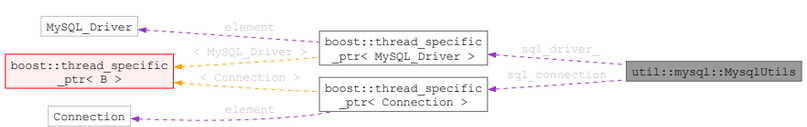
Class provides a library of function for accessing and manipulating a MySQL database.

```
#include <MysqlUtils.h>
```

Inheritance diagram for util::mysql::MysqlUtils:



Collaboration diagram for util::mysql::MysqlUtils:



Static Public Member Functions

- static void CloseSqlConnection ()

  Close the thread-specific MySQL connection if it is currently open.
- static shared_ptr< ResultSet > ExecuteQuery (Connection *con, const string &query)

  Execute an SQL query and return a shared pointer to the ResultSet object.
- static int ExecuteUpdate (Connection *con, const string &update)

  Execute an SQL update and return the status code.
- static shared_ptr< PreparedStatement > GeneratePreparedStatement (Connection *con, const string &statement)

  Generate a prepared SQL statement object for the given SQL statement.
- static string GenerateSqlDeleteStr (const string &from, const string &where="")

  Generate an SQL DELETE statement.
- static string GenerateSqlSelectStr (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)

  Generate an SQL select statement.
- static thread_specific_ptr< Connection > & GetSqlConnection (string url, string user, string password, string schema)

  Get a thread-specific instance of a MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > & GetSqlDriver ()

  Get a thread-specific instance of a MySQL driver object.

Static Private Member Functions

- static void CleanupSqlConnection (Connection *con)

  Cleanup an SQL connection.
- static void CleanupSqlDriver (MySQL_Driver *driver)

  Function for memory cleanup of MySQL driver on destruct.

Static Private Attributes

- static thread_specific_ptr< Connection > sql_connection_

  Tthe thread-specific pointer to MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > sql_driver_

  The thread-specific pointer to MySQL driver object.

10.34.1 Detailed Description

Class provides a library of function for accessing and manipulating a MySQL database.

10.34.2 Member Function Documentation

10.34.2.1 CleanupSqlConnection()

```
static void util::mysql::MysqlUtils::CleanupSqlConnection (
            Connection * con)  [inline], [static], [private]
```

Cleanup an SQL connection.

This function for memory cleanup of the SQL connection on destruction. The thread-specific SQL connection object will be deleted if it exists.

Parameters

in	*con*	The SQL connection to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL connection object.

References CATCH_BLOCK.

10.34.2.2 CleanupSqlDriver()

```
static void util::mysql::MysqlUtils::CleanupSqlDriver (
            MySQL_Driver * driver)  [inline], [static], [private]
```

Function for memory cleanup of MySQL driver on destruct.

Signals the SQL driver to end operation, if it exists.

Parameters

in	*driver*	Driver to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL driver object.

References CATCH_BLOCK.

10.34.2.3 CloseSqlConnection()

```
static void util::mysql::MysqlUtils::CloseSqlConnection ()  [inline], [static]
```

Close the thread-specific MySQL connection if it is currently open.

If the thread local MySQL connection is not currently open, then this function will have no effect.

Note

The MySQL connection should be closed when idle to prevent the connection from timing out and throwing exceptions.

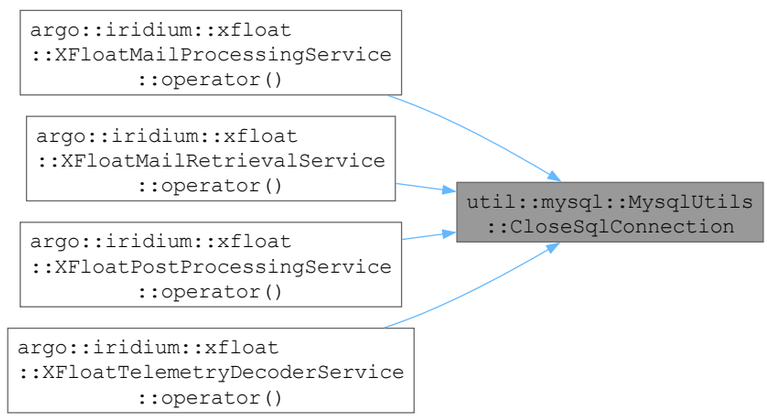
Exceptions

log::MessageException	if an error occurs while attempting to close the MySQL connection.

References CATCH_BLOCK, and sql_connection_.

Referenced by argo::iridium::xfloat::XFloatMailProcessingService::operator()(), argo::iridium::xfloat::XFloatMailRetrievalService::operator(
argo::iridium::xfloat::XFloatPostProcessingService::operator()(), and argo::iridium::xfloat::XFloatTelemetryDecoderService::operator()().

Here is the caller graph for this function:



10.34.2.4 ExecuteQuery()

```
static shared_ptr< ResultSet > util::mysql::MysqlUtils::ExecuteQuery (
            Connection * con,
            const string & query)  [inline], [static]
```

Execute an SQL query and return a shared pointer to the ResultSet object.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*query*	The SQL query to execute. This must be a well-formatted SQL query string.

Exceptions

log::MessageException	if 'con' is null, 'query' is a malfored SQL string, or any other error occurs.

Returns

A shared pointer to the query ResultSet object.

References CATCH_BLOCK, and GeneratePreparedStatement().

Referenced by util::mysql::LocalMysqlConfiguration::executeQuery().

Here is the call graph for this function:

Here is the caller graph for this function:

10.34.2.5 ExecuteUpdate()

```
static int util::mysql::MysqlUtils::ExecuteUpdate (
            Connection * con,
            const string & update)  [inline], [static]
```

Execute an SQL update and return the status code.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*update*	The SQL update to execute. This must be a well-formatted SQL update string.

Exceptions

log::MessageException	if 'con' is null, 'update' is a malformed SQL string, or any other error occurs.

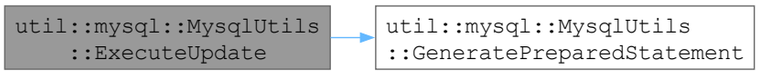
Returns

The update status code.

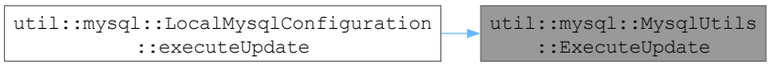
References CATCH_BLOCK, and GeneratePreparedStatement().

Referenced by util::mysql::LocalMysqlConfiguration::executeUpdate().

Here is the call graph for this function:



Here is the caller graph for this function:



10.34.2.6 GeneratePreparedStatement()

```
static shared_ptr< PreparedStatement > util::mysql::MysqlUtils::GeneratePreparedStatement (
            Connection * con,
            const string & statement)  [inline], [static]
```

Generate a prepared SQL statement object for the given SQL statement.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*statement*	The SQL statement to prepare. This must be a well-formed SQL string.

Exceptions

log::MessageException	if 'con' is NULL, 'statement' is not a valid SQL string, or if an error occurs.

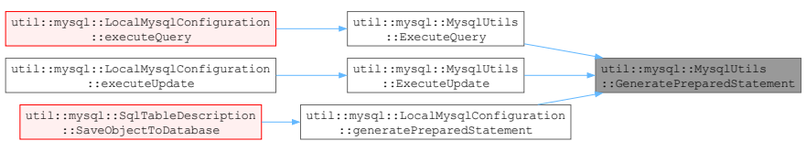
Returns

A prepared SQL statement object generated from the given SQL statement.

References CATCH_BLOCK, and EXC_THROW.

Referenced by ExecuteQuery(), ExecuteUpdate(), and util::mysql::LocalMysqlConfiguration::generatePreparedStatement().

Here is the caller graph for this function:



10.34.2.7 GenerateSqlDeleteStr()

```
static string util::mysql::MysqlUtils::GenerateSqlDeleteStr (
            const string & from,
            const string & where = "")  [inline], [static]
```

Generate an SQL DELETE statement.

Warning

Without a `where` clause, the statement deletes every row in the table.

Parameters

in	*from*	The name of the table to delete from.
in	*where*	The SQL "where-condition" clause (empty = all rows).

Returns

The SQL statement.

10.34.2.8 GenerateSqlSelectStr()

```
static string util::mysql::MysqlUtils::GenerateSqlSelectStr (
            const string & what,
            const string & from,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [inline], [static]
```

Generate an SQL select statement.

Parameters

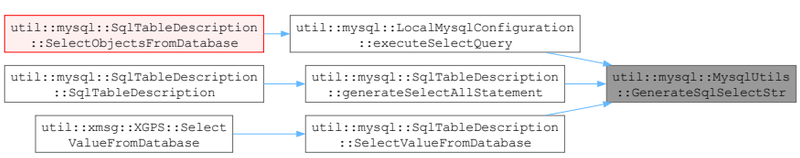
in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table-references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Returns

The SQL select statement.

Referenced by util::mysql::LocalMysqlConfiguration::executeSelectQuery(), util::mysql::SqlTableDescription< T >::generateSelectAllState
and util::mysql::SqlTableDescription< T >::SelectValueFromDatabase().

Here is the caller graph for this function:



10.34.2.9 GetSqlConnection()

```
static thread_specific_ptr< Connection > & util::mysql::MysqlUtils::GetSqlConnection (
            string url,
            string user,
            string password,
            string schema)  [inline], [static]
```

Get a thread-specific instance of a MySQL connection object.

A new connection will be created, if necessary.

Parameters

in	*url*	The MySQL host server qualified address.
in	*user*	The MySQL account username.
in	*password*	The MySQL account password.
in	*schema*	The MySQL account schema name.

Exceptions

log::MessageException	if an error occurs while creating a new thread-specific instance of the SQL connection object

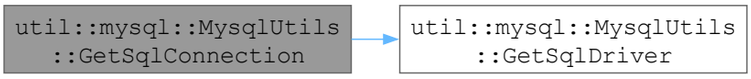
Returns

A thread-specific instance of a MySQL connection object.

References CATCH_BLOCK, GetSqlDriver(), and sql_connection_.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

Here is the call graph for this function:



Here is the caller graph for this function:

10.34.2.10 GetSqlDriver()

```
static thread_specific_ptr< MySQL_Driver > & util::mysql::MysqlUtils::GetSqlDriver ()  [inline],
[static]
```

Get a thread-specific instance of a MySQL driver object.

A new driver will created, if necessary.

Exceptions

log::MessageException	if an error occurs while creating a new thread-specific instance of the SQL driver object

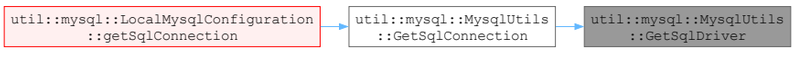
Returns

A thread-specific instance of a MySQL driver object.

References CATCH_BLOCK, and sql_driver_.

Referenced by GetSqlConnection().

Here is the caller graph for this function:



10.34.3 Member Data Documentation

10.34.3.1 sql_connection_

`thread_specific_ptr<Connection> util::mysql::MysqlUtils::sql_connection_ [static], [private]`

Tthe thread-specific pointer to MySQL connection object.

Thread-specific MySQL connection, released by `MysqlUtils::CleanupSqlConnection()` when the thread exits.

Referenced by CloseSqlConnection(), and GetSqlConnection().

10.34.3.2 sql_driver_

`thread_specific_ptr<MySQL_Driver> util::mysql::MysqlUtils::sql_driver_ [static], [private]`

The thread-specific pointer to MySQL driver object.

Thread-specific reference to the MySQL driver.

Its cleanup function, `MysqlUtils::CleanupSqlDriver()`, does not delete the shared driver instance.

Referenced by GetSqlDriver().

The documentation for this class was generated from the following files:

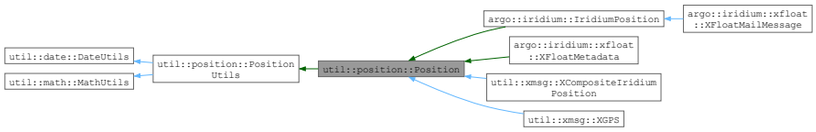
- utility/MysqlUtils.h
- utility/MysqlUtils.cpp

10.35 util::position::Position Class Reference

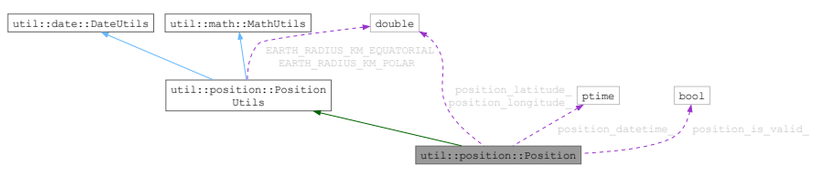
Abstract class representing a position, date, and time.

`#include <Position.h>`

Inheritance diagram for util::position::Position:



Collaboration diagram for util::position::Position:



Public Member Functions

- Position () ATTR_NO_EXCEPTIONS

  The default constructor.
- virtual ~Position ()

  The destructor.
- ptime position_datetime () const

  Get the date/time of the position.
- string position_datetime_as_iso8601_string () const

  Get a formatted string representing the position date/time composed using the ISO 8601 standard.
- bool position_is_valid () const

  Is the position valid?
- double position_latitude () const

  Get the latitude of the position, in decimal degrees.
- double position_longitude () const

  Get the longitude of the position, in decimal degrees.
- string postition_as_iso6709_string () const

  Get a formatted string representing the position composed using the ISO 6709 standard.

Protected Member Functions

- void set_gps_position_datetime (unsigned int gpsWeek, unsigned int gpsDay, unsigned int gpsHour=0, unsigned int gpsMinute=0, unsigned int gpsSecond=0)

  Set the date and time of this position from the given GPS week, day, and time.
- void set_position_datetime (const ptime &datetime)

  Set the date/time of the position.
- void set_position_is_valid (bool is_valid=true)

  Set the position is valid flag.
- void set_position_latitude (double lat)

  Set the latitude of the position, in decimal degrees.
- void set_position_longitude (double lon)

  Set the longitude of the position, in decimal degrees.

Static Protected Member Functions

- static float **bitcastUint32ToFloat** (uint32_t u)
- template<typename T >
  static double CalculateEllipsoidHeight (T lat)

  Get the approximate surface altitude or height of earth for a given latitude, in kilometers.
- template<typename T >
  static double CalculateGeographicDistance (T lat1, T lon1, T lat0, T lon0)

  Get the geographical distance between two position, in kilometers, from the positions' locations, in decimal degrees.
- template<typename T >
  static double degToRad (T deg)

  Convert angular units from from degrees to decimal radians.
- static string GenerateCurrentUtcTimeIso8601String ()

  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- template<typename T >
  static std::string GenerateIso6709String (T lat, T lon)

  Generate an IS06709 string representation of the position given by (`lat`, `lon`).
- static string GenerateIso8601String (const ptime &p, bool extended=true)

  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)

  Convert a date/time to fractional days since a reference date/time.
- static ptime GetCurrentUtcTime ()

  Generate a POSIX time object representing the current date and time (rounded to the nearest second).
- template<typename T >
  static bool IsPositionValid (T lat, T lon)

  Check position validity.

Private Attributes

- ptime position_datetime_

  The date and time of the position.
- bool position_is_valid_

  The valid position indicator.
- double position_latitude_

  The latitude of the position, in decimal degrees.
- double position_longitude_

  The longitude of the position, in decimal degrees.

Static Private Attributes

- static const double EARTH_RADIUS_KM_EQUATORIAL = 6378.1

  The equatorial radius of the earth, in kilometers.
- static const double EARTH_RADIUS_KM_POLAR = 6356.1

  The polar radius of the earth, in kilometers.

10.35.1 Detailed Description

Abstract class representing a position, date, and time.

10.35.2 Constructor & Destructor Documentation

10.35.2.1 Position()

```
util::position::Position::Position ()  [inline]
```

The default constructor.

Exceptions

None.	Never throws.

10.35.2.2 ~Position()

```
virtual util::position::Position::~Position ()  [inline], [virtual]
```

The destructor.

10.35.3 Member Function Documentation

10.35.3.1 CalculateEllipsoidHeight()

```
template<typename T >
static double util::position::PositionUtils::CalculateEllipsoidHeight (
            T lat)  [inline], [static], [inherited]
```

Get the approximate surface altitude or height of earth for a given latitude, in kilometers.

Warning

This method provides approximate surface height estimates only! This approximation is calculated from a reference ellipsoid – a mathematically-defined surface that approximates the geoid, the truer figure of the Earth.

Parameters

in	*lat*	The geographic latitude of interest, in decimal degrees.

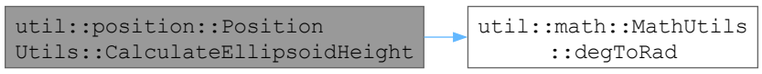
Returns

The approximate surface altitude or height of earth for the given latitude, in kilometers.

References util::math::MathUtils::degToRad(), util::position::PositionUtils::EARTH_RADIUS_KM_EQUATORIAL, and util::position::PositionUtils::EARTH_RADIUS_KM_POLAR.

Referenced by util::position::PositionUtils::CalculateGeographicDistance().

Here is the call graph for this function:



Here is the caller graph for this function:

10.35.3.2 CalculateGeographicDistance()

```
template<typename T >
static double util::position::PositionUtils::CalculateGeographicDistance (
            T lat1,
            T lon1,
            T lat0,
            T lon0)  [inline], [static], [inherited]
```

Get the geographical distance between two position, in kilometers, from the positions' locations, in decimal degrees.

Warning

This method provides approximate geographic estimates only! This approximation is calculated from a reference ellipsoid – a mathematically-defined surface that approximates the geoid, the truer figure of the Earth.

Note

This method uses the 'haversine' formula to calculate the great-circle distance between two points – that is, the shortest distance over the earth's surface – giving an 'as-the-crow-flies' distance between the points (ignoring any hills they fly over, of course!).

Parameters

in	*lat1*	The latitude of the geographic final position, in decimal degrees North.
in	*lon1*	The longitude of the geographic final position, in decimal degrees East.
in	*lat0*	The latitude of the geographic initial position, in decimal degrees North.
in	*lon0*	The longitude of the geographic initial position, in decimal degrees East.

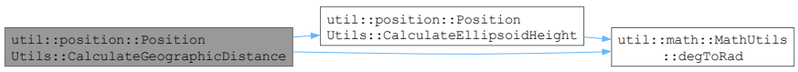
Returns

The geographical distance between the two given positions, in kilometers.

References util::position::PositionUtils::CalculateEllipsoidHeight(), and util::math::MathUtils::degToRad().

Referenced by util::xmsg::XCompositeIridiumPosition::ComputeAverageIrdiumPosition().

Here is the call graph for this function:



Here is the caller graph for this function:

10.35.3.3 degToRad()

```
template<typename T >
static double util::math::MathUtils::degToRad (
            T deg)  [inline], [static], [inherited]
```

Convert angular units from from degrees to decimal radians.

Parameters

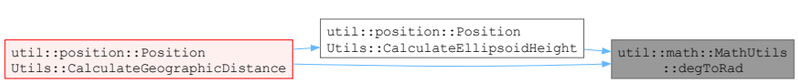
in	*deg*	Angle in integer or decimal degrees to convert to radians.

Returns

Angle in decimal radians.

Referenced by util::position::PositionUtils::CalculateEllipsoidHeight(), and util::position::PositionUtils::CalculateGeographicDistance().

Here is the caller graph for this function:



10.35.3.4 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

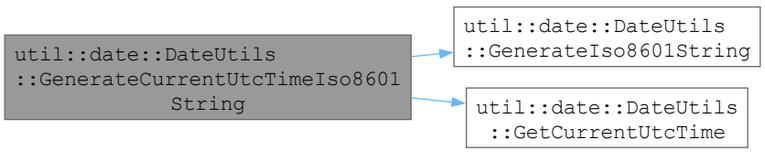
Returns

An ISO8601 format date/time string representation of the current time.

References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:

10.35.3.5 GenerateIso6709String()

```
template<typename T >
static std::string util::position::PositionUtils::GenerateIso6709String (
            T lat,
            T lon)  [inline], [static], [inherited]
```

Generate an IS06709 string representation of the position given by (`lat`, `lon`).

Parameters

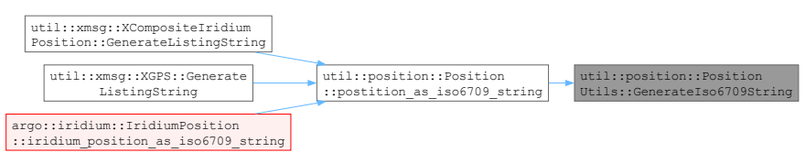
in	*lat*	The latitude of the position, in degrees North.
in	*lon*	The longitude of the position, in degrees East.

Returns

An IS06709 string representation of the position given by (`lat`, `lon`).

Referenced by postition_as_iso6709_string().

Here is the caller graph for this function:



10.35.3.6 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

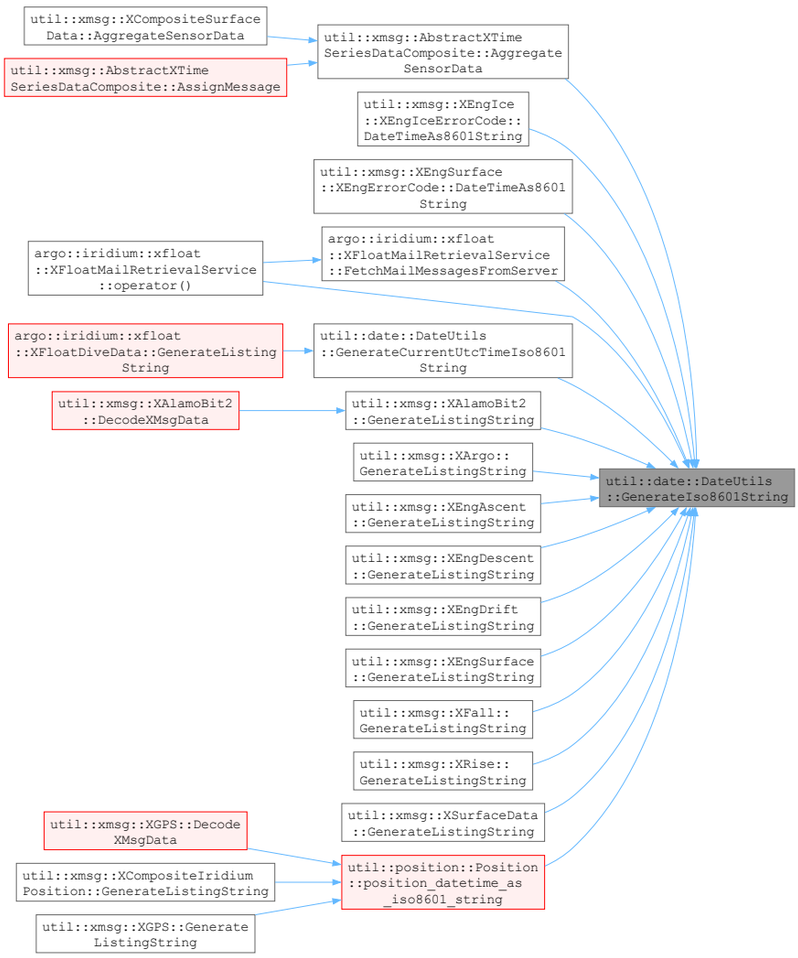
in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), util::xmsg::XEngIce::XEngIce util::xmsg::XEngSurface::XEngErrorCode::DateTimeAs8601String(), argo::iridium::xfloat::XFloatMailRetrievalService::FetchMailMessages util::date::DateUtils::GenerateCurrentUtcTimeIso8601String(), util::xmsg::XAlamoBit2::GenerateListingString(), util::xmsg::XArgo::Genera util::xmsg::XEngAscent::GenerateListingString(), util::xmsg::XEngDescent::GenerateListingString(), util::xmsg::XEngDrift::GenerateListing util::xmsg::XEngSurface::GenerateListingString(), util::xmsg::XFall::GenerateListingString(), util::xmsg::XRise::GenerateListingString(), util::xmsg::XSurfaceData::GenerateListingString(), argo::iridium::xfloat::XFloatMailRetrievalService::operator()(), and position_datetime_as_iso8601_string().

Here is the caller graph for this function:



10.35.3.7 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref_dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.35.3.8 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

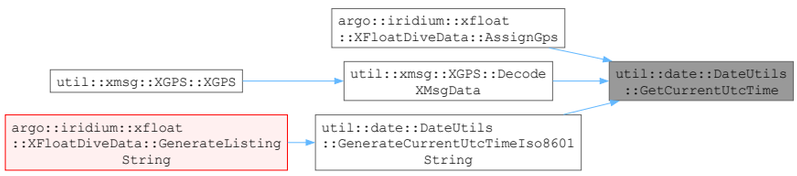
Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

Here is the caller graph for this function:



10.35.3.9 IsPositionValid()

```
template<typename T >
static bool util::position::PositionUtils::IsPositionValid (
            T lat,
            T lon)  [inline], [static], [inherited]
```

Check position validity.

Parameters

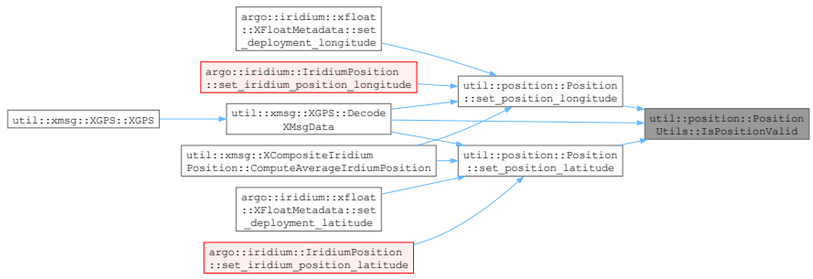
in	*lat*	Latitude of position.
in	*lon*	Longitude of position.

Returns

TRUE if (lat, lon) represents a valid geographical position, or FALSE otherwise.

Referenced by util::xmsg::XGPS::DecodeXMsgData(), set_position_latitude(), and set_position_longitude().

Here is the caller graph for this function:



10.35.3.10 position_datetime()

```
ptime util::position::Position::position_datetime () const  [inline]
```

Get the date/time of the position.

Returns

The date/time of the position.

References position_datetime_.

Referenced by util::xmsg::XGPS::DecodeXMsgData(), argo::iridium::xfloat::XFloatMetadata::deployment_datetime(), util::xmsg::XGPS::GeneratePhyString(), and argo::iridium::IridiumPosition::iridium_position_datetime().

Here is the caller graph for this function:

10.35.3.16 set_gps_position_datetime()

```
void util::position::Position::set_gps_position_datetime (
            unsigned int gpsWeek,
            unsigned int gpsDay,
            unsigned int gpsHour = 0,
            unsigned int gpsMinute = 0,
            unsigned int gpsSecond = 0)  [inline], [protected]
```

Set the date and time of this position from the given GPS week, day, and time.

Parameters

in	*gpsWeek*	The GPS week, in weeks since midnight of January 6, 1980.
in	*gpsDay*	The GPS day of week (0 - 6).
in	*gpsHour*	The UTC hour of day (0 - 23).
in	*gpsMinute*	The UTC minute of hour (0 - 59)..
in	*gpsSecond*	The UTC second of minute (0 - 59).

10.35.3.18 set_position_is_valid()

```
void util::position::Position::set_position_is_valid (
            bool is_valid = true)  [inline], [protected]
```

Set the position is valid flag.

Parameters

in	*is_valid*	TRUE if the position is valid, or FALSE otherwise.

References position_is_valid_.

Referenced by util::xmsg::XCompositeIridiumPosition::ComputeAverageIrdiumPosition(), util::xmsg::XGPS::DecodeXMsgData(), argo::iridium::IridiumPosition::set_iridium_position_is_valid(), set_position_latitude(), and set_position_longitude().

10.35.4 Member Data Documentation

10.35.4.1 EARTH_RADIUS_KM_EQUATORIAL

```
const double util::position::PositionUtils::EARTH_RADIUS_KM_EQUATORIAL = 6378.1  [static], [private],
[inherited]
```

The equatorial radius of the earth, in kilometers.

Referenced by util::position::PositionUtils::CalculateEllipsoidHeight().

10.35.4.2 EARTH_RADIUS_KM_POLAR

```
const double util::position::PositionUtils::EARTH_RADIUS_KM_POLAR = 6356.1  [static], [private],
[inherited]
```

The polar radius of the earth, in kilometers.

Referenced by util::position::PositionUtils::CalculateEllipsoidHeight().

10.35.4.3 position_datetime_

```
ptime util::position::Position::position_datetime_  [private]
```

The date and time of the position.

Referenced by position_datetime(), position_datetime_as_iso8601_string(), and set_position_datetime().

10.35.4.4 position_is_valid_

```
bool util::position::Position::position_is_valid_  [private]
```

The valid position indicator.

Referenced by position_is_valid(), and set_position_is_valid().

10.35.4.5 position_latitude_

```
double util::position::Position::position_latitude_  [private]
```

The latitude of the position, in decimal degrees.

Referenced by position_latitude(), postition_as_iso6709_string(), set_position_latitude(), and set_position_longitude().

10.35.4.6 position_longitude_

```
double util::position::Position::position_longitude_  [private]
```

The longitude of the position, in decimal degrees.

Referenced by position_longitude(), postition_as_iso6709_string(), set_position_latitude(), and set_position_longitude().

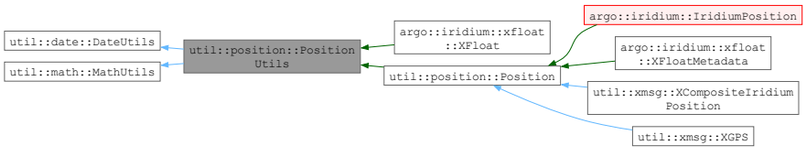
10.36 util::position::PositionUtils Class Reference

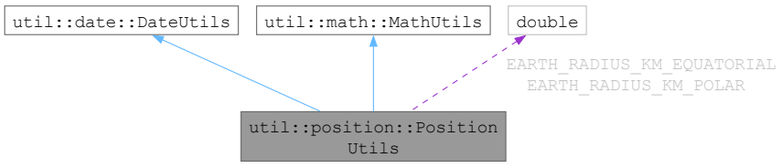
Class providing library of useful functions for manipulating and processing geographic positions.

```
#include <PositionUtils.h>
```

Inheritance diagram for util::position::PositionUtils:



Collaboration diagram for util::position::PositionUtils:



Static Public Member Functions

- static float **bitcastUint32ToFloat** (uint32_t u)
- template<typename T >
  static double CalculateEllipsoidHeight (T lat)

  Get the approximate surface altitude or height of earth for a given latitude, in kilometers.
- template<typename T >
  static double CalculateGeographicDistance (T lat1, T lon1, T lat0, T lon0)

  Get the geographical distance between two position, in kilometers, from the positions' locations, in decimal degrees.
- template<typename T >
  static double degToRad (T deg)

  Convert angular units from from degrees to decimal radians.
- static string GenerateCurrentUtcTimeIso8601String ()

  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- template<typename T >
  static std::string GenerateIso6709String (T lat, T lon)

  Generate an IS06709 string representation of the position given by (`lat, lon`).
- static string GenerateIso8601String (const ptime &p, bool extended=true)

  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)

  Convert a date/time to fractional days since a reference date/time.
- static ptime GetCurrentUtcTime ()

  Generate a POSIX time object representing the current date and time (rounded to the nearest second).
- template<typename T >
  static bool IsPositionValid (T lat, T lon)

  Check position validity.

Static Private Attributes

- static const double EARTH_RADIUS_KM_EQUATORIAL = 6378.1

  The equatorial radius of the earth, in kilometers.
- static const double EARTH_RADIUS_KM_POLAR = 6356.1

  The polar radius of the earth, in kilometers.

10.36.1 Detailed Description

Class providing library of useful functions for manipulating and processing geographic positions.

10.36.2 Member Function Documentation

10.36.2.1 CalculateEllipsoidHeight()

```
template<typename T >
static double util::position::PositionUtils::CalculateEllipsoidHeight (
            T lat)  [inline], [static]
```

Get the approximate surface altitude or height of earth for a given latitude, in kilometers.

Warning

This method provides approximate surface height estimates only! This approximation is calculated from a reference ellipsoid – a mathematically-defined surface that approximates the geoid, the truer figure of the Earth.

Parameters

in	*lat*	The geographic latitude of interest, in decimal degrees.

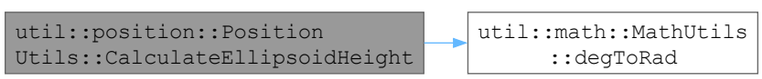
Returns

The approximate surface altitude or height of earth for the given latitude, in kilometers.

References util::math::MathUtils::degToRad(), EARTH_RADIUS_KM_EQUATORIAL, and EARTH_RADIUS_KM_POLAR.

Referenced by CalculateGeographicDistance().

Here is the call graph for this function:



Here is the caller graph for this function:

10.36.2.2 CalculateGeographicDistance()

```
template<typename T >
static double util::position::PositionUtils::CalculateGeographicDistance (
            T lat1,
            T lon1,
            T lat0,
            T lon0)  [inline], [static]
```

Get the geographical distance between two position, in kilometers, from the positions' locations, in decimal degrees.

Warning

This method provides approximate geographic estimates only! This approximation is calculated from a reference ellipsoid – a mathematically-defined surface that approximates the geoid, the truer figure of the Earth.

Note

This method uses the 'haversine' formula to calculate the great-circle distance between two points – that is, the shortest distance over the earth's surface – giving an 'as-the-crow-flies' distance between the points (ignoring any hills they fly over, of course!).

Parameters

in	*lat1*	The latitude of the geographic final position, in decimal degrees North.
in	*lon1*	The longitude of the geographic final position, in decimal degrees East.
in	*lat0*	The latitude of the geographic initial position, in decimal degrees North.
in	*lon0*	The longitude of the geographic initial position, in decimal degrees East.

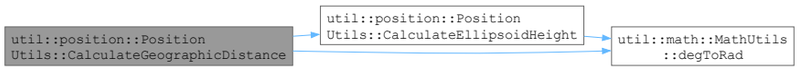
Returns

The geographical distance between the two given positions, in kilometers.

References CalculateEllipsoidHeight(), and util::math::MathUtils::degToRad().

Referenced by util::xmsg::XCompositeIridiumPosition::ComputeAverageIrdiumPosition().

Here is the call graph for this function:



Here is the caller graph for this function:

10.36.2.3 degToRad()

```
template<typename T >
static double util::math::MathUtils::degToRad (
            T deg)  [inline], [static], [inherited]
```

Convert angular units from from degrees to decimal radians.

Parameters

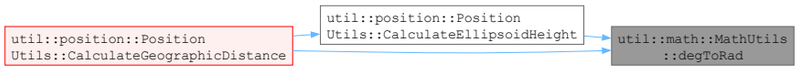
in	*deg*	Angle in integer or decimal degrees to convert to radians.

Returns

Angle in decimal radians.

Referenced by CalculateEllipsoidHeight(), and CalculateGeographicDistance().

Here is the caller graph for this function:



10.36.2.4 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

Returns

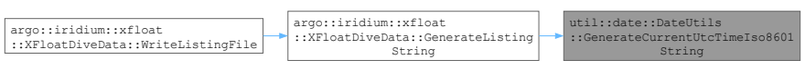
An ISO8601 format date/time string representation of the current time.

References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:

Here is the caller graph for this function:



10.36.2.5 GenerateIso6709String()

```
template<typename T >
static std::string util::position::PositionUtils::GenerateIso6709String (
            T lat,
            T lon)  [inline], [static]
```

Generate an IS06709 string representation of the position given by (`lat`, `lon`).

Parameters

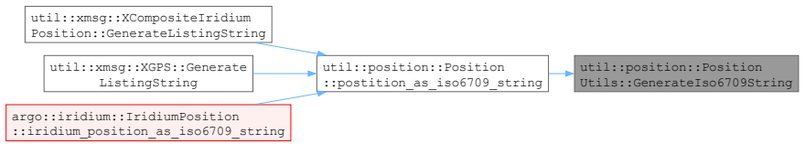
in	*lat*	The latitude of the position, in degrees North.
in	*lon*	The longitude of the position, in degrees East.

Returns

An IS06709 string representation of the position given by (`lat`, `lon`).

Referenced by util::position::Position::postition_as_iso6709_string().

Here is the caller graph for this function:



10.36.2.6 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), util::xmsg::XEngIce::XEngIce
util::xmsg::XEngSurface::XEngErrorCode::DateTimeAs8601String(), argo::iridium::xfloat::XFloatMailRetrievalService::FetchMailMessages

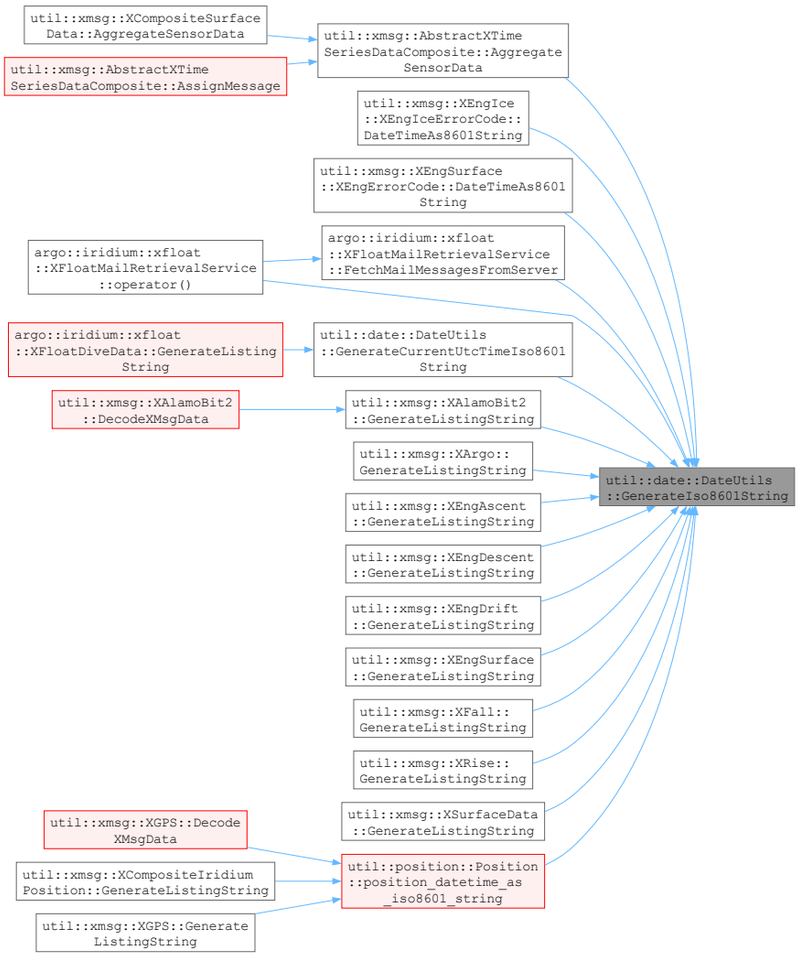
util::position::Position::position_datetime_as_iso8601_string().

Here is the caller graph for this function:



10.36.2.7 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref↩ _dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.36.2.8 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

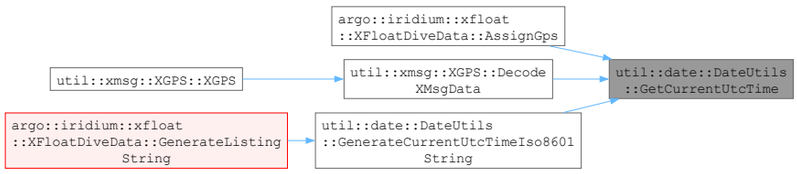
Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

Here is the caller graph for this function:



10.36.2.9 IsPositionValid()

```
template<typename T >
static bool util::position::PositionUtils::IsPositionValid (
            T lat,
            T lon)  [inline], [static]
```

Check position validity.

Parameters

in	*lat*	Latitude of position.
in	*lon*	Longitude of position.

Returns

TRUE if (lat, lon) represents a valid geographical position, or FALSE otherwise.

Referenced by util::xmsg::XGPS::DecodeXMsgData(), util::position::Position::set_position_latitude(), and util::position::Position::set_positi

10.36.3 Member Data Documentation

10.36.3.1 EARTH_RADIUS_KM_EQUATORIAL

```
const double util::position::PositionUtils::EARTH_RADIUS_KM_EQUATORIAL = 6378.1  [static], [private]
```

The equatorial radius of the earth, in kilometers.

Referenced by CalculateEllipsoidHeight().

10.36.3.2 EARTH_RADIUS_KM_POLAR

```
const double util::position::PositionUtils::EARTH_RADIUS_KM_POLAR = 6356.1  [static], [private]
```

The polar radius of the earth, in kilometers.

Referenced by CalculateEllipsoidHeight().

The documentation for this class was generated from the following files:

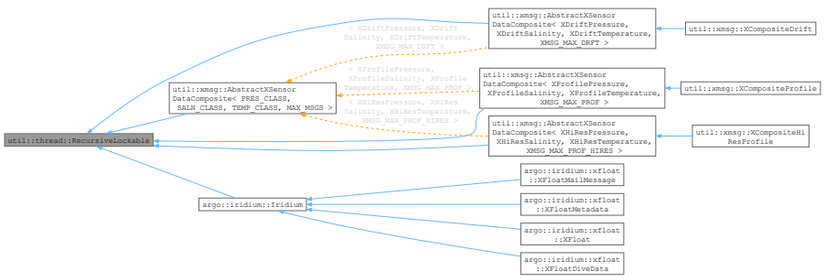
- utility/PositionUtils.h
- utility/PositionUtils.cpp

10.37 util::thread::RecursiveLockable Class Reference

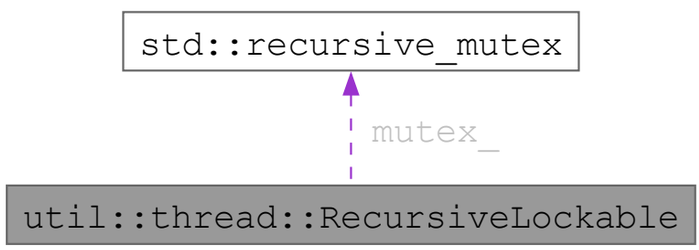
A recursively lockable class.

```
#include <RecursiveLockable.h>
```

Inheritance diagram for util::thread::RecursiveLockable:



Collaboration diagram for util::thread::RecursiveLockable:



Public Member Functions

- RecursiveLockable ()
  Default constructor.
- virtual ~RecursiveLockable ()
  Destructor.
- bool LockObject (bool block)
  Lock the object.
- void UnlockObject ()
  Unlock the object.

Protected Attributes

- recursive_mutex mutex_

  Recursive mutual exclusion lock for synchronizing operations.

10.37.1 Detailed Description

A recursively lockable class.

Note

This class uses a recursive mutex which means that it may be locked multiple times by the same thread.

10.37.2 Constructor & Destructor Documentation

10.37.2.1 RecursiveLockable()

```
util::thread::RecursiveLockable::RecursiveLockable ()  [inline]
```

Default constructor.

10.37.2.2 ~RecursiveLockable()

```
virtual util::thread::RecursiveLockable::~RecursiveLockable ()  [inline], [virtual]
```

Destructor.

10.37.3 Member Function Documentation

10.37.3.1 LockObject()

```
bool util::thread::RecursiveLockable::LockObject (
            bool block)  [inline]
```

Lock the object.

Parameters

in	*block*	If TRUE, then the calling thread will block until the lock becomes available.

Exceptions

util::log::MessageException	if an error occurs.

Returns

TRUE if the lock was successfully obtained, or FALSE if block is FALSE and another thread owns the lock on the mutex.

References CATCH_BLOCK, and mutex_.

10.37.3.2 UnlockObject()

```
void util::thread::RecursiveLockable::UnlockObject ()  [inline]
```

Unlock the object.

Exceptions

util::log::MessageException	if an error occurs.

References CATCH_BLOCK, and mutex_.

10.37.4 Member Data Documentation

10.37.4.1 mutex_

```
recursive_mutex util::thread::RecursiveLockable::mutex_  [mutable], [protected]
```

Recursive mutual exclusion lock for synchronizing operations.

10.40 util::sig::SignalHandler Class Reference

Class providing function for handling POSIX style system signals.

`#include <SignalHandler.h>`

Static Public Member Functions

- static void ExitHandler (int signo)
  The exit handler.
- static void RegisterSignalHandlers () ATTR_NO_EXCEPTIONS
  Register signal handlers functions for UNIX-style system signals.

10.40.1 Detailed Description

Class providing function for handling POSIX style system signals.

This class provides functions for graceful shutdown, triggered by catchable system signals.

10.40.2 Member Function Documentation

10.40.2.1 ExitHandler()

```
void util::sig::SignalHandler::ExitHandler (
            int signo)  [static]
```

The exit handler.

This function is responsible for handling signals received from the local system. It is invoked when a signal is caught, but may also be invoked "manually" anywhere in the execution of the primary daemon thread to terminate the application, for example, at the bequest of a user.

This function attempts an orderly shutdown of the application. First, the worker threads are terminated. Then, locally cached data is saved to the database. Next, run-time lock is released. Finally, the globally logger is flushed and the application is terminated.

Parameters

in	*signo*	The signal number.

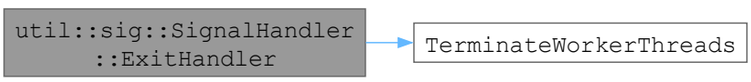
Exceptions

None.	Never throws.

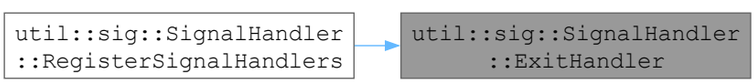
References CATCH_NOTHROW, Iout, and TerminateWorkerThreads().

Referenced by RegisterSignalHandlers().

Here is the call graph for this function:



Here is the caller graph for this function:



10.40.2.2 RegisterSignalHandlers()

```
static void util::sig::SignalHandler::RegisterSignalHandlers ()  [inline], [static]
```

Register signal handlers functions for UNIX-style system signals.

Exceptions

None.	Never throws.

References CATCH_BLOCK, EXC_THROW, ExitHandler(), ldbg, linf, and lout.

Here is the call graph for this function:

The documentation for this class was generated from the following files:

  The parameterized constructor.
- size_t column_index () const

  Get the index of the SQL table column.
- const string & column_name () const

  Get the name of the SQL table column.
- string column_select_name () const

  Get the name of the SQL table column to be used in a `SELECT` query.
- ColumDataType_t data_type () const

  Get the the enumerated SQL column data type.
- bool is_primary_key () const

  Is this column a primary key for the corresponding SQL database table?
- void set_column_index (size_t idx)

  Set the index of this SQL table column.

Protected Member Functions

- T GetValueFromObject (const C &obj) const

  Get the object member value from the object.
- void SetObjectValue (C &obj, const T &value) const

  Set the object member value.

Private Attributes

- function< T(const C &)> accessor_

  The accessor function object wrapper.
- size_t column_index_

  The index of the SQL table column.
- string column_name_

  The name of the SQL table column.
- ColumDataType_t data_type_

  The enumerated SQL table column data type.
- bool is_primary_key_

  Indicates whether the column is part of the primary key for the SQL table.
- function< void(C &, T)> mutator_

  The mutator function object wrapper.

10.41.1 Detailed Description

template<class C, typename T>
class util::mysql::SqlTableColumnDescription< C, T >

The `SqlTableColumnDescription` class is a template class used to describe an SQL table column for class `C` and data member of type `T`.

10.41.2 Constructor & Destructor Documentation

10.41.2.1 SqlTableColumnDescription() [1/3]

```
template<class C , typename T >
util::mysql::SqlTableColumnDescription< C, T >::SqlTableColumnDescription (
            string column_name,
            ColumDataType_t data_type,
            T(C::* accessor )() const = NULL,
            void(C::* mutator )(T) = NULL,
            bool is_primary_key = false)  [inline]
```

The parameterized constructor.

Parameters

in	*column_name*	The name of the SQL table column.
in	*data_type*	They enumerated SQL table column type.
in	*accessor*	A pointer to the accessor method for acquiring the value of the corresponding object field.
in	*mutator*	A pointer to the mutator method for setting the value of the corresponding object field.
in	*is_primary_key*	TRUE if this column is a primary key for the SQL table, or FALSE otherwise.

10.41.2.2 SqlTableColumnDescription() [2/3]

```
template<class C , typename T >
util::mysql::SqlTableColumnDescription< C, T >::SqlTableColumnDescription (
            string column_name,
            ColumDataType_t data_type,
            T(C::* accessor )() const = NULL,
            void(C::* mutator )(const T &) = NULL,
            bool is_primary_key = false)  [inline]
```

The parameterized constructor.

Parameters

in	*column_name*	The name of the SQL table column.
in	*data_type*	They enumerated SQL table column type.
in	*accessor*	A pointer to the accessor method for acquiring the value of the corresponding object field.
in	*mutator*	A pointer to the mutator method for setting the value of the corresponding object field.
in	*is_primary_key*	TRUE if this column is a primary key for the SQL table, or FALSE otherwise.

10.41.2.3 SqlTableColumnDescription() [3/3]

```
template<class C , typename T >
util::mysql::SqlTableColumnDescription< C, T >::SqlTableColumnDescription (
            string column_name,
            ColumDataType_t data_type,
            const T &(C::* accessor )() const = NULL,
            void(C::* mutator )(const T &) = NULL,
            bool is_primary_key = false)  [inline]
```

The parameterized constructor.

Parameters

in	*column_name*	The name of the SQL table column.
in	*data_type*	They enumerated SQL table column type.
in	*accessor*	A pointer to the accessor method for acquiring the value of the corresponding object field.
in	*mutator*	A pointer to the mutator method for setting the value of the corresponding object field.
in	*is_primary_key*	TRUE if this column is a primary key for the SQL table, or FALSE otherwise.

10.41.3 Member Function Documentation

10.41.3.1 column_index()

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index () const  [inline], [inherited]
```

Get the index of the SQL table column.

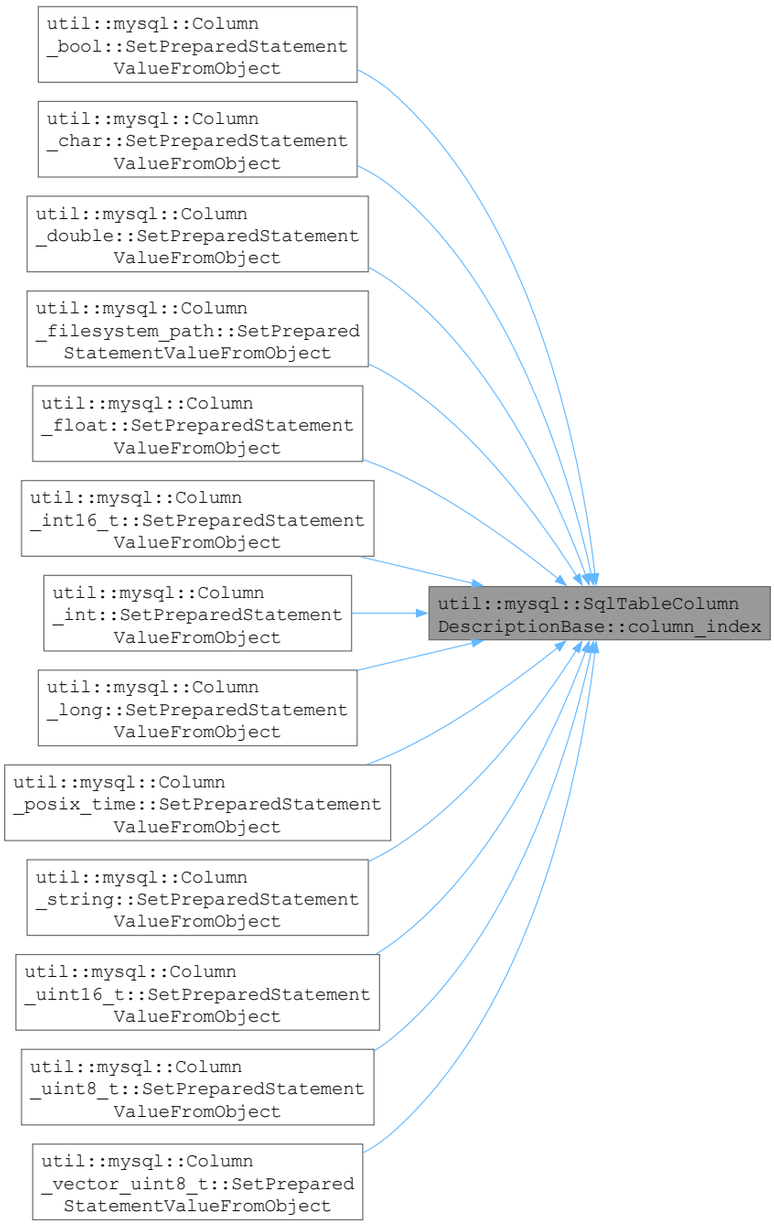
Returns

The index of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

Referenced by util::mysql::Column_bool< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_char< C >::SetPreparedS
util::mysql::Column_double< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_filesystem_path< C >::SetPreparedS
util::mysql::Column_float< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_int16_t< C >::SetPreparedStatementVa
util::mysql::Column_int< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_long< C >::SetPreparedStatementValueF
util::mysql::Column_posix_time< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_string< C >::SetPreparedStateme
util::mysql::Column_uint16_t< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_uint8_t< C >::SetPreparedStatemer
and util::mysql::Column_vector_uint8_t< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.41.3.2 column_name()

```
const string & util::mysql::SqlTableColumnDescriptionBase::column_name () const  [inline], [inherited]
```

Get the name of the SQL table column.

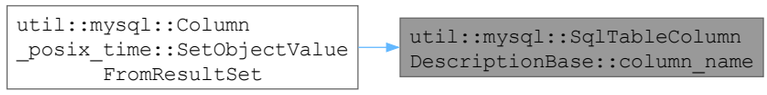
Returns

The name of the SQL table column.

References util::mysql::SqlTableColumnDescriptionBase::column_name_.

Referenced by util::mysql::Column_posix_time< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.41.3.3 column_select_name()

```
string util::mysql::SqlTableColumnDescriptionBase::column_select_name () const  [inline], [inherited]
```

Get the name of the SQL table column to be used in a `SELECT` query.

Returns

The name of the SQL table column to be used in a `SELECT` query.

References util::mysql::SqlTableColumnDescriptionBase::column_name_, and util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.41.3.4 data_type()

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type () const  [inline], [inherited]
```

Get the the enumerated SQL column data type.

Returns

The the enumerated SQL column data type.

References util::mysql::SqlTableColumnDescriptionBase::data_type_.

10.41.3.5 GetValueFromObject()

```
template<class C , typename T >
T util::mysql::SqlTableColumnDescription< C, T >::GetValueFromObject (
            const C & obj) const  [inline], [protected]
```

Get the object member value from the object.

Parameters

in	*obj*	The object of type `C`.

Returns

The value of type `T` of the object member corresponding to this SQL column.

References util::mysql::SqlTableColumnDescription< C, T >::accessor_.

10.41.3.6 is_primary_key()

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key () const  [inline], [inherited]
```

Is this column a primary key for the corresponding SQL database table?

Returns

TRUE if this column is a primary key for the corresponding SQL database table, or FALSE otherwise.

References util::mysql::SqlTableColumnDescriptionBase::is_primary_key_.

10.41.3.7 set_column_index()

```
void util::mysql::SqlTableColumnDescriptionBase::set_column_index (
            size_t idx)  [inline], [inherited]
```

Set the index of this SQL table column.

Parameters

in	*idx*	The index to set.

References util::mysql::SqlTableColumnDescriptionBase::column_index_.

10.41.3.8 SetObjectValue()

```
template<class C , typename T >
void util::mysql::SqlTableColumnDescription< C, T >::SetObjectValue (
            C & obj,
            const T & value) const  [inline], [protected]
```

Set the object member value.

Parameters

in	*obj*	The object of type C.
in	*value*	The value of type T, to set.

References util::mysql::SqlTableColumnDescription< C, T >::mutator_.

10.41.4 Member Data Documentation

10.41.4.1 accessor_

```
template<class C , typename T >
function<T(const C&)> util::mysql::SqlTableColumnDescription< C, T >::accessor_  [private]
```

The accessor function object wrapper.

This object is used as a wrapper for the accessor method of the template class C. It is used to retrieve the value of the SQL table column from the object for generating an INSERT or UPDATE statement.

Referenced by util::mysql::SqlTableColumnDescription< C, T >::GetValueFromObject().

10.41.4.2 column_index_

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index_  [private], [inherited]
```

The index of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_index(), and util::mysql::SqlTableColumnDescriptionBase::set_colum

10.41.4.3 column_name_

```
string util::mysql::SqlTableColumnDescriptionBase::column_name_  [private], [inherited]
```

The name of the SQL table column.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_name(), and util::mysql::SqlTableColumnDescriptionBase::column_s

10.41.4.4 data_type_

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type_  [private], [inherited]
```

The enumerated SQL table column data type.

Referenced by util::mysql::SqlTableColumnDescriptionBase::column_select_name(), and util::mysql::SqlTableColumnDescriptionBase::da

10.41.4.5 is_primary_key_

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key_  [private], [inherited]
```

Indicates whether the column is part of the primary key for the SQL table.

Referenced by util::mysql::SqlTableColumnDescriptionBase::is_primary_key().

10.41.4.6 mutator_

```
template<class C , typename T >
function<void(C&, T)> util::mysql::SqlTableColumnDescription< C, T >::mutator_  [private]
```

The mutator function object wrapper.

This object is used as a wrapper for the mutator method of the template class C. It is used to set the value of an object from the result set of an SQL SELECT query statement.

Referenced by util::mysql::SqlTableColumnDescription< C, T >::SetObjectValue().

The documentation for this class was generated from the following file:

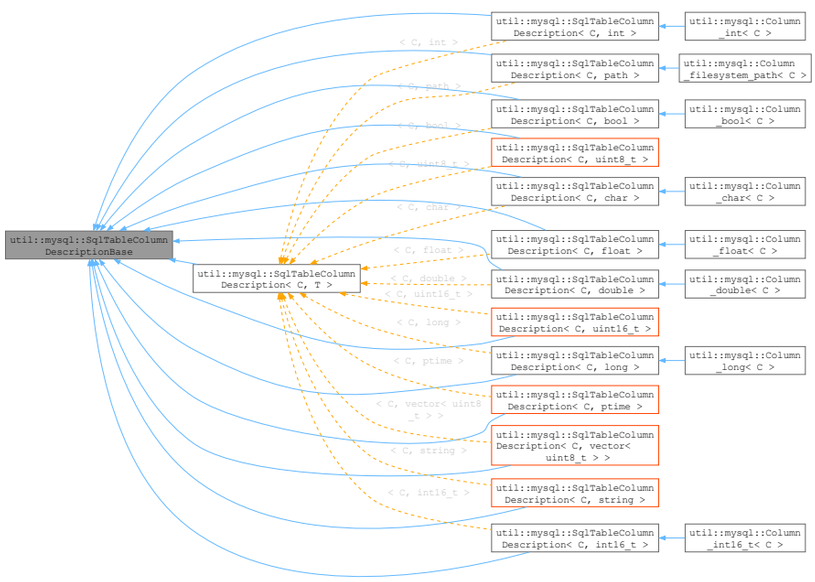
- utility/SqlTableColumnDescription.h

10.42 util::mysql::SqlTableColumnDescriptionBase Class Reference

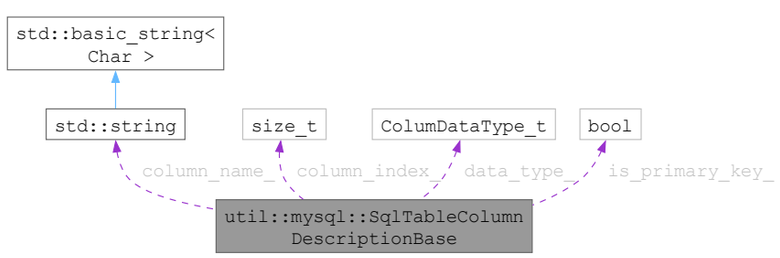
An abstract base class for the description of an SQL database table column.

```
#include <SqlTableColumnDescription.h>
```

Inheritance diagram for util::mysql::SqlTableColumnDescriptionBase:



Collaboration diagram for util::mysql::SqlTableColumnDescriptionBase:



Public Member Functions

- SqlTableColumnDescriptionBase (string column_name, ColumDataType_t type, bool is_primary_key)

  The parameterized constructor.
- virtual ~SqlTableColumnDescriptionBase ()

  The destructor.
- size_t column_index () const

  Get the index of the SQL table column.
- const string & column_name () const

  Get the name of the SQL table column.
- string column_select_name () const

  Get the name of the SQL table column to be used in a `SELECT` query.
- ColumDataType_t data_type () const

  Get the the enumerated SQL column data type.
- bool is_primary_key () const

  Is this column a primary key for the corresponding SQL database table?
- void set_column_index (size_t idx)

  Set the index of this SQL table column.

Private Attributes

- size_t column_index_

  The index of the SQL table column.
- string column_name_

  The name of the SQL table column.
- ColumDataType_t data_type_

  The enumerated SQL table column data type.
- bool is_primary_key_

  Indicates whether the column is part of the primary key for the SQL table.

10.42.1 Detailed Description

An abstract base class for the description of an SQL database table column.

This base class is necessary for utilizing polymorphism such that a pointers to classes that inherit from this class may be stored in a single vector.

10.42.2 Constructor & Destructor Documentation

10.42.2.1 SqlTableColumnDescriptionBase()

```
util::mysql::SqlTableColumnDescriptionBase::SqlTableColumnDescriptionBase (
            string column_name,
            ColumDataType_t type,
            bool is_primary_key)  [inline]
```

The parameterized constructor.

Parameters

in	*column_name*	The name of the SQL table column.
in	*type*	They enumerated SQL table column type.
in	*is_primary_key*	TRUE if this column is a primary key for the SQL table, or FALSE otherwise.

10.42.2.2 ~SqlTableColumnDescriptionBase()

```
virtual util::mysql::SqlTableColumnDescriptionBase::~SqlTableColumnDescriptionBase ()  [inline],
[virtual]
```

The destructor.

10.42.3 Member Function Documentation

10.42.3.1 column_index()

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index () const  [inline]
```

Get the index of the SQL table column.

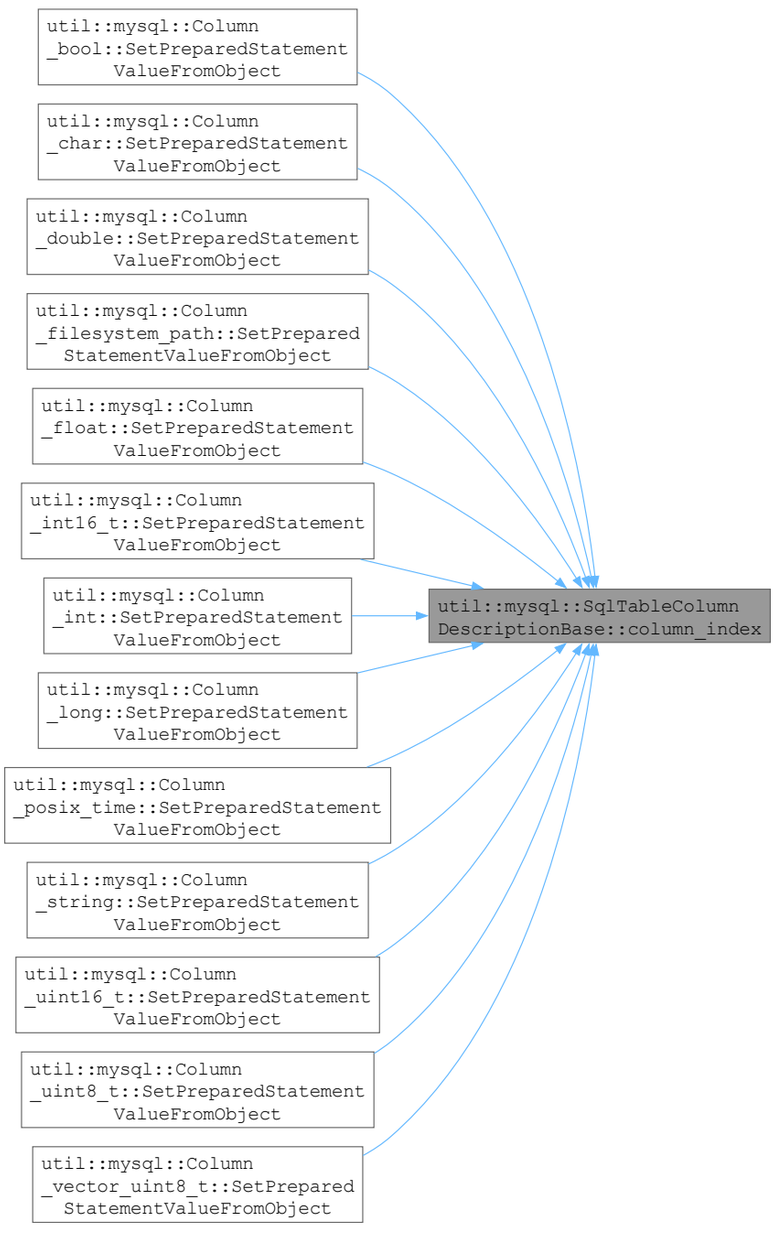
Returns

The index of the SQL table column.

References column_index_.

Referenced by util::mysql::Column_bool< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_char< C >::SetPreparedS
util::mysql::Column_double< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_filesystem_path< C >::SetPreparedS
util::mysql::Column_float< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_int16_t< C >::SetPreparedStatementVa
util::mysql::Column_int< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_long< C >::SetPreparedStatementValueF
util::mysql::Column_posix_time< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_string< C >::SetPreparedStateme
util::mysql::Column_uint16_t< C >::SetPreparedStatementValueFromObject(), util::mysql::Column_uint8_t< C >::SetPreparedStatemer
and util::mysql::Column_vector_uint8_t< C >::SetPreparedStatementValueFromObject().

Here is the caller graph for this function:



10.42.3.2 column_name()

```
const string & util::mysql::SqlTableColumnDescriptionBase::column_name () const  [inline]
```

Get the name of the SQL table column.

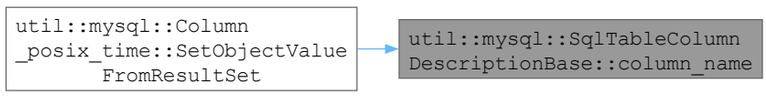
Returns

The name of the SQL table column.

References column_name_.

Referenced by util::mysql::Column_posix_time< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.42.3.3 column_select_name()

```
string util::mysql::SqlTableColumnDescriptionBase::column_select_name () const  [inline]
```

Get the name of the SQL table column to be used in a `SELECT` query.

Returns

The name of the SQL table column to be used in a `SELECT` query.

References column_name_, and data_type_.

10.42.3.4 data_type()

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type () const  [inline]
```

Get the the enumerated SQL column data type.

Returns

The the enumerated SQL column data type.

References data_type_.

10.42.3.5 is_primary_key()

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key () const  [inline]
```

Is this column a primary key for the corresponding SQL database table?

Returns

TRUE if this column is a primary key for the corresponding SQL database table, or FALSE otherwise.

References is_primary_key_.

10.42.3.6 set_column_index()

```
void util::mysql::SqlTableColumnDescriptionBase::set_column_index (
            size_t idx)  [inline]
```

Set the index of this SQL table column.

Parameters

in	*idx*	The index to set.

References column_index_.

10.42.4 Member Data Documentation

10.42.4.1 column_index_

```
size_t util::mysql::SqlTableColumnDescriptionBase::column_index_  [private]
```

The index of the SQL table column.

Referenced by column_index(), and set_column_index().

10.42.4.2 column_name_

```
string util::mysql::SqlTableColumnDescriptionBase::column_name_  [private]
```

The name of the SQL table column.

Referenced by column_name(), and column_select_name().

10.42.4.3 data_type_

```
ColumDataType_t util::mysql::SqlTableColumnDescriptionBase::data_type_  [private]
```

The enumerated SQL table column data type.

Referenced by column_select_name(), and data_type().

10.42.4.4 is_primary_key_

```
bool util::mysql::SqlTableColumnDescriptionBase::is_primary_key_  [private]
```

Indicates whether the column is part of the primary key for the SQL table.

Referenced by is_primary_key().

- void **DeleteObjectsFromDatabase** (const string &where="") const
- string generateInsertStatment ()

  Generate an SQL INSERT statement for this SQL table.
- string generateSelectAllStatement ()

  Generate the "select all" SQL statement for this table.
- string getColumnNames () const

  Generate a string containing comma-separated, ordered list of column names for this SQL table from the column descriptions.
- vector< shared_ptr< SqlTableColumnDescriptionBase > > getColumns () const

  Get the vector of shared pointers to ColumnDescription objects describing the columns of this SQL table.
- string getColumnSelectNames () const

  Generate a string containing comma-separated, ordered list of column names used for select statements for this SQL table from the column descriptions.
- void SaveObjectToDatabase (const T &obj) const

  Save a persistent entity to the SQL table.
- vector< shared_ptr< T > > SelectAllObjectsFromDatabase (const string &groupBy="", const string &orderBy="", const unsigned int &limit=0, const unsigned int &offset=0) const

  Select all objects from this SQL database table.
- shared_ptr< T > SelectObjectFromDatabase (const string &where="", const string &groupBy="", const string &orderBy="", const unsigned int &offset=0) const

  Get a single object from the database.
- vector< shared_ptr< T > > SelectObjectsFromDatabase (const string &where="", const string &groupBy="", const string &orderBy="", const unsigned int &limit=0, const unsigned int &offset=0) const

  Select objects from this SQL database table.
- template<typename TT >
  TT SelectValueFromDatabase (const string &what, const string &where="", const string &groupBy="", const string &orderBy="", const unsigned int &offset=0) const

  Select a value from the SQL database table represented by this object.

Static Public Member Functions

- static void CloseSqlConnection ()

  Close the thread-specific MySQL connection if it is currently open.
- static shared_ptr< sql::ResultSet > **executeDeleteQuery** (const string &from, const string &where="")
- static shared_ptr< ResultSet > ExecuteQuery (Connection *con, const string &query)

  Execute an SQL query and return a shared pointer to the ResultSet object.
- static shared_ptr< sql::ResultSet > executeQuery (const string &query)

  Execute an SQL query and return a shared pointer to the ResultSet object.
- static shared_ptr< sql::ResultSet > executeSelectQuery (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)

  Execute an SQL select query and return a shared pointer to the ResultSet object.
- static int ExecuteUpdate (Connection *con, const string &update)

  Execute an SQL update and return the status code.
- static int executeUpdate (const string &update)

  Execute an SQL update and return the status code.
- static shared_ptr< PreparedStatement > GeneratePreparedStatement (Connection *con, const string &statement)

  Generate a prepared SQL statement object for the given SQL statement.
- static shared_ptr< sql::PreparedStatement > generatePreparedStatement (const string &statement)

  Generate a prepared SQL statement object for the given SQL statement.
- static string GenerateSqlDeleteStr (const string &from, const string &where="")

  Generate an SQL DELETE statement.
- static string GenerateSqlSelectStr (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)

  Generate an SQL select statement.
- static thread_specific_ptr< Connection > & GetSqlConnection (string url, string user, string password, string schema)

  Get a thread-specific instance of a MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > & GetSqlDriver ()

  Get a thread-specific instance of a MySQL driver object.
- static string values (size_t n)

  Generate a values string component of an SQL insert statement with n values.

Static Protected Member Functions

- static sql::Connection * getSqlConnection ()

  Generate a thread-specific instance of a MySQL connection object.
- static uint8_t htoi (char c)

  Get the integer value of a hexadecimal character.

Private Types

- typedef Column_bool< T > cbol

  A column of type `bool`.
- typedef Column_char< T > cchar

  A column of type `char`.
- typedef Column_double< T > cdbl

  A column of type `double`.
- typedef Column_float< T > cflt

  A column of type `float`.
- typedef Column_int16_t< T > ci16

  A column of type `int16_t`.
- typedef Column_int< T > cint

  A column of type `int`.
- typedef Column_long< T > clng

  A column of type `long`.
- typedef Column_filesystem_path< T > cpth

  A column of type `boost::filesystem::path`.
- typedef Column_posix_time< T > cptm

  A column of type `boost::posix_time::ptime`.
- typedef Column_string< T > cstr

  A column of type `std::string`.
- typedef Column_uint16_t< T > cu16

  A column of type `uint16_t`.
- typedef Column_uint8_t< T > cu8

  A column of type `uint8_t`.
- typedef Column_vector_uint8_t< T > cvu8

  A column of type `std::vector<uint8_t>`.

Private Member Functions

- vector< shared_ptr< T > > GenerateObjectList (shared_ptr< ResultSet > res) const

  Generate a vector of object T from the given result set.

Static Private Member Functions

- static void CleanupSqlConnection (Connection *con)

  Cleanup an SQL connection.
- static void CleanupSqlDriver (MySQL_Driver *driver)

  Function for memory cleanup of MySQL driver on destruct.

Private Attributes

- string insert_on_duplicate_key_update_statement_

  The insert statement for this SQL table.
- string select_statement_

  The select all statement for this SQL table.
- vector< shared_ptr< SqlTableColumnDescriptionBase > > table_columns_

  A vector of shared pointers to SqlTableColumnDescription objects describing the columns of this SQL table.
- string table_name_

  The name of this SQL table.

Static Private Attributes

- static string address_
  The SQL server qualified name or IP address string.
- static string password_
  The SQL server account password string.
- static unsigned int port_
  The SQL server port number.
- static string protocol_
  The protocol to use in the SQL server connection e.g.
- static string schema_
  The SQL server schema name.
- static thread_specific_ptr< Connection > sql_connection_
  Tthe thread-specific pointer to MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > sql_driver_
  The thread-specific pointer to MySQL driver object.
- static string user_
  The SQL server account username string.

10.43.1 Detailed Description

template<class T>
class util::mysql::SqlTableDescription< T >

Template class representing the description of an SQL database table.

The template parameter T represents the class that the SQL database table represents.

10.43.2 Member Typedef Documentation

10.43.2.1 cbol

```
template<class T >
typedef Column_bool<T> util::mysql::SqlTableDescription< T >::cbol  [private]
```

A column of type `bool`.

10.43.2.2 cchar

```
template<class T >
typedef Column_char<T> util::mysql::SqlTableDescription< T >::cchar  [private]
```

A column of type `char`.

10.43.2.3 cdbl

```
template<class T >
typedef Column_double<T> util::mysql::SqlTableDescription< T >::cdbl  [private]
```

A column of type `double`.

10.43.2.4 cflt

```
template<class T >
typedef Column_float<T> util::mysql::SqlTableDescription< T >::cflt  [private]
```

A column of type `float`.

10.43.2.5 ci16

```
template<class T >
typedef Column_int16_t<T> util::mysql::SqlTableDescription< T >::ci16  [private]
```

A column of type `int16_t`.

10.43.2.6 cint

```
template<class T >
typedef Column_int<T> util::mysql::SqlTableDescription< T >::cint  [private]
```

A column of type `int`.

10.43.2.7 clng

```
template<class T >
typedef Column_long<T> util::mysql::SqlTableDescription< T >::clng  [private]
```

A column of type `long`.

10.43.2.8 cpth

```
template<class T >
typedef Column_filesystem_path<T> util::mysql::SqlTableDescription< T >::cpth  [private]
```

A column of type `boost::filesystem::path`.

10.43.2.9 cptm

```
template<class T >
typedef Column_posix_time<T> util::mysql::SqlTableDescription< T >::cptm  [private]
```

A column of type `boost::posix_time::ptime`.

10.43.2.10 cstr

```
template<class T >
typedef Column_string<T> util::mysql::SqlTableDescription< T >::cstr  [private]
```

A column of type `std::string`.

10.43.2.11 cu16

```
template<class T >
typedef Column_uint16_t<T> util::mysql::SqlTableDescription< T >::cu16  [private]
```

A column of type `uint16_t`.

10.43.2.12 cu8

```
template<class T >
typedef Column_uint8_t<T> util::mysql::SqlTableDescription< T >::cu8  [private]
```

A column of type `uint8_t`.

10.43.2.13 cvu8

```
template<class T >
typedef Column_vector_uint8_t<T> util::mysql::SqlTableDescription< T >::cvu8  [private]
```

A column of type `std::vector<uint8_t>`.

10.43.3 Constructor & Destructor Documentation

10.43.3.1 SqlTableDescription()

```
template<class T >
util::mysql::SqlTableDescription< T >::SqlTableDescription (
            const string & name,
            const vector< shared_ptr< SqlTableColumnDescriptionBase > > & columns)  [inline]
```

The parameterized constructor.

Parameters

in	*name*	The name of the SQL database table.
in	*columns*	Vector of shared pointers to ColumnDescription objects describing the columns of this SQL table.

References util::mysql::SqlTableDescription< T >::generateInsertStatment(), util::mysql::SqlTableDescription< T >::generateSelectAllSta
and util::mysql::SqlTableDescription< T >::table_columns_.

Here is the call graph for this function:

10.43.3.2 ~SqlTableDescription()

```
template<class T >
util::mysql::SqlTableDescription< T >::~SqlTableDescription ()  [inline]
```

The destructor.

10.43.4 Member Function Documentation

10.43.4.1 CleanupSqlConnection()

```
static void util::mysql::MysqlUtils::CleanupSqlConnection (
            Connection * con)  [inline], [static], [private], [inherited]
```

Cleanup an SQL connection.

This function for memory cleanup of the SQL connection on destruction. The thread-specific SQL connection object will be deleted if it exists.

Parameters

in	*con*	The SQL connection to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL connection object.

References CATCH_BLOCK.

10.43.4.2 CleanupSqlDriver()

```
static void util::mysql::MysqlUtils::CleanupSqlDriver (
            MySQL_Driver * driver)  [inline], [static], [private], [inherited]
```

Function for memory cleanup of MySQL driver on destruct.

Signals the SQL driver to end operation, if it exists.

Parameters

in	*driver*	Driver to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL driver object.

References CATCH_BLOCK.

10.43.4.3 CloseSqlConnection()

```
static void util::mysql::MysqlUtils::CloseSqlConnection ()  [inline], [static], [inherited]
```

Close the thread-specific MySQL connection if it is currently open.

If the thread local MySQL connection is not currently open, then this function will have no effect.

Note

The MySQL connection should be closed when idle to prevent the connection from timing out and throwing exceptions.

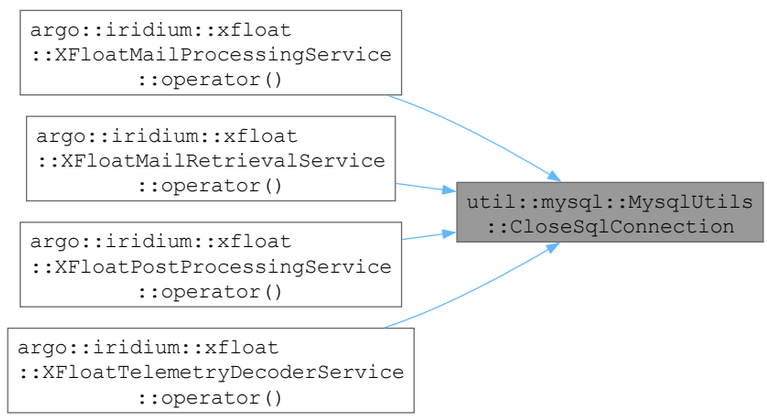
Exceptions

log::MessageException	if an error occurs while attempting to close the MySQL connection.

References CATCH_BLOCK, and util::mysql::MysqlUtils::sql_connection_.

Referenced by argo::iridium::xfloat::XFloatMailProcessingService::operator()(), argo::iridium::xfloat::XFloatMailRetrievalService::operator(
argo::iridium::xfloat::XFloatPostProcessingService::operator()(), and argo::iridium::xfloat::XFloatTelemetryDecoderService::operator()().

Here is the caller graph for this function:



10.43.4.4 ExecuteQuery()

```
static shared_ptr< ResultSet > util::mysql::MysqlUtils::ExecuteQuery (
            Connection * con,
            const string & query)  [inline], [static], [inherited]
```

Execute an SQL query and return a shared pointer to the ResultSet object.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*query*	The SQL query to execute. This must be a well-formatted SQL query string.

Exceptions

log::MessageException	if 'con' is null, 'query' is a malfored SQL string, or any other error occurs.

Returns

A shared pointer to the query ResultSet object.

References CATCH_BLOCK, and util::mysql::MysqlUtils::GeneratePreparedStatement().

Referenced by util::mysql::LocalMysqlConfiguration::executeQuery().

Here is the call graph for this function:

Here is the caller graph for this function:

10.43.4.5 executeQuery()

```
shared_ptr< sql::ResultSet > util::mysql::LocalMysqlConfiguration::executeQuery (
            const string & query)  [static], [inherited]
```

Execute an SQL query and return a shared pointer to the ResultSet object.

Parameters

in	*query*	The SQL query to execute. This must be a well-formatted SQL query string.

Exceptions

log::MessageException	'query' is a malfored SQL string or any other error occurs while executing the query.

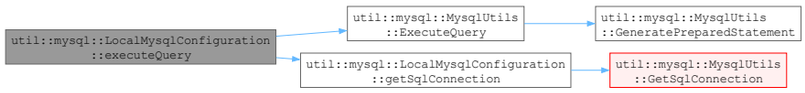
Returns

A shared pointer to the query ResultSet object.

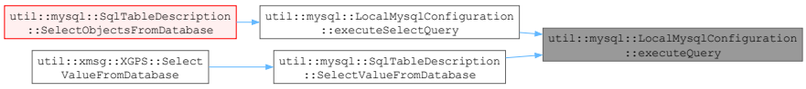
References util::mysql::MysqlUtils::ExecuteQuery(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

Referenced by util::mysql::LocalMysqlConfiguration::executeSelectQuery(), and util::mysql::SqlTableDescription< T >::SelectValueFromD

Here is the call graph for this function:



Here is the caller graph for this function:



10.43.4.6 executeSelectQuery()

```
shared_ptr< sql::ResultSet > util::mysql::LocalMysqlConfiguration::executeSelectQuery (
            const string & what,
            const string & from,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [static], [inherited]
```

Execute an SQL select query and return a shared pointer to the ResultSet object.

Parameters

in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table–references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Exceptions

log::MessageException	if an error occurs while executing the query.

Returns

A shared pointer to the ResultSet object.

References CATCH_BLOCK, util::mysql::LocalMysqlConfiguration::executeQuery(), and util::mysql::MysqlUtils::GenerateSqlSelectStr().

Referenced by util::mysql::SqlTableDescription< T >::SelectObjectsFromDatabase().

Here is the call graph for this function:

Here is the caller graph for this function:

10.43.4.7 ExecuteUpdate()

```
static int util::mysql::MysqlUtils::ExecuteUpdate (
            Connection * con,
            const string & update)  [inline], [static], [inherited]
```

Execute an SQL update and return the status code.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*update*	The SQL update to execute. This must be a well-formatted SQL update string.

Exceptions

log::MessageException	if 'con' is null, 'update' is a malformed SQL string, or any other error occurs.

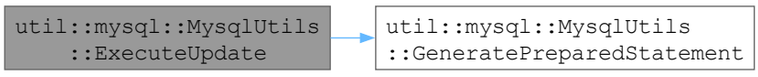
Returns

The update status code.

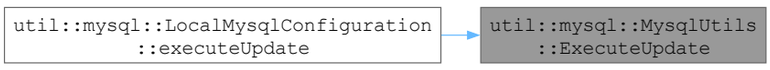
References CATCH_BLOCK, and util::mysql::MysqlUtils::GeneratePreparedStatement().

Referenced by util::mysql::LocalMysqlConfiguration::executeUpdate().

Here is the call graph for this function:



Here is the caller graph for this function:



10.43.4.8 executeUpdate()

```
int util::mysql::LocalMysqlConfiguration::executeUpdate (
            const string & update)  [static], [inherited]
```

Execute an SQL update and return the status code.

Parameters

in	*update*	The SQL update to execute. This must be a well-formatted SQL update string.

Exceptions

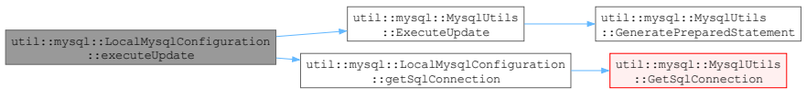
log::MessageException	if 'update' is a malformed SQL string, or any other error occurs while executing the update.

Returns

The update status code.

References util::mysql::MysqlUtils::ExecuteUpdate(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

Here is the call graph for this function:



10.43.4.9 generateInsertStatment()

```
template<class T >
string util::mysql::SqlTableDescription< T >::generateInsertStatment ()  [inline]
```

Generate an SQL INSERT statement for this SQL table.

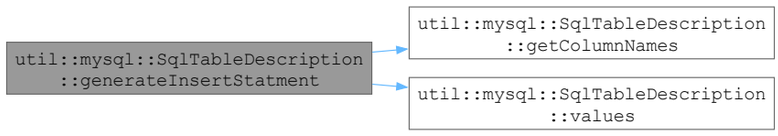
Returns

An SQL INSERT statement for this SQL table.

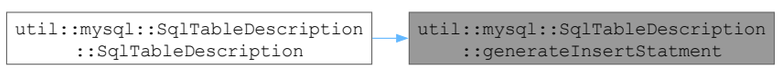
References util::mysql::SqlTableDescription< T >::getColumnNames(), util::mysql::SqlTableDescription< T >::insert_on_duplicate_key_ util::mysql::SqlTableDescription< T >::table_columns_, util::mysql::SqlTableDescription< T >::table_name_, and util::mysql::SqlTableDescription< T >::values().

Referenced by util::mysql::SqlTableDescription< T >::SqlTableDescription().

Here is the call graph for this function:



Here is the caller graph for this function:



10.43.4.10 GenerateObjectList()

```
template<class T >
vector< shared_ptr< T > > util::mysql::SqlTableDescription< T >::GenerateObjectList (
            shared_ptr< ResultSet > res) const  [inline], [private]
```

Generate a vector of object T from the given result set.

Parameters

in	*res*	A shared pointer to the result set from which the vector of objects is to be constructed.

Note

The columns of the result set must correspond in name, type, and order to column descriptions contained in SqlTableDescription<T>::table_columns_.

Exceptions

log::MessageException	if an error occurs while constructing the result vector.

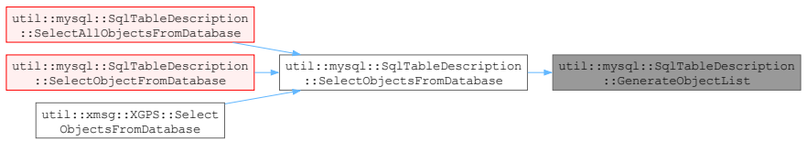
Returns

A vector of object T constructed from the given result set.

References EXC_THROW, and util::mysql::SqlTableDescription< T >::table_columns_.

Referenced by util::mysql::SqlTableDescription< T >::SelectObjectsFromDatabase().

Here is the caller graph for this function:



10.43.4.11 GeneratePreparedStatement()

```
static shared_ptr< PreparedStatement > util::mysql::MysqlUtils::GeneratePreparedStatement (
            Connection * con,
            const string & statement)  [inline], [static], [inherited]
```

Generate a prepared SQL statement object for the given SQL statement.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*statement*	The SQL statement to prepare. This must be a well-formed SQL string.

Exceptions

log::MessageException	if 'con' is NULL, 'statement' is not a valid SQL string, or if an error occurs.

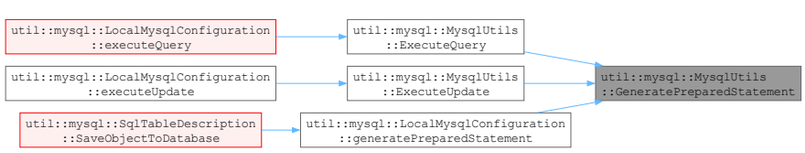
Returns

A prepared SQL statement object generated from the given SQL statement.

References CATCH_BLOCK, and EXC_THROW.

Referenced by util::mysql::MysqlUtils::ExecuteQuery(), util::mysql::MysqlUtils::ExecuteUpdate(), and util::mysql::LocalMysqlConfiguration:

Here is the caller graph for this function:



10.43.4.12 generatePreparedStatement()

```
std::shared_ptr< sql::PreparedStatement > util::mysql::LocalMysqlConfiguration::generatePrepared↩
Statement (
            const string & statement)  [static], [inherited]
```

Generate a prepared SQL statement object for the given SQL statement.

Parameters

in	*statement*	The SQL statement to prepare. This must be a well-formed SQL string.

Exceptions

log::MessageException	if 'statement' is not a valid SQL string or if an error occurs while generating the prepared statement object..

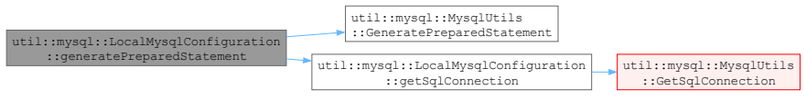
Returns

A prepared SQL statement object generated from the given SQL statement.

References util::mysql::MysqlUtils::GeneratePreparedStatement(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

Referenced by util::mysql::SqlTableDescription< T >::SaveObjectToDatabase().

Here is the call graph for this function:



Here is the caller graph for this function:

10.43.4.13 generateSelectAllStatement()

```
template<class T >
string util::mysql::SqlTableDescription< T >::generateSelectAllStatement ()  [inline]
```

Generate the "select all" SQL statement for this table.

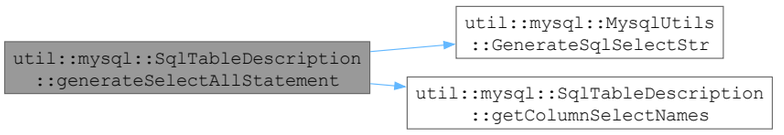
Returns

The "select all" SQL statement for this table.

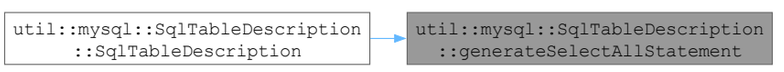
References util::mysql::MysqlUtils::GenerateSqlSelectStr(), util::mysql::SqlTableDescription< T >::getColumnSelectNames(), util::mysql::SqlTableDescription< T >::select_statement_, and util::mysql::SqlTableDescription< T >::table_name_.

Referenced by util::mysql::SqlTableDescription< T >::SqlTableDescription().

Here is the call graph for this function:



Here is the caller graph for this function:



10.43.4.14 GenerateSqlDeleteStr()

```
static string util::mysql::MysqlUtils::GenerateSqlDeleteStr (
            const string & from,
            const string & where = "")  [inline], [static], [inherited]
```

Generate an SQL DELETE statement.

Warning

Without a `where` clause, the statement deletes every row in the table.

Parameters

in	*from*	The name of the table to delete from.
in	*where*	The SQL "where-condition" clause (empty = all rows).

Returns

The SQL statement.

10.43.4.15 GenerateSqlSelectStr()

```
static string util::mysql::MysqlUtils::GenerateSqlSelectStr (
            const string & what,
            const string & from,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [inline], [static], [inherited]
```

Generate an SQL select statement.

Parameters

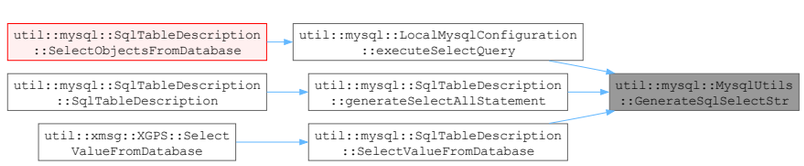
in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table-references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Returns

The SQL select statement.

Referenced by util::mysql::LocalMysqlConfiguration::executeSelectQuery(), util::mysql::SqlTableDescription< T >::generateSelectAllState
and util::mysql::SqlTableDescription< T >::SelectValueFromDatabase().

Here is the caller graph for this function:



10.43.4.16 getColumnNames()

```
template<class T >
string util::mysql::SqlTableDescription< T >::getColumnNames () const  [inline]
```

Generate a string containing comma-separated, ordered list of column names for this SQL table from the column descriptions.

Note

This function is used to generate both INSERT and SELECT query statements for the SQL table.

Returns

A string containing comma-separated, ordered list of column names for this SQL table.

References util::mysql::SqlTableDescription< T >::table_columns_.

Referenced by util::mysql::SqlTableDescription< T >::generateInsertStatment().

Here is the caller graph for this function:

10.43.4.17 getColumns()

```
template<class T >
vector< shared_ptr< SqlTableColumnDescriptionBase > > util::mysql::SqlTableDescription< T >↩
::getColumns () const  [inline]
```

Get the vector of shared pointers to ColumnDescription objects describing the columns of this SQL table.

Returns

The vector of shared pointers to ColumnDescription objects describing the columns of this SQL table.

References util::mysql::SqlTableDescription< T >::table_columns_.

10.43.4.18 getColumnSelectNames()

```
template<class T >
string util::mysql::SqlTableDescription< T >::getColumnSelectNames () const  [inline]
```

Generate a string containing comma-separated, ordered list of column names used for select statements for this SQL table from the column descriptions.

Note

This function is used to generate both INSERT and SELECT query statements for the SQL table.

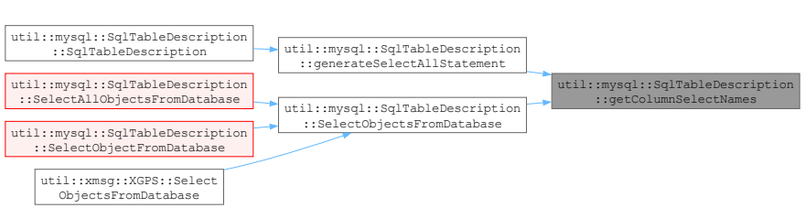
Returns

A string containing comma-separated, ordered list of column names for this SQL table.

References util::mysql::SqlTableDescription< T >::table_columns_.

Referenced by util::mysql::SqlTableDescription< T >::generateSelectAllStatement(), and util::mysql::SqlTableDescription< T >::SelectOb

Here is the caller graph for this function:



10.43.4.19 GetSqlConnection()

```
static thread_specific_ptr< Connection > & util::mysql::MysqlUtils::GetSqlConnection (
            string url,
            string user,
            string password,
            string schema)  [inline], [static], [inherited]
```

Get a thread-specific instance of a MySQL connection object.

A new connection will be created, if necessary.

Parameters

in	*url*	The MySQL host server qualified address.
in	*user*	The MySQL account username.
in	*password*	The MySQL account password.
in	*schema*	The MySQL account schema name.

Exceptions

log::MessageException	if an error occurs while creating a new thread-specific instance of the SQL connection object

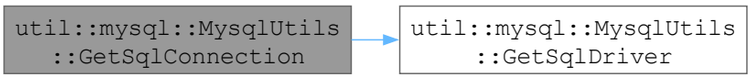
Returns

A thread-specific instance of a MySQL connection object.

References CATCH_BLOCK, util::mysql::MysqlUtils::GetSqlDriver(), and util::mysql::MysqlUtils::sql_connection_.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

Here is the call graph for this function:



Here is the caller graph for this function:

10.43.4.20 getSqlConnection()

```
sql::Connection * util::mysql::LocalMysqlConfiguration::getSqlConnection ()  [static], [protected],
[inherited]
```

Generate a thread-specific instance of a MySQL connection object.

A new connection will be created, if necessary.

Exceptions

log::MessageException	if an error occurs while generating the SQL connection object.

Returns

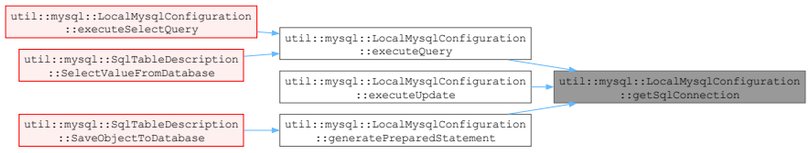
A thread-specific instance of a MySQL connection object.

References util::mysql::LocalMysqlConfiguration::address_, CATCH_BLOCK, util::mysql::MysqlUtils::GetSqlConnection(), util::mysql::LocalMysqlConfiguration::password_, util::mysql::LocalMysqlConfiguration::port_, util::mysql::LocalMysqlConfiguration::protoc util::mysql::LocalMysqlConfiguration::schema_, and util::mysql::LocalMysqlConfiguration::user_.

Referenced by util::mysql::LocalMysqlConfiguration::executeQuery(), util::mysql::LocalMysqlConfiguration::executeUpdate(), and util::mysql::LocalMysqlConfiguration::generatePreparedStatement().

Here is the call graph for this function:

Here is the caller graph for this function:



10.43.4.21 GetSqlDriver()

```
static thread_specific_ptr< MySQL_Driver > & util::mysql::MysqlUtils::GetSqlDriver ()  [inline],
[static], [inherited]
```

Get a thread-specific instance of a MySQL driver object.

A new driver will created, if necessary.

Exceptions

log::MessageException	if an error occurs while creating a new thread-specific instance of the SQL driver object

Returns

A thread-specific instance of a MySQL driver object.

References CATCH_BLOCK, and util::mysql::MysqlUtils::sql_driver_.

Referenced by util::mysql::MysqlUtils::GetSqlConnection().

Here is the caller graph for this function:

10.43.4.22 htoi()

```
static uint8_t util::stream::StreamUtils::htoi (
             char c)  [inline], [static], [inherited]
```

Get the integer value of a hexadecimal character.

Parameters

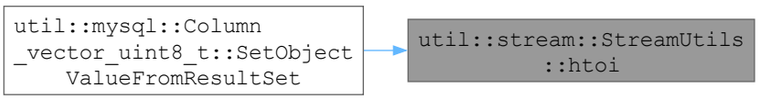
in	*c*	The hexadecimal character.

Returns

The integer value of a hexadecimal character, or 0 if c is not a hexadecimal character.

Referenced by util::mysql::Column_vector_uint8_t< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



10.43.4.23 SaveObjectToDatabase()

```
template<class T >
void util::mysql::SqlTableDescription< T >::SaveObjectToDatabase (
            const T & obj) const  [inline]
```

Save a persistent entity to the SQL table.

Exceptions

util::log::MessageException	if an error occurs.

Parameters

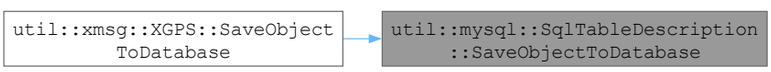
in	*obj*	The instance of the persistent entity to save to the SQL database table.

References CATCH_BLOCK, CATCH_NOTHROW, EXC_THROW, util::mysql::LocalMysqlConfiguration::generatePreparedStatement(), util::mysql::SqlTableDescription< T >::insert_on_duplicate_key_update_statement_, and util::mysql::SqlTableDescription< T >::table_co

Referenced by util::xmsg::XGPS::SaveObjectToDatabase().

Here is the call graph for this function:

Here is the caller graph for this function:



10.43.4.24 SelectAllObjectsFromDatabase()

```
template<class T >
vector< shared_ptr< T > > util::mysql::SqlTableDescription< T >::SelectAllObjectsFromDatabase (
            const string & groupBy = "",
            const string & orderBy = "",
            const unsigned int & limit = 0,
            const unsigned int & offset = 0) const  [inline]
```

Select all objects from this SQL database table.

Parameters

in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Exceptions

util::log::MessageException	if an error occurs while querying the database.

Returns

A vector of shared pointers to the object selected from the database.

References util::mysql::SqlTableDescription< T >::SelectObjectsFromDatabase().

Referenced by util::xmsg::XGPS::SelectAllObjectsFromDatabase().

Here is the call graph for this function:

Here is the caller graph for this function:

```
template<class T >
template<typename TT >
TT util::mysql::SqlTableDescription< T >::SelectValueFromDatabase (
            const string & what,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            const unsigned int & offset = 0) const  [inline]
```

Select a value from the SQL database table represented by this object.

Warning

The "select expression" clause must name a singular element when querying a singular value from the database.

Note

The result set of this query is always limited to a single result.

Parameters

in	*what*	The SQL select statement select-expression clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*offset*	The SQL select statement result set row offset.

Exceptions

log::MessageException	if an error occurs while querying the database or if con == NULL.

Returns

The selected value from the SQL database table represented by this object.

Todo Implement the functionality to parse values of type vector<uint8_t> from the result set of an SQL query.

References CATCH_BLOCK, EXC_THROW, util::mysql::LocalMysqlConfiguration::executeQuery(), util::mysql::MysqlUtils::GenerateSqlSe

10.43.5 Member Data Documentation

10.43.5.1 address_

```
std::string util::mysql::LocalMysqlConfiguration::address_  [static], [private], [inherited]
```

The SQL server qualified name or IP address string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.43.5.2 insert_on_duplicate_key_update_statement_

```
template<class T >
string util::mysql::SqlTableDescription< T >::insert_on_duplicate_key_update_statement_  [private]
```

The insert statement for this SQL table.

Referenced by util::mysql::SqlTableDescription< T >::generateInsertStatment(), and util::mysql::SqlTableDescription< T >::SaveObjectT

10.43.5.3 password_

```
std::string util::mysql::LocalMysqlConfiguration::password_  [static], [private], [inherited]
```

The SQL server account password string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.43.5.4 port_

```
unsigned int util::mysql::LocalMysqlConfiguration::port_  [static], [private], [inherited]
```

The SQL server port number.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.43.5.5 protocol_

```
std::string util::mysql::LocalMysqlConfiguration::protocol_  [static], [private], [inherited]
```

The protocol to use in the SQL server connection e.g.

"tcp".

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.43.5.6 schema_

```
std::string util::mysql::LocalMysqlConfiguration::schema_  [static], [private], [inherited]
```

The SQL server schema name.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.43.5.7 select_statement_

```
template<class T >
string util::mysql::SqlTableDescription< T >::select_statement_  [private]
```

The select all statement for this SQL table.

Referenced by util::mysql::SqlTableDescription< T >::generateSelectAllStatement().

10.43.5.8 sql_connection_

```
thread_specific_ptr<Connection> util::mysql::MysqlUtils::sql_connection_  [static], [private],
[inherited]
```

Tthe thread-specific pointer to MySQL connection object.

Thread-specific MySQL connection, released by `MysqlUtils::CleanupSqlConnection()` when the thread exits.

Referenced by util::mysql::MysqlUtils::CloseSqlConnection(), and util::mysql::MysqlUtils::GetSqlConnection().

10.43.5.9 sql_driver_

```
thread_specific_ptr<MySQL_Driver> util::mysql::MysqlUtils::sql_driver_  [static], [private],
[inherited]
```

The thread-specific pointer to MySQL driver object.

Thread-specific reference to the MySQL driver.

Its cleanup function, `MysqlUtils::CleanupSqlDriver()`, does not delete the shared driver instance.

Referenced by util::mysql::MysqlUtils::GetSqlDriver().

10.43.5.10 table_columns_

```
template<class T >
vector<shared_ptr<SqlTableColumnDescriptionBase> > util::mysql::SqlTableDescription< T >::table↩
_columns_  [private]
```

A vector of shared pointers to SqlTableColumnDescription objects describing the columns of this SQL table.

Referenced by util::mysql::SqlTableDescription< T >::SqlTableDescription(), util::mysql::SqlTableDescription< T >::generateInsertStatme
util::mysql::SqlTableDescription< T >::GenerateObjectList(), util::mysql::SqlTableDescription< T >::getColumnNames(),
util::mysql::SqlTableDescription< T >::getColumns(), util::mysql::SqlTableDescription< T >::getColumnSelectNames(),
util::mysql::SqlTableDescription< T >::SaveObjectToDatabase(), and util::mysql::SqlTableDescription< T >::SelectValueFromDatabase()

10.43.5.11 table_name_

```
template<class T >
string util::mysql::SqlTableDescription< T >::table_name_  [private]
```

The name of this SQL table.

Referenced by util::mysql::SqlTableDescription< T >::generateInsertStatment(), util::mysql::SqlTableDescription< T >::generateSelectAl
util::mysql::SqlTableDescription< T >::SelectObjectsFromDatabase(), and util::mysql::SqlTableDescription< T >::SelectValueFromDatab

10.43.5.12 user_

```
std::string util::mysql::LocalMysqlConfiguration::user_  [static], [private], [inherited]
```

The SQL server account username string.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.45 util::stream::StreamUtils Class Reference

Class providing useful functions for manipulating I/O streams.

`#include <StreamUtils.h>`

Inheritance diagram for util::stream::StreamUtils:

Static Public Member Functions

- static uint8_t htoi (char c)

  Get the integer value of a hexadecimal character.

10.45.1 Detailed Description

Class providing useful functions for manipulating I/O streams.

10.45.2 Member Function Documentation

10.45.2.1 htoi()

```
static uint8_t util::stream::StreamUtils::htoi (
            char c)  [inline], [static]
```

Get the integer value of a hexadecimal character.

Parameters

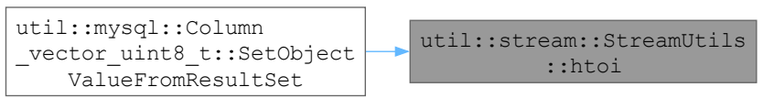
in	*c*	The hexadecimal character.

Returns

The integer value of a hexadecimal character, or 0 if c is not a hexadecimal character.

Referenced by util::mysql::Column_vector_uint8_t< C >::SetObjectValueFromResultSet().

Here is the caller graph for this function:



The documentation for this class was generated from the following file:

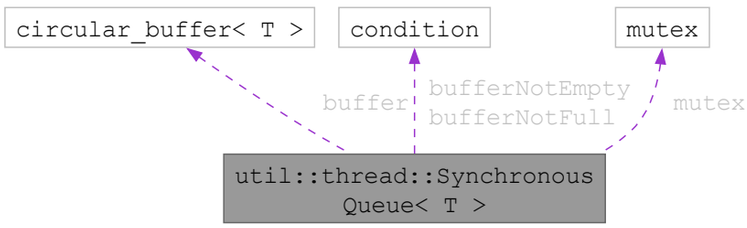
10.46 util::thread::SynchronousQueue< T > Class Template Reference

Synchronous queue template.

`#include <SynchronousQueue.h>`

Inheritance diagram for util::thread::SynchronousQueue< T >:

Collaboration diagram for util::thread::SynchronousQueue< T >:



Public Member Functions

- SynchronousQueue (size_t n)
  Constructor.
- bool **contains** (const T &elem) ATTR_DEPRECATED
- bool empty () const ATTR_DEPRECATED
  Is the queue empty?
- bool full () const ATTR_DEPRECATED
  Is the queue full?
- bool pop (T &elem, bool block)
  Pop element out of queue.
- bool push (const T &elem, bool block)
  Push element into queue.
- template<typename Iter >
  void push (Iter first, Iter last)
  Push multiple elements into queue.
- bool **pushIfNotContained** (const T &elem, bool block) ATTR_DEPRECATED
- size_t size () const ATTR_DEPRECATED
  Get the number of elements currently in the queue.

Private Attributes

- boost::circular_buffer< T > buffer

  Circular buffer for synchronized data storage.
- boost::condition bufferNotEmpty

  Conditional variable indicating that the buffer is not empty.
- boost::condition bufferNotFull

  Conditional variable indicating that the buffer is not full.
- boost::mutex mutex

  Mutual exclusion lock for synchronizing operations.

10.46.1 Detailed Description

template<typename T>
class util::thread::SynchronousQueue< T >

Synchronous queue template.

This template provides synchronized access to the underlying circular buffer and may be implemented for data of arbitrary type.

10.46.2 Constructor & Destructor Documentation

10.46.2.1 SynchronousQueue()

```
template<typename T >
util::thread::SynchronousQueue< T >::SynchronousQueue (
            size_t n)  [inline]
```

Constructor.

Parameters

in	*n*	Capacity of the underlying circular buffer to set.

10.46.3 Member Function Documentation

10.46.3.1 empty()

```
template<typename T >
bool util::thread::SynchronousQueue< T >::empty () const  [inline]
```

Is the queue empty?

Returns

TRUE if the buffer is empty, or FALSE otherwise.

References util::thread::SynchronousQueue< T >::buffer.

10.46.3.2 full()

```
template<typename T >
bool util::thread::SynchronousQueue< T >::full () const  [inline]
```

Is the queue full?

Returns

TRUE if the buffer is full, or FALSE otherwise.

References util::thread::SynchronousQueue< T >::buffer.

10.46.3.3 pop()

```
template<typename T >
bool util::thread::SynchronousQueue< T >::pop (
            T & elem,
            bool block)  [inline]
```

Pop element out of queue.

Parameters

out	*elem*	The destination of element to pop out of the queue.
in	*block*	If TRUE, this function will block until the queue is not empty. If FALSE, this function will return FALSE if the queue is empty (and no element will be popped out of the queue).

Returns

TRUE if the element was successfully popped out of the queue, or FALSE otherwise.

References util::thread::SynchronousQueue< T >::buffer, util::thread::SynchronousQueue< T >::bufferNotEmpty, and util::thread::SynchronousQueue< T >::bufferNotFull.

10.46.3.4 push() [1/2]

```
template<typename T >
bool util::thread::SynchronousQueue< T >::push (
            const T & elem,
            bool block)  [inline]
```

Push element into queue.

Parameters

in	*elem*	Element to push into queue.
in	*block*	If TRUE, this function will block until the queue is not full. If FALSE, this function will return FALSE if the queue is full (and the element will not be pushed into the queue).

Returns

TRUE if the element was successfully pushed into the queue, or FALSE otherwise.

References util::thread::SynchronousQueue< T >::buffer, util::thread::SynchronousQueue< T >::bufferNotEmpty, and util::thread::SynchronousQueue< T >::bufferNotFull.

10.46.3.5 push() [2/2]

```
template<typename T >
template<typename Iter >
void util::thread::SynchronousQueue< T >::push (
            Iter first,
            Iter last)  [inline]
```

Push multiple elements into queue.

Parameters

in	*first,last*	Input iterators to the initial and final positions in a range. The range used is [first,last), which includes all the elements between first and last, including the element pointed by first but not the element pointed by last.

References util::thread::SynchronousQueue< T >::buffer, util::thread::SynchronousQueue< T >::bufferNotEmpty, and util::thread::SynchronousQueue< T >::bufferNotFull.

10.46.3.6 size()

```
template<typename T >
size_t util::thread::SynchronousQueue< T >::size () const  [inline]
```

Get the number of elements currently in the queue.

Returns

The number of elements currently in the queue.

References util::thread::SynchronousQueue< T >::buffer.

10.46.4 Member Data Documentation

10.46.4.1 buffer

```
template<typename T >
boost::circular_buffer<T> util::thread::SynchronousQueue< T >::buffer  [private]
```

Circular buffer for synchronized data storage.

Referenced by util::thread::SynchronousQueue< T >::empty(), util::thread::SynchronousQueue< T >::full(), util::thread::SynchronousQu
util::thread::SynchronousQueue< T >::push(), util::thread::SynchronousQueue< T >::push(), and util::thread::SynchronousQueue< T >

10.46.4.2 bufferNotEmpty

```
template<typename T >
boost::condition util::thread::SynchronousQueue< T >::bufferNotEmpty  [private]
```

Conditional variable indicating that the buffer is not empty.

Referenced by util::thread::SynchronousQueue< T >::pop(), util::thread::SynchronousQueue< T >::push(), and util::thread::SynchronousQueue< T >::push().

10.46.4.3 bufferNotFull

```
template<typename T >
boost::condition util::thread::SynchronousQueue< T >::bufferNotFull  [private]
```

Conditional variable indicating that the buffer is not full.

Referenced by util::thread::SynchronousQueue< T >::pop(), util::thread::SynchronousQueue< T >::push(), and util::thread::SynchronousQueue< T >::push().

10.46.4.4 mutex

```
template<typename T >
boost::mutex util::thread::SynchronousQueue< T >::mutex  [mutable], [private]
```

Mutual exclusion lock for synchronizing operations.

The documentation for this class was generated from the following file:

- utility/SynchronousQueue.h

10.47 boost::thread_specific_ptr< B > Class Template Reference

Dummy template class used for configuring Doxygen to interpret boost::thread_specific_ptr objects as plain pointers.

```

10.48 util::thread::ThreadUtils Class Reference

Class providing useful functions for manipulating threads and processes.

```
#include <ThreadUtils.h>
```

Static Public Member Functions

- static std::string executeAndPipe (const char *cmd)
  Invoke an executable on the local filesystem, pipe the output of the command back to this application .
- static std::string executeAndPipe (const std::string &cmd)
  Invoke an executable on the local filesystem, pipe the output of the command back to this application .

10.48.1 Detailed Description

Class providing useful functions for manipulating threads and processes.

10.48.2 Member Function Documentation

10.48.2.1 executeAndPipe() [1/2]

```
static std::string util::thread::ThreadUtils::executeAndPipe (
            const char * cmd)  [inline], [static]
```

Invoke an executable on the local filesystem, pipe the output of the command back to this application .

Parameters

in	*cmd*	A pointer to the C-string containing the local system command to execute.

Exceptions

log::MessageException	if the pointer to the command string is null, the command string is zero length, or an error occurs while executing the external command or piping its output back to this application.

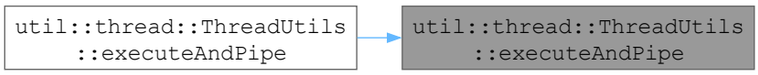
Returns

The output of the executed command.

References CATCH_BLOCK, dbg1, and EXC_THROW.

Referenced by executeAndPipe().

Here is the caller graph for this function:



10.48.2.2 executeAndPipe() [2/2]

```
static std::string util::thread::ThreadUtils::executeAndPipe (
            const std::string & cmd)  [inline], [static]
```

Invoke an executable on the local filesystem, pipe the output of the command back to this application .

Parameters

in	*cmd*	A reference to the string containing the local system command to execute.

Exceptions

log::MessageException	if the pointer to the command string is null, the command string is zero length, or an error occurs while executing the external command or piping its output back to this application.

Returns

The output of the executed command.

References executeAndPipe().

Private Attributes

- uint32_t **counter_**
- uint32_t mfd_power_
  Matched filter peak value, in dB.
- uint16_t psk_error_code_
  PSK error code enumeration.
- int32_t snr_in_
  Input SNR, in 1/10 dB.
- int32_t snr_out_
  SNR at output of equalizer, in 1/10 dB.
- int16_t src_
  Acoustic message source ID.
- uint32_t toa_sec_
  Time of arrival, in UNIX time.
- uint32_t toa_usec_
  Microsecond of arrival time.
- int **window_idx_**

Friends

- class **XAcousticPosition**

10.51.1 Detailed Description

An acoustic reception (CACST) record.

An instance of this class represents a single acoustic signal received by the instrument, decoded from an acoustic position message (see XAcousticPosition): its counter, time of arrival (seconds and microseconds), source identifier, signal power, PSK error code, input and output signal-to-noise ratios, and the index of the listening window it was received in.

10.51.2 Constructor & Destructor Documentation

10.51.2.1 XAcousticCacst() [1/2]

```
util::xmsg::XAcousticCacst::XAcousticCacst ()  [inline]
```

Default constructor.

10.51.2.2 XAcousticCacst() [2/2]

```
util::xmsg::XAcousticCacst::XAcousticCacst (
            const vector< uint8_t > & data)  [inline]
```

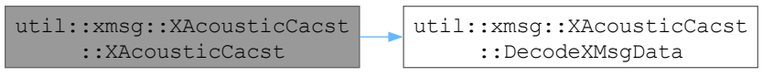
Construct from message data.

Parameters

in	*data*	The binary message data to decode.

References DecodeXMsgData().

Here is the call graph for this function:



10.51.2.3 ~XAcousticCacst()

```
util::xmsg::XAcousticCacst::~XAcousticCacst ()  [inline]
```

Destructor.

10.51.3 Member Function Documentation

10.51.3.1 DecodeXMsgData()

```
void util::xmsg::XAcousticCacst::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline]
```

Decode the acoustic position CACST X-Message from the binary message data.

Parameters

in	*data*	The binary message data to decode.

References CATCH_BLOCK, u16, and u32.

Referenced by XAcousticCacst().

Here is the caller graph for this function:

Matched filter peak value, in dB.

10.51.4.2 psk_error_code_

```
uint16_t util::xmsg::XAcousticCacst::psk_error_code_  [private]
```

PSK error code enumeration.

10.51.4.3 snr_in_

```
int32_t util::xmsg::XAcousticCacst::snr_in_  [private]
```

Input SNR, in 1/10 dB.

10.51.4.4 snr_out_

```
int32_t util::xmsg::XAcousticCacst::snr_out_  [private]
```

SNR at output of equalizer, in 1/10 dB.

10.51.4.5 src_

```
int16_t util::xmsg::XAcousticCacst::src_  [private]
```

Acoustic message source ID.

10.51.4.6 toa_sec_

```
uint32_t util::xmsg::XAcousticCacst::toa_sec_  [private]
```

Time of arrival, in UNIX time.

10.51.4.7 toa_usec_

```
uint32_t util::xmsg::XAcousticCacst::toa_usec_  [private]
```

Microsecond of arrival time.

Public Member Functions

- XAcousticPosition (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)

  Parameterized constructor.
- ~XAcousticPosition ()

  Destructor.
- void AssignWindowIndices (void)

  Number the acoustic listening windows and assign each ping to its window.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)

  Check the X-message for the correct ID, minimum size, and message terminator.
- void DecodeXMsgData (const vector< uint8_t > &data)

  Decode the acoustic position X-Message from the binary message data.
- const string GenerateListingString () const

  Generate a listing string representation of the acoustic position message.
- int16_t id_dive () const

  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const

  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const

  Get the enumerated X-Message type identifier.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Protected Member Functions

- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.

Private Attributes

- vector< shared_ptr< XAcousticCacst > > **acoustic_cacst_**
- vector< shared_ptr< XAcousticWindow > > **acoustic_window_**
- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.52.1 Detailed Description

Class representing an acoustic position X-Message.

Note

This message type was added in X-Message version 2.0.

This message type is used by marginal ice-zone (MIZ) floats only.

10.52.2 Constructor & Destructor Documentation

10.52.2.1 XAcousticPosition()

```
util::xmsg::XAcousticPosition::XAcousticPosition (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

Parameterized constructor.

Parameters

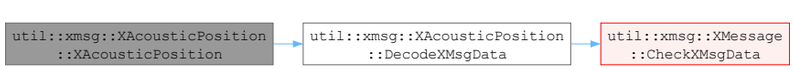
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.52.2.2 ~XAcousticPosition()

```
util::xmsg::XAcousticPosition::~XAcousticPosition ()  [inline]
```

Destructor.

10.52.3 Member Function Documentation

10.52.3.1 AssignWindowIndices()

```
void util::xmsg::XAcousticPosition::AssignWindowIndices (
            void )  [inline]
```

Number the acoustic listening windows and assign each ping to its window.

Windows are numbered in order, starting at 0. Each ping (CACST record) whose time of arrival falls within a window's start and end times is given that window's index, and the window's receive count is incremented. A ping outside every window keeps its window index unchanged.

Exceptions

util::log::MessageException	if an error occurs.

References CATCH_BLOCK.

10.52.3.2 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

10.53.1 Detailed Description

An acoustic listening window.

An instance of this class represents a period during which the instrument listened for acoustic signals, decoded from an acoustic position message (see XAcousticPosition): its start and end times, the pressure, temperature and salinity at the start and end, its index, and the number of receptions (see XAcousticCacst) that fall within it.

10.53.2 Constructor & Destructor Documentation

10.53.2.1 XAcousticWindow() [1/2]

```
util::xmsg::XAcousticWindow::XAcousticWindow ()  [inline]
```

Default constructor.

10.53.2.2 XAcousticWindow() [2/2]

```
util::xmsg::XAcousticWindow::XAcousticWindow (
            const vector< uint8_t > & data)  [inline]
```

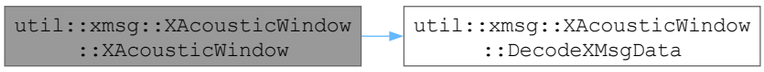
Construct from message data.

Parameters

in	*data*	The binary message data to decode.

References DecodeXMsgData().

Here is the call graph for this function:



10.53.2.3 ~XAcousticWindow()

```
util::xmsg::XAcousticWindow::~XAcousticWindow ()  [inline]
```

Destructor.

10.53.3 Member Function Documentation

10.53.3.1 DecodeXMsgData()

```
void util::xmsg::XAcousticWindow::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline]
```

Decode the acoustic position CACST X-Message from the binary message data.

Parameters

in	*data*	The binary message data to decode.

References CATCH_BLOCK, and u32.

Referenced by XAcousticWindow().

- uint16_t **vac_at_start_of_bit_**

10.54.1 Detailed Description

Class representing the BIT test of an ALAMO float.

10.54.2 Constructor & Destructor Documentation

10.54.2.1 XAlamoBit()

```
util::xmsg::XAlamoBit::XAlamoBit (
            const vector< uint8_t > & data)  [inline]
```

The parameterized constructor.

Parameters

in	*data*	The binary data to decode.

Exceptions

log::MessageException	if an error occurs while decoding.

References DecodeXMsgData().

Here is the call graph for this function:

10.54.2.2 ~XAlamoBit()

```
util::xmsg::XAlamoBit::~XAlamoBit ()  [inline]
```

The destructor.

10.54.3 Member Function Documentation

10.54.3.1 bit_status_code()

```
uint32_t util::xmsg::XAlamoBit::bit_status_code () const  [inline]
```

Get the Built-in-Test (BIT) status code.

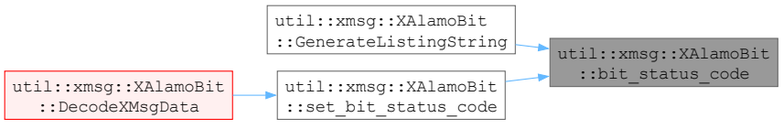
Returns

The Built-in-Test (BIT) status code.

References bit_status_code_.

Referenced by GenerateListingString(), and set_bit_status_code().

Here is the caller graph for this function:



10.54.3.2 bit_version()

```
uint8_t util::xmsg::XAlamoBit::bit_version () const  [inline]
```

Get the Built-in-Test (BIT) version.

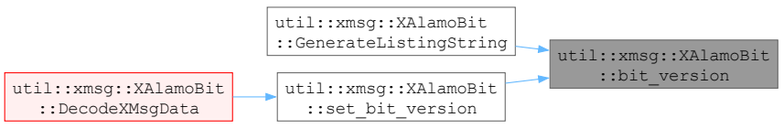
Returns

The Built-in-Test (BIT) version.

References bit_version_.

Referenced by GenerateListingString(), and set_bit_version().

Here is the caller graph for this function:



10.54.3.3 DecodeXMsgData()

```
void util::xmsg::XAlamoBit::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline]
```

Decode the ALAMO BIT test engineering message from the binary message data.

Parameters

in	*data*	The binary data to decode.

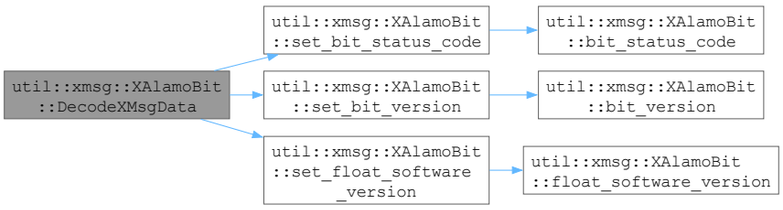
Exceptions

log::MessageException	if an error occurs while decoding.

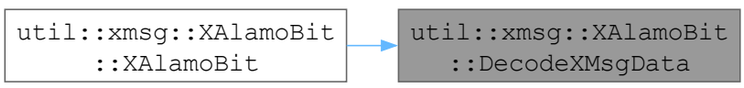
References bit_version_, CATCH_BLOCK, EXC_THROW, set_bit_status_code(), set_bit_version(), set_float_software_version(), u08, u16, and u32.

Referenced by XAlamoBit().

Here is the call graph for this function:



Here is the caller graph for this function:



10.54.3.4 float_software_version()

```
uint32_t util::xmsg::XAlamoBit::float_software_version () const  [inline]
```

Get the instrument software version.

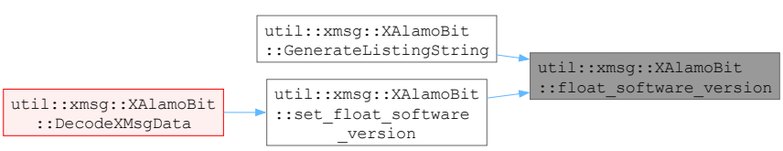
Returns

The instrument software version.

References float_software_version_.

Referenced by GenerateListingString(), and set_float_software_version().

Here is the caller graph for this function:



10.54.3.5 GenerateListingString()

```
const string util::xmsg::XAlamoBit::GenerateListingString (
            int whoi,
            int dive,
            uint16_t pg,
            uint16_t po,
            uint16_t sg,
            uint16_t so,
            uint16_t tg,
            uint16_t to) const  [inline]
```

Generate a listing entry string representation of the the ALAMO BIT test engineering message.

Parameters

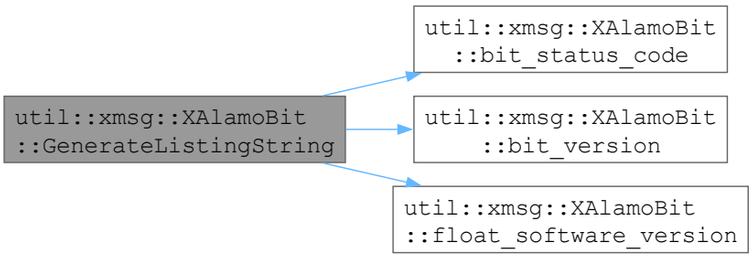
in	*whoi*	The instrument serial number.
in	*dive*	The dive number of this ALAMO BIT test engineering message.
in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*sg*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*so*	The salinity sensor offset, in PSU.
in	*tg*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*to*	The temperatUre sensor offset, in degC.

Returns

A listing entry string representation of the the ALAMO BIT test engineering message.

References bit_status_code(), bit_version(), bit_version_, EXC_THROW, and float_software_version().

Here is the call graph for this function:



10.54.3.6 set_bit_status_code()

```
void util::xmsg::XAlamoBit::set_bit_status_code (
            uint32_t bit_status_code)  [inline], [protected]
```

Set the Built-in-Test (BIT) status code.

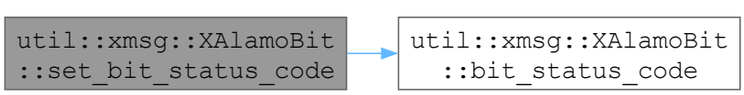
Parameters

in	*bit_status_code*	The Built-in-Test (BIT) status code to set.

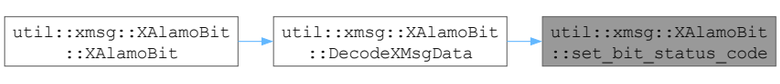
References bit_status_code(), and bit_status_code_.

Referenced by DecodeXMsgData().

Here is the call graph for this function:



Here is the caller graph for this function:



10.54.3.7 set_bit_version()

```
void util::xmsg::XAlamoBit::set_bit_version (
            uint8_t bit_version)  [inline], [protected]
```

Set the Built-in-Test (BIT) version.

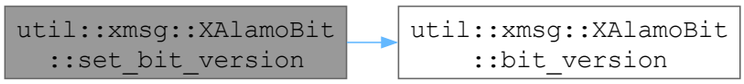
Parameters

in	*bit_version*	The Built-in-Test (BIT) version to set.

References bit_version(), and bit_version_.

Referenced by DecodeXMsgData().

Here is the call graph for this function:



Here is the caller graph for this function:

10.54.3.8 set_float_software_version()

```
void util::xmsg::XAlamoBit::set_float_software_version (
            uint32_t float_software_version)  [inline], [protected]
```

Set the instrument software version.

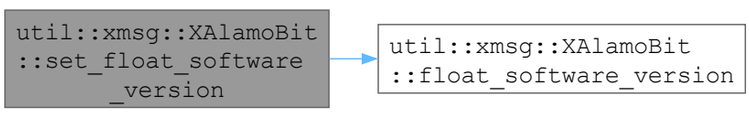
Parameters

in	*float_software_version*	The instrument software version to set.

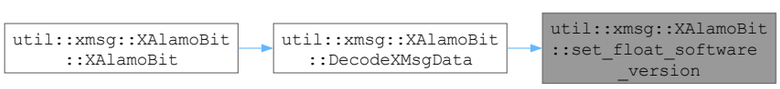
References float_software_version(), and float_software_version_.

Referenced by DecodeXMsgData().

Here is the call graph for this function:



Here is the caller graph for this function:



10.54.4 Member Data Documentation

10.54.4.1 bit_status_code_

```
uint32_t util::xmsg::XAlamoBit::bit_status_code_  [private]
```

The Built-in-Test (BIT) status code.

Referenced by bit_status_code(), and set_bit_status_code().

10.54.4.2 bit_version_

```
uint8_t util::xmsg::XAlamoBit::bit_version_  [private]
```

The Built-in-Test (BIT) version identifier.

Referenced by bit_version(), DecodeXMsgData(), GenerateListingString(), and set_bit_version().

10.54.4.3 float_software_version_

```
uint32_t util::xmsg::XAlamoBit::float_software_version_  [private]
```

The software version identifier.

Referenced by float_software_version(), and set_float_software_version().

10.54.4.4 pres_offset_

```
uint16_t util::xmsg::XAlamoBit::pres_offset_  [private]
```

The measured pressure offset, in 1/1000 dBar.

The documentation for this class was generated from the following file:

- data/xmsg/XAlamoBit.h

10.55 util::xmsg::XAlamoBit2 Class Reference

The ALAMO Built-in-Test (BIT) message, version 2.

`#include <XAlamoBit2.h>`

Static Public Member Functions

- static string GenerateCurrentUtcTimeIso8601String ()

  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- static string GenerateIso8601String (const ptime &p, bool extended=true)

  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)

  Convert a date/time to fractional days since a reference date/time.
- static ptime GetCurrentUtcTime ()

  Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Private Attributes

- float **air_pump_curr_avg_**
- float air_pump_curr_max_

  Max.
- uint8_t air_pump_cycle_count_

  Air pump cycle count.
- uint32_t air_pump_errors_

  Air pump errors bitmask.
- float **air_pump_pres_max_**
- uint16_t air_pump_test_duration_

  Air pump test duration, in seconds.
- float air_pump_v12_curr_max_

  Max.
- float air_pump_volt_max_

  Max.
- float **air_valve_cal_closed_**
- float **air_valve_cal_mid_**
- float air_valve_cal_open_

  Air valve open, closed, and middle calibration positions, in volts.
- float **air_valve_closed_**
- uint32_t air_valve_errors_

  Air valve errors bitmask.
- float **air_valve_mid_**
- float air_valve_open_

  Air valve open, closed, and middle positions, in volts.
- uint32_t **bat_errors_**
- float **bat_volt_end_**
- float bat_volt_start_

  Battery voltages at start and end of BIT, in volts.
- bool bit_passed_

  The BIT passed flag.
- uint32_t bit_status_code_

  The Built-in-Test (BIT) status code.
- uint8_t bit_version_

  The Built-in-Test (BIT) version identifier.
- uint32_t **case_pres_errors_**
- float **case_vac_end_**
- float case_vac_start_

  Case vac at start and end of BIT, in inHg.
- uint32_t **ctd_errors_**
- uint32_t **ctd_status_**
- ptime dt_end_

  BIT End time.
- uint32_t dt_end_epoch_

  BIT End time, in seconds since 1970-01-01T00:00:00Z.
- ptime dt_start_

  BIT Start time.
- uint32_t dt_start_epoch_

  BIT start time, in seconds since 1970-01-01T00:00:00Z.
- int32_t duration_sec_

  BIT duration in seconds.
- uint32_t float_software_version_

  The software version identifier.
- uint32_t gps_errors_

  GPS errors bitmask.
- uint32_t **iridum_errors_**
- float **oil_pump_curr_avg_**
- float oil_pump_curr_max_

  Max.
- uint32_t oil_pump_errors_

  Oil pump errors bitmask.
- uint16_t oil_pump_test_duration_

  Oil pump test duration, in seconds.

- float oil_pump_v12_curr_max_

  Max 12V rail current during oil pump test, in amps.
- float oil_pump_volt_max_

  Max battery voltage during oil pump test, in volts.
- float **oil_valve_cal_closed_**
- float oil_valve_cal_open_

  Oil valve open and clased calibration positions, in volts.
- float **oil_valve_closed_**
- uint32_t oil_valve_errors_

  Oil valve errors bitmask.
- float oil_valve_open_

  Oil valve open and closed positions, in volts.
- float **pres_after_cal_**
- float **pres_before_cal_**
- float **pres_offset_**
- float **saln_**
- uint8_t sensor_type_

  Sensor type enum.
- float **temp_**
- uint32_t **traveler_errors_**
- uint8_t type_

  BIT test type enum.

10.55.1 Detailed Description

The ALAMO Built-in-Test (BIT) message, version 2.

An instance of this class represents a decoded BIT message from ALAMO instruments with firmware version 10.x or later (BIT formats 9, 10 and 11; see XEngBIT). Earlier instruments use XAlamoBit.

10.55.2 Constructor & Destructor Documentation

10.55.2.1 XAlamoBit2()

```
util::xmsg::XAlamoBit2::XAlamoBit2 (
            const vector< uint8_t > & data)  [inline]
```

The parameterized constructor.

Parameters

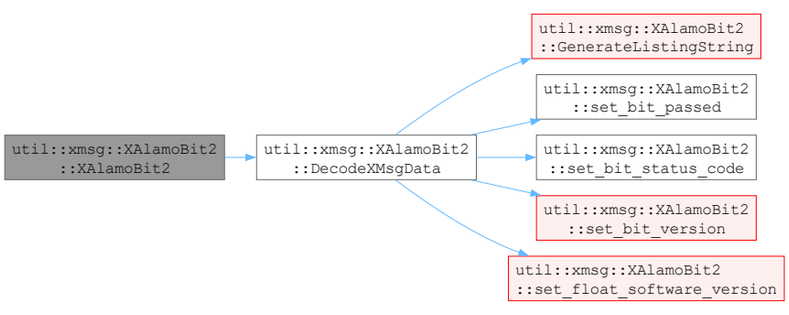
in	*data*	The binary data to decode.

Exceptions

log::MessageException	if an error occurs while decoding.

References DecodeXMsgData().

Here is the call graph for this function:



10.55.2.2 ~XAlamoBit2()

```
util::xmsg::XAlamoBit2::~XAlamoBit2 ()  [inline]
```

The destructor.

10.55.3 Member Function Documentation

10.55.3.1 bit_version()

```
uint8_t util::xmsg::XAlamoBit2::bit_version () const  [inline]
```

Get the Built-in-Test (BIT) version.

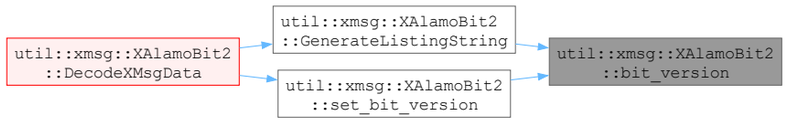
Returns

The Built-in-Test (BIT) version.

References bit_version_.

Referenced by GenerateListingString(), and set_bit_version().

Here is the caller graph for this function:



10.55.3.2 DecodeXMsgData()

```
void util::xmsg::XAlamoBit2::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline]
```

Decode the ALAMO BIT test engineering message from the binary message data.

Parameters

in	*data*	The binary data to decode.

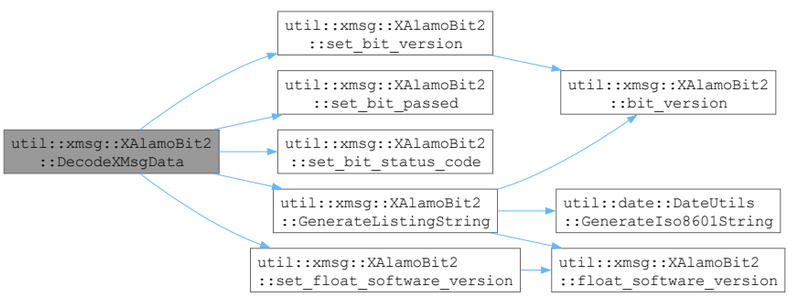
Exceptions

log::MessageException	if an error occurs while decoding.

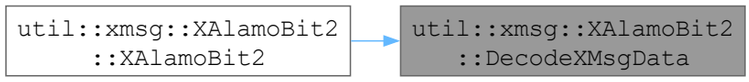
References bit_version_, CATCH_BLOCK, EXC_THROW, GenerateListingString(), ldbg, lwrn, s1970, set_bit_passed(), set_bit_status_code(), set_bit_version(), set_float_software_version(), u08, u16, and u32.

Referenced by XAlamoBit2().

Here is the call graph for this function:



Here is the caller graph for this function:



10.55.3.3 float_software_version()

```
uint32_t util::xmsg::XAlamoBit2::float_software_version () const  [inline]
```

Get the instrument software version.

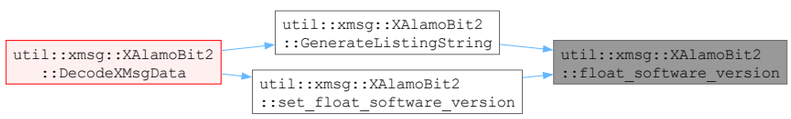
Returns

The instrument software version.

References float_software_version_.

Referenced by GenerateListingString(), and set_float_software_version().

Here is the caller graph for this function:



10.55.3.4 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

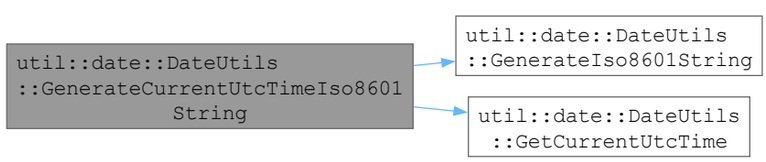
Returns

An ISO8601 format date/time string representation of the current time.

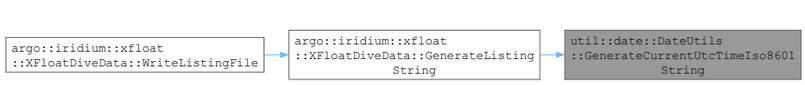
References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:



10.55.3.5 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

10.55.3.6 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref_dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.55.3.7 GenerateListingString()

```
const string util::xmsg::XAlamoBit2::GenerateListingString (
            int whoi,
            int dive) const  [inline]
```

Generate a listing entry string representation of the the ALAMO BIT test engineering message.

Parameters

in	*whoi*	The instrument serial number.
in	*dive*	The dive number of this ALAMO BIT test engineering message.

Returns

A listing entry string representation of the the ALAMO BIT test engineering message.

References bit_version(), EXC_THROW, float_software_version(), and util::date::DateUtils::GenerateIso8601String().

Referenced by DecodeXMsgData().

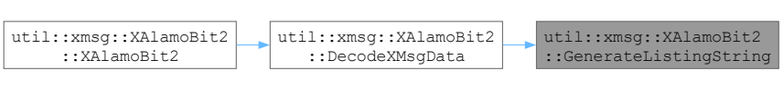
Here is the caller graph for this function:



10.55.3.8 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

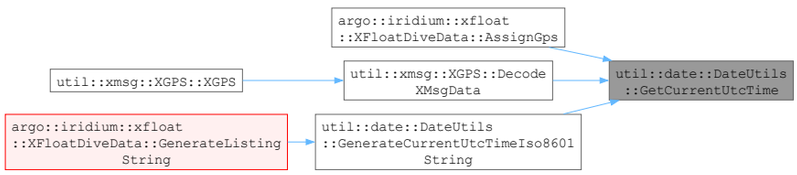
Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

Here is the caller graph for this function:



10.55.3.9 set_bit_passed()

```
void util::xmsg::XAlamoBit2::set_bit_passed (
            bool bit_passed)  [inline], [protected]
```

Set the BIT passed flag.

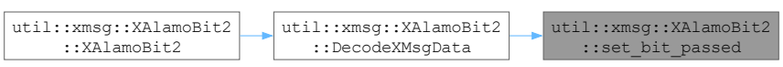
Parameters

in	*bit_passed*	BIT passed flag to set.

References bit_passed_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.55.3.10 set_bit_status_code()

```
void util::xmsg::XAlamoBit2::set_bit_status_code (
            uint32_t bit_status_code)  [inline], [protected]
```

Set the Built-in-Test (BIT) status code.

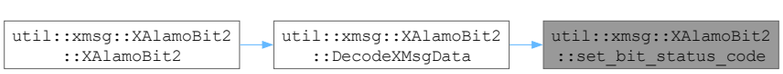
Parameters

in	*bit_status_code*	The Built-in-Test (BIT) status code to set.

References bit_status_code_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.55.3.11 set_bit_version()

```
void util::xmsg::XAlamoBit2::set_bit_version (
            uint8_t bit_version)  [inline], [protected]
```

Set the Built-in-Test (BIT) version.

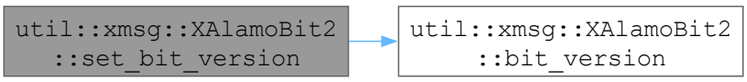
Parameters

in	*bit_version*	The Built-in-Test (BIT) version to set.

References bit_version(), and bit_version_.

Referenced by DecodeXMsgData().

Here is the call graph for this function:



Here is the caller graph for this function:

10.55.3.12 set_float_software_version()

```
void util::xmsg::XAlamoBit2::set_float_software_version (
            uint32_t float_software_version)  [inline], [protected]
```

Set the instrument software version.

Parameters

in	*float_software_version*	The instrument software version to set.

References float_software_version(), and float_software_version_.

Referenced by DecodeXMsgData().

10.55.4 Member Data Documentation

10.55.4.1 air_pump_curr_max_

```
float util::xmsg::XAlamoBit2::air_pump_curr_max_  [private]
```

Max.

and mean current during air pump test, in amps.

10.55.4.2 air_pump_cycle_count_

```
uint8_t util::xmsg::XAlamoBit2::air_pump_cycle_count_  [private]
```

Air pump cycle count.

10.55.4.3 air_pump_errors_

```
uint32_t util::xmsg::XAlamoBit2::air_pump_errors_  [private]
```

Air pump errors bitmask.

10.55.4.4 air_pump_test_duration_

```
uint16_t util::xmsg::XAlamoBit2::air_pump_test_duration_  [private]
```

Air pump test duration, in seconds.

10.55.4.5 air_pump_v12_curr_max_

```
float util::xmsg::XAlamoBit2::air_pump_v12_curr_max_  [private]
```

Max.

12V rail current during air pump test, in amps.

10.55.4.6 air_pump_volt_max_

```
float util::xmsg::XAlamoBit2::air_pump_volt_max_  [private]
```

Max.

voltage during air pump test, in volts.

10.55.4.7 air_valve_cal_open_

```
float util::xmsg::XAlamoBit2::air_valve_cal_open_  [private]
```

Air valve open, closed, and middle calibration positions, in volts.

10.55.4.8 air_valve_errors_

```
uint32_t util::xmsg::XAlamoBit2::air_valve_errors_  [private]
```

Air valve errors bitmask.

10.55.4.9 air_valve_open_

```
float util::xmsg::XAlamoBit2::air_valve_open_  [private]
```

Air valve open, closed, and middle positions, in volts.

10.55.4.10 bat_volt_start_

```
float util::xmsg::XAlamoBit2::bat_volt_start_  [private]
```

Battery voltages at start and end of BIT, in volts.

10.55.4.11 bit_passed_

```
bool util::xmsg::XAlamoBit2::bit_passed_  [private]
```

The BIT passed flag.

Referenced by set_bit_passed().

10.55.4.12 bit_status_code_

```
uint32_t util::xmsg::XAlamoBit2::bit_status_code_  [private]
```

The Built-in-Test (BIT) status code.

Referenced by set_bit_status_code().

10.55.4.13 bit_version_

```
uint8_t util::xmsg::XAlamoBit2::bit_version_  [private]
```

The Built-in-Test (BIT) version identifier.

Referenced by bit_version(), DecodeXMsgData(), and set_bit_version().

10.55.4.14 case_vac_start_

```
float util::xmsg::XAlamoBit2::case_vac_start_  [private]
```

Case vac at start and end of BIT, in inHg.

10.55.4.15 dt_end_

```
ptime util::xmsg::XAlamoBit2::dt_end_  [private]
```

BIT End time.

10.55.4.16 dt_end_epoch_

```
uint32_t util::xmsg::XAlamoBit2::dt_end_epoch_  [private]
```

BIT End time, in seconds since 1970-01-01T00:00:00Z.

10.55.4.17 dt_start_

```
ptime util::xmsg::XAlamoBit2::dt_start_  [private]
```

BIT Start time.

10.55.4.18 dt_start_epoch_

```
uint32_t util::xmsg::XAlamoBit2::dt_start_epoch_  [private]
```

BIT start time, in seconds since 1970-01-01T00:00:00Z.

10.55.4.19 duration_sec_

```
int32_t util::xmsg::XAlamoBit2::duration_sec_  [private]
```

BIT duration in seconds.

10.55.4.20 float_software_version_

```
uint32_t util::xmsg::XAlamoBit2::float_software_version_  [private]
```

The software version identifier.

Referenced by float_software_version(), and set_float_software_version().

10.55.4.21 gps_errors_

```
uint32_t util::xmsg::XAlamoBit2::gps_errors_  [private]
```

GPS errors bitmask.

10.55.4.22 oil_pump_curr_max_

```
float util::xmsg::XAlamoBit2::oil_pump_curr_max_  [private]
```

Max.

and mean oil pump current during test, in amps.

10.55.4.23 oil_pump_errors_

```
uint32_t util::xmsg::XAlamoBit2::oil_pump_errors_  [private]
```

Oil pump errors bitmask.

10.55.4.24 oil_pump_test_duration_

```
uint16_t util::xmsg::XAlamoBit2::oil_pump_test_duration_  [private]
```

Oil pump test duration, in seconds.

10.55.4.25 oil_pump_v12_curr_max_

```
float util::xmsg::XAlamoBit2::oil_pump_v12_curr_max_  [private]
```

Max 12V rail current during oil pump test, in amps.

10.55.4.26 oil_pump_volt_max_

```
float util::xmsg::XAlamoBit2::oil_pump_volt_max_  [private]
```

Max battery voltage during oil pump test, in volts.

10.55.4.27 oil_valve_cal_open_

```
float util::xmsg::XAlamoBit2::oil_valve_cal_open_  [private]
```

Oil valve open and clased calibration positions, in volts.

10.55.4.28 oil_valve_errors_

```
uint32_t util::xmsg::XAlamoBit2::oil_valve_errors_  [private]
```

Oil valve errors bitmask.

10.55.4.29 oil_valve_open_

```
float util::xmsg::XAlamoBit2::oil_valve_open_  [private]
```

Oil valve open and closed positions, in volts.

10.55.4.30 sensor_type_

```
uint8_t util::xmsg::XAlamoBit2::sensor_type_  [private]
```

Sensor type enum.

10.55.4.31 type_

```
uint8_t util::xmsg::XAlamoBit2::type_  [private]
```

BIT test type enum.

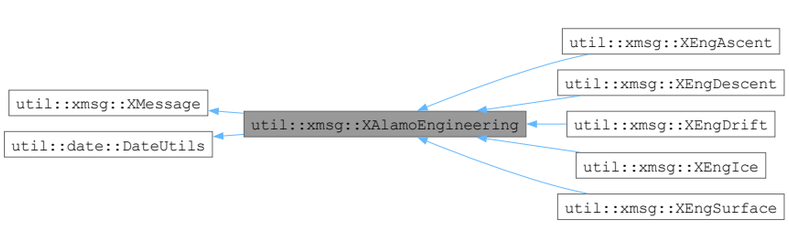
10.56 util::xmsg::XAlamoEngineering Class Reference

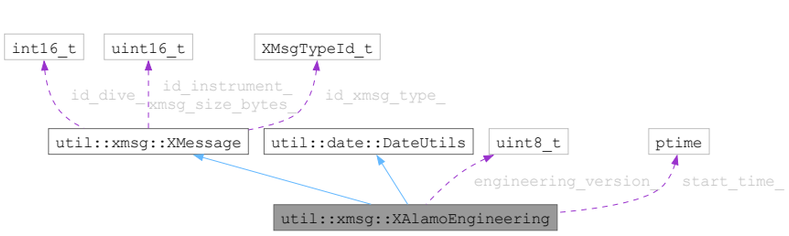
Abstract class representing a version controlled engineering message for ALAMO-type instruments.

`#include <XAlamoEngineering.h>`

Inheritance diagram for util::xmsg::XAlamoEngineering:



Collaboration diagram for util::xmsg::XAlamoEngineering:



Public Member Functions

- XAlamoEngineering (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)
  Parameterized constructor.
- virtual ~XAlamoEngineering ()
  Destructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)
  Check the X-message for the correct ID, minimum size, and message terminator.
- virtual void DecodeXMsgData (const vector< uint8_t > &data)=0
  Decode the X-Message data.
- uint8_t engineering_version () const
  Get the engineering message version identifier.
- float engineering_version_as_float () const
  Get the engineering message verion identifier as a floating point number.
- int16_t id_dive () const
  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const
  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const
  Get the enumerated X-Message type identifier.
- const ptime & start_time () const
  Get the engineering message state start time.
- uint16_t xmsg_size_bytes () const
  Get the size of the X-Message, in bytes.

Static Public Member Functions

- static string GenerateCurrentUtcTimeIso8601String ()
  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- static string GenerateIso8601String (const ptime &p, bool extended=true)
  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)
  Convert a date/time to fractional days since a reference date/time.
- static ptime GetCurrentUtcTime ()
  Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Protected Member Functions

- void set_engineering_version (uint8_t engineering_version)
  Set the engineering message version identifier.
- void set_id_dive (int16_t id_dive)
  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)
  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)
  Set the X-Message type identifier.
- void set_start_time (const ptime &start_time)
  Set the engineering message state start time.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)
  Set the size of the X-Message, in bytes.

Private Attributes

- uint8_t engineering_version_
  The engineering message version identifier.
- int16_t id_dive_
  The dive or cycle number of this message.
- uint16_t id_instrument_
  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_
  The X-message type identifier.
- ptime start_time_
  The engineering message state start time.
- uint16_t xmsg_size_bytes_
  The size of the X message, in bytes.

10.56.1 Detailed Description

Abstract class representing a version controlled engineering message for ALAMO-type instruments.

Note

The X-Message types extended from this class are used by ALAMO-type instruments only.

The X-Message types extended from this class were introduced in the X-Message format specification version 2.1.

10.56.2 Constructor & Destructor Documentation

10.56.2.1 XAlamoEngineering()

```
util::xmsg::XAlamoEngineering::XAlamoEngineering (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

Parameterized constructor.

Parameters

in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

10.56.2.2 ~XAlamoEngineering()

```
virtual util::xmsg::XAlamoEngineering::~XAlamoEngineering ()  [inline], [virtual]
```

Destructor.

10.56.3 Member Function Documentation

10.56.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::XMessage::set_xmsg_size_byte
u16, and util::xmsg::XMessage::xmsg_size_bytes().

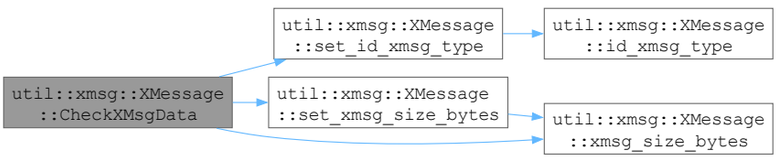
util::xmsg::XValve::DecodeXMsgData(), util::xmsg::XWave::DecodeXMsgData(), and util::xmsg::AbstractXFallRise::UnpackData().

Here is the call graph for this function:



10.56.3.2 DecodeXMsgData()

```
virtual void util::xmsg::XMessage::DecodeXMsgData (
            const vector< uint8_t > & data)  [pure virtual], [inherited]
```

Decode the X-Message data.

Parameters

in	*data*	The encoded X message to decode.

Implemented in util::xmsg::AbstractXFallRise, util::xmsg::AbstractXSensorData, util::xmsg::XAcousticPosition, util::xmsg::XArgo, util::xmsg::XDriftPressure, util::xmsg::XDriftSalinity, util::xmsg::XDriftTemperature, util::xmsg::XEngAbort, util::xmsg::XEngAscent, util::xmsg::XEngBIT, util::xmsg::XEngDescent, util::xmsg::XEngDiagnostic, util::xmsg::XEngDrift, util::xmsg::XEngIce, util::xmsg::XEngSurface, util::xmsg::XFall, util::xmsg::XGPS, util::xmsg::XHiResPressure, util::xmsg::XHiResSalinity, util::xmsg::XHiResTemperature, util::xmsg::XMessageIndexable, util::xmsg::XMissionCmdEcho, util::xmsg::XMissionConfiguration, util::xmsg::XProfilePressure, util::xmsg::XProfileSalinity, util::xmsg::XProfileTemperature, util::xmsg::XPump, util::xmsg::XRise, util::xmsg::XSurfaceData, util::xmsg::XValve, and util::xmsg::XWave.

10.56.3.3 engineering_version()

```
uint8_t util::xmsg::XAlamoEngineering::engineering_version () const  [inline]
```

Get the engineering message version identifier.

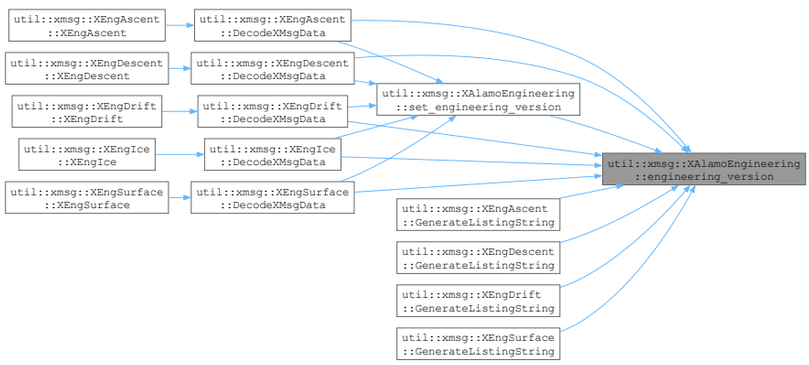
Returns

The engineering message version identifier.

References engineering_version_.

Referenced by util::xmsg::XEngAscent::DecodeXMsgData(), util::xmsg::XEngDescent::DecodeXMsgData(), util::xmsg::XEngDrift::Decode
util::xmsg::XEngIce::DecodeXMsgData(), util::xmsg::XEngSurface::DecodeXMsgData(), util::xmsg::XEngAscent::GenerateListingString(),
util::xmsg::XEngDescent::GenerateListingString(), util::xmsg::XEngDrift::GenerateListingString(), util::xmsg::XEngSurface::GenerateListin
and set_engineering_version().

Here is the caller graph for this function:



10.56.3.4 engineering_version_as_float()

```
float util::xmsg::XAlamoEngineering::engineering_version_as_float () const  [inline]
```

Get the engineering message verion identifier as a floating point number.

Returns

The engineering message verion identifier as a floating point number.

References engineering_version_.

10.56.3.5 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

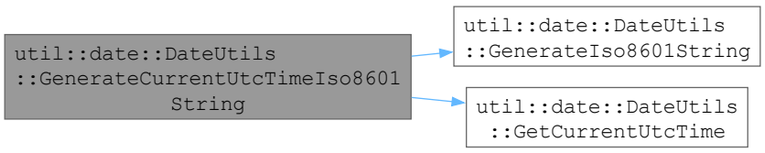
Returns

An ISO8601 format date/time string representation of the current time.

References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:

10.56.3.6 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

10.56.3.7 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref↩ _dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.56.3.8 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

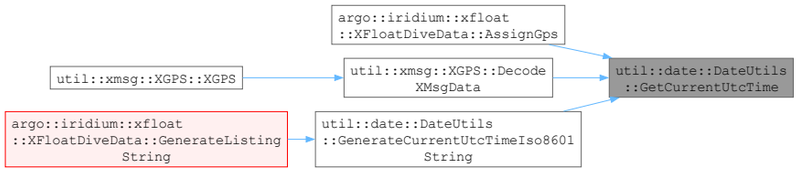
Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

Here is the caller graph for this function:



10.56.3.9 id_dive()

```
int16_t util::xmsg::XMessage::id_dive () const  [inline], [inherited]
```

Get the dive or cycle number of this X-Message.

Returns

The dive or cycle number of this X-Message.

References util::xmsg::XMessage::id_dive_.

Referenced by util::xmsg::XGPS::DeleteFromDatabase(), util::xmsg::XArgo::GenerateListingString(), util::xmsg::XEngAscent::GenerateLis

10.56.3.13 set_id_dive()

```
void util::xmsg::XMessage::set_id_dive (
            int16_t id_dive)  [inline], [protected], [inherited]
```

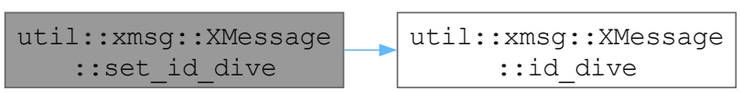
Set the dive or cycle number of this message.

Parameters

in	*id_dive*	The dive or cycle number of this message to set.

References util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::id_dive_.

Here is the call graph for this function:



10.56.3.14 set_id_instrument()

```
void util::xmsg::XMessage::set_id_instrument (
            uint16_t id_instrument)  [inline], [protected], [inherited]
```

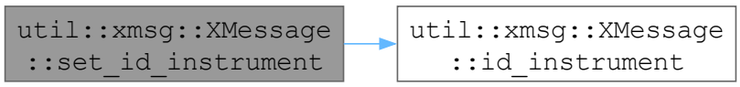
Set the unique instrument identifier.

Parameters

in	*id_instrument*	The unique instrument identifier to set.

References util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::id_instrument_.

Here is the call graph for this function:



10.56.3.15 set_id_xmsg_type()

```
void util::xmsg::XMessage::set_id_xmsg_type (
            XMsgTypeId_t id_xmsg_type)  [inline], [protected], [inherited]
```

Set the X-Message type identifier.

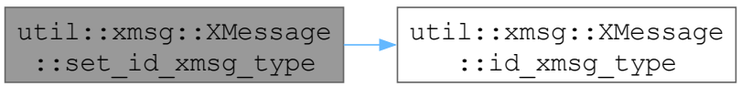
Parameters

in	*id_xmsg_type*	The X-Message type identifier to set.

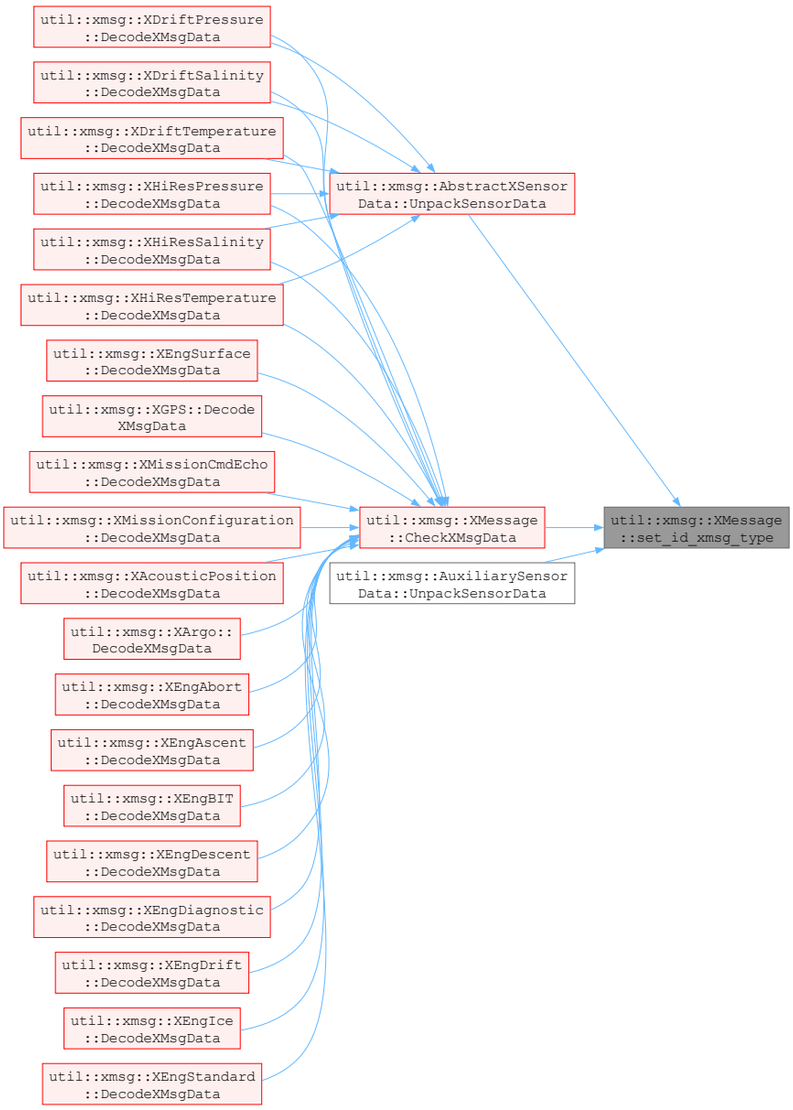
References util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::id_xmsg_type_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

Here is the call graph for this function:



Here is the caller graph for this function:



10.56.3.16 set_start_time()

```
void util::xmsg::XAlamoEngineering::set_start_time (
            const ptime & start_time)  [inline], [protected]
```

Set the engineering message state start time.

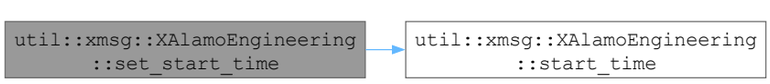
Parameters

in	*start_time*	The engineering message state start time.

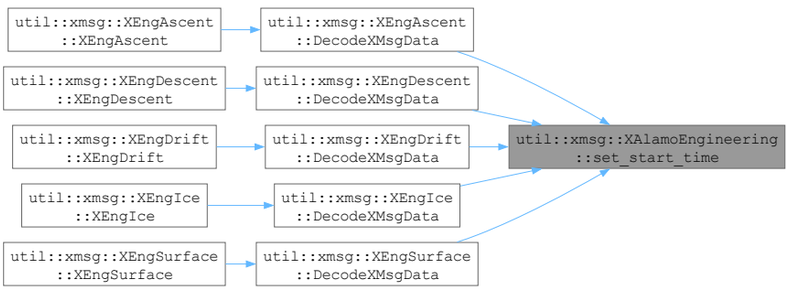
References start_time(), and start_time_.

Referenced by util::xmsg::XEngAscent::DecodeXMsgData(), util::xmsg::XEngDescent::DecodeXMsgData(), util::xmsg::XEngDrift::Decode
util::xmsg::XEngIce::DecodeXMsgData(), and util::xmsg::XEngSurface::DecodeXMsgData().

Here is the call graph for this function:



Here is the caller graph for this function:



10.56.3.17 set_xmsg_size_bytes()

```
void util::xmsg::XMessage::set_xmsg_size_bytes (
            uint16_t xmsg_size_bytes)  [inline], [protected], [inherited]
```

Set the size of the X-Message, in bytes.

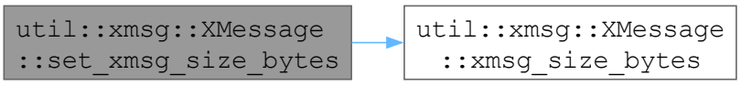
Parameters

in	*xmsg_size_bytes*	The size of the X-Message to set, in bytes.

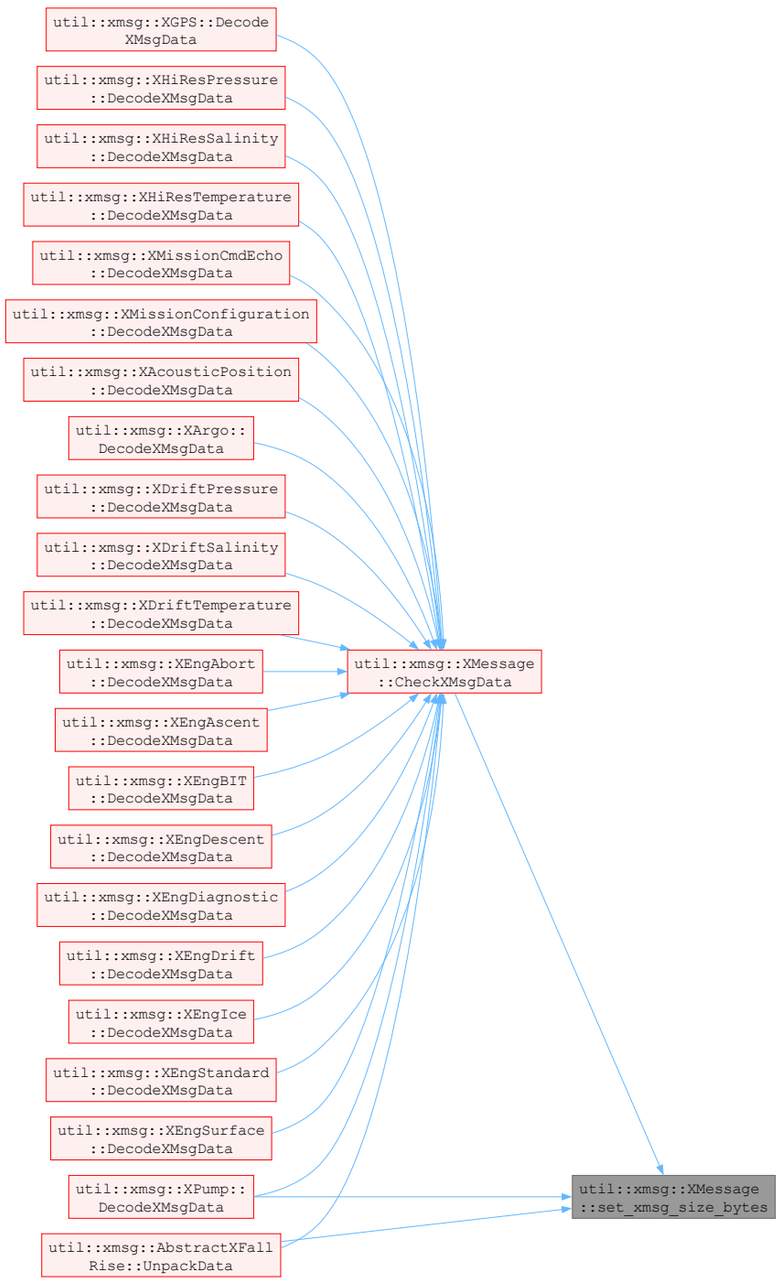
References util::xmsg::XMessage::xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), util::xmsg::XPump::DecodeXMsgData(), and util::xmsg::AbstractXFallRise::Unpa

Here is the call graph for this function:



Here is the caller graph for this function:



10.56.3.18 start_time()

```
const ptime & util::xmsg::XAlamoEngineering::start_time () const  [inline]
```

Get the engineering message state start time.

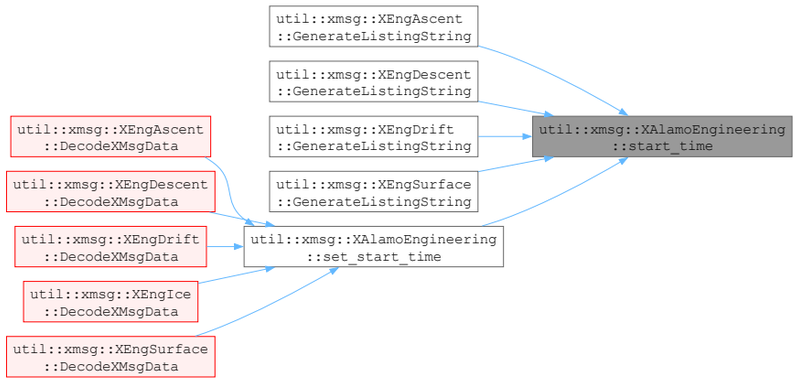
Returns

The engineering message state start time.

References start_time_.

Referenced by util::xmsg::XEngAscent::GenerateListingString(), util::xmsg::XEngDescent::GenerateListingString(), util::xmsg::XEngDrift::GenerateListingString(), util::xmsg::XEngSurface::GenerateListingString(), and set_start_time().

Here is the caller graph for this function:



10.56.3.19 xmsg_size_bytes()

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes () const  [inline], [inherited]
```

Get the size of the X-Message, in bytes.

Returns

The size of the X-Message, in bytes.

References util::xmsg::XMessage::xmsg_size_bytes_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), util::xmsg::XArgo::DecodeXMsgData(), util::xmsg::XEngDescent::DecodeXMsgI
util::xmsg::XEngIce::DecodeXMsgData(), util::xmsg::XEngSurface::DecodeXMsgData(), util::xmsg::XPump::DecodeXMsgData(),
util::xmsg::XValve::DecodeXMsgData(), util::xmsg::XWave::DecodeXMsgData(), util::xmsg::XMessage::set_xmsg_size_bytes(),
and util::xmsg::AbstractXFallRise::UnpackData().

10.56.4 Member Data Documentation

10.56.4.1 engineering_version_

```
uint8_t util::xmsg::XAlamoEngineering::engineering_version_  [private]
```

The engineering message version identifier.

Referenced by engineering_version(), engineering_version_as_float(), and set_engineering_version().

10.56.4.2 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.56.4.3 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.56.4.4 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.56.4.5 start_time_

```
ptime util::xmsg::XAlamoEngineering::start_time_  [private]
```

The engineering message state start time.

Referenced by set_start_time(), and start_time().

10.56.4.6 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

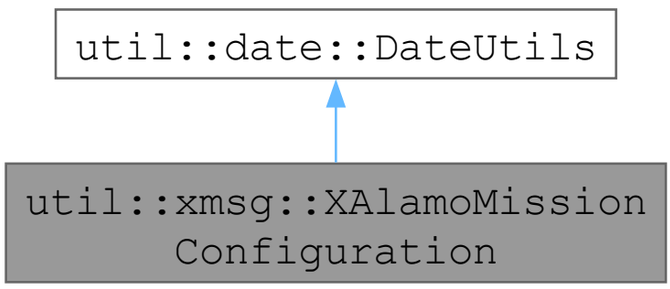
- data/xmsg/XAlamoEngineering.h

10.57 util::xmsg::XAlamoMissionConfiguration Class Reference

Class representing an ALAMO Mission Configuration message.

```
#include <XAlamoMissionConfiguration.h>
```

Inheritance diagram for util::xmsg::XAlamoMissionConfiguration:



Collaboration diagram for util::xmsg::XAlamoMissionConfiguration:

Static Public Member Functions

- static string GenerateCurrentUtcTimeIso8601String ()

  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- static string GenerateIso8601String (const ptime &p, bool extended=true)

  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)

  Convert a date/time to fractional days since a reference date/time.
- static ptime GetCurrentUtcTime ()

  Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Private Member Functions

- XAlamoMissionConfiguration (void)
  Default constructor.

Private Attributes

- uint16_t **aca_**
- uint16_t **acg_**
- uint16_t **acr_**
- uint16_t add_
  The ascent state data storage pressure interval, in dBar.
- uint16_t adt_
  The ascent state data storage interval timeout, in seconds.
- uint16_t **ahd_**
- uint16_t **ahr_**
- uint16_t apf_
  The ascent state pump off duration/interval/timeout, in seconds.
- uint16_t **apm_**
- uint16_t apn_
  The ascent state pump on duration/interval/timeout, in seconds.
- uint8_t apt_
  The auto-transmit mission configuration message flag.
- uint16_t **arc_**
- uint16_t arr_
  The ascent state rise rate, in centimeters per second.
- ptime ascent_start_time_
  The start time of the ascent state of the dive cycle.
- uint16_t asd_
  The ascent state surface threshold pressure, in dBar.
- uint32_t asi_
  The ascent state sampling interval/timeout, in milliseconds.
- uint16_t asn_
  The ascent number.
- uint8_t btm_
  The bluetooth mode.
- uint16_t cpb_ [3]
  The CTD sampling period pressure boundaries, in dBar.
- uint16_t cpn_ [3]
  The CTD sampling period bin sizes, in 0.1 dBar.
- uint16_t cpp_ [3]
  The CTD sampling period interval, in milliseconds.
- uint8_t cps_
  The CTD profiling mode.
- uint32_t csp_
  The CTD continuous sampling period, in milliseconds.
- uint8_t cst_
  The CTD sampling type.
- uint16_t ctf_
  The profile cutoff pressure.
- uint16_t ctl_
  The pressure sensor offset reset lower pressure limit.
- uint16_t ctu_
  The pressure sensor offset reset lower pressure limit.
- uint8_t **dal_**
- uint8_t **dca_**
- uint16_t **dcd_**
- uint16_t **dcf_**
- uint8_t **dcm_**
- uint16_t **dcp_**
- uint16_t **dcr_**
- uint16_t **dct_**
- uint16_t **dcx_**
- uint16_t **ddc_**

- uint16_t ddd_

  The descent state data storage pressure interval, in dBar.
- uint16_t **ddf_**
- uint16_t **ddp_**
- uint16_t **dds_**
- uint16_t ddt_

  The descent state data storage interval, in seconds.
- ptime descend_start_time_

  The start time of the descend state of the dive cycle.
- uint16_t dft_

  The descent state fall timeout, in seconds.
- uint16_t dns_

  The descent number.
- uint16_t **dpd_**
- uint16_t **dpt_**
- uint8_t **dra_**
- uint16_t **drc_**
- uint16_t **drt_**
- uint16_t dsd_

  The descent state start pressure, in dBar.
- uint32_t dsi_

  The descent state sampling interval, in milliseconds.
- uint16_t dst_

  The descent state start timeout, in seconds.
- uint16_t **dsw_**
- uint16_t dtd_

  The target descent/drift/park pressure, in dBar.
- uint16_t **duc_**
- uint16_t **dut_**
- uint16_t **dvd_**
- uint16_t **dvt_**
- uint16_t **dvw_**
- uint16_t **fos_**
- uint8_t **fta_**
- uint8_t **ftm_**
- uint16_t **fto_**
- uint32_t fw_version_

  The software version identifier.
- uint16_t **iat_**
- uint16_t **ica_** [2]
- uint16_t **icb_** [2]
- uint16_t **icd_** [2]
- uint32_t **icf_**
- uint8_t **icg_** [2]
- uint8_t **icm_**
- uint16_t **icn_**
- uint16_t **ico_** [2]
- uint32_t **icr_** [2]
- uint16_t **ics_**
- int16_t **ict_**
- uint32_t **icw_**
- uint16_t **icx_**
- uint16_t **ilt_** [2]
- uint16_t **imm_**
- uint16_t **imt_** [2]
- uint8_t **isa_**
- uint16_t **isd_**
- uint8_t **ism_**
- uint16_t **iso_**
- uint8_t **isp_**
- uint8_t **iss_** [2]
- uint16_t **ist_**
- uint16_t **isv_**
- uint16_t **isw_**
- uint8_t **iue_** [2]
- uint8_t mam_

The motion processing unit (MPU) data acquisition operational mode.

- uint16_t mat_

  The motion processing unit (MPU) sampling duration, in seconds.

- uint16_t mds_

  The maximum descent/fall/profile pressure, in dBar.

- uint8_t msg_version_

  The message version identifier.

- int16_t msn_

  The mission, dive, or cycle number for this mission configuration.

- uint16_t mtd_

  The initial trigger depth, in dBar.

- uint16_t mtt_

  The initial trigger timeout/interval, in milliseconds.

- ptime park_start_time_

  The start time of the park/drift state of the dive cycle.

- uint16_t **pbh_**
- uint16_t **pbl_**
- uint16_t **pc0_**
- uint16_t **pc1_**
- uint16_t pdt_

  The park/drift state data storage interval/timeout, in seconds.

- uint16_t **pfc_**
- uint16_t pfd_

  The park/drift state fall depth (i.e.

- uint8_t pfm_

  The park/drift state fall mode.

- uint16_t **pfr_**
- uint16_t **pft_**
- uint16_t **pfv_**
- uint16_t **pnb_**
- uint16_t **pnc_**
- uint16_t pns_

  The park/drift number.

- uint16_t **pp0_**
- uint16_t **pp1_**
- uint8_t psa_

  The park/drift state sampling mode.

- uint16_t **psd_**
- uint32_t psi_

  The park/drift state sample interval/timeout, in milliseconds.

- uint8_t **psm_**
- uint16_t **pst_**
- uint16_t **psv_**
- uint16_t **psw_**
- uint32_t pth_

  The bit-encoded park/drift state hour timeout trigger(s).

- uint32_t pto_

  The park/drift state timeout, in seconds.

- uint16_t **pv0_**
- uint16_t **pv5_**
- uint16_t **pvh_**
- uint16_t **pvl_**
- uint16_t **pxc_**
- uint8_t **sam_**
- uint16_t **san_**
- uint16_t **sao_**
- uint16_t **sap_**
- uint16_t **sax_**
- uint8_t sbm_

  The surface state beacon mode flag.

- uint16_t sbt_

  The surface state beacon interval timeout, in seconds.

- int16_t sdc_

  The surface state sensor depth compensation offset, in dBar.

- uint16_t sds_

The surface state sampling storage duration/interval/timeout, in seconds.

- uint32_t **sdt_**
- uint8_t sensor_type_

  The sensor type identifier.
- uint16_t set_

  The surface state Iridium session timeout, in minutes.
- uint16_t sfn_

  The surface number.
- uint16_t sgt_

  The surface state GPS timeout, in minutes.
- uint16_t **spt_**
- uint16_t **ssa_**
- uint32_t ssi_

  The surface state sampling interval timeout, in milliseconds.
- uint16_t **ssp_**
- ptime surface_start_time_

  The start time of the surface state of the dive cycle.
- uint8_t xas_

  The profile data encode method.

10.57.1 Detailed Description

Class representing an ALAMO Mission Configuration message.

10.57.2 Constructor & Destructor Documentation

10.57.2.1 XAlamoMissionConfiguration() [1/2]

```
util::xmsg::XAlamoMissionConfiguration::XAlamoMissionConfiguration (
            void )  [inline], [private]
```

Default constructor.

10.57.2.2 XAlamoMissionConfiguration() [2/2]

```
util::xmsg::XAlamoMissionConfiguration::XAlamoMissionConfiguration (
            const vector< uint8_t > & data)  [inline]
```

Parameterized Constructor.

Parameters

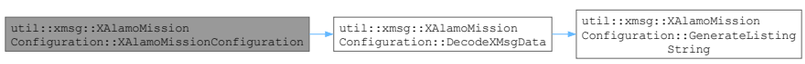
in	*data*	The binary data to decode.

Exceptions

log::MessageException	if the message is invalid or an error occurs while decoding.

References DecodeXMsgData().

Here is the call graph for this function:



10.57.2.3 ~XAlamoMissionConfiguration()

```
util::xmsg::XAlamoMissionConfiguration::~XAlamoMissionConfiguration ()  [inline]
```

Destructor.

10.57.3 Member Function Documentation

10.57.3.1 DecodeXMsgData()

```
void util::xmsg::XAlamoMissionConfiguration::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline]
```

Decode the ALAMO mission configuration message from the binary message data.

Parameters

in	*data*	The binary data to decode.

Exceptions

log::MessageException	if the message is invalid or an error occurs while decoding.

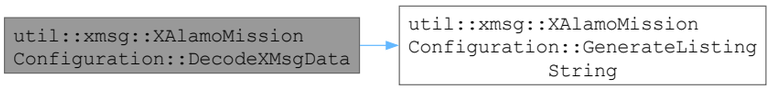
Todo Implement ALAMO mission parameter: SSP.

Todo Implement ALAMO mission parameter: SSP.

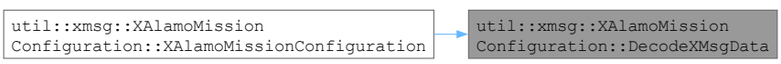
References CATCH_BLOCK, cpb_, cpn_, cpp_, EXC_THROW, GenerateListingString(), i16, ldbg, lwrn, s2000, u16, u32, and XMSG_BAD_U16.

Referenced by XAlamoMissionConfiguration().

Here is the call graph for this function:



Here is the caller graph for this function:



10.57.3.2 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

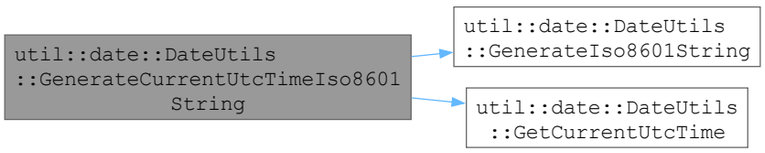
Returns

An ISO8601 format date/time string representation of the current time.

References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:

10.57.3.3 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), util::xmsg::XEngIce::XEngIce
util::xmsg::XEngSurface::XEngErrorCode::DateTimeAs8601String(), argo::iridium::xfloat::XFloatMailRetrievalService::FetchMailMessages

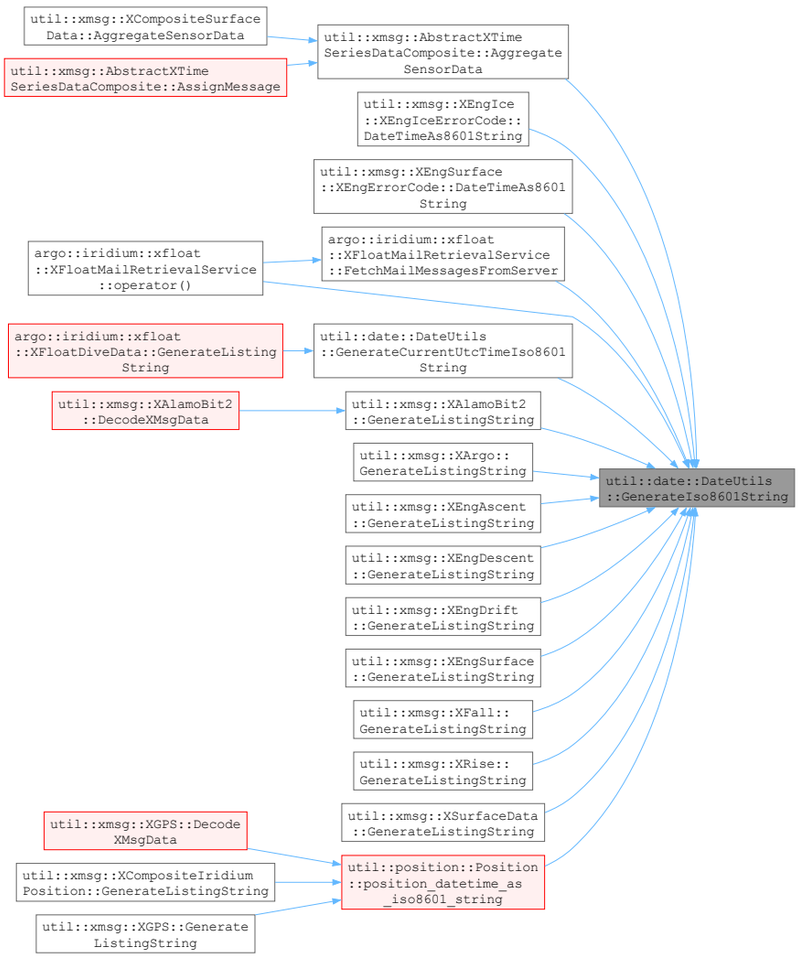
util::position::Position::position_datetime_as_iso8601_string().

Here is the caller graph for this function:



10.57.3.4 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref*↩ *_dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.57.3.5 GenerateListingString()

```
const string util::xmsg::XAlamoMissionConfiguration::GenerateListingString (
            int whoi,
            int dive,
            int idx) const  [inline]
```

Generate a listing entry string from this ALAMO mission configuration message object.

Parameters

in	*whoi*	The unique WHOI instrument identifier or serial number.
in	*dive*	The dive or cycle number of this ALAMO mission configuration message object.
in	*idx*	The X-Message index of this ALAMO mission configuration message object.

Returns

A listing entry string from this ALAMO mission configuration message object.

References CATCH_BLOCK, and EXC_THROW.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:

10.57.3.6 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

10.57.4 Member Data Documentation

10.57.4.1 add_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::add_  [private]
```

The ascent state data storage pressure interval, in dBar.

10.57.4.2 adt_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::adt_  [private]
```

The ascent state data storage interval timeout, in seconds.

10.57.4.3 apf_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::apf_  [private]
```

The ascent state pump off duration/interval/timeout, in seconds.

10.57.4.4 apn_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::apn_  [private]
```

The ascent state pump on duration/interval/timeout, in seconds.

10.57.4.5 apt_

```
uint8_t util::xmsg::XAlamoMissionConfiguration::apt_  [private]
```

The auto-transmit mission configuration message flag.

10.57.4.6 arr_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::arr_  [private]
```

The ascent state rise rate, in centimeters per second.

10.57.4.7 ascent_start_time_

```
ptime util::xmsg::XAlamoMissionConfiguration::ascent_start_time_  [private]
```

The start time of the ascent state of the dive cycle.

10.57.4.8 asd_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::asd_  [private]
```

The ascent state surface threshold pressure, in dBar.

10.57.4.9 asi_

```
uint32_t util::xmsg::XAlamoMissionConfiguration::asi_  [private]
```

The ascent state sampling interval/timeout, in milliseconds.

10.57.4.10 asn_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::asn_  [private]
```

The ascent number.

10.57.4.11 btm_

```
uint8_t util::xmsg::XAlamoMissionConfiguration::btm_  [private]
```

The bluetooth mode.

10.57.4.12 cpb_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::cpb_[3]  [private]
```

The CTD sampling period pressure boundaries, in dBar.

Referenced by DecodeXMsgData().

10.57.4.13 cpn_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::cpn_[3]  [private]
```

The CTD sampling period bin sizes, in 0.1 dBar.

Referenced by DecodeXMsgData().

10.57.4.14 cpp_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::cpp_[3]  [private]
```

The CTD sampling period interval, in milliseconds.

Referenced by DecodeXMsgData().

10.57.4.15 cps_

```
uint8_t util::xmsg::XAlamoMissionConfiguration::cps_  [private]
```

The CTD profiling mode.

10.57.4.16 csp_

```
uint32_t util::xmsg::XAlamoMissionConfiguration::csp_  [private]
```

The CTD continuous sampling period, in milliseconds.

10.57.4.17 cst_

```
uint8_t util::xmsg::XAlamoMissionConfiguration::cst_  [private]
```

The CTD sampling type.

10.57.4.18 ctf_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::ctf_  [private]
```

The profile cutoff pressure.

Todo Determine gain for profile cutoff pressure field.

Note

This field was added in firmware version 0x02006900.

10.57.4.19 ctl_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::ctl_  [private]
```

The pressure sensor offset reset lower pressure limit.

Todo Determine gain for pressure sensor offset reset lower pressure limit field.

Note

This field was added in firmware version 0x02006900.

10.57.4.20 ctu_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::ctu_  [private]
```

The pressure sensor offset reset lower pressure limit.

Todo Determine gain for pressure sensor offset reset lower pressure limit field.

Note

This field was added in firmware version 0x02006900.

10.57.4.21 ddd_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::ddd_  [private]
```

The descent state data storage pressure interval, in dBar.

10.57.4.22 ddt_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::ddt_  [private]
```

The descent state data storage interval, in seconds.

10.57.4.23 descend_start_time_

```
ptime util::xmsg::XAlamoMissionConfiguration::descend_start_time_  [private]
```

The start time of the descend state of the dive cycle.

10.57.4.24 dft_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::dft_  [private]
```

The descent state fall timeout, in seconds.

10.57.4.25 dns_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::dns_  [private]
```

The descent number.

10.57.4.26 dsd_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::dsd_  [private]
```

The descent state start pressure, in dBar.

10.57.4.27 dsi_

```
uint32_t util::xmsg::XAlamoMissionConfiguration::dsi_  [private]
```

The descent state sampling interval, in milliseconds.

10.57.4.28 dst_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::dst_  [private]
```

The descent state start timeout, in seconds.

10.57.4.29 dtd_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::dtd_  [private]
```

The target descent/drift/park pressure, in dBar.

10.57.4.30 fw_version_

```
uint32_t util::xmsg::XAlamoMissionConfiguration::fw_version_  [private]
```

The software version identifier.

10.57.4.31 mam_

```
uint8_t util::xmsg::XAlamoMissionConfiguration::mam_  [private]
```

The motion processing unit (MPU) data acquisition operational mode.

10.57.4.32 mat_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::mat_  [private]
```

The motion processing unit (MPU) sampling duration, in seconds.

10.57.4.33 mds_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::mds_  [private]
```

The maximum descent/fall/profile pressure, in dBar.

10.57.4.34 msg_version_

```
uint8_t util::xmsg::XAlamoMissionConfiguration::msg_version_  [private]
```

The message version identifier.

10.57.4.35 msn_

```
int16_t util::xmsg::XAlamoMissionConfiguration::msn_  [private]
```

The mission, dive, or cycle number for this mission configuration.

10.57.4.36 mtd_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::mtd_  [private]
```

The initial trigger depth, in dBar.

10.57.4.37 mtt_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::mtt_  [private]
```

The initial trigger timeout/interval, in milliseconds.

10.57.4.38 park_start_time_

```
ptime util::xmsg::XAlamoMissionConfiguration::park_start_time_  [private]
```

The start time of the park/drift state of the dive cycle.

10.57.4.39 pdt_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::pdt_  [private]
```

The park/drift state data storage interval/timeout, in seconds.

10.57.4.40 pfd_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::pfd_  [private]
```

The park/drift state fall depth (i.e.

profile depth), in dBar.

10.57.4.41 pfm_

```
uint8_t util::xmsg::XAlamoMissionConfiguration::pfm_  [private]
```

The park/drift state fall mode.

10.57.4.42 pns_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::pns_  [private]
```

The park/drift number.

10.57.4.43 psa_

```
uint8_t util::xmsg::XAlamoMissionConfiguration::psa_  [private]
```

The park/drift state sampling mode.

10.57.4.44 psi_

```
uint32_t util::xmsg::XAlamoMissionConfiguration::psi_  [private]
```

The park/drift state sample interval/timeout, in milliseconds.

10.57.4.45 pth_

```
uint32_t util::xmsg::XAlamoMissionConfiguration::pth_  [private]
```

The bit-encoded park/drift state hour timeout trigger(s).

10.57.4.46 pto_

```
uint32_t util::xmsg::XAlamoMissionConfiguration::pto_  [private]
```

The park/drift state timeout, in seconds.

10.57.4.47 sbm_

```
uint8_t util::xmsg::XAlamoMissionConfiguration::sbm_  [private]
```

The surface state beacon mode flag.

10.57.4.48 sbt_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::sbt_  [private]
```

The surface state beacon interval timeout, in seconds.

10.57.4.49 sdc_

```
int16_t util::xmsg::XAlamoMissionConfiguration::sdc_  [private]
```

The surface state sensor depth compensation offset, in dBar.

10.57.4.50 sds_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::sds_  [private]
```

The surface state sampling storage duration/interval/timeout, in seconds.

10.57.4.51 sensor_type_

```
uint8_t util::xmsg::XAlamoMissionConfiguration::sensor_type_  [private]
```

The sensor type identifier.

10.57.4.52 set_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::set_  [private]
```

The surface state Iridium session timeout, in minutes.

10.57.4.53 sfn_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::sfn_  [private]
```

The surface number.

10.57.4.54 sgt_

```
uint16_t util::xmsg::XAlamoMissionConfiguration::sgt_  [private]
```

The surface state GPS timeout, in minutes.

10.57.4.55 ssi_

```
uint32_t util::xmsg::XAlamoMissionConfiguration::ssi_  [private]
```

The surface state sampling interval timeout, in milliseconds.

10.57.4.56 surface_start_time_

```
ptime util::xmsg::XAlamoMissionConfiguration::surface_start_time_  [private]
```

The start time of the surface state of the dive cycle.

10.57.4.57 xas_

```
uint8_t util::xmsg::XAlamoMissionConfiguration::xas_  [private]
```

The profile data encode method.

The documentation for this class was generated from the following file:

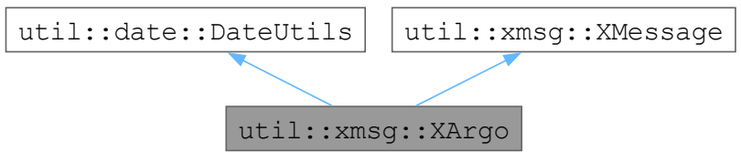
- data/xmsg/XAlamoMissionConfiguration.h

10.58 util::xmsg::XArgo Class Reference

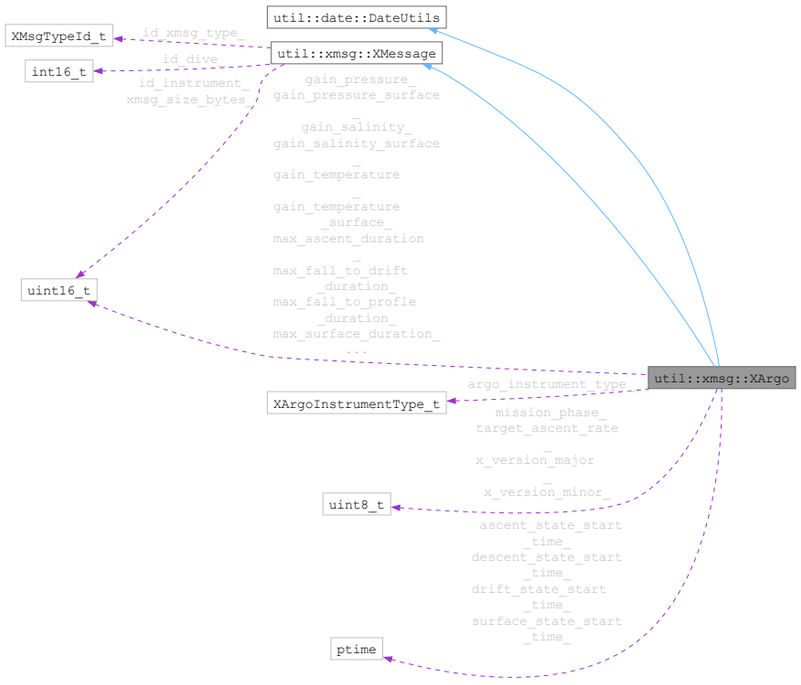
Class representing Argo X message.

`#include <XArgo.h>`

Inheritance diagram for util::xmsg::XArgo:



Collaboration diagram for util::xmsg::XArgo:



Public Member Functions

- XArgo (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)

  The constructor.
- ~XArgo ()

  The destructor.
- XArgoInstrumentType_t argo_instrument_type () const

  Get the Argo instrument type identifier.
- const ptime & ascent_state_start_time () const

  Get the start time of the ascent state of the dive cycle.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)

  Check the X-message for the correct ID, minimum size, and message terminator.
- void DecodeXMsgData (const vector< uint8_t > &data)

  Decode the Argo X message.
- const ptime & descent_state_start_time () const

  Get the start time of the descent state of the dive cycle.
- const ptime & drift_state_start_time () const

  Get the start time of the drift/park state of the dive cycle.
- uint16_t gain_pressure () const

Get the pressure sensor gain value, in LSB/dBar.

- uint16_t gain_pressure_surface () const

  Get the pressure sensor gain value for surface data, in LSB/dBar.

- uint16_t gain_salinity () const

  Get the salinity sensor gain value, in LSB/PSU.

- uint16_t gain_salinity_surface () const

  Get the salinity sensor gain value for surface data, in LSB/PSU.

- uint16_t gain_temperature () const

  Get the temperature sensor gain value, in LSB/degC.

- uint16_t gain_temperature_surface () const

  Get the temperature sensor gain value for surface data, in LSB/degC.

- const string GenerateListingString () const

  Generate a listing entry string representation of this Argo data message.

- int16_t id_dive () const

  Get the dive or cycle number of this X-Message.

- uint16_t id_instrument () const

  Get the unique instrument identifier of this X-Message.

- XMsgTypeId_t id_xmsg_type () const

  Get the enumerated X-Message type identifier.

- uint16_t max_ascent_duration () const

  Get the maximum duration of the ascent state of the dive cycle, in minutes.

- uint16_t max_fall_to_drift_duration () const

  Get the maximum duration of the descent-to-drift/park-pressure phase of the dive cycle.

- uint16_t max_fall_to_profle_duration () const

  Get the maximum duration of the descent-to-profile-pressure phase of the dive cycle, in seconds.

- uint16_t max_surface_duration () const

  Get the maximum duration of the surface state of the dive cycle, in seconds.

- uint8_t mission_phase () const

  Get the mission phase.

- uint16_t num_seeks_to_drift_pressure () const

  Get the maximum number of seeks to drift/park pressure.

- uint16_t offset_pressure () const

  Get the pressure sensor offset, in dBar.

- uint16_t offset_pressure_surface () const

  Get the pressure sensor offset for surface data, in dBar.

- uint16_t offset_salinity () const

  Get the salinity sensor offset, in PSU.

- uint16_t offset_salinity_surface () const

  Get the salinity sensor offset for surface data, in PSU.

- uint16_t offset_temperature () const

  Get the temperature sensor offset, in degC.

- uint16_t offset_temperature_surface () const

  Get the temperature sensor offset for surface data, in degC.

- uint16_t seek_to_drift_pressure_interval_duration () const

  Get the seek-to-drift/park-pressure interval duration, in minutes.

- const ptime & surface_state_start_time () const

  Get the start time of the surface state of the dive cycle.

- uint8_t target_ascent_rate () const

  Get the target ascent/profile rate, in cm/sec.

- uint16_t target_drift_duration () const

  Get the target druration of the drift/park phase of the dive cycle, in minutes.

- uint16_t target_drift_pressure () const

  Get the target drift/park pressure, in dBar.

- uint16_t target_profile_pressure () const

  Get the target profile pressure, in dBar.

- float x_version_float () const

  Get the X-Message version as a floating-point value.

- uint8_t x_version_major () const

  Get the X-Message major version indicator.

- uint8_t x_version_minor () const

  Get the X-Message minor version indicator.

- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Static Public Member Functions

- static string GenerateCurrentUtcTimeIso8601String ()

  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- static string GenerateIso8601String (const ptime &p, bool extended=true)

  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)

  Convert a date/time to fractional days since a reference date/time.
- static ptime GetCurrentUtcTime ()

  Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Protected Member Functions

- void set_argo_instrument_type (XArgoInstrumentType_t type)

  Set the Argo instrument type identifier.
- void set_ascent_state_start_time (const ptime &time)

  Set the start time of the ascent state of the dive cycle.
- void set_descent_state_start_time (const ptime &time)

  Set the start time of the descent state of the dive cycle.
- void set_drift_state_start_time (const ptime &time)

  Set the start time of the drift state of the dive cycle.
- void set_gain_pressure (uint16_t gain)

  Set the pressure sensor gain, in LSB/dBar.
- void set_gain_pressure_surface (uint16_t gain)

  Set the pressure sensor gain for surface data, in LSB/dBar.
- void set_gain_salinity (uint16_t gain)

  Set the salinity sensor gain, in LSB/PSU.
- void set_gain_salinity_surface (uint16_t gain)

  Set the salinity sensor gain for surface data, in PSU/PSU.
- void set_gain_temperature (uint16_t gain)

  Set the temperature sensor gain, in PSU/degC.
- void set_gain_temperature_surface (uint16_t gain)

  Set the temperature sensor gain for surface data, in PSU/degC.
- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_max_ascent_duration (uint16_t duration)

  Set the maximum duration for the ascent state of the dive cycle, in minutes.
- void set_max_fall_to_drift_duration (uint16_t duration)

  Set the maximum duration for the descent-to-drift/park-pressure state of the dive cycle, in minutes.
- void set_max_fall_to_profle_duration (uint16_t duration)

  Set the maximum duration for the descent-to-profile-pressure state of the dive cycle, in minutes.
- void set_max_surface_duration (uint16_t duration)

  Set the maximum duration for the surface state of the dive cycle, in seconds.
- void set_mission_phase (uint8_t phase)

  Set the mission phase number.
- void set_num_seeks_to_drift_pressure (uint16_t seeks)

  Set the maximum number of seeks to drift/park pressure.
- void set_offset_pressure (uint16_t offs)

  Set the pressure sensor offset, in dBar.
- void set_offset_pressure_surface (uint16_t offs)

  Set the pressure sensor offset for surface data, in dBar.
- void set_offset_salinity (uint16_t offs)

  Set the salinity sensor offset, in PSU.
- void set_offset_salinity_surface (uint16_t offs)

  Set the salinity sensor offset for surface data, in PSU.
- void set_offset_temperature (uint16_t offs)

  Set the temperature sensor offset, in degC.
- void set_offset_temperature_surface (uint16_t offs)

Set the temperature sensor offset for surface data, in degC.

- void set_seek_to_drift_pressure_interval_duration (uint16_t duration)

  Set the seek-to-drift/park-pressure interval duration, in minutes.
- void set_surface_state_start_time (const ptime &time)

  Set the start time of the surface state of the dive cycle.
- void set_target_ascent_rate (uint8_t rate)

  Set the target ascent rate, in cm/s.
- void set_target_drift_duration (uint16_t duration)

  Set the target duration of the drift/park phase of the dive cycle, in minutes.
- void set_target_drift_pressure (uint16_t pres)

  Set the target drift/park pressure, in dBar.
- void set_target_profile_pressure (uint16_t pres)

  Set the target profile pressure, in dBar.
- void set_x_version_major (uint8_t vers)

  Set the X-Message major version identifier.
- void set_x_version_minor (uint8_t vers)

  Set the X-Message minor version identifier.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.

Private Attributes

- XArgoInstrumentType_t argo_instrument_type_

  The Argo instrument type identifier.
- ptime ascent_state_start_time_

  The ascend state start time.
- ptime descent_state_start_time_

  The descend state start time.
- ptime drift_state_start_time_

  The park state start time.
- uint16_t gain_pressure_

  The pressure sensitivity gain factor, in LSB/dBar.
- uint16_t gain_pressure_surface_

  The pressure sensitivity gain factor for surface data, in LSB/dBar.
- uint16_t gain_salinity_

  The salinity sensitivity scale factor, in LSB/PSU.
- uint16_t gain_salinity_surface_

  The salinity sensitivity scale factor for surface data, in LSB/PSU.
- uint16_t gain_temperature_

  The temperature sensitivity scale factor, in LSB/degC.
- uint16_t gain_temperature_surface_

  The temperature sensitivity scale factor for surface data, in LSB/degC.
- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint16_t max_ascent_duration_

  The maximum rise/ascend/profile time, in minutes.
- uint16_t max_fall_to_drift_duration_

  The maximum time to fall from the surface to drift/park depth, in minutes.
- uint16_t max_fall_to_profle_duration_

  The maximum time to fall from the drift/park depth to profile depth, in seconds.
- uint16_t max_surface_duration_

  The maximum duration at the surface, in seconds.
- uint8_t mission_phase_

  The mission phase number of this dive.
- uint16_t num_seeks_to_drift_pressure_

  The number of seeks to drift depth.
- uint16_t offset_pressure_

  The pressure offset, in dBar.

- uint16_t offset_pressure_surface_

  The pressure offset for surface data, in dBar.
- uint16_t offset_salinity_

  The salinity offset, in PSU.
- uint16_t offset_salinity_surface_

  The salinity offset for surface data, in PSU.
- uint16_t offset_temperature_

  The temperature offset, in degC.
- uint16_t offset_temperature_surface_

  The temperature offset for surface data, in degC.
- uint16_t seek_to_drift_pressure_interval_duration_

  The interval duration between subsequent seeks to drift/park depth, in minutes.
- ptime surface_state_start_time_

  The surface state start time.
- uint8_t target_ascent_rate_

  The target ascent rate, in cm/s.
- uint16_t target_drift_duration_

  The target duration of the drift/park phase of the dive cycle, in minutes.
- uint16_t target_drift_pressure_

  The target parking or drift depth (DTD), in dBar.
- uint16_t target_profile_pressure_

  The target profile depth (PFD), in dBar.
- uint8_t x_version_major_

  The X message format major version number.
- uint8_t x_version_minor_

  The X Message format minor version number.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.58.1 Detailed Description

Class representing Argo X message.

This message contains information about the characteristics of the dive cycle.

Todo Add support for the Solo-II-type Argo data message.

Add support for the Deep-Argo-type Argo data message.

10.58.2 Constructor & Destructor Documentation

10.58.2.1 XArgo()

```
util::xmsg::XArgo::XArgo (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

The constructor.

Parameters

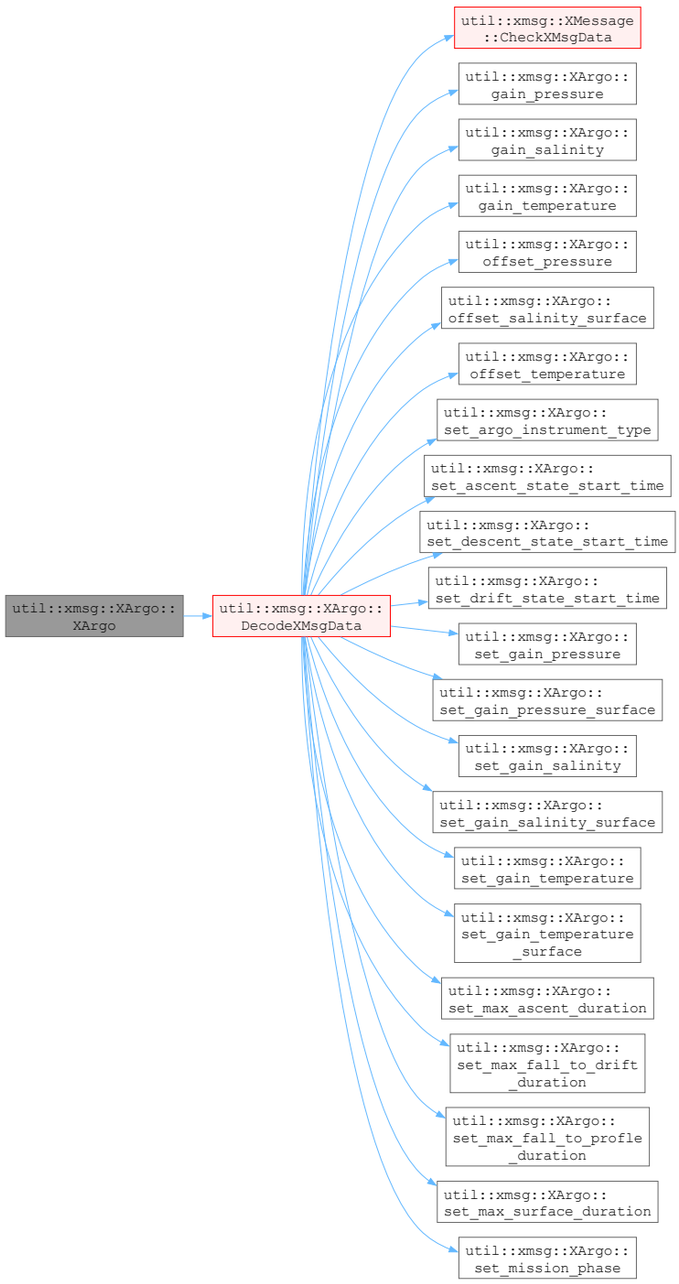
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary Argo data X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.58.2.2 ~XArgo()

```
util::xmsg::XArgo::~XArgo ()  [inline]
```

The destructor.

10.58.3 Member Function Documentation

10.58.3.1 argo_instrument_type()

```
XArgoInstrumentType_t util::xmsg::XArgo::argo_instrument_type () const  [inline]
```

Get the Argo instrument type identifier.

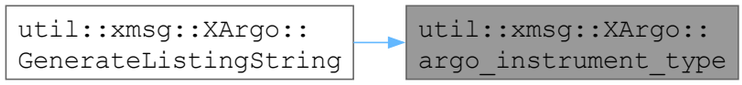
Returns

The Argo instrument type identifier.

References argo_instrument_type_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.2 ascent_state_start_time()

```
const ptime & util::xmsg::XArgo::ascent_state_start_time () const  [inline]
```

Get the start time of the ascent state of the dive cycle.

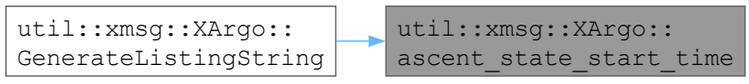
Returns

The start time of the ascent state of the dive cycle.

References ascent_state_start_time_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.3 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::XMessage::set_xmsg_size_byte
u16, and util::xmsg::XMessage::xmsg_size_bytes().

10.58.3.4 DecodeXMsgData()

```
void util::xmsg::XArgo::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode the Argo X message.

Parameters

in	*data*	The data to decode.

Exceptions

util::log::MessageException	if an error occurs while decoding the message.

Todo Implement the functionality to decode the argo data message for Solo-II floats.

Todo Implement the functionality to decode the argo data message for Deep Argo floats.

Implements util::xmsg::XMessage.

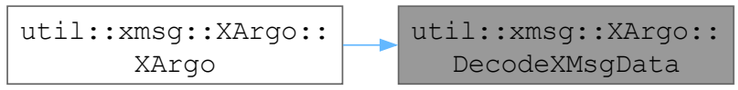
Here is the caller graph for this function:



10.58.3.5 descent_state_start_time()

```
const ptime & util::xmsg::XArgo::descent_state_start_time () const  [inline]
```

Get the start time of the descent state of the dive cycle.

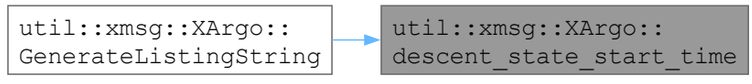
Returns

The start time of the descent state of the dive cycle.

References descent_state_start_time_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.6 drift_state_start_time()

```
const ptime & util::xmsg::XArgo::drift_state_start_time () const  [inline]
```

Get the start time of the drift/park state of the dive cycle.

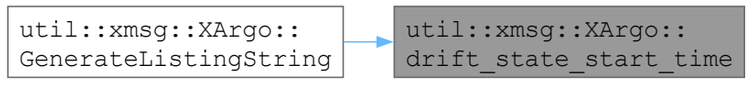
Returns

The start time of the drift/park state of the dive cycle.

References drift_state_start_time_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.7 gain_pressure()

```
uint16_t util::xmsg::XArgo::gain_pressure () const  [inline]
```

Get the pressure sensor gain value, in LSB/dBar.

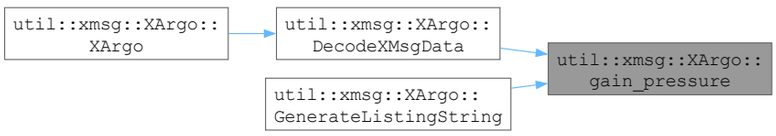
Returns

The pressure sensor gain value, in LSB/dBar.

References gain_pressure_.

Referenced by DecodeXMsgData(), and GenerateListingString().

Here is the caller graph for this function:



10.58.3.8 gain_pressure_surface()

```
uint16_t util::xmsg::XArgo::gain_pressure_surface () const  [inline]
```

Get the pressure sensor gain value for surface data, in LSB/dBar.

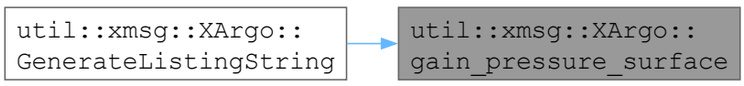
Returns

The pressure sensor gain value, in LSB/dBar.

References gain_pressure_surface_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.9 gain_salinity()

```
uint16_t util::xmsg::XArgo::gain_salinity () const  [inline]
```

Get the salinity sensor gain value, in LSB/PSU.

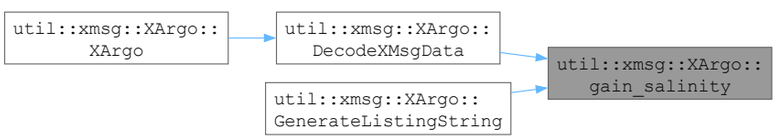
Returns

The salinity sensor gain value, in LSB/PSU.

References gain_salinity_.

Referenced by DecodeXMsgData(), and GenerateListingString().

Here is the caller graph for this function:



10.58.3.10 gain_salinity_surface()

```
uint16_t util::xmsg::XArgo::gain_salinity_surface () const  [inline]
```

Get the salinity sensor gain value for surface data, in LSB/PSU.

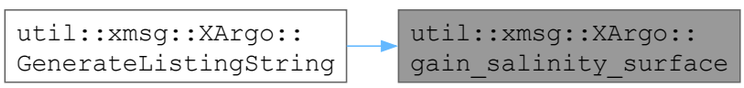
Returns

The salinity sensor gain value, in LSB/PSU.

References gain_salinity_surface_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.11 gain_temperature()

```
uint16_t util::xmsg::XArgo::gain_temperature () const  [inline]
```

Get the temperature sensor gain value, in LSB/degC.

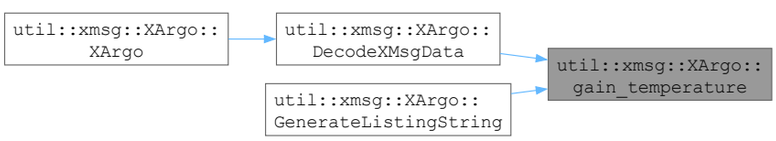
Returns

The temperature sensor gain value, in LSB/degC.

References gain_temperature_.

Referenced by DecodeXMsgData(), and GenerateListingString().

Here is the caller graph for this function:



10.58.3.12 gain_temperature_surface()

```
uint16_t util::xmsg::XArgo::gain_temperature_surface () const  [inline]
```

Get the temperature sensor gain value for surface data, in LSB/degC.

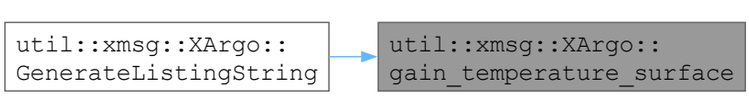
Returns

The temperature sensor gain value, in LSB/degC.

References gain_temperature_surface_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.13 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

Returns

An ISO8601 format date/time string representation of the current time.

References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the caller graph for this function:

10.58.3.14 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

10.58.3.15 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref*↩ *_dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.58.3.16 GenerateListingString()

```
const string util::xmsg::XArgo::GenerateListingString () const  [inline]
```

Generate a listing entry string representation of this Argo data message.

Returns

A listing entry string representation of this Argo data message.

Todo Implement the functionality for generating a listing string for a Solo-II-type Argo data message.

Todo Implement the functionality for generating a listing string for a Deep-Argo-type Argo data message.

Here is the caller graph for this function:

10.58.3.21 max_ascent_duration()

```
uint16_t util::xmsg::XArgo::max_ascent_duration () const  [inline]
```

Get the maximum duration of the ascent state of the dive cycle, in minutes.

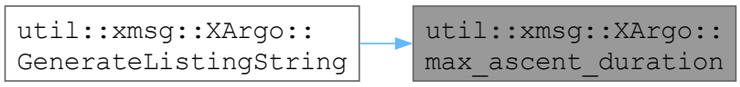
Returns

The maximum duration of the ascent state of the dive cycle, in minutes.

References max_ascent_duration_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.22 max_fall_to_drift_duration()

```
uint16_t util::xmsg::XArgo::max_fall_to_drift_duration () const  [inline]
```

Get the maximum duration of the descent-to-drift/park-pressure phase of the dive cycle.

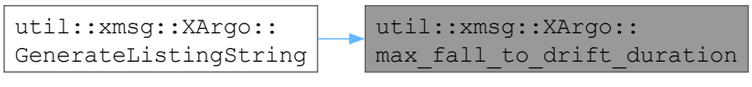
Returns

The maximum duration of the descent-to-drift/park-pressure phase of the dive cycle.

References max_fall_to_drift_duration_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.23 max_fall_to_profle_duration()

```
uint16_t util::xmsg::XArgo::max_fall_to_profle_duration () const  [inline]
```

Get the maximum duration of the descent-to-profile-pressure phase of the dive cycle, in seconds.

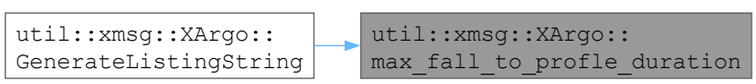
Returns

The maximum duration of the descent-to-profile-pressure phase of the dive cycle, in seconds.

References max_fall_to_profle_duration_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.24 max_surface_duration()

```
uint16_t util::xmsg::XArgo::max_surface_duration () const  [inline]
```

Get the maximum duration of the surface state of the dive cycle, in seconds.

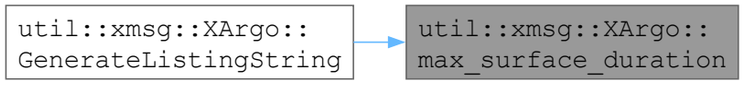
Returns

The maximum duration of the surface state of the dive cycle, in seconds.

References max_surface_duration_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.25 mission_phase()

```
uint8_t util::xmsg::XArgo::mission_phase () const  [inline]
```

Get the mission phase.

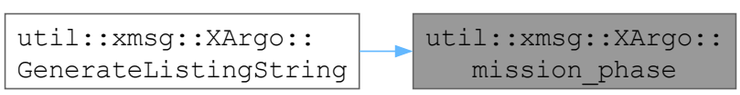
Returns

The mission phase.

References mission_phase_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.26 num_seeks_to_drift_pressure()

```
uint16_t util::xmsg::XArgo::num_seeks_to_drift_pressure () const  [inline]
```

Get the maximum number of seeks to drift/park pressure.

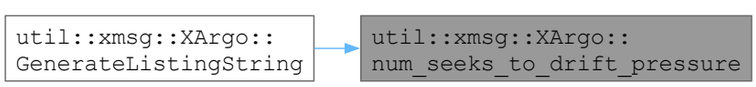
Returns

The maximum number of seeks to drift/park pressure.

References num_seeks_to_drift_pressure_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.27 offset_pressure()

```
uint16_t util::xmsg::XArgo::offset_pressure () const  [inline]
```

Get the pressure sensor offset, in dBar.

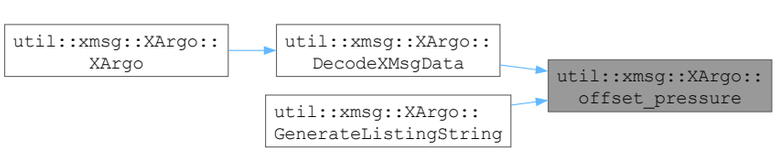
Returns

The pressure sensor offset, in dBar.

References offset_pressure_.

Referenced by DecodeXMsgData(), and GenerateListingString().

Here is the caller graph for this function:



10.58.3.28 offset_pressure_surface()

```
uint16_t util::xmsg::XArgo::offset_pressure_surface () const  [inline]
```

Get the pressure sensor offset for surface data, in dBar.

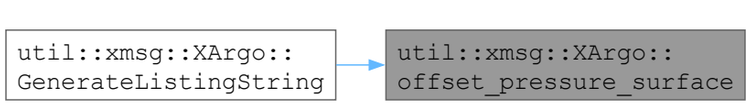
Returns

The pressure sensor offset, in dBar.

References offset_pressure_surface_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.29 offset_salinity()

```
uint16_t util::xmsg::XArgo::offset_salinity () const  [inline]
```

Get the salinity sensor offset, in PSU.

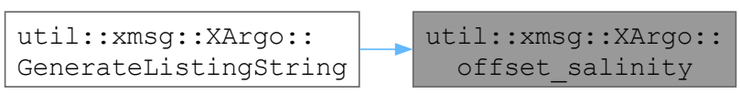
Returns

The salinity sensor offset, in PSU.

References offset_salinity_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.30 offset_salinity_surface()

```
uint16_t util::xmsg::XArgo::offset_salinity_surface () const  [inline]
```

Get the salinity sensor offset for surface data, in PSU.

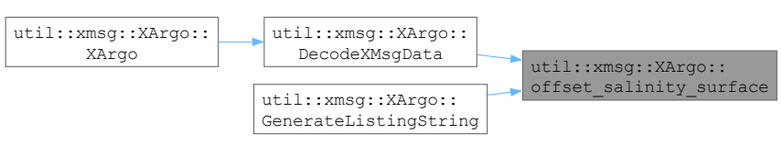
Returns

The salinity sensor offset, in PSU.

References offset_salinity_surface_.

Referenced by DecodeXMsgData(), and GenerateListingString().

Here is the caller graph for this function:



10.58.3.31 offset_temperature()

```
uint16_t util::xmsg::XArgo::offset_temperature () const  [inline]
```

Get the temperature sensor offset, in degC.

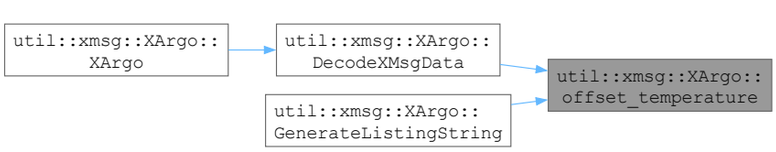
Returns

The temperature sensor offset, in degC.

References offset_temperature_.

Referenced by DecodeXMsgData(), and GenerateListingString().

Here is the caller graph for this function:



10.58.3.32 offset_temperature_surface()

```
uint16_t util::xmsg::XArgo::offset_temperature_surface () const  [inline]
```

Get the temperature sensor offset for surface data, in degC.

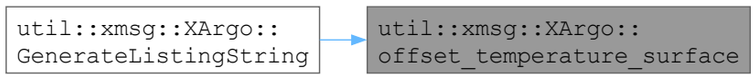
Returns

The temperature sensor offset, in degC.

References offset_temperature_surface_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.33 seek_to_drift_pressure_interval_duration()

```
uint16_t util::xmsg::XArgo::seek_to_drift_pressure_interval_duration () const  [inline]
```

Get the seek-to-drift/park-pressure interval duration, in minutes.

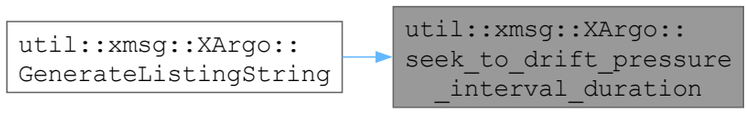
Returns

The seek-to-drift/park-pressure interval duration, in minutes.

References seek_to_drift_pressure_interval_duration_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.34 set_argo_instrument_type()

```
void util::xmsg::XArgo::set_argo_instrument_type (
            XArgoInstrumentType_t type)  [inline], [protected]
```

Set the Argo instrument type identifier.

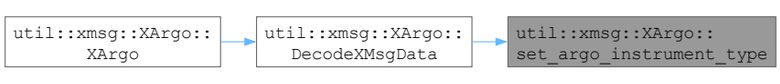
Parameters

in	*type*	The Argo instrument type identifier.

References argo_instrument_type_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.35 set_ascent_state_start_time()

```
void util::xmsg::XArgo::set_ascent_state_start_time (
            const ptime & time)  [inline], [protected]
```

Set the start time of the ascent state of the dive cycle.

Parameters

in	*time*	The start time.

References ascent_state_start_time_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:

10.58.3.36 set_descent_state_start_time()

```
void util::xmsg::XArgo::set_descent_state_start_time (
            const ptime & time)  [inline], [protected]
```

Set the start time of the descent state of the dive cycle.

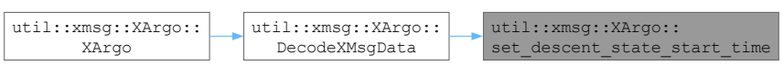
Parameters

in	*time*	The start time.

References descent_state_start_time_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.37 set_drift_state_start_time()

```
void util::xmsg::XArgo::set_drift_state_start_time (
            const ptime & time)  [inline], [protected]
```

Set the start time of the drift state of the dive cycle.

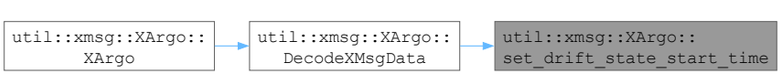
Parameters

in	*time*	The start time.

References drift_state_start_time_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.38 set_gain_pressure()

```
void util::xmsg::XArgo::set_gain_pressure (
            uint16_t gain)  [inline], [protected]
```

Set the pressure sensor gain, in LSB/dBar.

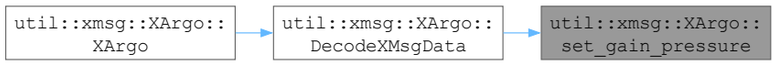
Parameters

in	*gain*	The sensor gain value.

References gain_pressure_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.39 set_gain_pressure_surface()

```
void util::xmsg::XArgo::set_gain_pressure_surface (
            uint16_t gain)  [inline], [protected]
```

Set the pressure sensor gain for surface data, in LSB/dBar.

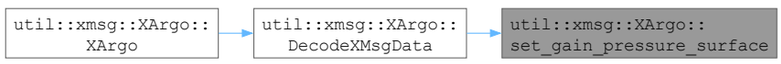
Parameters

in	*gain*	The sensor gain value.

References gain_pressure_surface_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.40 set_gain_salinity()

```
void util::xmsg::XArgo::set_gain_salinity (
            uint16_t gain)  [inline], [protected]
```

Set the salinity sensor gain, in LSB/PSU.

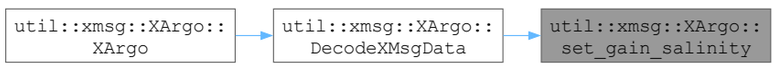
Parameters

in	*gain*	The sensor gain value.

References gain_salinity_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.41 set_gain_salinity_surface()

```
void util::xmsg::XArgo::set_gain_salinity_surface (
            uint16_t gain)  [inline], [protected]
```

Set the salinity sensor gain for surface data, in PSU/PSU.

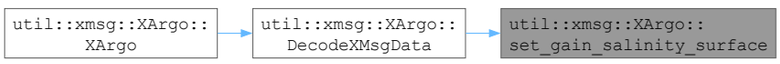
Parameters

in	*gain*	The sensor gain value.

References gain_salinity_surface_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.42 set_gain_temperature()

```
void util::xmsg::XArgo::set_gain_temperature (
            uint16_t gain)  [inline], [protected]
```

Set the temperature sensor gain, in PSU/degC.

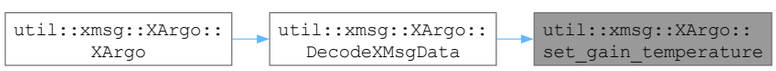
Parameters

in	*gain*	The sensor gain value.

References gain_temperature_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.43 set_gain_temperature_surface()

```
void util::xmsg::XArgo::set_gain_temperature_surface (
            uint16_t gain)  [inline], [protected]
```

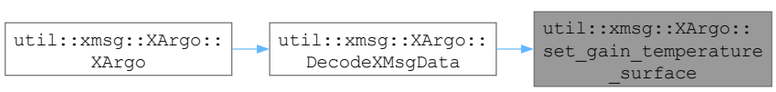
Set the temperature sensor gain for surface data, in PSU/degC.

Parameters

in	*gain*	The sensor gain value.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.44 set_id_dive()

```
void util::xmsg::XMessage::set_id_dive (
            int16_t id_dive)  [inline], [protected], [inherited]
```

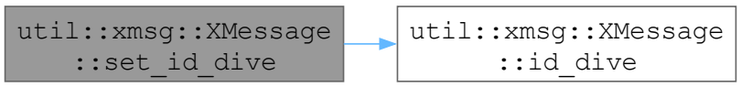
Set the dive or cycle number of this message.

Parameters

in	*id_dive*	The dive or cycle number of this message to set.

References util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::id_dive_.

Here is the call graph for this function:



10.58.3.45 set_id_instrument()

```
void util::xmsg::XMessage::set_id_instrument (
            uint16_t id_instrument)  [inline], [protected], [inherited]
```

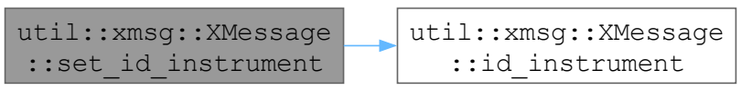
Set the unique instrument identifier.

Parameters

in	*id_instrument*	The unique instrument identifier to set.

References util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::id_instrument_.

Here is the call graph for this function:



10.58.3.46 set_id_xmsg_type()

```
void util::xmsg::XMessage::set_id_xmsg_type (
            XMsgTypeId_t id_xmsg_type)  [inline], [protected], [inherited]
```

Set the X-Message type identifier.

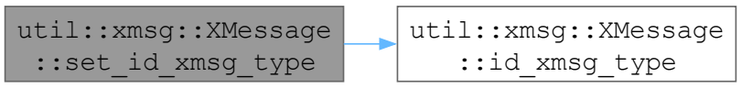
Parameters

in	*id_xmsg_type*	The X-Message type identifier to set.

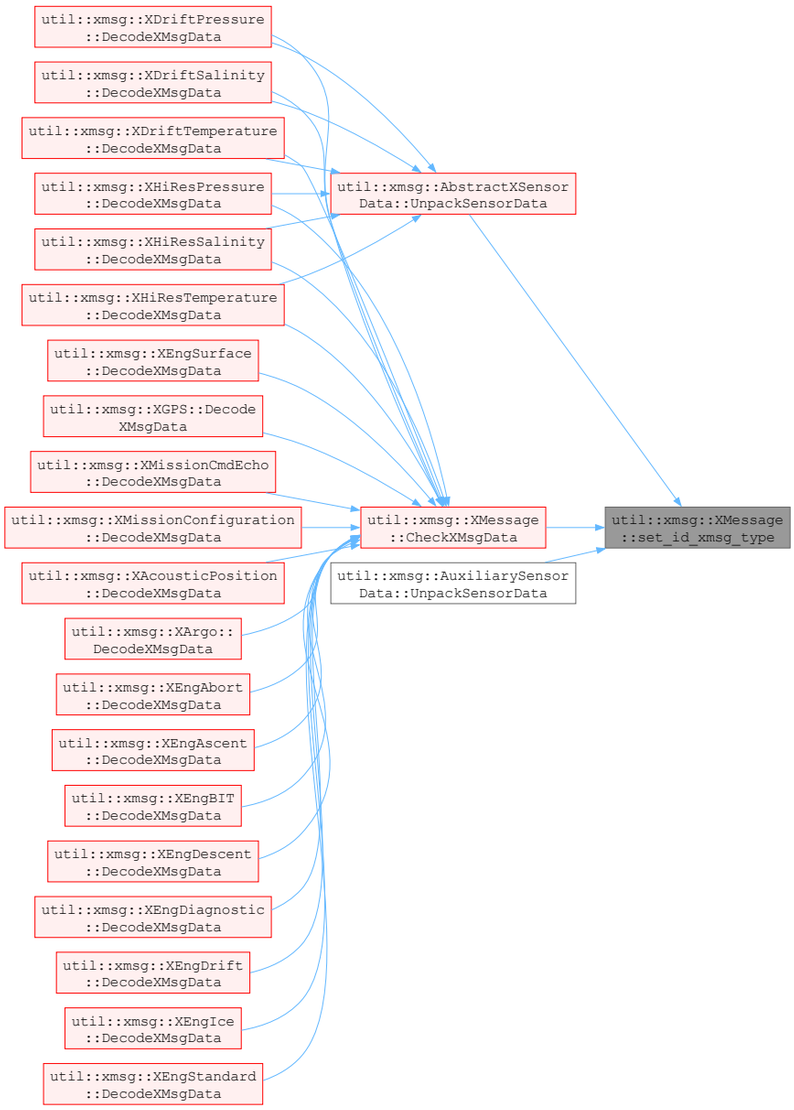
References util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::id_xmsg_type_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

Here is the call graph for this function:



Here is the caller graph for this function:



10.58.3.47 set_max_ascent_duration()

```
void util::xmsg::XArgo::set_max_ascent_duration (
            uint16_t duration)  [inline], [protected]
```

Set the maximum duration for the ascent state of the dive cycle, in minutes.

Parameters

in	*duration*	The maximum duration.

References max_ascent_duration_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:

10.58.3.48 set_max_fall_to_drift_duration()

```
void util::xmsg::XArgo::set_max_fall_to_drift_duration (
            uint16_t duration)  [inline], [protected]
```

Set the maximum duration for the descent-to-drift/park-pressure state of the dive cycle, in minutes.

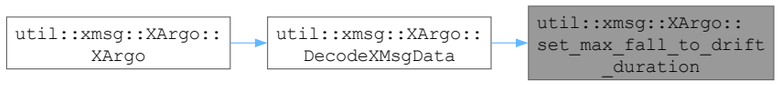
Parameters

in	*duration*	The maximum duration.

References max_fall_to_drift_duration_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.49 set_max_fall_to_profle_duration()

```
void util::xmsg::XArgo::set_max_fall_to_profle_duration (
            uint16_t duration)  [inline], [protected]
```

Set the maximum duration for the descent-to-profile-pressure state of the dive cycle, in minutes.

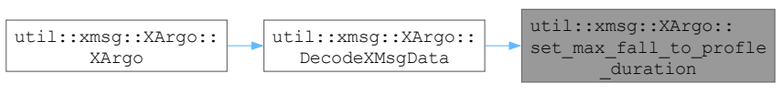
Parameters

in	*duration*	The maximum duration.

References max_fall_to_profle_duration_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.50 set_max_surface_duration()

```
void util::xmsg::XArgo::set_max_surface_duration (
            uint16_t duration)  [inline], [protected]
```

Set the maximum duration for the surface state of the dive cycle, in seconds.

Parameters

in	*duration*	The maximum duration.

References max_surface_duration_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:

10.58.3.51 set_mission_phase()

```
void util::xmsg::XArgo::set_mission_phase (
            uint8_t phase)  [inline], [protected]
```

Set the mission phase number.

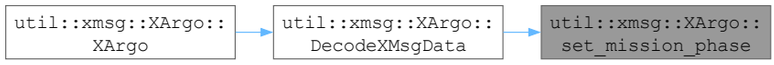
Parameters

in	*phase*	The mission phase number.

References mission_phase_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.52 set_num_seeks_to_drift_pressure()

```
void util::xmsg::XArgo::set_num_seeks_to_drift_pressure (
            uint16_t seeks)  [inline], [protected]
```

Set the maximum number of seeks to drift/park pressure.

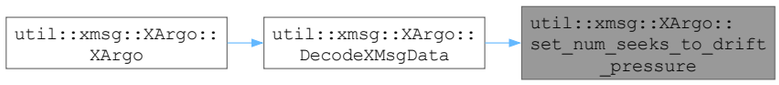
Parameters

in	*seeks*	The number of seeks.

References num_seeks_to_drift_pressure_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.53 set_offset_pressure()

```
void util::xmsg::XArgo::set_offset_pressure (
            uint16_t offs)  [inline], [protected]
```

Set the pressure sensor offset, in dBar.

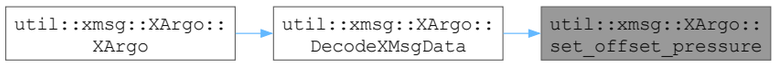
Parameters

in	*offs*	The sensor offset.

References offset_pressure_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.54 set_offset_pressure_surface()

```
void util::xmsg::XArgo::set_offset_pressure_surface (
            uint16_t offs)  [inline], [protected]
```

Set the pressure sensor offset for surface data, in dBar.

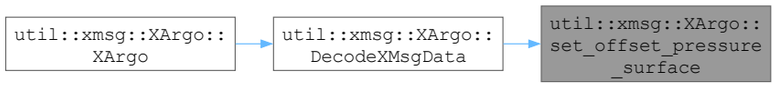
Parameters

in	*offs*	The sensor offset.

References offset_pressure_surface_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.55 set_offset_salinity()

```
void util::xmsg::XArgo::set_offset_salinity (
            uint16_t offs)  [inline], [protected]
```

Set the salinity sensor offset, in PSU.

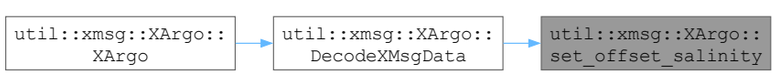
Parameters

in	*offs*	The sensor offset.

References offset_salinity_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.56 set_offset_salinity_surface()

```
void util::xmsg::XArgo::set_offset_salinity_surface (
            uint16_t offs)  [inline], [protected]
```

Set the salinity sensor offset for surface data, in PSU.

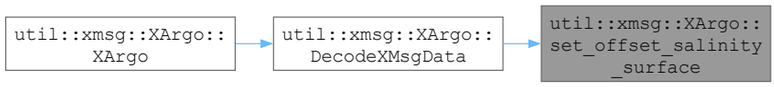
Parameters

in	*offs*	The sensor offset.

References offset_salinity_surface_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.57 set_offset_temperature()

```
void util::xmsg::XArgo::set_offset_temperature (
            uint16_t offs)  [inline], [protected]
```

Set the temperature sensor offset, in degC.

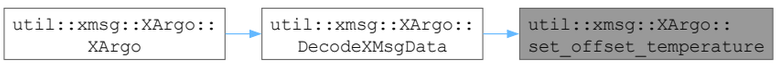
Parameters

in	*offs*	The sensor offset.

References offset_temperature_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.58 set_offset_temperature_surface()

```
void util::xmsg::XArgo::set_offset_temperature_surface (
            uint16_t offs)  [inline], [protected]
```

Set the temperature sensor offset for surface data, in degC.

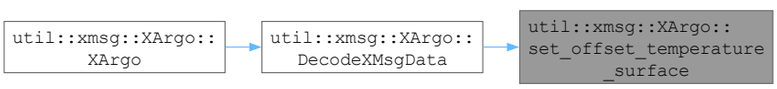
Parameters

in	*offs*	The sensor offset.

References offset_temperature_surface_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.59 set_seek_to_drift_pressure_interval_duration()

```
void util::xmsg::XArgo::set_seek_to_drift_pressure_interval_duration (
            uint16_t duration)  [inline], [protected]
```

Set the seek-to-drift/park-pressure interval duration, in minutes.

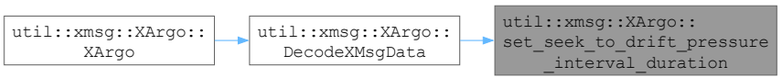
Parameters

in	*duration*	The interval duration.

References seek_to_drift_pressure_interval_duration_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.60 set_surface_state_start_time()

```
void util::xmsg::XArgo::set_surface_state_start_time (
            const ptime & time)  [inline], [protected]
```

Set the start time of the surface state of the dive cycle.

Parameters

in	*time*	The start time.

References surface_state_start_time_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:

10.58.3.61 set_target_ascent_rate()

```
void util::xmsg::XArgo::set_target_ascent_rate (
            uint8_t rate)  [inline], [protected]
```

Set the target ascent rate, in cm/s.

Parameters

in	*rate*	The target rate.

References target_ascent_rate_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:

10.58.3.62 set_target_drift_duration()

```
void util::xmsg::XArgo::set_target_drift_duration (
            uint16_t duration)  [inline], [protected]
```

Set the target duration of the drift/park phase of the dive cycle, in minutes.

Parameters

in	*duration*	The target duration.

References target_drift_duration_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:

10.58.3.63 set_target_drift_pressure()

```
void util::xmsg::XArgo::set_target_drift_pressure (
            uint16_t pres)  [inline], [protected]
```

Set the target drift/park pressure, in dBar.

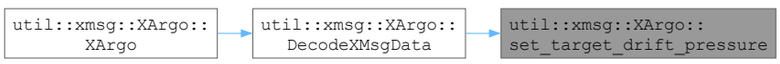
Parameters

in	*pres*	The target pressure.

References target_drift_pressure_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.64 set_target_profile_pressure()

```
void util::xmsg::XArgo::set_target_profile_pressure (
            uint16_t pres)  [inline], [protected]
```

Set the target profile pressure, in dBar.

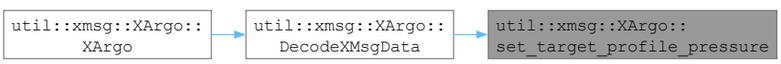
Parameters

in	*pres*	The target pressure.

References target_profile_pressure_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.65 set_x_version_major()

```
void util::xmsg::XArgo::set_x_version_major (
            uint8_t vers)  [inline], [protected]
```

Set the X-Message major version identifier.

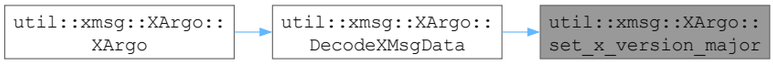
Parameters

in	*vers*	The version.

References x_version_major_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.66 set_x_version_minor()

```
void util::xmsg::XArgo::set_x_version_minor (
            uint8_t vers)  [inline], [protected]
```

Set the X-Message minor version identifier.

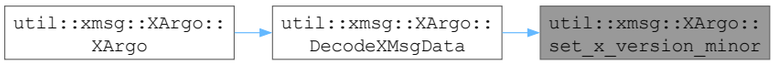
Parameters

in	*vers*	The version.

References x_version_minor_.

Referenced by DecodeXMsgData().

Here is the caller graph for this function:



10.58.3.67 set_xmsg_size_bytes()

```
void util::xmsg::XMessage::set_xmsg_size_bytes (
            uint16_t xmsg_size_bytes)  [inline], [protected], [inherited]
```

Set the size of the X-Message, in bytes.

Parameters

in	*xmsg_size_bytes*	The size of the X-Message to set, in bytes.

References util::xmsg::XMessage::xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), util::xmsg::XPump::DecodeXMsgData(), and util::xmsg::AbstractXFallRise::Unpa

10.58.3.68 surface_state_start_time()

```
const ptime & util::xmsg::XArgo::surface_state_start_time () const  [inline]
```

Get the start time of the surface state of the dive cycle.

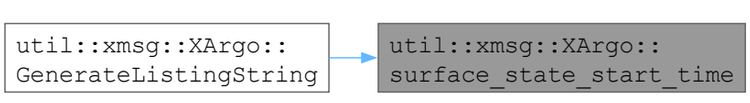
Returns

The start time of the surface state of the dive cycle.

References surface_state_start_time_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.69 target_ascent_rate()

```
uint8_t util::xmsg::XArgo::target_ascent_rate () const  [inline]
```

Get the target ascent/profile rate, in cm/sec.

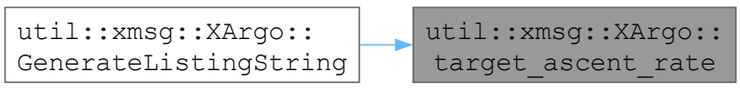
Returns

The target ascent/profile rate, in cm/sec.

References target_ascent_rate_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.70 target_drift_duration()

```
uint16_t util::xmsg::XArgo::target_drift_duration () const  [inline]
```

Get the target druration of the drift/park phase of the dive cycle, in minutes.

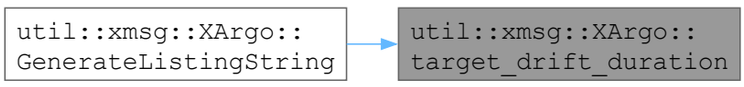
Returns

The target druration of the drift/park phase of the dive cycle, in minutes.

References target_drift_duration_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.71 target_drift_pressure()

```
uint16_t util::xmsg::XArgo::target_drift_pressure () const  [inline]
```

Get the target drift/park pressure, in dBar.

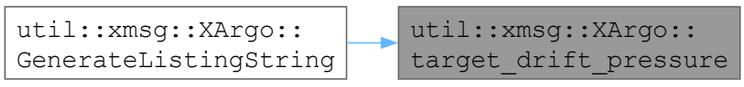
Returns

The target drift/park pressure, in dBar.

References target_drift_pressure_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.72 target_profile_pressure()

```
uint16_t util::xmsg::XArgo::target_profile_pressure () const  [inline]
```

Get the target profile pressure, in dBar.

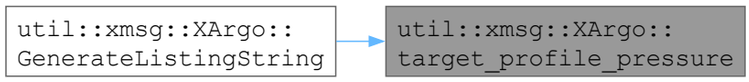
Returns

The target profile pressure, in dBar.

References target_profile_pressure_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.58.3.73 x_version_float()

```
float util::xmsg::XArgo::x_version_float () const  [inline]
```

Get the X-Message version as a floating-point value.

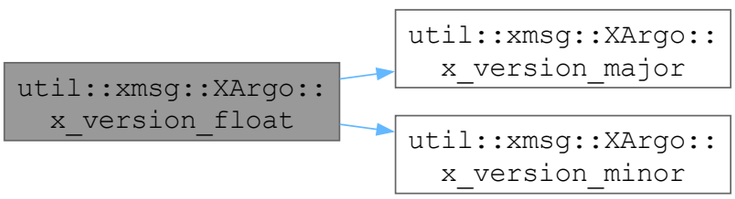
Returns

The X-Message version as a floating-point value.

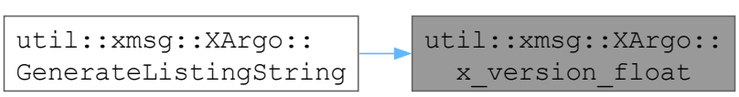
References x_version_major(), and x_version_minor().

Referenced by GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:



10.58.3.74 x_version_major()

```
uint8_t util::xmsg::XArgo::x_version_major () const  [inline]
```

Get the X-Message major version indicator.

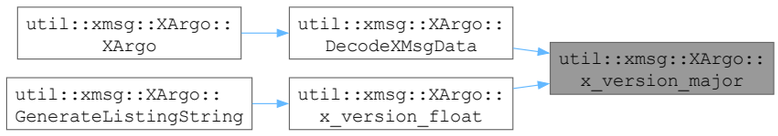
Returns

The X-Message major version indicator.

References x_version_major_.

Referenced by DecodeXMsgData(), and x_version_float().

Here is the caller graph for this function:



10.58.3.75 x_version_minor()

```
uint8_t util::xmsg::XArgo::x_version_minor () const  [inline]
```

Get the X-Message minor version indicator.

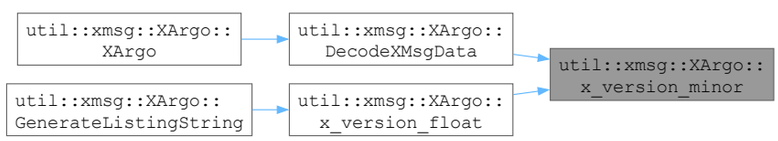
Returns

The X-Message minor version indicator.

References x_version_minor_.

Referenced by DecodeXMsgData(), and x_version_float().

Here is the caller graph for this function:



10.58.3.76 xmsg_size_bytes()

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes () const  [inline], [inherited]
```

Get the size of the X-Message, in bytes.

Returns

The size of the X-Message, in bytes.

References util::xmsg::XMessage::xmsg_size_bytes_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), DecodeXMsgData(), util::xmsg::XEngDescent::DecodeXMsgData(), util::xmsg::XEngIce::DecodeXMsgData(), util::xmsg::XEngSurface::DecodeXMsgData(), util::xmsg::XPump::DecodeXMsgData(), util::xmsg::XValve::DecodeXMsgData(), util::xmsg::XWave::DecodeXMsgData(), util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::AbstractXFallRise::UnpackData().

```
ptime util::xmsg::XArgo::descent_state_start_time_  [private]
```

The descend state start time.

Note

This field is used for ALAMO-type floats only.

This field was added in X-Message format version 2.1.

Referenced by descent_state_start_time(), and set_descent_state_start_time().

10.58.4.4 drift_state_start_time_

```
ptime util::xmsg::XArgo::drift_state_start_time_  [private]
```

The park state start time.

Note

This field is used for ALAMO-type floats only.

This field was added in X-Message format version 2.1.

Referenced by drift_state_start_time(), and set_drift_state_start_time().

10.58.4.5 gain_pressure_

```
uint16_t util::xmsg::XArgo::gain_pressure_  [private]
```

The pressure sensitivity gain factor, in LSB/dBar.

Note

This field was added in X-Message format version 1.2.

Referenced by gain_pressure(), and set_gain_pressure().

10.58.4.6 gain_pressure_surface_

```
uint16_t util::xmsg::XArgo::gain_pressure_surface_  [private]
```

The pressure sensitivity gain factor for surface data, in LSB/dBar.

Note

This field was added in X-Message format version 2.2.

Referenced by gain_pressure_surface(), and set_gain_pressure_surface().

10.58.4.7 gain_salinity_

```
uint16_t util::xmsg::XArgo::gain_salinity_  [private]
```

The salinity sensitivity scale factor, in LSB/PSU.

Note

This field was added in X-Message format version 1.2.

Referenced by gain_salinity(), and set_gain_salinity().

10.58.4.8 gain_salinity_surface_

```
uint16_t util::xmsg::XArgo::gain_salinity_surface_  [private]
```

The salinity sensitivity scale factor for surface data, in LSB/PSU.

Note

This field was added in X-Message format version 2.2.

Referenced by gain_salinity_surface(), and set_gain_salinity_surface().

10.58.4.9 gain_temperature_

```
uint16_t util::xmsg::XArgo::gain_temperature_  [private]
```

The temperature sensitivity scale factor, in LSB/degC.

Note

This field was added in X-Message format version 1.2.

Referenced by gain_temperature(), and set_gain_temperature().

10.58.4.10 gain_temperature_surface_

```
uint16_t util::xmsg::XArgo::gain_temperature_surface_  [private]
```

The temperature sensitivity scale factor for surface data, in LSB/degC.

Note

This field was added in X-Message format version 2.2.

Referenced by gain_temperature_surface().

10.58.4.11 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.58.4.12 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.58.4.13 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.58.4.14 max_ascent_duration_

```
uint16_t util::xmsg::XArgo::max_ascent_duration_  [private]
```

The maximum rise/ascend/profile time, in minutes.

Referenced by max_ascent_duration(), and set_max_ascent_duration().

10.58.4.15 max_fall_to_drift_duration_

```
uint16_t util::xmsg::XArgo::max_fall_to_drift_duration_  [private]
```

The maximum time to fall from the surface to drift/park depth, in minutes.

Referenced by max_fall_to_drift_duration(), and set_max_fall_to_drift_duration().

10.58.4.16 max_fall_to_profle_duration_

```
uint16_t util::xmsg::XArgo::max_fall_to_profle_duration_  [private]
```

The maximum time to fall from the drift/park depth to profile depth, in seconds.

Referenced by max_fall_to_profle_duration(), and set_max_fall_to_profle_duration().

10.58.4.17 max_surface_duration_

```
uint16_t util::xmsg::XArgo::max_surface_duration_  [private]
```

The maximum duration at the surface, in seconds.

Referenced by max_surface_duration(), and set_max_surface_duration().

10.58.4.18 mission_phase_

```
uint8_t util::xmsg::XArgo::mission_phase_  [private]
```

The mission phase number of this dive.

Referenced by mission_phase(), and set_mission_phase().

10.58.4.19 num_seeks_to_drift_pressure_

```
uint16_t util::xmsg::XArgo::num_seeks_to_drift_pressure_  [private]
```

The number of seeks to drift depth.

Referenced by num_seeks_to_drift_pressure(), and set_num_seeks_to_drift_pressure().

10.58.4.20 offset_pressure_

```
uint16_t util::xmsg::XArgo::offset_pressure_  [private]
```

The pressure offset, in dBar.

Note

This field was added in X-Message format version 1.2.

Referenced by offset_pressure(), and set_offset_pressure().

10.58.4.21 offset_pressure_surface_

```
uint16_t util::xmsg::XArgo::offset_pressure_surface_  [private]
```

The pressure offset for surface data, in dBar.

Note

This field was added in X-Message format version 2.2.

Referenced by offset_pressure_surface(), and set_offset_pressure_surface().

10.58.4.22 offset_salinity_

```
uint16_t util::xmsg::XArgo::offset_salinity_  [private]
```

The salinity offset, in PSU.

Note

This field was added in X-Message format version 1.2.

Referenced by offset_salinity(), and set_offset_salinity().

10.58.4.23 offset_salinity_surface_

```
uint16_t util::xmsg::XArgo::offset_salinity_surface_  [private]
```

The salinity offset for surface data, in PSU.

Note

This field was added in X-Message format version 2.2.

Referenced by offset_salinity_surface(), and set_offset_salinity_surface().

10.58.4.24 offset_temperature_

```
uint16_t util::xmsg::XArgo::offset_temperature_  [private]
```

The temperature offset, in degC.

Note

This field was added in X-Message format version 1.2.

Referenced by offset_temperature(), and set_offset_temperature().

10.58.4.25 offset_temperature_surface_

```
uint16_t util::xmsg::XArgo::offset_temperature_surface_  [private]
```

The temperature offset for surface data, in degC.

Note

This field was added in X-Message format version 2.2.

Referenced by offset_temperature_surface(), and set_offset_temperature_surface().

10.58.4.26 seek_to_drift_pressure_interval_duration_

```
uint16_t util::xmsg::XArgo::seek_to_drift_pressure_interval_duration_  [private]
```

The interval duration between subsequent seeks to drift/park depth, in minutes.

Referenced by seek_to_drift_pressure_interval_duration(), and set_seek_to_drift_pressure_interval_duration().

10.58.4.27 surface_state_start_time_

```
ptime util::xmsg::XArgo::surface_state_start_time_  [private]
```

The surface state start time.

Note

This field is used for ALAMO-type floats only.
This field was added in X-Message format version 2.1.

Referenced by set_surface_state_start_time(), and surface_state_start_time().

10.58.4.28 target_ascent_rate_

```
uint8_t util::xmsg::XArgo::target_ascent_rate_  [private]
```

The target ascent rate, in cm/s.

Referenced by set_target_ascent_rate(), and target_ascent_rate().

10.58.4.29 target_drift_duration_

```
uint16_t util::xmsg::XArgo::target_drift_duration_  [private]
```

The target duration of the drift/park phase of the dive cycle, in minutes.

Referenced by set_target_drift_duration(), and target_drift_duration().

10.58.4.30 target_drift_pressure_

```
uint16_t util::xmsg::XArgo::target_drift_pressure_  [private]
```

The target parking or drift depth (DTD), in dBar.

Referenced by set_target_drift_pressure(), and target_drift_pressure().

10.58.4.31 target_profile_pressure_

```
uint16_t util::xmsg::XArgo::target_profile_pressure_  [private]
```

The target profile depth (PFD), in dBar.

Referenced by set_target_profile_pressure(), and target_profile_pressure().

10.58.4.32 x_version_major_

```
uint8_t util::xmsg::XArgo::x_version_major_  [private]
```

The X message format major version number.

Referenced by set_x_version_major(), and x_version_major().

10.58.4.33 x_version_minor_

```
uint8_t util::xmsg::XArgo::x_version_minor_  [private]
```

The X Message format minor version number.

Referenced by set_x_version_minor(), and x_version_minor().

10.58.4.34 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

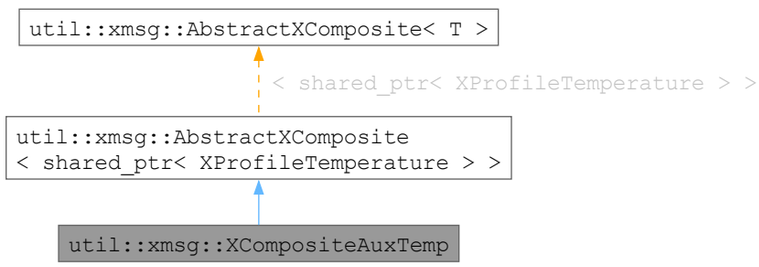
- data/xmsg/XArgo.h

10.59 util::xmsg::XCompositeAuxTemp Class Reference

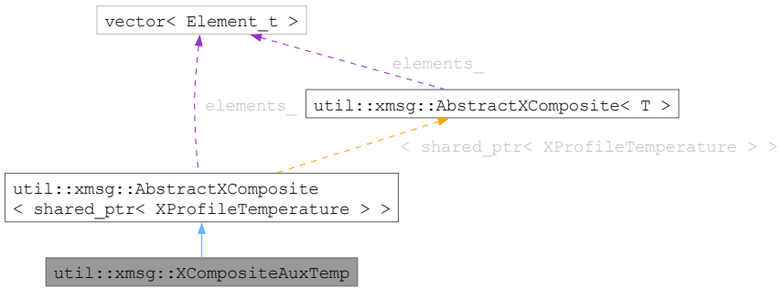
The composite auxiliary temperature class.

```
#include <XCompositeAuxTemp.h>
```

Inheritance diagram for util::xmsg::XCompositeAuxTemp:



Collaboration diagram for util::xmsg::XCompositeAuxTemp:



Public Member Functions

- void AppendAllElements (const static_vector< Element_t, I > &elements)

  Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.
- virtual void AssignElement (const Element_t &element)

  Assign an element to this composite object.
- const vector< Element_t > & elements () const

  Get the vector of individual X-Messages elements that compose this composite object.
- const string GenerateListingString (int id_inst, int id_dive, uint16_t tGain, uint16_t tOff)

  Generate the listing file section for the auxiliary temperature data.
- virtual bool **IsEmpty** () const
- virtual size_t num_elements () const

  Get the number of individual elements that compose this composite object.

Protected Member Functions

- void AppendAllElements (const vector< Element_t > &elements)

  Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.
- void AppendElement (const Element_t &element)

  Append one element to the vector of individual X-Messages elements that compose this composite object.

Private Types

- typedef shared_ptr< XProfileTemperature > Element_t

  Type definition for the element aggregated by this object.
- typedef ElementVec_t::const_iterator **ElementConstIter_t**
- typedef ElementVec_t::iterator **ElementIter_t**
- typedef vector< Element_t > **ElementVec_t**

Private Attributes

- ElementVec_t elements_

  The vector of individual X-Messages elements that compose this composite object.

10.59.1 Detailed Description

The composite auxiliary temperature class.

An instance of this class aggregates the auxiliary-channel profile temperature messages (see XProfileTemperature) received for a single dive.

10.59.2 Member Typedef Documentation

10.59.2.1 Element_t

```
typedef shared_ptr< XProfileTemperature > util::xmsg::AbstractXComposite< shared_ptr< XProfileTemperature
> >::Element_t  [private], [inherited]
```

Type definition for the element aggregated by this object.

10.59.3 Member Function Documentation

10.59.3.1 AppendAllElements() [1/2]

```
void util::xmsg::AbstractXComposite< shared_ptr< XProfileTemperature > >::AppendAllElements (
            const static_vector< Element_t, I > & elements)  [inline], [inherited]
```

Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*elements*	The vector of elements to append.

10.59.3.2 AppendAllElements() [2/2]

```
void util::xmsg::AbstractXComposite< shared_ptr< XProfileTemperature > >::AppendAllElements (
            const vector< Element_t > & elements)  [inline], [protected], [inherited]
```

Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*elements*	The vector of elements to append.

10.59.3.3 AppendElement()

```
void util::xmsg::AbstractXComposite< shared_ptr< XProfileTemperature > >::AppendElement (
            const Element_t & element)  [inline], [protected], [inherited]
```

Append one element to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*element*	The element to append.

10.59.3.4 AssignElement()

```
virtual void util::xmsg::AbstractXComposite< shared_ptr< XProfileTemperature > >::AssignElement
(
            const Element_t & element)  [inline], [virtual], [inherited]
```

Assign an element to this composite object.

The default implementation appends the element; derived classes may override it to insert elements in order or reject duplicates.

Parameters

in	*element*	The element to assign.

10.59.3.5 elements()

```
const vector< Element_t > & util::xmsg::AbstractXComposite< shared_ptr< XProfileTemperature >
>::elements () const  [inline], [inherited]
```

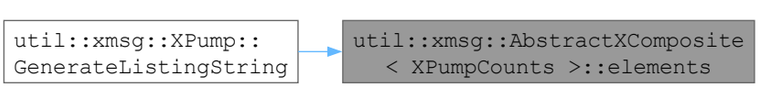
Get the vector of individual X-Messages elements that compose this composite object.

Returns

The vector of individual X-Messages elements that compose this composite object.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.59.3.6 GenerateListingString()

```
const string util::xmsg::XCompositeAuxTemp::GenerateListingString (
            int id_inst,
            int id_dive,
            uint16_t tGain,
            uint16_t tOff)  [inline]
```

Generate the listing file section for the auxiliary temperature data.

Writes an `AXT` header line, then one `axt` line per sample of each auxiliary temperature message, with the raw counts and the temperature in degrees Celsius.

Parameters

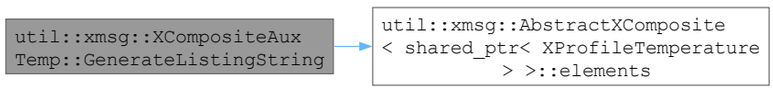
in	*id_inst*	The unique instrument identifier.
in	*id_dive*	The dive or cycle number.
in	*tGain*	The temperature gain used to convert counts.
in	*tOff*	The temperature offset used to convert counts.

Returns

The listing file section.

References util::xmsg::AbstractXComposite< shared_ptr< XProfileTemperature > >::elements().

Here is the call graph for this function:



10.59.3.7 num_elements()

```
virtual size_t util::xmsg::AbstractXComposite< shared_ptr< XProfileTemperature > >::num_elements
() const  [inline], [virtual], [inherited]
```

Get the number of individual elements that compose this composite object.

Returns

The number of individual elements that compose this composite object.

10.59.4 Member Data Documentation

10.59.4.1 elements_

```
ElementVec_t util::xmsg::AbstractXComposite< shared_ptr< XProfileTemperature > >::elements_↩
[private], [inherited]
```

The vector of individual X-Messages elements that compose this composite object.

The documentation for this class was generated from the following file:

- data/xmsg/XCompositeAuxTemp.h

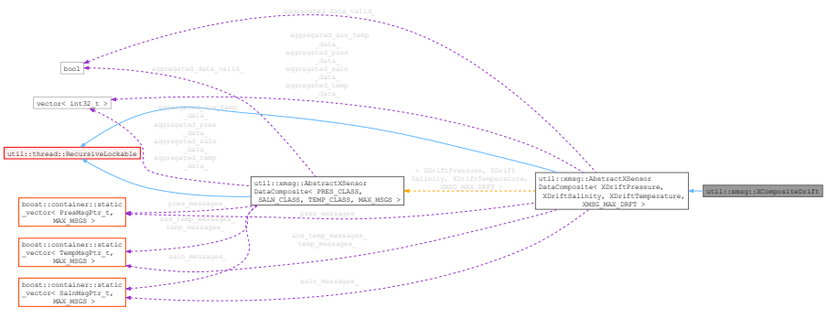
10.60 util::xmsg::XCompositeDrift Class Reference

Class representing the aggregate drift data for a single dive, composed from one or more drift messages.

`#include <XCompositeDrift.h>`

Inheritance diagram for util::xmsg::XCompositeDrift:

Collaboration diagram for util::xmsg::XCompositeDrift:



Public Member Functions

- XCompositeDrift ()

  The default constructor.
- ~XCompositeDrift ()

  The destructor.
- void AssignAuxTemperatureMessage (const TempMsgPtr_t &x)

  Assign an auxiliary-channel temperature message and re-aggregate the sensor data.
- void AssignPressureMessage (const PresMsgPtr_t &x)

  Assign a pressure data message to this composite data object.
- void AssignSalinityMessage (const SalnMsgPtr_t &x)

  Assign a salinity data message to this composite data object.
- void AssignTemperatureMessage (const TempMsgPtr_t &x)

  Assign a temperature data message to this composite data object.
- void **CopyPressureDataToArray** (T dest[], size_t max_len, int16_t gain, int16_t offs, float pres_correction, T fill_value=XMSG_SENS_BAD_PRES) const
- void **CopySalinityDataToArray** (T dest[], size_t max_len, int16_t gain, int16_t offs, T fill_value=XMSG_SENS_BAD_SALN) const
- void **CopyTemperatureDataToArray** (T dest[], size_t max_len, int16_t gain, int16_t offs, T fill_↩ value=XMSG_SENS_BAD_TEMP) const
- const string GenerateListingString (int id_inst, int id_dive, uint16_t pg, uint16_t po, uint16_t sg, uint16_t so, uint16_t tg, uint16_t to, float pc) const

  Generate a listing string representation of the this composite sensor data object.
- const string GeneratePhyString (uint16_t pg, uint16_t po, uint16_t sg, uint16_t so, uint16_t tg, uint16_t to, float pc) const

  Generate a PHY entry string from this composite drift data object.
- bool **HasAuxTempData** () const
- bool HasContiguousMessageIndices () const

  Do the sensor data messages assigned to this composite data object have contiguous message indices?
- bool is_aggregated_data_valid () const

  Is the aggregated data valid?
- bool IsDataComplete () const

  Is the sensor data for this composite date message complete?
- bool IsEmpty () const

  Is this composite data object empty?
- bool LockObject (bool block)

  Lock the object.

- size_t max_num_samples () const

  Return the maximum of the number of pressure, temperature, or salinity sensor samples in the sensor data messages assigned to this composite sensor data object.
- size_t **num_aux_temp_samples** () const
- size_t num_pres_samples () const

  Get the total number of pressure sensor samples contained in the pressure data messages assigned to this composite data object.
- size_t num_saln_samples () const

  Get the total number of salinity sensor samples contained in the salinity data messages assigned to this composite data object.
- size_t num_temp_samples () const

  Get the total number of temperature sensor samples contained in the temperature data messages assigned to this composite data object.
- void Reset ()

  Remove the assigned pressure, temperature and salinity messages and their aggregated data.
- T **SampleAuxTempAsFloat** (size_t i, int16_t gain, int16_t offs) const
- int32_t SamplePres (size_t i) const

  Get the i^{th} pressure sensor value, in raw counts.
- T SamplePresAsFloat (size_t i, int16_t pg, int16_t po, float pc) const

  Get the i^{th} pressure sensor value, in dBar.
- int32_t SampleSaln (size_t i) const

  Get the i^{th} salinity sensor value, in raw counts.
- T SampleSalnAsFloat (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} salinity sensor value, in PSU.
- int32_t SampleTemp (size_t i) const

  Get the i^{th} temperature sensor value, in raw counts.
- T SampleTempAsFloat (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} temperature sensor value, in degC.
- void UnlockObject ()

  Unlock the object.

Protected Member Functions

- void AggregateSensorData () ATTR_NO_EXCEPTIONS

  Aggregate the sensor data for this composite sensor data object.
- void set_aggregated_data_valid (bool valid)

  Set the value of the aggregated_data_valid_ field.

Protected Attributes

- recursive_mutex mutex_

  Recursive mutual exclusion lock for synchronizing operations.

Private Types

- typedef shared_ptr< XDriftPressure > PresMsgPtr_t

  Type definition for a shared pointer to the pressure data message.
- typedef static_vector< PresMsgPtr_t, MAX_MSGS > PresMsgVector_t

  Type definition for a static vector (of size MAX_MSGS) of shared pointers to the pressure data message.
- typedef shared_ptr< XDriftSalinity > SalnMsgPtr_t

  Type definition for a shared pointer to the salinity data message.
- typedef static_vector< SalnMsgPtr_t, MAX_MSGS > SalnMsgVector_t

  Type definition for a static vector (of size MAX_MSGS) of shared pointers to the salinity data message.
- typedef shared_ptr< XDriftTemperature > TempMsgPtr_t

  Type definition for a shared pointer to the temperature data message.
- typedef static_vector< TempMsgPtr_t, MAX_MSGS > TempMsgVector_t

  Type definition for a static vector (of size MAX_MSGS) of shared pointers to the temperature data message.

Private Attributes

- vector< int32_t > **aggregated_aux_temp_data_**
- bool aggregated_data_valid_

  The aggregated data is valid flag.
- vector< int32_t > aggregated_pres_data_

  A vector of the aggregated pressure data samples, in raw counts.
- vector< int32_t > aggregated_saln_data_

  A vector of the aggregated salinity data samples, in raw counts.
- vector< int32_t > aggregated_temp_data_

  A vector of the aggregated temperature data samples, in raw counts.
- TempMsgVector_t **aux_temp_messages_**
- PresMsgVector_t pres_messages_

  A static vector (of size MAX_MSGS) containing pointers the pressure sensor data messages assigned to this composite object.
- SalnMsgVector_t saln_messages_

  A static vector (of size MAX_MSGS) containing pointers the salinity sensor data messages assigned to this composite object.
- TempMsgVector_t temp_messages_

  A static vector (of size MAX_MSGS) containing pointers the temperature sensor data messages assigned to this composite object.

10.60.1 Detailed Description

Class representing the aggregate drift data for a single dive, composed from one or more drift messages.

10.60.2 Member Typedef Documentation

10.60.2.1 PresMsgPtr_t

```
typedef shared_ptr<XDriftPressure> util::xmsg::AbstractXSensorDataComposite< XDriftPressure,
XDriftSalinity, XDriftTemperature, MAX_MSGS >::PresMsgPtr_t  [private], [inherited]
```

Type definition for a shared pointer to the pressure data message.

10.60.2.2 PresMsgVector_t

```
typedef static_vector<PresMsgPtr_t, MAX_MSGS> util::xmsg::AbstractXSensorDataComposite< XDriftPressure,
XDriftSalinity, XDriftTemperature, MAX_MSGS >::PresMsgVector_t  [private], [inherited]
```

Type definition for a static vector (of size MAX_MSGS) of shared pointers to the pressure data message.

10.60.2.3 SalnMsgPtr_t

```
typedef shared_ptr<XDriftSalinity> util::xmsg::AbstractXSensorDataComposite< XDriftPressure,
XDriftSalinity, XDriftTemperature, MAX_MSGS >::SalnMsgPtr_t  [private], [inherited]
```

Type definition for a shared pointer to the salinity data message.

10.60.2.4 SalnMsgVector_t

```
typedef static_vector<SalnMsgPtr_t, MAX_MSGS> util::xmsg::AbstractXSensorDataComposite< XDriftPressure,
XDriftSalinity, XDriftTemperature, MAX_MSGS >::SalnMsgVector_t  [private], [inherited]
```

Type definition for a static vector (of size MAX_MSGS) of shared pointers to the salinity data message.

10.60.2.5 TempMsgPtr_t

typedef shared_ptr<XDriftTemperature> util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature, MAX_MSGS >::TempMsgPtr_t [private], [inherited]

Type definition for a shared pointer to the temperature data message.

10.60.2.6 TempMsgVector_t

typedef static_vector<TempMsgPtr_t, MAX_MSGS> util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature, MAX_MSGS >::TempMsgVector_t [private], [inherited]

Type definition for a static vector (of size MAX_MSGS) of shared pointers to the temperature data message.

10.60.3 Constructor & Destructor Documentation

10.60.3.1 XCompositeDrift()

util::xmsg::XCompositeDrift::XCompositeDrift () [inline]

The default constructor.

10.60.3.2 ~XCompositeDrift()

util::xmsg::XCompositeDrift::~XCompositeDrift () [inline]

The destructor.

10.60.4 Member Function Documentation

10.60.4.1 AggregateSensorData()

void util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature, MAX_MSGS >::AggregateSensorData () [inline], [protected], [inherited]

Aggregate the sensor data for this composite sensor data object.

This function iterates over each of the sensor data messages assigned to this composite data object, and copies of the sensor data values into the corresponding sensor data vector.

If aggregated_data_valid_ is TRUE, then this function will have no effect. Otherwise, each of the aggregegated sensor data vectors will be cleared and the appropriate number of samples will be reserved.

Then, the sensor data message will be iterated over in order of increasing message indices, and the sensor data values will be copied into the corresponding sensor data vector in the appropriate order.

Finally, aggregated_data_valid_ will be set to FALSE to ensure that subsequent calls to this function will have no effect, until another sensor data message object is assigned to this composite object and aggregated_data_valid_ is set to TRUE.

Exceptions

util::log::MessageException	if an error occurs while aggregating the sensor data.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

10.60.4.2 AssignAuxTemperatureMessage()

void util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature, MAX_MSGS >::AssignAuxTemperatureMessage (
const TempMsgPtr_t & x) [inline], [inherited]

Assign an auxiliary-channel temperature message and re-aggregate the sensor data.

The message is inserted in order of message index, and the aggregated sensor data is rebuilt.

Parameters

in	*x*	The auxiliary-channel temperature message to assign.

Exceptions

util::log::MessageException	if x is NULL or an auxiliary temperature message with the same index has already been assigned.

10.60.4.3 AssignPressureMessage()

```
void util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature,
MAX_MSGS >::AssignPressureMessage (
            const PresMsgPtr_t & x)  [inline], [inherited]
```

Assign a pressure data message to this composite data object.

The pressure data message will be emplaced into the sensor data message vector in order of increasing message indices. If a message with the same index is as x is already contained in the vector, then an exception will be thrown.

Parameters

in	*x*	A shared pointer to the pressure data message.

Exceptions

util::log::MessageException	if x is a null pointer, a duplicate message index is encountered, or any other error occurs.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

10.60.4.4 AssignSalinityMessage()

```
void util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature,
MAX_MSGS >::AssignSalinityMessage (
            const SalnMsgPtr_t & x)  [inline], [inherited]
```

Assign a salinity data message to this composite data object.

The salinity data message will be emplaced into the sensor data message vector in order of increasing message indices. If a message with the same index is as x is already contained in the vector, then an exception will be thrown.

Parameters

in	*x*	A shared pointer to the salinity data message.

Exceptions

util::log::MessageException	if x is a null pointer, a duplicate message index is encountered, or any other error occurs.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

10.60.4.5 AssignTemperatureMessage()

```
void util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature,
MAX_MSGS >::AssignTemperatureMessage (
            const TempMsgPtr_t & x)  [inline], [inherited]
```

Assign a temperature data message to this composite data object.

The temperature data message will be emplaced into the sensor data message vector in order of increasing message indices. If a message with the same index is as `x` is already contained in the vector, then an exception will be thrown.

Parameters

in	*x*	A shared pointer to the temperature data message.

Exceptions

util::log::MessageException	if `x` is a null pointer, a duplicate message index is encountered, or any other error occurs.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

10.60.4.6 GenerateListingString()

```
const string util::xmsg::XCompositeDrift::GenerateListingString (
            int id_inst,
            int id_dive,
            uint16_t pg,
            uint16_t po,
            uint16_t sg,
            uint16_t so,
            uint16_t tg,
            uint16_t to,
            float pc) const  [inline], [virtual]
```

Generate a listing string representation of the this composite sensor data object.

Parameters

in	*id_inst*	The unique instrument identifier for this composite sensor data object.
in	*id_dive*	The dive or cycle number for this composite data object.
in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*sg*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*so*	The salinity sensor offset, in PSU.
in	*tg*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*to*	The temperature sensor offset, in degC.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Exceptions

log::MessageException	if an error occurs while generating the listing string.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

A listing string representation of this composite sensor data object.

Implements util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature, XMSG_MAX_DRFT >.

References CATCH_BLOCK, util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature, XMSG_MA

Here is the caller graph for this function:

10.60.4.7 GeneratePhyString()

```
const string util::xmsg::XCompositeDrift::GeneratePhyString (
            uint16_t pg,
            uint16_t po,
            uint16_t sg,
            uint16_t so,
            uint16_t tg,
            uint16_t to,
            float pc) const  [inline]
```

Generate a PHY entry string from this composite drift data object.

Parameters

in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*sg*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*so*	The salinity sensor offset, in PSU.
in	*tg*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*to*	The temperature sensor offset, in degC.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Exceptions

log::MessageException	if an error occurs while generating the PHY string.

Returns

A PHY entry string representation of this composite drift dataobject.

References CATCH_BLOCK, util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature, XMSG_MA
util::thread::RecursiveLockable::mutex_, util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature, X

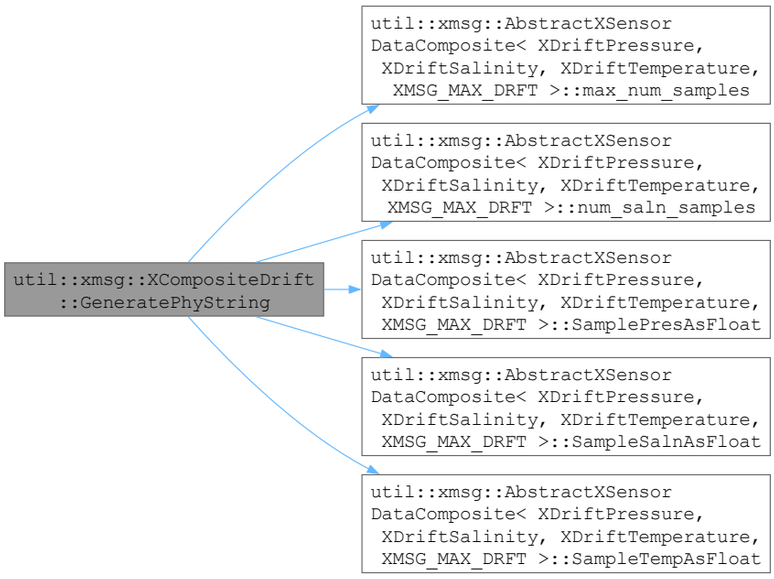
and util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature, XMSG_MAX_DRFT >::SampleTemp

Here is the call graph for this function:



10.60.4.8 HasContiguousMessageIndices()

```
bool util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature,
MAX_MSGS >::HasContiguousMessageIndices () const  [inline], [inherited]
```

Do the sensor data messages assigned to this composite data object have contiguous message indices?

This function is used, in part, to determine the sensor data is complete.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

TRUE if the sensor data messages have contiguous message indices or if there is less than two of each sensor data message, or FALSE otherwise.

10.60.4.9 is_aggregated_data_valid()

bool util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature, MAX_MSGS >::is_aggregated_data_valid () const [inline], [inherited]

Is the aggregated data valid?

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

TRUE if the aggregated sensor is valid, or FALSE otherwise.

10.60.4.10 IsDataComplete()

bool util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature, MAX_MSGS >::IsDataComplete () const [inline], [inherited]

Is the sensor data for this composite date message complete?

This function returns true if

- this composite sensor data object is not empty,
- the sensor data messages assigned to this composite data object have contiguous message indices,
- this sensor data object contains the same number of temperature and pressure sensor values, and
- the number of salinity data samples is either zero or equal to the number of pressure data samples.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

TRUE if the sensor data is complete, or FALSE otherwise.

Referenced by GenerateListingString().

Here is the caller graph for this function:

10.60.4.11 IsEmpty()

bool util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature, MAX_MSGS >::IsEmpty () const [inline], [inherited]

Is this composite data object empty?

Returns

TRUE if empty, or FALSE otherwise.

10.60.4.12 LockObject()

bool util::thread::RecursiveLockable::LockObject (
bool *block*) [inline], [inherited]

Lock the object.

Parameters

in	*block*	If TRUE, then the calling thread will block until the lock becomes available.

Exceptions

util::log::MessageException	if an error occurs.

Returns

TRUE if the lock was successfully obtained, or FALSE if block is FALSE and another thread owns the lock on the mutex.

References CATCH_BLOCK, and util::thread::RecursiveLockable::mutex_.

10.60.4.13 max_num_samples()

`size_t util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature, MAX_MSGS >::max_num_samples () const [inline], [inherited]`

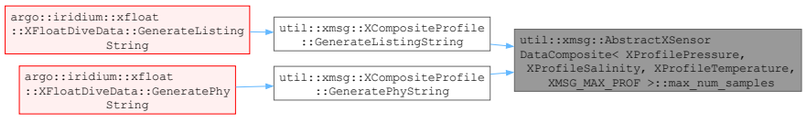
Return the maximum of the number of pressure, temperature, or salinity sensor samples in the sensor data messages assigned to this composite sensor data object.

Returns

The maximum of the number of pressure, temperature, or salinity sensor samples.

Referenced by GenerateListingString(), and GeneratePhyString().

Here is the caller graph for this function:



10.60.4.14 num_pres_samples()

`size_t util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature, MAX_MSGS >::num_pres_samples () const [inline], [inherited]`

Get the total number of pressure sensor samples contained in the pressure data messages assigned to this composite data object.

Exceptions

util::log::MessageException	if an error occurs.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The total number of pressure sensor samples contained in the pressure data messages assigned to this composite data object.

10.60.4.15 num_saln_samples()

`size_t util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature, MAX_MSGS >::num_saln_samples () const [inline], [inherited]`

Get the total number of salinity sensor samples contained in the salinity data messages assigned to this composite data object.

Exceptions

util::log::MessageException	if an error occurs.

Note

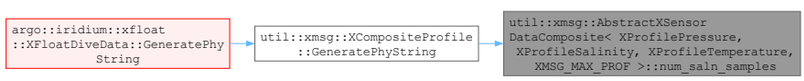
This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The total number of pressure sensor samples contained in the pressure data messages assigned to this composite data object.

Referenced by GeneratePhyString().

Here is the caller graph for this function:



10.60.4.16 num_temp_samples()

```
size_t util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature,
MAX_MSGS >::num_temp_samples () const  [inline], [inherited]
```

Get the total number of temperature sensor samples contained in the temperature data messages assigned to this composite data object.

Exceptions

util::log::MessageException	if an error occurs.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The total number of pressure sensor samples contained in the pressure data messages assigned to this composite data object.

10.60.4.17 Reset()

```
void util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature,
MAX_MSGS >::Reset ()  [inline], [inherited]
```

Remove the assigned pressure, temperature and salinity messages and their aggregated data.

Warning

The auxiliary temperature messages and aggregated auxiliary temperature data are not cleared, so re-assigning them after a reset fails with a duplicate index.

Exceptions

util::log::MessageException	if an error occurs.

10.60.4.18 SamplePres()

```
int32_t util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature,
MAX_MSGS >::SamplePres (
            size_t i) const  [inline], [inherited]
```

Get the i^{th} pressure sensor value, in raw counts.

Parameters

in	*i*	The index of the pressure sensor sample to return. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD will be returned.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} pressure sensor value, in raw counts, or XMSG_SENS_BAD if the index `i` exceeds the number of pressure sensor samples in the aggregated data vector.

10.60.4.19 SamplePresAsFloat()

```
T util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature,
MAX_MSGS >::SamplePresAsFloat (
            size_t i,
            int16_t pg,
            int16_t po,
            float pc) const  [inline], [inherited]
```

Get the i^{th} pressure sensor value, in dBar.

Parameters

in	*i*	The index of the sensor value. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_PRES will be returned.
in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Note

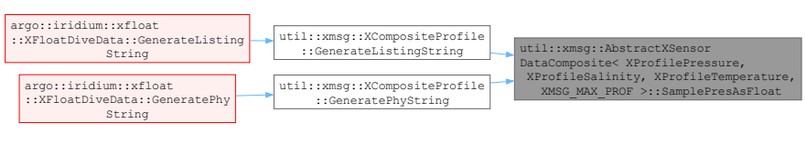
This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} pressure sensor value, in dBar. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_PRES will be returned.

Referenced by GenerateListingString(), and GeneratePhyString().

Here is the caller graph for this function:



10.60.4.20 SampleSaln()

```
int32_t util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature,
MAX_MSGS >::SampleSaln (
            size_t i) const  [inline], [inherited]
```

Get the i^{th} salinity sensor value, in raw counts.

Parameters

in	*i*	The index of the salinity sensor sample to return. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD will be returned.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} salinity sensor value, in raw counts, or XMSG_SENS_BAD if the index `i` exceeds the number of pressure sensor samples in the aggregated data vector.

10.60.4.21 SampleSalnAsFloat()

```
T util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature,
MAX_MSGS >::SampleSalnAsFloat (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} salinity sensor value, in PSU.

Parameters

in	*i*	The index of the sensor value. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_SALN will be returned.
in	*gain*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*offs*	The salinity sensor offset, in PSU.

Note

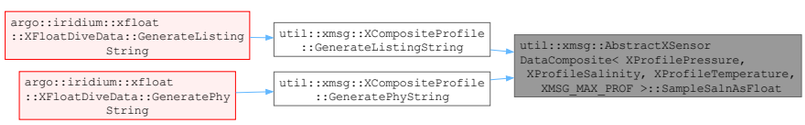
This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} salinity sensor value, in PSU. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_SALN will be returned.

Referenced by GenerateListingString(), and GeneratePhyString().

Here is the caller graph for this function:



10.60.4.22 SampleTemp()

```
int32_t util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature,
MAX_MSGS >::SampleTemp (
            size_t i) const  [inline], [inherited]
```

Get the i^{th} temperature sensor value, in raw counts.

Parameters

in	*i*	The index of the temperature sensor sample to return. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD will be returned.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} temperature sensor value, in raw counts, or XMSG_SENS_BAD if the index `i` exceeds the number of pressure sensor samples in the aggregated data vector.

10.60.4.23 SampleTempAsFloat()

```
T util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature,
MAX_MSGS >::SampleTempAsFloat (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} temperature sensor value, in degC.

Parameters

in	*i*	The index of the sensor value. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_SALN will be returned.
in	*gain*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*offs*	The temperature sensor offset, in degC.

Note

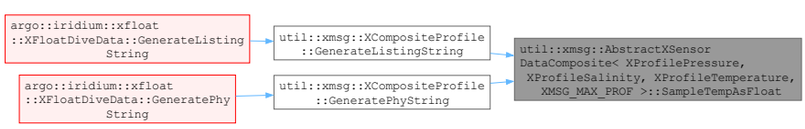
This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} temperature sensor value, in degC. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_TEMP will be returned.

Referenced by GenerateListingString(), and GeneratePhyString().

Here is the caller graph for this function:



10.60.4.24 set_aggregated_data_valid()

```
void util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature,
MAX_MSGS >::set_aggregated_data_valid (
            bool valid)  [inline], [protected], [inherited]
```

Set the value of the aggregated_data_valid_ field.

Parameters

in	*valid*	TRUE if the aggregated data is valid, or FALSE otherwise.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

10.60.4.25 UnlockObject()

```
void util::thread::RecursiveLockable::UnlockObject ()  [inline], [inherited]
```

Unlock the object.

Exceptions

util::log::MessageException	if an error occurs.

References CATCH_BLOCK, and util::thread::RecursiveLockable::mutex_.

10.60.5 Member Data Documentation

10.60.5.1 aggregated_data_valid_

```
bool util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature,
MAX_MSGS >::aggregated_data_valid_  [private], [inherited]
```

The aggregated data is valid flag.

This flag indicates the status of the aggregated sensor data. It is used to ensure the composite sensor data is aggregated only once following each assignment of sensor data to the composite data message.

This field is set to FALSE during initialization, and is set to FALSE each time a sensor data message is assigned to the composite data message. Each time AggregateSensorData() is called, the data will be aggregated, and this field will be set to TRUE.

10.60.5.2 aggregated_pres_data_

```
vector<int32_t> util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature,
MAX_MSGS >::aggregated_pres_data_  [private], [inherited]
```

A vector of the aggregated pressure data samples, in raw counts.

Each time the data is aggregated, the sensor data samples from the sensor data messages assigned to this composite objects are stored in this vector.

10.60.5.3 aggregated_saln_data_

```
vector<int32_t> util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature,
MAX_MSGS >::aggregated_saln_data_  [private], [inherited]
```

A vector of the aggregated salinity data samples, in raw counts.

Each time the data is aggregated, the sensor data samples from the sensor data messages assigned to this composite objects are stored in this vector.

10.60.5.4 aggregated_temp_data_

vector<int32_t> util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature, MAX_MSGS >::aggregated_temp_data_ [private], [inherited]

A vector of the aggregated temperature data samples, in raw counts.

Each time the data is aggregated, the sensor data samples from the sensor data messages assigned to this composite object are stored in this vector.

10.60.5.5 mutex_

recursive_mutex util::thread::RecursiveLockable::mutex_ [mutable], [protected], [inherited]

Recursive mutual exclusion lock for synchronizing operations.

10.60.5.6 pres_messages_

```
PresMsgVector_t util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature,
MAX_MSGS >::pres_messages_  [private], [inherited]
```

A static vector (of size MAX_MSGS) containing pointers the pressure sensor data messages assigned to this composite object.

Each time a pressure sensor data message is assigned to the this object, it will be emplaced in this vector in order of increasing message indices.

10.60.5.7 saln_messages_

SalnMsgVector_t util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature, MAX_MSGS >::saln_messages_ [private], [inherited]

A static vector (of size MAX_MSGS) containing pointers the salinity sensor data messages assigned to this composite object.

Each time a salinity sensor data message is assigned to the this object, it will be emplaced in this vector in order of increasing message indices.

10.60.5.8 temp_messages_

TempMsgVector_t util::xmsg::AbstractXSensorDataComposite< XDriftPressure, XDriftSalinity, XDriftTemperature, MAX_MSGS >::temp_messages_ [private], [inherited]

A static vector (of size MAX_MSGS) containing pointers the temperature sensor data messages assigned to this composite object.

Each time a temperature sensor data message is assigned to the this object, it will be emplaced in this vector in order of increasing message indices.

The documentation for this class was generated from the following file:

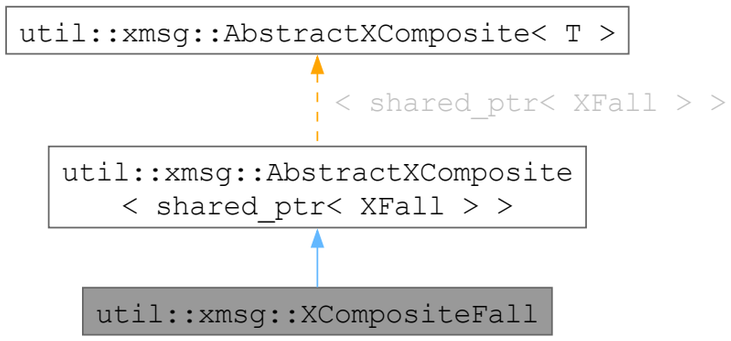
- data/xmsg/XCompositeDrift.h

10.61 util::xmsg::XCompositeFall Class Reference

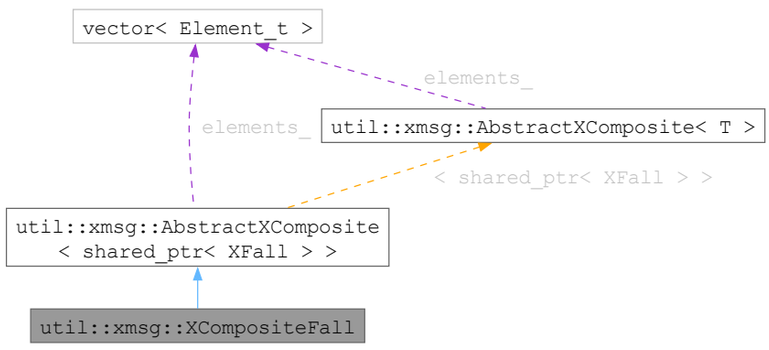
Class representing the aggregate fall time-series data for a single dive, composed from one or more fall time-series messages.

#include <XCompositeFall.h>

Inheritance diagram for util::xmsg::XCompositeFall:



Collaboration diagram for util::xmsg::XCompositeFall:



Public Member Functions

- XCompositeFall ()

  The default constructor.
- ~XCompositeFall ()

  The destructor.
- void AppendAllElements (const static_vector< Element_t, I > &elements)

  Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.
- virtual void AssignElement (const Element_t &element)

  Assign an element to this composite object.
- const vector< Element_t > & elements () const

  Get the vector of individual X-Messages elements that compose this composite object.
- const string GenerateListingString (uint16_t pg, uint16_t po, uint16_t sg, uint16_t so, uint16_t tg, uint16_t to, float pc) const

  Generate a listing entry string from this composite fall time-series data object.
- virtual bool **IsEmpty** () const
- virtual size_t num_elements () const

  Get the number of individual elements that compose this composite object.

Protected Member Functions

- void AppendAllElements (const vector< Element_t > &elements)

  Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.
- void AppendElement (const Element_t &element)

  Append one element to the vector of individual X-Messages elements that compose this composite object.

Private Types

- typedef shared_ptr< XFall > Element_t

  Type definition for the element aggregated by this object.
- typedef ElementVec_t::const_iterator **ElementConstIter_t**
- typedef ElementVec_t::iterator **ElementIter_t**
- typedef vector< Element_t > **ElementVec_t**

Private Attributes

- ElementVec_t elements_

  The vector of individual X-Messages elements that compose this composite object.

10.61.1 Detailed Description

Class representing the aggregate fall time-series data for a single dive, composed from one or more fall time-series messages.

10.61.2 Member Typedef Documentation

10.61.2.1 Element_t

```
typedef shared_ptr< XFall > util::xmsg::AbstractXComposite< shared_ptr< XFall > >::Element_↩
t  [private], [inherited]
```

Type definition for the element aggregated by this object.

10.61.3 Constructor & Destructor Documentation

10.61.3.1 XCompositeFall()

```
util::xmsg::XCompositeFall::XCompositeFall ()  [inline]
```

The default constructor.

10.61.3.2 ~XCompositeFall()

```
util::xmsg::XCompositeFall::~XCompositeFall ()  [inline]
```

The destructor.

10.61.4 Member Function Documentation

10.61.4.1 AppendAllElements() [1/2]

```
void util::xmsg::AbstractXComposite< shared_ptr< XFall > >::AppendAllElements (
            const static_vector< Element_t, I > & elements)  [inline], [inherited]
```

Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*elements*	The vector of elements to append.

10.61.4.2 AppendAllElements() [2/2]

```
void util::xmsg::AbstractXComposite< shared_ptr< XFall > >::AppendAllElements (
            const vector< Element_t > & elements)  [inline], [protected], [inherited]
```

Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*elements*	The vector of elements to append.

10.61.4.3 AppendElement()

```
void util::xmsg::AbstractXComposite< shared_ptr< XFall > >::AppendElement (
            const Element_t & element)  [inline], [protected], [inherited]
```

Append one element to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*element*	The element to append.

10.61.4.4 AssignElement()

```
virtual void util::xmsg::AbstractXComposite< shared_ptr< XFall > >::AssignElement (
            const Element_t & element)  [inline], [virtual], [inherited]
```

Assign an element to this composite object.

The default implementation appends the element; derived classes may override it to insert elements in order or reject duplicates.

Parameters

in	*element*	The element to assign.

10.61.4.5 elements()

```
const vector< Element_t > & util::xmsg::AbstractXComposite< shared_ptr< XFall > >::elements ()
const  [inline], [inherited]
```

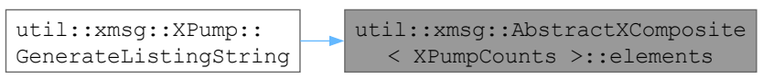
Get the vector of individual X-Messages elements that compose this composite object.

Returns

The vector of individual X-Messages elements that compose this composite object.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.61.4.6 GenerateListingString()

```
const string util::xmsg::XCompositeFall::GenerateListingString (
            uint16_t pg,
            uint16_t po,
            uint16_t sg,
            uint16_t so,
            uint16_t tg,
            uint16_t to,
            float pc) const  [inline]
```

Generate a listing entry string from this composite fall time-series data object.

Parameters

in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*sg*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*so*	The salinity sensor offset, in PSU.
in	*tg*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*to*	The temperature sensor offset, in degC.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Exceptions

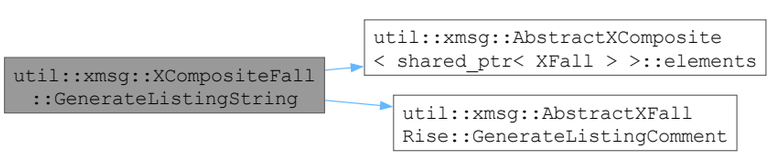
log::MessageException	if an error occurs while generating the listing string.

Returns

A listing entry string representation of this composite fall time-series data object.

References CATCH_BLOCK, util::xmsg::AbstractXComposite< shared_ptr< XFall > >::elements(), util::xmsg::AbstractXFallRise::Gener
and XMSG_SECTION_BREAK.

Here is the call graph for this function:



10.61.4.7 num_elements()

```
virtual size_t util::xmsg::AbstractXComposite< shared_ptr< XFall > >::num_elements () const
[inline], [virtual], [inherited]
```

Get the number of individual elements that compose this composite object.

Returns

The number of individual elements that compose this composite object.

10.61.5 Member Data Documentation

10.61.5.1 elements_

```
ElementVec_t util::xmsg::AbstractXComposite< shared_ptr< XFall > >::elements_  [private], [inherited]
```

The vector of individual X-Messages elements that compose this composite object.

The documentation for this class was generated from the following file:

- data/xmsg/XCompositeFall.h

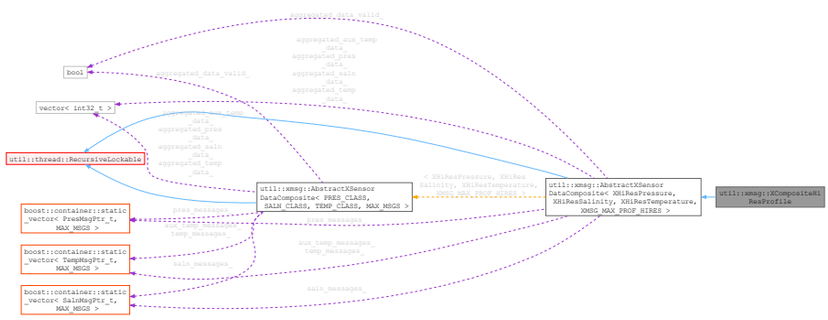
10.62 util::xmsg::XCompositeHiResProfile Class Reference

Class representing the aggregate raw/high-resolution/unbinned profile data for a single dive, composed from one or more raw profile data messages.

```
#include <XCompositeHiResProfile.h>
```

Inheritance diagram for util::xmsg::XCompositeHiResProfile:

Collaboration diagram for util::xmsg::XCompositeHiResProfile:



Public Member Functions

- XCompositeHiResProfile ()

  The default constructor.
- ~XCompositeHiResProfile ()

  The destructor.
- void AssignAuxTemperatureMessage (const TempMsgPtr_t &x)

  Assign an auxiliary-channel temperature message and re-aggregate the sensor data.
- void AssignPressureMessage (const PresMsgPtr_t &x)

  Assign a pressure data message to this composite data object.
- void AssignSalinityMessage (const SalnMsgPtr_t &x)

  Assign a salinity data message to this composite data object.
- void AssignTemperatureMessage (const TempMsgPtr_t &x)

  Assign a temperature data message to this composite data object.
- void **CopyPressureDataToArray** (T dest[ ], size_t max_len, int16_t gain, int16_t offs, float pres_correction, T fill_value=XMSG_SENS_BAD_PRES) const
- void **CopySalinityDataToArray** (T dest[ ], size_t max_len, int16_t gain, int16_t offs, T fill_value=XMSG_SENS_BAD_SALN) const
- void **CopyTemperatureDataToArray** (T dest[ ], size_t max_len, int16_t gain, int16_t offs, T fill_↩ value=XMSG_SENS_BAD_TEMP) const
- const string GenerateListingString (int id_inst, int id_dive, uint16_t pg, uint16_t po, uint16_t sg, uint16_t so, uint16_t tg, uint16_t to, float pc) const

  Generate a listing string representation of the this composite sensor data object.
- const string GeneratePhyString (uint16_t pg, uint16_t po, uint16_t sg, uint16_t so, uint16_t tg, uint16_t to, float pc) const

  Generate a PHY entry string from this composite bin-averaged profile data object.
- bool **HasAuxTempData** () const
- bool HasContiguousMessageIndices () const

  Do the sensor data messages assigned to this composite data object have contiguous message indices?
- bool is_aggregated_data_valid () const

  Is the aggregated data valid?
- bool IsDataComplete () const

  Is the sensor data for this composite date message complete?
- bool IsEmpty () const

  Is this composite data object empty?
- bool LockObject (bool block)

  Lock the object.
- size_t max_num_samples () const

  Return the maximum of the number of pressure, temperature, or salinity sensor samples in the sensor data messages assigned to this composite sensor data object.
- size_t **num_aux_temp_samples** () const
- size_t num_pres_samples () const

  Get the total number of pressure sensor samples contained in the pressure data messages assigned to this composite data object.
- size_t num_saln_samples () const

  Get the total number of salinity sensor samples contained in the salinity data messages assigned to this composite data object.
- size_t num_temp_samples () const

  Get the total number of temperature sensor samples contained in the temperature data messages assigned to this composite data object.
- void Reset ()

  Remove the assigned pressure, temperature and salinity messages and their aggregated data.
- T **SampleAuxTempAsFloat** (size_t i, int16_t gain, int16_t offs) const
- int32_t SamplePres (size_t i) const

  Get the i^{th} pressure sensor value, in raw counts.
- T SamplePresAsFloat (size_t i, int16_t pg, int16_t po, float pc) const

  Get the i^{th} pressure sensor value, in dBar.
- int32_t SampleSaln (size_t i) const

  Get the i^{th} salinity sensor value, in raw counts.
- T SampleSalnAsFloat (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} salinity sensor value, in PSU.
- int32_t SampleTemp (size_t i) const

  Get the i^{th} temperature sensor value, in raw counts.
- T SampleTempAsFloat (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} temperature sensor value, in degC.
- void UnlockObject ()

  Unlock the object.

Protected Member Functions

- void AggregateSensorData () ATTR_NO_EXCEPTIONS

  Aggregate the sensor data for this composite sensor data object.
- void set_aggregated_data_valid (bool valid)

  Set the value of the aggregated_data_valid_ field.

Protected Attributes

- recursive_mutex mutex_

  Recursive mutual exclusion lock for synchronizing operations.

Private Types

- typedef shared_ptr< XHiResPressure > PresMsgPtr_t

  Type definition for a shared pointer to the pressure data message.
- typedef static_vector< PresMsgPtr_t, MAX_MSGS > PresMsgVector_t

  Type definition for a static vector (of size MAX_MSGS) of shared pointers to the pressure data message.
- typedef shared_ptr< XHiResSalinity > SalnMsgPtr_t

  Type definition for a shared pointer to the salinity data message.
- typedef static_vector< SalnMsgPtr_t, MAX_MSGS > SalnMsgVector_t

  Type definition for a static vector (of size MAX_MSGS) of shared pointers to the salinity data message.
- typedef shared_ptr< XHiResTemperature > TempMsgPtr_t

  Type definition for a shared pointer to the temperature data message.
- typedef static_vector< TempMsgPtr_t, MAX_MSGS > TempMsgVector_t

  Type definition for a static vector (of size MAX_MSGS) of shared pointers to the temperature data message.

Private Attributes

- vector< int32_t > **aggregated_aux_temp_data_**
- bool aggregated_data_valid_

  The aggregated data is valid flag.
- vector< int32_t > aggregated_pres_data_

  A vector of the aggregated pressure data samples, in raw counts.
- vector< int32_t > aggregated_saln_data_

  A vector of the aggregated salinity data samples, in raw counts.
- vector< int32_t > aggregated_temp_data_

  A vector of the aggregated temperature data samples, in raw counts.
- TempMsgVector_t **aux_temp_messages_**
- PresMsgVector_t pres_messages_

  A static vector (of size MAX_MSGS) containing pointers the pressure sensor data messages assigned to this composite object.
- SalnMsgVector_t saln_messages_

  A static vector (of size MAX_MSGS) containing pointers the salinity sensor data messages assigned to this composite object.
- TempMsgVector_t temp_messages_

  A static vector (of size MAX_MSGS) containing pointers the temperature sensor data messages assigned to this composite object.

10.62.1 Detailed Description

Class representing the aggregate raw/high-resolution/unbinned profile data for a single dive, composed from one or more raw profile data messages.

10.62.2 Member Typedef Documentation

10.62.2.1 PresMsgPtr_t

```
typedef shared_ptr<XHiResPressure> util::xmsg::AbstractXSensorDataComposite< XHiResPressure,
XHiResSalinity, XHiResTemperature, MAX_MSGS >::PresMsgPtr_t  [private], [inherited]
```

Type definition for a shared pointer to the pressure data message.

10.62.2.2 PresMsgVector_t

typedef static_vector<PresMsgPtr_t, MAX_MSGS> util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature, MAX_MSGS >::PresMsgVector_t [private], [inherited]

Type definition for a static vector (of size MAX_MSGS) of shared pointers to the pressure data message.

10.62.2.3 SalnMsgPtr_t

typedef shared_ptr<XHiResSalinity> util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature, MAX_MSGS >::SalnMsgPtr_t [private], [inherited]

Type definition for a shared pointer to the salinity data message.

10.62.2.4 SalnMsgVector_t

typedef static_vector<SalnMsgPtr_t, MAX_MSGS> util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature, MAX_MSGS >::SalnMsgVector_t [private], [inherited]

Type definition for a static vector (of size MAX_MSGS) of shared pointers to the salinity data message.

10.62.2.5 TempMsgPtr_t

typedef shared_ptr<XHiResTemperature> util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature, MAX_MSGS >::TempMsgPtr_t [private], [inherited]

Type definition for a shared pointer to the temperature data message.

10.62.2.6 TempMsgVector_t

typedef static_vector<TempMsgPtr_t, MAX_MSGS> util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature, MAX_MSGS >::TempMsgVector_t [private], [inherited]

Type definition for a static vector (of size MAX_MSGS) of shared pointers to the temperature data message.

10.62.3 Constructor & Destructor Documentation

10.62.3.1 XCompositeHiResProfile()

util::xmsg::XCompositeHiResProfile::XCompositeHiResProfile () [inline]

The default constructor.

10.62.3.2 ~XCompositeHiResProfile()

util::xmsg::XCompositeHiResProfile::~XCompositeHiResProfile () [inline]

The destructor.

10.62.4 Member Function Documentation

10.62.4.1 AggregateSensorData()

void util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature, MAX_MSGS >::AggregateSensorData () [inline], [protected], [inherited]

Aggregate the sensor data for this composite sensor data object.

This function iterates over each of the sensor data messages assigned to this composite data object, and copies of the sensor data values into the corresponding sensor data vector.

If aggregated_data_valid_ is TRUE, then this function will have no effect. Otherwise, each of the aggregegated sensor data vectors will be cleared and the appropriate number of samples will be reserved.

Then, the sensor data message will be iterated over in order of increasing message indices, and the sensor data values will be copied into the corresponding sensor data vector in the appropriate order.

Finally, aggregated_data_valid_ will be set to FALSE to ensure that subsequent calls to this function will have no effect, until another sensor data message object is assigned to this composite object and aggregated_data_valid_ is set to TRUE.

Exceptions

util::log::MessageException	if an error occurs while aggregating the sensor data.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

10.62.4.2 AssignAuxTemperatureMessage()

```
void util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature,
MAX_MSGS >::AssignAuxTemperatureMessage (
            const TempMsgPtr_t & x)  [inline], [inherited]
```

Assign an auxiliary-channel temperature message and re-aggregate the sensor data.

The message is inserted in order of message index, and the aggregated sensor data is rebuilt.

Parameters

in	*x*	The auxiliary-channel temperature message to assign.

Exceptions

util::log::MessageException	if x is NULL or an auxiliary temperature message with the same index has already been assigned.

10.62.4.3 AssignPressureMessage()

```
void util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature,
MAX_MSGS >::AssignPressureMessage (
            const PresMsgPtr_t & x)  [inline], [inherited]
```

Assign a pressure data message to this composite data object.

The pressure data message will be emplaced into the sensor data message vector in order of increasing message indices. If a message with the same index is as x is already contained in the vector, then an exception will be thrown.

Parameters

in	*x*	A shared pointer to the pressure data message.

Exceptions

util::log::MessageException	if x is a null pointer, a duplicate message index is encountered, or any other error occurs.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

10.62.4.4 AssignSalinityMessage()

```
void util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature,
MAX_MSGS >::AssignSalinityMessage (
            const SalnMsgPtr_t & x)  [inline], [inherited]
```

Assign a salinity data message to this composite data object.

The salinity data message will be emplaced into the sensor data message vector in order of increasing message indices. If a message with the same index is as x is already contained in the vector, then an exception will be thrown.

Parameters

in	*x*	A shared pointer to the salinity data message.

Exceptions

util::log::MessageException	if x is a null pointer, a duplicate message index is encountered, or any other error occurs.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

10.62.4.5 AssignTemperatureMessage()

```
void util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature,
MAX_MSGS >::AssignTemperatureMessage (
            const TempMsgPtr_t & x)  [inline], [inherited]
```

Assign a temperature data message to this composite data object.

The temperature data message will be emplaced into the sensor data message vector in order of increasing message indices. If a message with the same index is as x is already contained in the vector, then an exception will be thrown.

Parameters

in	*x*	A shared pointer to the temperature data message.

Exceptions

util::log::MessageException	if x is a null pointer, a duplicate message index is encountered, or any other error occurs.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

10.62.4.6 GenerateListingString()

```
const string util::xmsg::XCompositeHiResProfile::GenerateListingString (
            int id_inst,
            int id_dive,
            uint16_t pg,
            uint16_t po,
            uint16_t sg,
            uint16_t so,
            uint16_t tg,
            uint16_t to,
            float pc) const  [inline], [virtual]
```

Generate a listing string representation of the this composite sensor data object.

Parameters

in	*id_inst*	The unique instrument identifier for this composite sensor data object.
in	*id_dive*	The dive or cycle number for this composite data object.
in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*sg*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*so*	The salinity sensor offset, in PSU.
in	*tg*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*to*	The temperature sensor offset, in degC.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Exceptions

log::MessageException	if an error occurs while generating the listing string.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

A listing string representation of this composite sensor data object.

Implements util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature, XMSG_MAX_PROF_H

10.62.4.7 GeneratePhyString()

```
const string util::xmsg::XCompositeHiResProfile::GeneratePhyString (
            uint16_t pg,
            uint16_t po,
            uint16_t sg,
            uint16_t so,
            uint16_t tg,
            uint16_t to,
            float pc) const  [inline]
```

Generate a PHY entry string from this composite bin-averaged profile data object.

Parameters

in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*sg*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*so*	The salinity sensor offset, in PSU.
in	*tg*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*to*	The temperature sensor offset, in degC.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Exceptions

log::MessageException	if an error occurs while generating the PHY string.

Returns

A PHY entry string representation of this composite raw profile data object.

10.62.4.8 HasContiguousMessageIndices()

```
bool util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature,
MAX_MSGS >::HasContiguousMessageIndices () const  [inline], [inherited]
```

Do the sensor data messages assigned to this composite data object have contiguous message indices?

This function is used, in part, to determine the sensor data is complete.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

TRUE if the sensor data messages have contiguous message indices or if there is less than two of each sensor data message, or FALSE otherwise.

10.62.4.9 is_aggregated_data_valid()

`bool util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature, MAX_MSGS >::is_aggregated_data_valid () const [inline], [inherited]`

Is the aggregated data valid?

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

TRUE if the aggregated sensor is valid, or FALSE otherwise.

10.62.4.10 IsDataComplete()

`bool util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature, MAX_MSGS >::IsDataComplete () const [inline], [inherited]`

Is the sensor data for this composite date message complete?

This function returns true if

- this composite sensor data object is not empty,
- the sensor data messages assigned to this composite data object have contiguous message indices,
- this sensor data object contains the same number of temperature and pressure sensor values, and
- the number of salinity data samples is either zero or equal to the number of pressure data samples.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

TRUE if the sensor data is complete, or FALSE otherwise.

Referenced by GenerateListingString().

Here is the caller graph for this function:

10.62.4.11 IsEmpty()

bool util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature, MAX_MSGS >::IsEmpty () const [inline], [inherited]

Is this composite data object empty?

Returns

TRUE if empty, or FALSE otherwise.

10.62.4.12 LockObject()

bool util::thread::RecursiveLockable::LockObject (bool *block*) [inline], [inherited]

Lock the object.

Parameters

in	*block*	If TRUE, then the calling thread will block until the lock becomes available.

Exceptions

util::log::MessageException	if an error occurs.

Returns

TRUE if the lock was successfully obtained, or FALSE if block is FALSE and another thread owns the lock on the mutex.

References CATCH_BLOCK, and util::thread::RecursiveLockable::mutex_.

10.62.4.13 max_num_samples()

size_t util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature, MAX_MSGS >::max_num_samples () const [inline], [inherited]

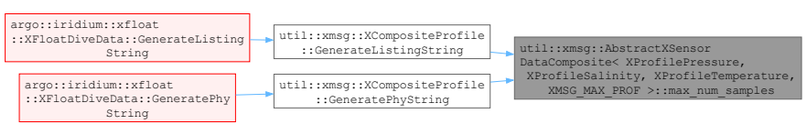
Return the maximum of the number of pressure, temperature, or salinity sensor samples in the sensor data messages assigned to this composite sensor data object.

Returns

The maximum of the number of pressure, temperature, or salinity sensor samples.

Referenced by GenerateListingString(), and GeneratePhyString().

Here is the caller graph for this function:



10.62.4.14 num_pres_samples()

size_t util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature, MAX_MSGS >::num_pres_samples () const [inline], [inherited]

Get the total number of pressure sensor samples contained in the pressure data messages assigned to this composite data object.

Exceptions

util::log::MessageException	if an error occurs.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The total number of pressure sensor samples contained in the pressure data messages assigned to this composite data object.

10.62.4.15 num_saln_samples()

`size_t util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature, MAX_MSGS >::num_saln_samples () const [inline], [inherited]`

Get the total number of salinity sensor samples contained in the salinity data messages assigned to this composite data object.

Exceptions

util::log::MessageException	if an error occurs.

Note

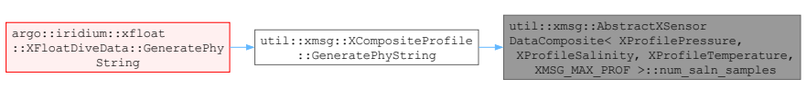
This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The total number of pressure sensor samples contained in the pressure data messages assigned to this composite data object.

Referenced by GeneratePhyString().

Here is the caller graph for this function:



10.62.4.16 num_temp_samples()

`size_t util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature, MAX_MSGS >::num_temp_samples () const [inline], [inherited]`

Get the total number of temperature sensor samples contained in the temperature data messages assigned to this composite data object.

Exceptions

util::log::MessageException	if an error occurs.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The total number of pressure sensor samples contained in the pressure data messages assigned to this composite data object.

10.62.4.17 Reset()

```
void util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature,
MAX_MSGS >::Reset ()  [inline], [inherited]
```

Remove the assigned pressure, temperature and salinity messages and their aggregated data.

Warning

The auxiliary temperature messages and aggregated auxiliary temperature data are not cleared, so re-assigning them after a reset fails with a duplicate index.

Exceptions

util::log::MessageException	if an error occurs.

10.62.4.18 SamplePres()

```
int32_t util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature,
MAX_MSGS >::SamplePres (
            size_t i) const  [inline], [inherited]
```

Get the i^{th} pressure sensor value, in raw counts.

Parameters

in	*i*	The index of the pressure sensor sample to return. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD will be returned.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} pressure sensor value, in raw counts, or XMSG_SENS_BAD if the index `i` exceeds the number of pressure sensor samples in the aggregated data vector.

10.62.4.19 SamplePresAsFloat()

```
T util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature,
MAX_MSGS >::SamplePresAsFloat (
            size_t i,
            int16_t pg,
            int16_t po,
            float pc) const  [inline], [inherited]
```

Get the i^{th} pressure sensor value, in dBar.

Parameters

in	*i*	The index of the sensor value. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_PRES will be returned.
in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Note

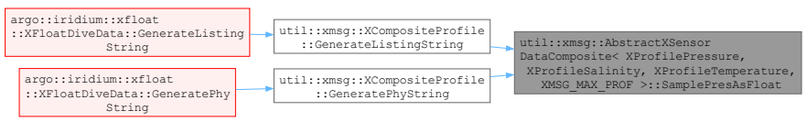
This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} pressure sensor value, in dBar. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_PRES will be returned.

Referenced by GenerateListingString(), and GeneratePhyString().

Here is the caller graph for this function:



10.62.4.20 SampleSaln()

```
int32_t util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature,
MAX_MSGS >::SampleSaln (
            size_t i) const  [inline], [inherited]
```

Get the i^{th} salinity sensor value, in raw counts.

Parameters

in	*i*	The index of the salinity sensor sample to return. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD will be returned.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} salinity sensor value, in raw counts, or XMSG_SENS_BAD if the index `i` exceeds the number of pressure sensor samples in the aggregated data vector.

10.62.4.21 SampleSalnAsFloat()

```
T util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature,
MAX_MSGS >::SampleSalnAsFloat (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} salinity sensor value, in PSU.

Parameters

in	*i*	The index of the sensor value. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_SALN will be returned.
in	*gain*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*offs*	The salinity sensor offset, in PSU.

Note

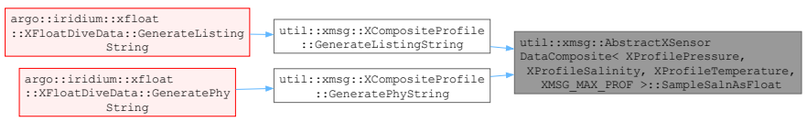
This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} salinity sensor value, in PSU. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_SALN will be returned.

Referenced by GenerateListingString(), and GeneratePhyString().

Here is the caller graph for this function:



10.62.4.22 SampleTemp()

```
int32_t util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature,
MAX_MSGS >::SampleTemp (
            size_t i) const  [inline], [inherited]
```

Get the i^{th} temperature sensor value, in raw counts.

Parameters

in	*i*	The index of the temperature sensor sample to return. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD will be returned.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} temperature sensor value, in raw counts, or XMSG_SENS_BAD if the index `i` exceeds the number of pressure sensor samples in the aggregated data vector.

10.62.4.23 SampleTempAsFloat()

```
T util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature,
MAX_MSGS >::SampleTempAsFloat (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} temperature sensor value, in degC.

Parameters

in	*i*	The index of the sensor value. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_SALN will be returned.
in	*gain*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*offs*	The temperature sensor offset, in degC.

Note

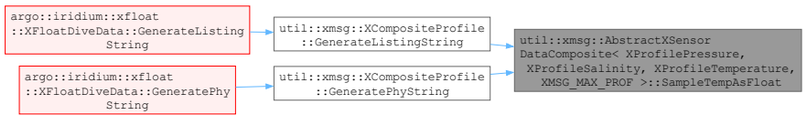
This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} temperature sensor value, in degC. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_TEMP will be returned.

Referenced by GenerateListingString(), and GeneratePhyString().

Here is the caller graph for this function:



10.62.4.24 set_aggregated_data_valid()

```
void util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature,
MAX_MSGS >::set_aggregated_data_valid (
            bool valid)  [inline], [protected], [inherited]
```

Set the value of the aggregated_data_valid_ field.

Parameters

in	*valid*	TRUE if the aggregated data is valid, or FALSE otherwise.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

10.62.4.25 UnlockObject()

```
void util::thread::RecursiveLockable::UnlockObject ()  [inline], [inherited]
```

Unlock the object.

Exceptions

util::log::MessageException	if an error occurs.

References CATCH_BLOCK, and util::thread::RecursiveLockable::mutex_.

10.62.5 Member Data Documentation

10.62.5.1 aggregated_data_valid_

```
bool util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature,
MAX_MSGS >::aggregated_data_valid_  [private], [inherited]
```

The aggregated data is valid flag.

This flag indicates the status of the aggregated sensor data. It is used to ensure the composite sensor data is aggregated only once following each assignment of sensor data to the composite data message.

This field is set to FALSE during initialization, and is set to FALSE each time a sensor data message is assigned to the composite data message. Each time AggregateSensorData() is called, the data will be aggregated, and this field will be set to TRUE.

10.62.5.2 aggregated_pres_data_

vector<int32_t> util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature, MAX_MSGS >::aggregated_pres_data_ [private], [inherited]

A vector of the aggregated pressure data samples, in raw counts.

Each time the data is aggregated, the sensor data samples from the sensor data messages assigned to this composite objects are stored in this vector.

10.62.5.3 aggregated_saln_data_

vector<int32_t> util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature, MAX_MSGS >::aggregated_saln_data_ [private], [inherited]

A vector of the aggregated salinity data samples, in raw counts.

Each time the data is aggregated, the sensor data samples from the sensor data messages assigned to this composite objects are stored in this vector.

10.62.5.4 aggregated_temp_data_

vector<int32_t> util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature, MAX_MSGS >::aggregated_temp_data_ [private], [inherited]

A vector of the aggregated temperature data samples, in raw counts.

Each time the data is aggregated, the sensor data samples from the sensor data messages assigned to this composite object are stored in this vector.

10.62.5.5 mutex_

recursive_mutex util::thread::RecursiveLockable::mutex_ [mutable], [protected], [inherited]

Recursive mutual exclusion lock for synchronizing operations.

10.62.5.6 pres_messages_

PresMsgVector_t util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature, MAX_MSGS >::pres_messages_ [private], [inherited]

A static vector (of size MAX_MSGS) containing pointers the pressure sensor data messages assigned to this composite object.

Each time a pressure sensor data message is assigned to the this object, it will be emplaced in this vector in order of increasing message indices.

10.62.5.7 saln_messages_

SalnMsgVector_t util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature, MAX_MSGS >::saln_messages_ [private], [inherited]

A static vector (of size MAX_MSGS) containing pointers the salinity sensor data messages assigned to this composite object.

Each time a salinity sensor data message is assigned to the this object, it will be emplaced in this vector in order of increasing message indices.

10.62.5.8 temp_messages_

TempMsgVector_t util::xmsg::AbstractXSensorDataComposite< XHiResPressure, XHiResSalinity, XHiResTemperature, MAX_MSGS >::temp_messages_ [private], [inherited]

A static vector (of size MAX_MSGS) containing pointers the temperature sensor data messages assigned to this composite object.

Each time a temperature sensor data message is assigned to the this object, it will be emplaced in this vector in order of increasing message indices.

The documentation for this class was generated from the following file:

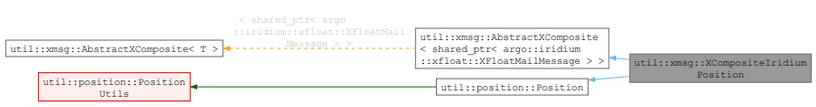
- data/xmsg/XCompositeHiResProfile.h

10.63 util::xmsg::XCompositeIridiumPosition Class Reference

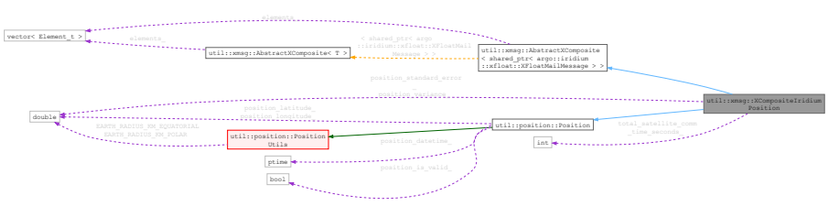
Class representing the aggregate Iridium position for a single dive, composed from one or more Iridium message positions.

#include <XCompositeIridiumPosition.h>

Inheritance diagram for util::xmsg::XCompositeIridiumPosition:



Collaboration diagram for util::xmsg::XCompositeIridiumPosition:



Public Member Functions

- XCompositeIridiumPosition ()

  The default constructor.
- ~XCompositeIridiumPosition ()

  The destructor.
- void AppendAllElements (const static_vector< Element_t, I > &elements)

  Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.
- virtual void AssignElement (const Element_t &element)

  Assign an element to this composite object.
- void ComputeAverageIridiumPosition ()

  Compute the weighted average position from the Iridium positions for this dive.
- const vector< Element_t > & elements () const

  Get the vector of individual X-Messages elements that compose this composite object.
- const string GenerateListingString (int whoi, int dive) const

  Generate a listing entry string from this composite Iridum position object.
- virtual bool **IsEmpty** () const
- virtual size_t num_elements () const

  Get the number of individual elements that compose this composite object.
- ptime position_datetime () const

  Get the date/time of the position.
- string position_datetime_as_iso8601_string () const

  Get a formatted string representing the position date/time composed using the ISO 8601 standard.
- bool position_is_valid () const

  Is the position valid?
- double position_latitude () const

  Get the latitude of the position, in decimal degrees.
- double position_longitude () const

  Get the longitude of the position, in decimal degrees.
- double position_standard_error () const

  Get the calculated variance of this composite Iridium position, in km^2.
- double position_variance () const

  Get the calculated variance of this composite Iridium position, in km^2.
- string postition_as_iso6709_string () const

  Get a formatted string representing the position composed using the ISO 6709 standard.
- int total_satellite_comm_time_seconds () const

  Get the Iridium session communication time, in seconds.

Static Public Member Functions

- static const string GenerateListingComment ()

  Generate the listing entry comment.

Protected Member Functions

- void AppendAllElements (const vector< Element_t > &elements)

  Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.
- void AppendElement (const Element_t &element)

  Append one element to the vector of individual X-Messages elements that compose this composite object.
- void set_gps_position_datetime (unsigned int gpsWeek, unsigned int gpsDay, unsigned int gpsHour=0, unsigned int gpsMinute=0, unsigned int gpsSecond=0)

  Set the date and time of this position from the given GPS week, day, and time.
- void set_position_datetime (const ptime &datetime)

  Set the date/time of the position.
- void set_position_is_valid (bool is_valid=true)

  Set the position is valid flag.
- void set_position_latitude (double lat)

  Set the latitude of the position, in decimal degrees.
- void set_position_longitude (double lon)

  Set the longitude of the position, in decimal degrees.
- void set_position_standard_error (double position_standard_error)

  Set the calculated standard error of this composite Iridium position, in km.
- void set_position_variance (double position_variance)

  Set the calculated variance of this composite Iridium position, in km^2.
- void set_total_satellite_comm_time_seconds (int time)

  Set the Iridium session communication time, in seconds.

Static Protected Member Functions

- static float **bitcastUint32ToFloat** (uint32_t u)
- template<typename T >
  static double CalculateEllipsoidHeight (T lat)

  Get the approximate surface altitude or height of earth for a given latitude, in kilometers.
- template<typename T >
  static double CalculateGeographicDistance (T lat1, T lon1, T lat0, T lon0)

  Get the geographical distance between two position, in kilometers, from the positions' locations, in decimal degrees.
- template<typename T >
  static double degToRad (T deg)

  Convert angular units from from degrees to decimal radians.
- static string GenerateCurrentUtcTimeIso8601String ()

  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- template<typename T >
  static std::string GenerateIso6709String (T lat, T lon)

  Generate an IS06709 string representation of the position given by (`lat`, `lon`).
- static string GenerateIso8601String (const ptime &p, bool extended=true)

  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)

  Convert a date/time to fractional days since a reference date/time.
- static ptime GetCurrentUtcTime ()

  Generate a POSIX time object representing the current date and time (rounded to the nearest second).
- template<typename T >
  static bool IsPositionValid (T lat, T lon)

  Check position validity.

Private Types

- typedef shared_ptr< argo::iridium::xfloat::XFloatMailMessage > Element_t

  Type definition for the element aggregated by this object.
- typedef ElementVec_t::const_iterator **ElementConstIter_t**
- typedef ElementVec_t::iterator **ElementIter_t**
- typedef vector< Element_t > **ElementVec_t**

Private Attributes

- ElementVec_t elements_

  The vector of individual X-Messages elements that compose this composite object.
- ptime position_datetime_

  The date and time of the position.
- bool position_is_valid_

  The valid position indicator.
- double position_latitude_

  The latitude of the position, in decimal degrees.
- double position_longitude_

  The longitude of the position, in decimal degrees.
- double position_standard_error_

  The calculated standard error of this composite Iridium position, in km.
- double position_variance_

  The calculated variance of this composite Iridium position, in km^2.
- int total_satellite_comm_time_seconds_

  The Iridium session communication time, in seconds.

Static Private Attributes

- static const double EARTH_RADIUS_KM_EQUATORIAL = 6378.1

  The equatorial radius of the earth, in kilometers.
- static const double EARTH_RADIUS_KM_POLAR = 6356.1

  The polar radius of the earth, in kilometers.

10.63.1 Detailed Description

Class representing the aggregate Iridium position for a single dive, composed from one or more Iridium message positions.

10.63.2 Member Typedef Documentation

10.63.2.1 Element_t

```
typedef shared_ptr< argo::iridium::xfloat::XFloatMailMessage > util::xmsg::AbstractXComposite<
shared_ptr< argo::iridium::xfloat::XFloatMailMessage > >::Element_t  [private], [inherited]
```

Type definition for the element aggregated by this object.

10.63.3 Constructor & Destructor Documentation

10.63.3.1 XCompositeIridiumPosition()

```
util::xmsg::XCompositeIridiumPosition::XCompositeIridiumPosition ()  [inline]
```

The default constructor.

10.63.3.2 ~XCompositeIridiumPosition()

```
util::xmsg::XCompositeIridiumPosition::~XCompositeIridiumPosition ()  [inline]
```

The destructor.

10.63.4 Member Function Documentation

10.63.4.1 AppendAllElements() [1/2]

```
void util::xmsg::AbstractXComposite< shared_ptr< argo::iridium::xfloat::XFloatMailMessage > >↩
::AppendAllElements (
            const static_vector< Element_t, I > & elements)  [inline], [inherited]
```

Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*elements*	The vector of elements to append.

10.63.4.2 AppendAllElements() [2/2]

```
void util::xmsg::AbstractXComposite< shared_ptr< argo::iridium::xfloat::XFloatMailMessage > >↩
::AppendAllElements (
            const vector< Element_t > & elements)  [inline], [protected], [inherited]
```

Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*elements*	The vector of elements to append.

10.63.4.3 AppendElement()

```
void util::xmsg::AbstractXComposite< shared_ptr< argo::iridium::xfloat::XFloatMailMessage > >↩
::AppendElement (
            const Element_t & element)  [inline], [protected], [inherited]
```

Append one element to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*element*	The element to append.

10.63.4.4 AssignElement()

```
virtual void util::xmsg::AbstractXComposite< shared_ptr< argo::iridium::xfloat::XFloatMailMessage
> >::AssignElement (
            const Element_t & element)  [inline], [virtual], [inherited]
```

Assign an element to this composite object.

The default implementation appends the element; derived classes may override it to insert elements in order or reject duplicates.

Parameters

in	*element*	The element to assign.

10.63.4.5 CalculateEllipsoidHeight()

```
template<typename T >
static double util::position::PositionUtils::CalculateEllipsoidHeight (
            T lat)  [inline], [static], [inherited]
```

Get the approximate surface altitude or height of earth for a given latitude, in kilometers.

Warning

This method provides approximate surface height estimates only! This approximation is calculated from a reference ellipsoid – a mathematically-defined surface that approximates the geoid, the truer figure of the Earth.

Parameters

in	*lat*	The geographic latitude of interest, in decimal degrees.

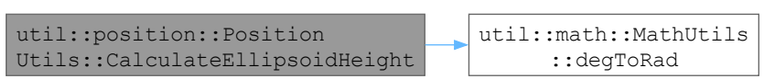
Returns

The approximate surface altitude or height of earth for the given latitude, in kilometers.

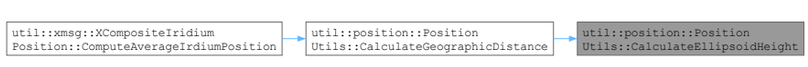
References util::math::MathUtils::degToRad(), util::position::PositionUtils::EARTH_RADIUS_KM_EQUATORIAL, and util::position::PositionUtils::EARTH_RADIUS_KM_POLAR.

Referenced by util::position::PositionUtils::CalculateGeographicDistance().

Here is the call graph for this function:



Here is the caller graph for this function:



10.63.4.6 CalculateGeographicDistance()

```
template<typename T >
static double util::position::PositionUtils::CalculateGeographicDistance (
            T lat1,
            T lon1,
            T lat0,
            T lon0)  [inline], [static], [inherited]
```

Get the geographical distance between two position, in kilometers, from the positions' locations, in decimal degrees.

Warning

This method provides approximate geographic estimates only! This approximation is calculated from a reference ellipsoid – a mathematically-defined surface that approximates the geoid, the truer figure of the Earth.

Note

This method uses the 'haversine' formula to calculate the great-circle distance between two points – that is, the shortest distance over the earth's surface – giving an 'as-the-crow-flies' distance between the points (ignoring any hills they fly over, of course!).

Parameters

in	*lat1*	The latitude of the geographic final position, in decimal degrees North.
in	*lon1*	The longitude of the geographic final position, in decimal degrees East.
in	*lat0*	The latitude of the geographic initial position, in decimal degrees North.
in	*lon0*	The longitude of the geographic initial position, in decimal degrees East.

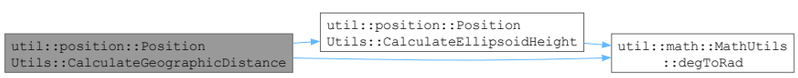
Returns

The geographical distance between the two given positions, in kilometers.

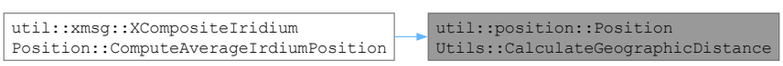
References util::position::PositionUtils::CalculateEllipsoidHeight(), and util::math::MathUtils::degToRad().

Referenced by ComputeAverageIrdiumPosition().

Here is the call graph for this function:



Here is the caller graph for this function:



10.63.4.7 ComputeAverageIrdiumPosition()

```
void util::xmsg::XCompositeIridiumPosition::ComputeAverageIrdiumPosition ()
```

Compute the weighted average position from the Iridium positions for this dive.

Note

Each Iridium position is assigned a weight of CEP^-2 when computing the average postion, where CEP is the circular error probable radius reported with each Iridium postion.

Exceptions

log::MessageException	if an error occurs while computing the average position.

References util::position::PositionUtils::CalculateGeographicDistance(), CATCH_BLOCK, util::xmsg::AbstractXComposite< shared_ptr< a
util::xmsg::AbstractXComposite< shared_ptr< argo::iridium::xfloat::XFloatMailMessage > >::num_elements(), util::position::Position::po

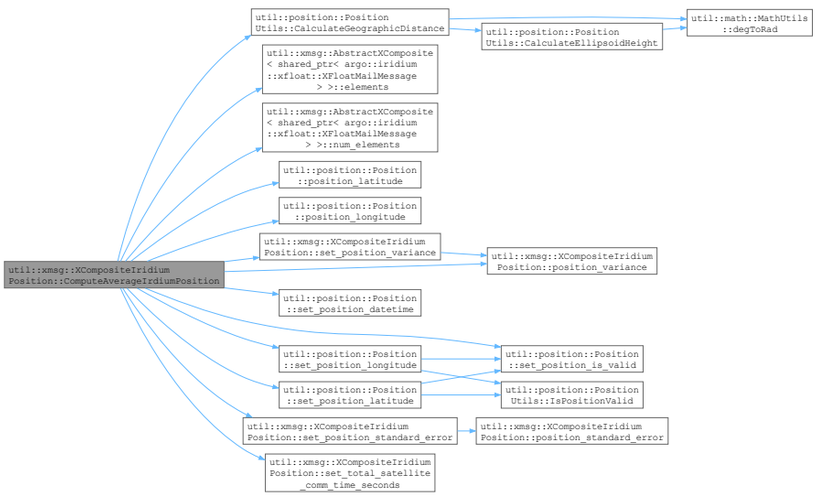
Here is the call graph for this function:



10.63.4.8 degToRad()

```
template<typename T >
static double util::math::MathUtils::degToRad (
            T deg)  [inline], [static], [inherited]
```

Convert angular units from from degrees to decimal radians.

Parameters

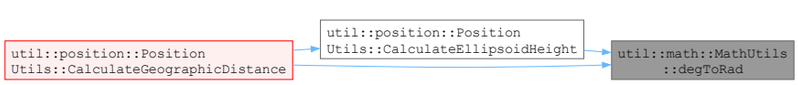
in	*deg*	Angle in integer or decimal degrees to convert to radians.

Returns

Angle in decimal radians.

Referenced by util::position::PositionUtils::CalculateEllipsoidHeight(), and util::position::PositionUtils::CalculateGeographicDistance().

Here is the caller graph for this function:



10.63.4.9 elements()

```
const vector< Element_t > & util::xmsg::AbstractXComposite< shared_ptr< argo::iridium::xfloat::XFloatMailMessage
> >::elements () const  [inline], [inherited]
```

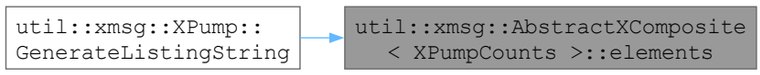
Get the vector of individual X-Messages elements that compose this composite object.

Returns

The vector of individual X-Messages elements that compose this composite object.

Referenced by ComputeAverageIrdiumPosition(), and GenerateListingString().

Here is the caller graph for this function:



10.63.4.10 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

Returns

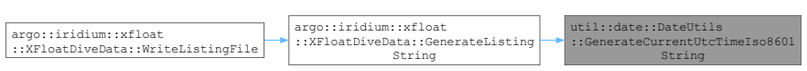
An ISO8601 format date/time string representation of the current time.

References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:

Here is the caller graph for this function:



10.63.4.11 GenerateIso6709String()

```
template<typename T >
static std::string util::position::PositionUtils::GenerateIso6709String (
            T lat,
            T lon)  [inline], [static], [inherited]
```

Generate an IS06709 string representation of the position given by (`lat`, `lon`).

Parameters

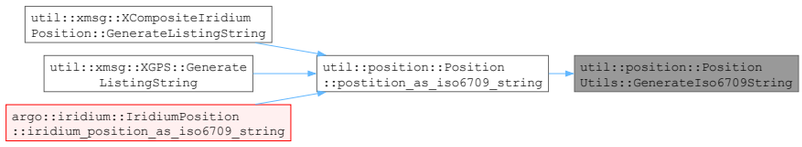
in	*lat*	The latitude of the position, in degrees North.
in	*lon*	The longitude of the position, in degrees East.

Returns

An IS06709 string representation of the position given by (`lat`, `lon`).

Referenced by util::position::Position::postition_as_iso6709_string().

Here is the caller graph for this function:



10.63.4.12 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

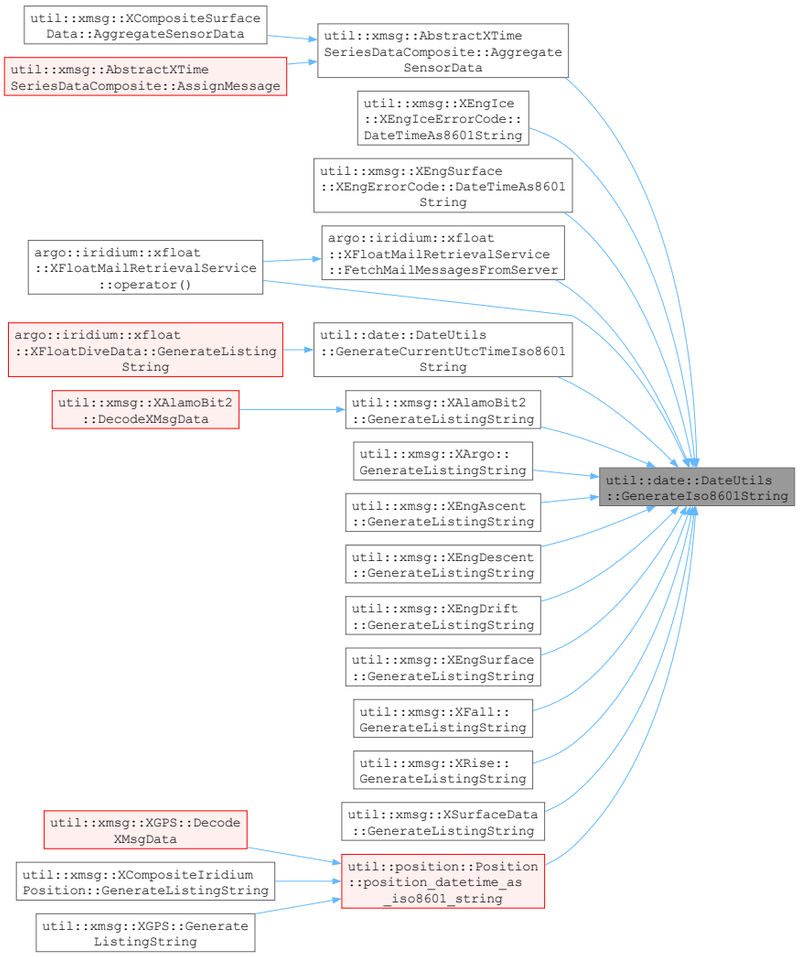
in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), util::xmsg::XEngIce::XEngIce
util::xmsg::XEngSurface::XEngErrorCode::DateTimeAs8601String(), argo::iridium::xfloat::XFloatMailRetrievalService::FetchMailMessages
util::date::DateUtils::GenerateCurrentUtcTimeIso8601String(), util::xmsg::XAlamoBit2::GenerateListingString(), util::xmsg::XArgo::Genera
util::xmsg::XEngAscent::GenerateListingString(), util::xmsg::XEngDescent::GenerateListingString(), util::xmsg::XEngDrift::GenerateListing
util::xmsg::XEngSurface::GenerateListingString(), util::xmsg::XFall::GenerateListingString(), util::xmsg::XRise::GenerateListingString(),
util::xmsg::XSurfaceData::GenerateListingString(), argo::iridium::xfloat::XFloatMailRetrievalService::operator()(), and
util::position::Position::position_datetime_as_iso8601_string().

Here is the caller graph for this function:



10.63.4.13 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref↩ _dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.63.4.14 GenerateListingComment()

```
static const string util::xmsg::XCompositeIridiumPosition::GenerateListingComment ()  [inline],
[static]
```

Generate the listing entry comment.

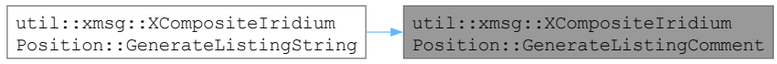
Returns

The listing entry comment.

References CATCH_BLOCK.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.63.4.15 GenerateListingString()

```
const string util::xmsg::XCompositeIridiumPosition::GenerateListingString (
            int whoi,
            int dive) const  [inline]
```

Generate a listing entry string from this composite Iridum position object.

Parameters

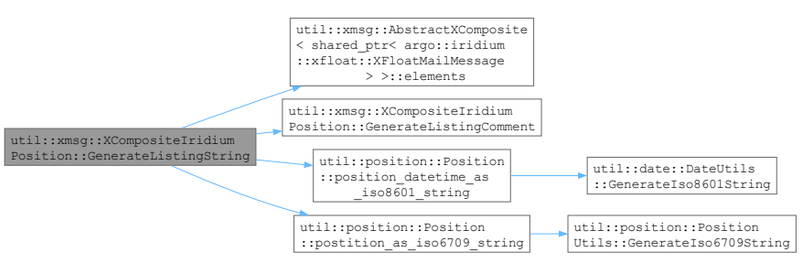
in	*whoi*	The unique WHOI instrument identifier or serial number.
in	*dive*	The dive or cycle number of this composite Iridum position object.

Returns

A listing entry string from this composite Iridum position object.

References CATCH_BLOCK, util::xmsg::AbstractXComposite< shared_ptr< argo::iridium::xfloat::XFloatMailMessage > >::elements(), GenerateListingComment(), util::position::Position::position_datetime_as_iso8601_string(), position_standard_error_, position_variance_, util::position::Position::postition_as_iso6709_string(), and total_satellite_comm_time_seconds_.

Here is the call graph for this function:



10.63.4.16 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

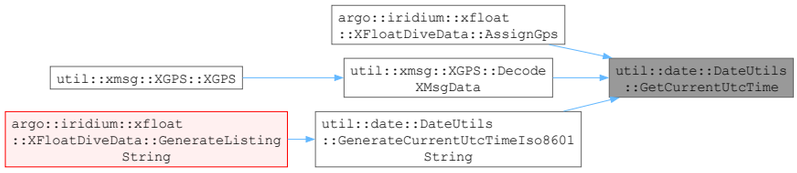
Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

Here is the caller graph for this function:



10.63.4.17 IsPositionValid()

```
template<typename T >
static bool util::position::PositionUtils::IsPositionValid (
            T lat,
            T lon)  [inline], [static], [inherited]
```

Check position validity.

Parameters

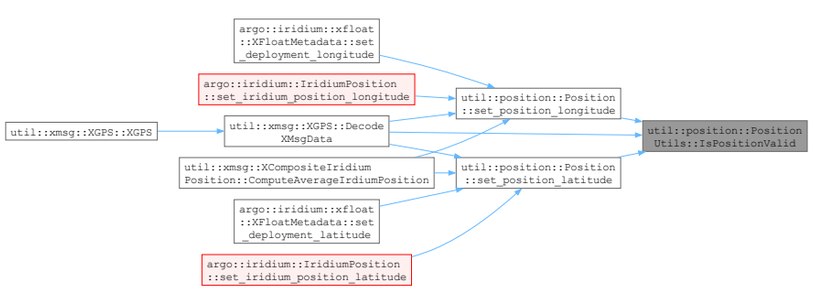
in	*lat*	Latitude of position.
in	*lon*	Longitude of position.

Returns

TRUE if (lat, lon) represents a valid geographical position, or FALSE otherwise.

Referenced by util::xmsg::XGPS::DecodeXMsgData(), util::position::Position::set_position_latitude(), and util::position::Position::set_positi

Here is the caller graph for this function:



10.63.4.18 num_elements()

```
virtual size_t util::xmsg::AbstractXComposite< shared_ptr< argo::iridium::xfloat::XFloatMailMessage
> >::num_elements () const  [inline], [virtual], [inherited]
```

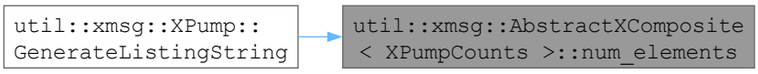
Get the number of individual elements that compose this composite object.

Returns

The number of individual elements that compose this composite object.

Referenced by ComputeAverageIrdiumPosition().

Here is the caller graph for this function:



10.63.4.19 position_datetime()

```
ptime util::position::Position::position_datetime () const  [inline], [inherited]
```

Get the date/time of the position.

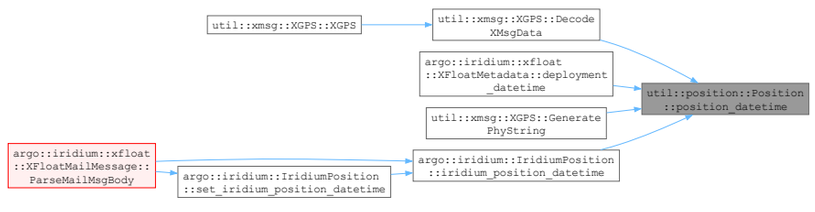
Returns

The date/time of the position.

References util::position::Position::position_datetime_.

Referenced by util::xmsg::XGPS::DecodeXMsgData(), argo::iridium::xfloat::XFloatMetadata::deployment_datetime(), util::xmsg::XGPS::GeneratePhyString(), and argo::iridium::IridiumPosition::iridium_position_datetime().

Here is the caller graph for this function:



10.63.4.20 position_datetime_as_iso8601_string()

```
string util::position::Position::position_datetime_as_iso8601_string () const  [inline], [inherited]
```

Get a formatted string representing the position date/time composed using the ISO 8601 standard.

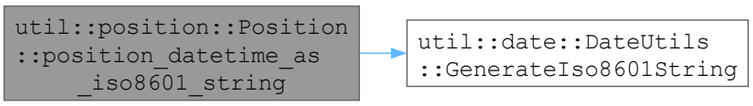
Returns

The formatted string representation of the position date/time.

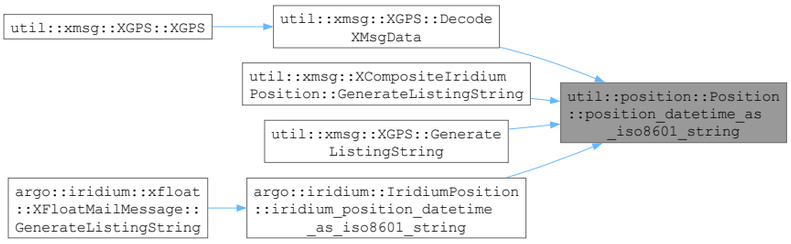
References util::date::DateUtils::GenerateIso8601String(), and util::position::Position::position_datetime_.

Referenced by util::xmsg::XGPS::DecodeXMsgData(), GenerateListingString(), util::xmsg::XGPS::GenerateListingString(), and argo::iridium::IridiumPosition::iridium_position_datetime_as_iso8601_string().

Here is the call graph for this function:



Here is the caller graph for this function:



10.63.4.21 position_is_valid()

```
bool util::position::Position::position_is_valid () const  [inline], [inherited]
```

Is the position valid?

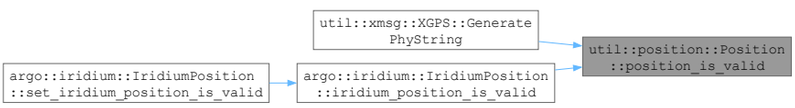
Returns

TRUE if the position is valid, or false otherwise.

References util::position::Position::position_is_valid_.

Referenced by util::xmsg::XGPS::GeneratePhyString(), and argo::iridium::IridiumPosition::iridium_position_is_valid().

Here is the caller graph for this function:



10.63.4.22 position_latitude()

```
double util::position::Position::position_latitude () const  [inline], [inherited]
```

Get the latitude of the position, in decimal degrees.

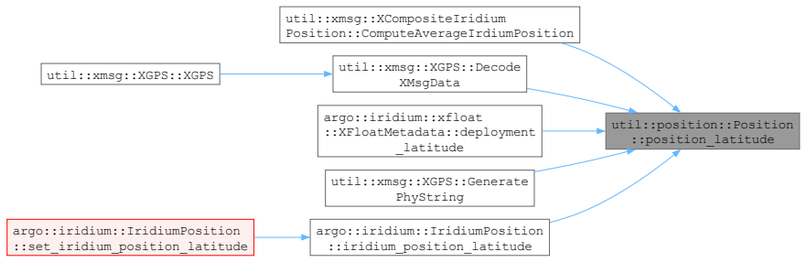
Returns

The latitude of the position, in decimal degrees.

References util::position::Position::position_latitude_.

Referenced by ComputeAverageIridiumPosition(), util::xmsg::XGPS::DecodeXMsgData(), argo::iridium::xfloat::XFloatMetadata::deploymer
util::xmsg::XGPS::GeneratePhyString(), and argo::iridium::IridiumPosition::iridium_position_latitude().

Here is the caller graph for this function:



10.63.4.23 position_longitude()

```
double util::position::Position::position_longitude () const  [inline], [inherited]
```

Get the longitude of the position, in decimal degrees.

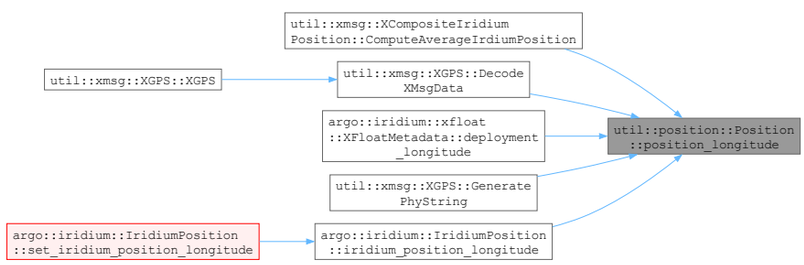
Returns

The longitude of the position, in decimal degrees.

References util::position::Position::position_longitude_.

Referenced by ComputeAverageIridiumPosition(), util::xmsg::XGPS::DecodeXMsgData(), argo::iridium::xfloat::XFloatMetadata::deploymer
util::xmsg::XGPS::GeneratePhyString(), and argo::iridium::IridiumPosition::iridium_position_longitude().

Here is the caller graph for this function:



10.63.4.24 position_standard_error()

```
double util::xmsg::XCompositeIridiumPosition::position_standard_error () const  [inline]
```

Get the calculated variance of this composite Iridium position, in km^2.

Returns

The calculated variance of this composite Iridium position, in km^2.

References position_standard_error_.

Referenced by set_position_standard_error().

Here is the caller graph for this function:

10.63.4.25 position_variance()

```
double util::xmsg::XCompositeIridiumPosition::position_variance () const  [inline]
```

Get the calculated variance of this composite Iridium position, in km^2.

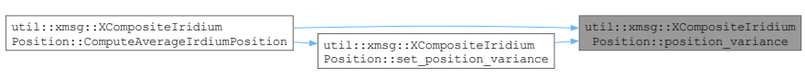
Returns

The calculated variance of this composite Iridium position, in km^2.

References position_variance_.

Referenced by ComputeAverageIrdiumPosition(), and set_position_variance().

Here is the caller graph for this function:



10.63.4.26 postition_as_iso6709_string()

```
string util::position::Position::postition_as_iso6709_string () const  [inline], [inherited]
```

Get a formatted string representing the position composed using the ISO 6709 standard.

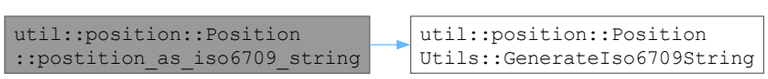
Returns

The formatted string representation of the position.

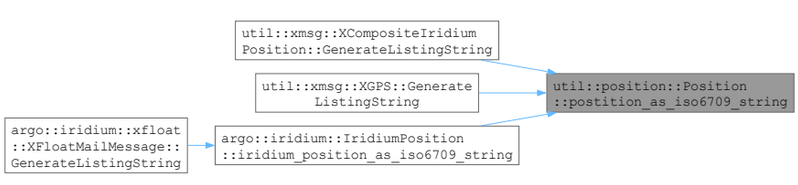
References util::position::PositionUtils::GenerateIso6709String(), util::position::Position::position_latitude_, and util::position::Position::position_longitude_.

Referenced by GenerateListingString(), util::xmsg::XGPS::GenerateListingString(), and argo::iridium::IridiumPosition::iridium_position_as_

Here is the call graph for this function:



Here is the caller graph for this function:



10.63.4.27 set_gps_position_datetime()

```
void util::position::Position::set_gps_position_datetime (
            unsigned int gpsWeek,
            unsigned int gpsDay,
            unsigned int gpsHour = 0,
            unsigned int gpsMinute = 0,
            unsigned int gpsSecond = 0)  [inline], [protected], [inherited]
```

Set the date and time of this position from the given GPS week, day, and time.

Parameters

in	*gpsWeek*	The GPS week, in weeks since midnight of January 6, 1980.
in	*gpsDay*	The GPS day of week (0 - 6).
in	*gpsHour*	The UTC hour of day (0 - 23).
in	*gpsMinute*	The UTC minute of hour (0 - 59)..
in	*gpsSecond*	The UTC second of minute (0 - 59).

References util::position::Position::set_position_datetime().

Referenced by util::xmsg::XGPS::DecodeXMsgData().

```
void util::xmsg::XCompositeIridiumPosition::set_position_standard_error (
            double position_standard_error)  [inline], [protected]
```

Set the calculated standard error of this composite Iridium position, in km.

Parameters

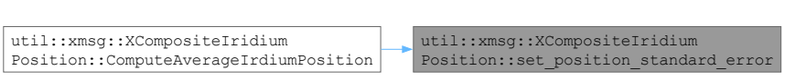
in	*position_standard_error*	The calculated standard error of this composite Iridium position, in km

References position_standard_error(), and position_standard_error_.

Referenced by ComputeAverageIrdiumPosition().

Here is the call graph for this function:

Here is the caller graph for this function:



10.63.4.33 set_position_variance()

```
void util::xmsg::XCompositeIridiumPosition::set_position_variance (
            double position_variance)  [inline], [protected]
```

Set the calculated variance of this composite Iridium position, in km^2.

Parameters

in	*position_variance*	The calculated variance of this composite Iridium position, in km^2

References position_variance(), and position_variance_.

Referenced by ComputeAverageIrdiumPosition().

Here is the call graph for this function:

Here is the caller graph for this function:

10.63.4.34 set_total_satellite_comm_time_seconds()

```
void util::xmsg::XCompositeIridiumPosition::set_total_satellite_comm_time_seconds (
            int time)  [inline], [protected]
```

Set the Iridium session communication time, in seconds.

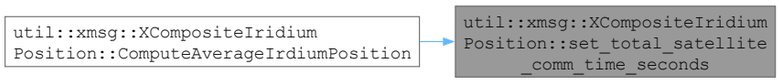
Parameters

in	*time*	The Iridium session communication time, in seconds.

References total_satellite_comm_time_seconds_.

Referenced by ComputeAverageIrdiumPosition().

Here is the caller graph for this function:



10.63.4.35 total_satellite_comm_time_seconds()

```
int util::xmsg::XCompositeIridiumPosition::total_satellite_comm_time_seconds () const  [inline]
```

Get the Iridium session communication time, in seconds.

Returns

The Iridium session communication time, in seconds.

References total_satellite_comm_time_seconds_.

10.63.5 Member Data Documentation

10.63.5.1 EARTH_RADIUS_KM_EQUATORIAL

```
const double util::position::PositionUtils::EARTH_RADIUS_KM_EQUATORIAL = 6378.1  [static], [private],
[inherited]
```

The equatorial radius of the earth, in kilometers.

Referenced by util::position::PositionUtils::CalculateEllipsoidHeight().

10.63.5.2 EARTH_RADIUS_KM_POLAR

```
const double util::position::PositionUtils::EARTH_RADIUS_KM_POLAR = 6356.1  [static], [private],
[inherited]
```

The polar radius of the earth, in kilometers.

Referenced by util::position::PositionUtils::CalculateEllipsoidHeight().

10.63.5.3 elements_

```
ElementVec_t util::xmsg::AbstractXComposite< shared_ptr< argo::iridium::xfloat::XFloatMailMessage
> >::elements_  [private], [inherited]
```

The vector of individual X-Messages elements that compose this composite object.

10.63.5.4 position_datetime_

```
ptime util::position::Position::position_datetime_  [private], [inherited]
```

The date and time of the position.

Referenced by util::position::Position::position_datetime(), util::position::Position::position_datetime_as_iso8601_string(), and util::position::Position::set_position_datetime().

10.63.5.5 position_is_valid_

```
bool util::position::Position::position_is_valid_  [private], [inherited]
```

The valid position indicator.

Referenced by util::position::Position::position_is_valid(), and util::position::Position::set_position_is_valid().

10.63.5.6 position_latitude_

```
double util::position::Position::position_latitude_  [private], [inherited]
```

The latitude of the position, in decimal degrees.

Referenced by util::position::Position::position_latitude(), util::position::Position::postition_as_iso6709_string(), util::position::Position::set_position_latitude(), and util::position::Position::set_position_longitude().

10.63.5.7 position_longitude_

```
double util::position::Position::position_longitude_  [private], [inherited]
```

The longitude of the position, in decimal degrees.

Referenced by util::position::Position::position_longitude(), util::position::Position::postition_as_iso6709_string(), util::position::Position::set_position_latitude(), and util::position::Position::set_position_longitude().

10.63.5.8 position_standard_error_

```
double util::xmsg::XCompositeIridiumPosition::position_standard_error_  [private]
```

The calculated standard error of this composite Iridium position, in km.

Referenced by GenerateListingString(), position_standard_error(), and set_position_standard_error().

10.63.5.9 position_variance_

```
double util::xmsg::XCompositeIridiumPosition::position_variance_  [private]
```

The calculated variance of this composite Iridium position, in km^2.

Referenced by GenerateListingString(), position_variance(), and set_position_variance().

10.63.5.10 total_satellite_comm_time_seconds_

```
int util::xmsg::XCompositeIridiumPosition::total_satellite_comm_time_seconds_  [private]
```

The Iridium session communication time, in seconds.

Note

This value is calculated from the difference in time between the first and last Iridium messages that are included in this composite Iridium position.

Referenced by GenerateListingString(), set_total_satellite_comm_time_seconds(), and total_satellite_comm_time_seconds().

The documentation for this class was generated from the following files:

- data/xmsg/XCompositeIridiumPosition.h
- data/XFloatMailMessage.cpp

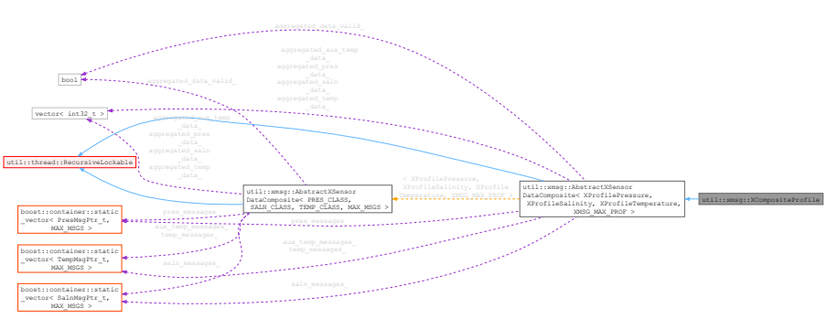
10.64 util::xmsg::XCompositeProfile Class Reference

Class representing the aggregate bin-averaged profile data for a single dive, composed from one or more bin-averaged profile data messages.

```
#include <XCompositeProfile.h>
```

Inheritance diagram for util::xmsg::XCompositeProfile:

Collaboration diagram for util::xmsg::XCompositeProfile:



Public Member Functions

- XCompositeProfile ()

  The default constructor.
- ~XCompositeProfile ()

  The destructor.
- void AssignAuxTemperatureMessage (const TempMsgPtr_t &x)

  Assign an auxiliary-channel temperature message and re-aggregate the sensor data.
- void AssignPressureMessage (const PresMsgPtr_t &x)

  Assign a pressure data message to this composite data object.
- void AssignSalinityMessage (const SalnMsgPtr_t &x)

  Assign a salinity data message to this composite data object.
- void AssignTemperatureMessage (const TempMsgPtr_t &x)

  Assign a temperature data message to this composite data object.
- void **CopyPressureDataToArray** (T dest[ ], size_t max_len, int16_t gain, int16_t offs, float pres_correction, T fill_value=XMSG_SENS_BAD_PRES) const
- void **CopySalinityDataToArray** (T dest[ ], size_t max_len, int16_t gain, int16_t offs, T fill_value=XMSG_SENS_BAD_SALN) const
- void **CopyTemperatureDataToArray** (T dest[ ], size_t max_len, int16_t gain, int16_t offs, T fill_↩ value=XMSG_SENS_BAD_TEMP) const
- const string GenerateListingString (int id_inst, int id_dive, uint16_t pg, uint16_t po, uint16_t sg, uint16_t so, uint16_t tg, uint16_t to, float pc) const

  Generate a listing string representation of the this composite sensor data object.
- const string GeneratePhyString (uint16_t pg, uint16_t po, uint16_t sg, uint16_t so, uint16_t tg, uint16_t to, float pc) const

  Generate a PHY entry string from this composite bin-averaged profile data object.
- bool **HasAuxTempData** () const
- bool HasContiguousMessageIndices () const

  Do the sensor data messages assigned to this composite data object have contiguous message indices?
- bool is_aggregated_data_valid () const

  Is the aggregated data valid?
- bool IsDataComplete () const

  Is the sensor data for this composite date message complete?
- bool IsEmpty () const

  Is this composite data object empty?
- bool LockObject (bool block)

  Lock the object.
- size_t max_num_samples () const

  Return the maximum of the number of pressure, temperature, or salinity sensor samples in the sensor data messages assigned to this composite sensor data object.
- size_t **num_aux_temp_samples** () const
- size_t num_pres_samples () const

  Get the total number of pressure sensor samples contained in the pressure data messages assigned to this composite data object.
- size_t num_saln_samples () const

  Get the total number of salinity sensor samples contained in the salinity data messages assigned to this composite data object.
- size_t num_temp_samples () const

  Get the total number of temperature sensor samples contained in the temperature data messages assigned to this composite data object.
- void Reset ()

  Remove the assigned pressure, temperature and salinity messages and their aggregated data.
- T **SampleAuxTempAsFloat** (size_t i, int16_t gain, int16_t offs) const
- int32_t SamplePres (size_t i) const

  Get the i^{th} pressure sensor value, in raw counts.
- T SamplePresAsFloat (size_t i, int16_t pg, int16_t po, float pc) const

  Get the i^{th} pressure sensor value, in dBar.
- int32_t SampleSaln (size_t i) const

  Get the i^{th} salinity sensor value, in raw counts.
- T SampleSalnAsFloat (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} salinity sensor value, in PSU.
- int32_t SampleTemp (size_t i) const

  Get the i^{th} temperature sensor value, in raw counts.
- T SampleTempAsFloat (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} temperature sensor value, in degC.
- void UnlockObject ()

  Unlock the object.

Protected Member Functions

- void AggregateSensorData () ATTR_NO_EXCEPTIONS

  Aggregate the sensor data for this composite sensor data object.
- void set_aggregated_data_valid (bool valid)

  Set the value of the aggregated_data_valid_ field.

Protected Attributes

- recursive_mutex mutex_

  Recursive mutual exclusion lock for synchronizing operations.

Private Types

- typedef shared_ptr< XProfilePressure > PresMsgPtr_t

  Type definition for a shared pointer to the pressure data message.
- typedef static_vector< PresMsgPtr_t, MAX_MSGS > PresMsgVector_t

  Type definition for a static vector (of size MAX_MSGS) of shared pointers to the pressure data message.
- typedef shared_ptr< XProfileSalinity > SalnMsgPtr_t

  Type definition for a shared pointer to the salinity data message.
- typedef static_vector< SalnMsgPtr_t, MAX_MSGS > SalnMsgVector_t

  Type definition for a static vector (of size MAX_MSGS) of shared pointers to the salinity data message.
- typedef shared_ptr< XProfileTemperature > TempMsgPtr_t

  Type definition for a shared pointer to the temperature data message.
- typedef static_vector< TempMsgPtr_t, MAX_MSGS > TempMsgVector_t

  Type definition for a static vector (of size MAX_MSGS) of shared pointers to the temperature data message.

Private Attributes

- vector< int32_t > **aggregated_aux_temp_data_**
- bool aggregated_data_valid_

  The aggregated data is valid flag.
- vector< int32_t > aggregated_pres_data_

  A vector of the aggregated pressure data samples, in raw counts.
- vector< int32_t > aggregated_saln_data_

  A vector of the aggregated salinity data samples, in raw counts.
- vector< int32_t > aggregated_temp_data_

  A vector of the aggregated temperature data samples, in raw counts.
- TempMsgVector_t **aux_temp_messages_**
- PresMsgVector_t pres_messages_

  A static vector (of size MAX_MSGS) containing pointers the pressure sensor data messages assigned to this composite object.
- SalnMsgVector_t saln_messages_

  A static vector (of size MAX_MSGS) containing pointers the salinity sensor data messages assigned to this composite object.
- TempMsgVector_t temp_messages_

  A static vector (of size MAX_MSGS) containing pointers the temperature sensor data messages assigned to this composite object.

10.64.1 Detailed Description

Class representing the aggregate bin-averaged profile data for a single dive, composed from one or more bin-averaged profile data messages.

10.64.2 Member Typedef Documentation

10.64.2.1 PresMsgPtr_t

```
typedef shared_ptr<XProfilePressure> util::xmsg::AbstractXSensorDataComposite< XProfilePressure,
XProfileSalinity, XProfileTemperature, MAX_MSGS >::PresMsgPtr_t  [private], [inherited]
```

Type definition for a shared pointer to the pressure data message.

10.64.2.2 PresMsgVector_t

typedef static_vector<PresMsgPtr_t, MAX_MSGS> util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, MAX_MSGS >::PresMsgVector_t [private], [inherited]

Type definition for a static vector (of size MAX_MSGS) of shared pointers to the pressure data message.

10.64.2.3 SalnMsgPtr_t

typedef shared_ptr<XProfileSalinity> util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, MAX_MSGS >::SalnMsgPtr_t [private], [inherited]

Type definition for a shared pointer to the salinity data message.

10.64.2.4 SalnMsgVector_t

typedef static_vector<SalnMsgPtr_t, MAX_MSGS> util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, MAX_MSGS >::SalnMsgVector_t [private], [inherited]

Type definition for a static vector (of size MAX_MSGS) of shared pointers to the salinity data message.

10.64.2.5 TempMsgPtr_t

typedef shared_ptr<XProfileTemperature> util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, MAX_MSGS >::TempMsgPtr_t [private], [inherited]

Type definition for a shared pointer to the temperature data message.

10.64.2.6 TempMsgVector_t

typedef static_vector<TempMsgPtr_t, MAX_MSGS> util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, MAX_MSGS >::TempMsgVector_t [private], [inherited]

Type definition for a static vector (of size MAX_MSGS) of shared pointers to the temperature data message.

10.64.3 Constructor & Destructor Documentation

10.64.3.1 XCompositeProfile()

util::xmsg::XCompositeProfile::XCompositeProfile () [inline]

The default constructor.

10.64.3.2 ~XCompositeProfile()

util::xmsg::XCompositeProfile::~XCompositeProfile () [inline]

The destructor.

10.64.4 Member Function Documentation

10.64.4.1 AggregateSensorData()

void util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, MAX_MSGS >::AggregateSensorData () [inline], [protected], [inherited]

Aggregate the sensor data for this composite sensor data object.

This function iterates over each of the sensor data messages assigned to this composite data object, and copies of the sensor data values into the corresponding sensor data vector.

If aggregated_data_valid_ is TRUE, then this function will have no effect. Otherwise, each of the aggregegated sensor data vectors will be cleared and the appropriate number of samples will be reserved.

Then, the sensor data message will be iterated over in order of increasing message indices, and the sensor data values will be copied into the corresponding sensor data vector in the appropriate order.

Finally, aggregated_data_valid_ will be set to FALSE to ensure that subsequent calls to this function will have no effect, until another sensor data message object is assigned to this composite object and aggregated_data_valid_ is set to TRUE.

Exceptions

util::log::MessageException	if an error occurs while aggregating the sensor data.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

10.64.4.2 AssignAuxTemperatureMessage()

```
void util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature,
MAX_MSGS >::AssignAuxTemperatureMessage (
            const TempMsgPtr_t & x)  [inline], [inherited]
```

Assign an auxiliary-channel temperature message and re-aggregate the sensor data.

The message is inserted in order of message index, and the aggregated sensor data is rebuilt.

Parameters

in	*x*	The auxiliary-channel temperature message to assign.

Exceptions

util::log::MessageException	if x is NULL or an auxiliary temperature message with the same index has already been assigned.

10.64.4.3 AssignPressureMessage()

```
void util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature,
MAX_MSGS >::AssignPressureMessage (
            const PresMsgPtr_t & x)  [inline], [inherited]
```

Assign a pressure data message to this composite data object.

The pressure data message will be emplaced into the sensor data message vector in order of increasing message indices. If a message with the same index is as x is already contained in the vector, then an exception will be thrown.

Parameters

in	*x*	A shared pointer to the pressure data message.

Exceptions

util::log::MessageException	if x is a null pointer, a duplicate message index is encountered, or any other error occurs.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

10.64.4.4 AssignSalinityMessage()

```
void util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature,
MAX_MSGS >::AssignSalinityMessage (
            const SalnMsgPtr_t & x)  [inline], [inherited]
```

Assign a salinity data message to this composite data object.

The salinity data message will be emplaced into the sensor data message vector in order of increasing message indices. If a message with the same index is as x is already contained in the vector, then an exception will be thrown.

Parameters

in	*x*	A shared pointer to the salinity data message.

Exceptions

util::log::MessageException	if x is a null pointer, a duplicate message index is encountered, or any other error occurs.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

10.64.4.5 AssignTemperatureMessage()

```
void util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature,
MAX_MSGS >::AssignTemperatureMessage (
            const TempMsgPtr_t & x)  [inline], [inherited]
```

Assign a temperature data message to this composite data object.

The temperature data message will be emplaced into the sensor data message vector in order of increasing message indices. If a message with the same index is as x is already contained in the vector, then an exception will be thrown.

Parameters

in	*x*	A shared pointer to the temperature data message.

Exceptions

util::log::MessageException	if x is a null pointer, a duplicate message index is encountered, or any other error occurs.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

10.64.4.6 GenerateListingString()

```
const string util::xmsg::XCompositeProfile::GenerateListingString (
            int id_inst,
            int id_dive,
            uint16_t pg,
            uint16_t po,
            uint16_t sg,
            uint16_t so,
            uint16_t tg,
            uint16_t to,
            float pc) const  [inline], [virtual]
```

Generate a listing string representation of the this composite sensor data object.

Parameters

in	*id_inst*	The unique instrument identifier for this composite sensor data object.
in	*id_dive*	The dive or cycle number for this composite data object.
in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*sg*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*so*	The salinity sensor offset, in PSU.
in	*tg*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*to*	The temperature sensor offset, in degC.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Exceptions

log::MessageException	if an error occurs while generating the listing string.
util::log::MessageException	if x if an error occurs while generating a listing string representation of this composite sensor data object.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

A listing string representation of this composite sensor data object.

Implements util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, XMSG_MAX_PROF >

References CATCH_BLOCK, util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, XMS util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, XMSG_MAX_PROF >::max_num util::thread::RecursiveLockable::mutex_, util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemper util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, XMSG_MAX_PROF >::SampleSa and util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, XMSG_MAX_PROF >::Samp

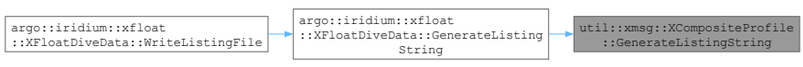
Here is the caller graph for this function:



10.64.4.7 GeneratePhyString()

```
const string util::xmsg::XCompositeProfile::GeneratePhyString (
            uint16_t pg,
            uint16_t po,
            uint16_t sg,
            uint16_t so,
            uint16_t tg,
            uint16_t to,
            float pc) const  [inline]
```

Generate a PHY entry string from this composite bin-averaged profile data object.

Parameters

in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*sg*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*so*	The salinity sensor offset, in PSU.
in	*tg*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*to*	The temperature sensor offset, in degC.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Exceptions

log::MessageException	if an error occurs while generating the PHY string.

Returns

A PHY entry string representation of this composite bin-averaged profile data object.

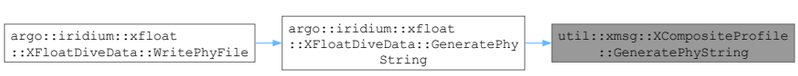
Referenced by argo::iridium::xfloat::XFloatDiveData::GeneratePhyString().

Here is the call graph for this function:

Here is the caller graph for this function:



10.64.4.8 HasContiguousMessageIndices()

```
bool util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature,
MAX_MSGS >::HasContiguousMessageIndices () const  [inline], [inherited]
```

Do the sensor data messages assigned to this composite data object have contiguous message indices?

This function is used, in part, to determine the sensor data is complete.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

TRUE if the sensor data messages have contiguous message indices or if there is less than two of each sensor data message, or FALSE otherwise.

10.64.4.9 is_aggregated_data_valid()

`bool util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, MAX_MSGS >::is_aggregated_data_valid () const [inline], [inherited]`

Is the aggregated data valid?

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

TRUE if the aggregated sensor is valid, or FALSE otherwise.

10.64.4.10 IsDataComplete()

`bool util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, MAX_MSGS >::IsDataComplete () const [inline], [inherited]`

Is the sensor data for this composite date message complete?

This function returns true if

- this composite sensor data object is not empty,
- the sensor data messages assigned to this composite data object have contiguous message indices,
- this sensor data object contains the same number of temperature and pressure sensor values, and
- the number of salinity data samples is either zero or equal to the number of pressure data samples.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

TRUE if the sensor data is complete, or FALSE otherwise.

Referenced by GenerateListingString().

Here is the caller graph for this function:

10.64.4.11 IsEmpty()

bool util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, MAX_MSGS >::IsEmpty () const [inline], [inherited]

Is this composite data object empty?

Returns

TRUE if empty, or FALSE otherwise.

10.64.4.12 LockObject()

bool util::thread::RecursiveLockable::LockObject (bool *block*) [inline], [inherited]

Lock the object.

Parameters

in	*block*	If TRUE, then the calling thread will block until the lock becomes available.

Exceptions

util::log::MessageException	if an error occurs.

Returns

TRUE if the lock was successfully obtained, or FALSE if block is FALSE and another thread owns the lock on the mutex.

References CATCH_BLOCK, and util::thread::RecursiveLockable::mutex_.

10.64.4.13 max_num_samples()

size_t util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, MAX_MSGS >::max_num_samples () const [inline], [inherited]

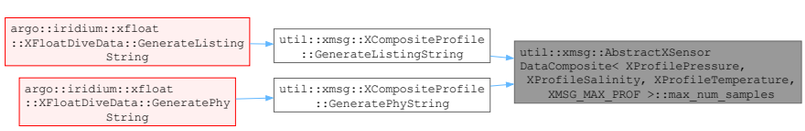
Return the maximum of the number of pressure, temperature, or salinity sensor samples in the sensor data messages assigned to this composite sensor data object.

Returns

The maximum of the number of pressure, temperature, or salinity sensor samples.

Referenced by GenerateListingString(), and GeneratePhyString().

Here is the caller graph for this function:



10.64.4.14 num_pres_samples()

size_t util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, MAX_MSGS >::num_pres_samples () const [inline], [inherited]

Get the total number of pressure sensor samples contained in the pressure data messages assigned to this composite data object.

Exceptions

util::log::MessageException	if an error occurs.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The total number of pressure sensor samples contained in the pressure data messages assigned to this composite data object.

10.64.4.15 num_saln_samples()

`size_t util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, MAX_MSGS >::num_saln_samples () const [inline], [inherited]`

Get the total number of salinity sensor samples contained in the salinity data messages assigned to this composite data object.

Exceptions

util::log::MessageException	if an error occurs.

Note

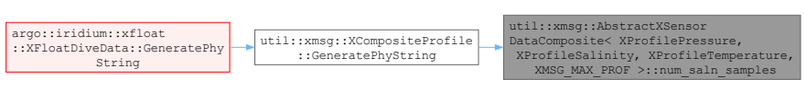
This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The total number of pressure sensor samples contained in the pressure data messages assigned to this composite data object.

Referenced by GeneratePhyString().

Here is the caller graph for this function:



10.64.4.16 num_temp_samples()

`size_t util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, MAX_MSGS >::num_temp_samples () const [inline], [inherited]`

Get the total number of temperature sensor samples contained in the temperature data messages assigned to this composite data object.

Exceptions

util::log::MessageException	if an error occurs.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The total number of pressure sensor samples contained in the pressure data messages assigned to this composite data object.

10.64.4.17 Reset()

```
void util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature,
MAX_MSGS >::Reset ()  [inline], [inherited]
```

Remove the assigned pressure, temperature and salinity messages and their aggregated data.

Warning

The auxiliary temperature messages and aggregated auxiliary temperature data are not cleared, so re-assigning them after a reset fails with a duplicate index.

Exceptions

util::log::MessageException	if an error occurs.

10.64.4.18 SamplePres()

```
int32_t util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature,
MAX_MSGS >::SamplePres (
            size_t i) const  [inline], [inherited]
```

Get the i^{th} pressure sensor value, in raw counts.

Parameters

in	*i*	The index of the pressure sensor sample to return. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD will be returned.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} pressure sensor value, in raw counts, or XMSG_SENS_BAD if the index `i` exceeds the number of pressure sensor samples in the aggregated data vector.

10.64.4.19 SamplePresAsFloat()

```
T util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature,
MAX_MSGS >::SamplePresAsFloat (
            size_t i,
            int16_t pg,
            int16_t po,
            float pc) const  [inline], [inherited]
```

Get the i^{th} pressure sensor value, in dBar.

Parameters

in	*i*	The index of the sensor value. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_PRES will be returned.
in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Note

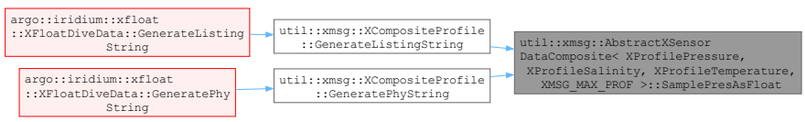
This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} pressure sensor value, in dBar. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_PRES will be returned.

Referenced by GenerateListingString(), and GeneratePhyString().

Here is the caller graph for this function:



10.64.4.20 SampleSaln()

```
int32_t util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature,
MAX_MSGS >::SampleSaln (
            size_t i) const  [inline], [inherited]
```

Get the i^{th} salinity sensor value, in raw counts.

Parameters

in	*i*	The index of the salinity sensor sample to return. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD will be returned.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} salinity sensor value, in raw counts, or XMSG_SENS_BAD if the index `i` exceeds the number of pressure sensor samples in the aggregated data vector.

10.64.4.21 SampleSalnAsFloat()

```
T util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature,
MAX_MSGS >::SampleSalnAsFloat (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} salinity sensor value, in PSU.

Parameters

in	*i*	The index of the sensor value. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_SALN will be returned.
in	*gain*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*offs*	The salinity sensor offset, in PSU.

Note

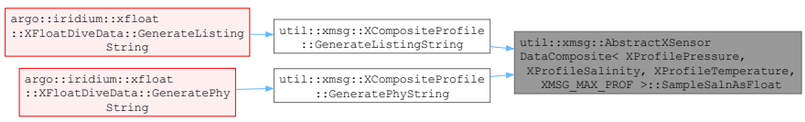
This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} salinity sensor value, in PSU. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_SALN will be returned.

Referenced by GenerateListingString(), and GeneratePhyString().

Here is the caller graph for this function:



10.64.4.22 SampleTemp()

```
int32_t util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature,
MAX_MSGS >::SampleTemp (
            size_t i) const  [inline], [inherited]
```

Get the i^{th} temperature sensor value, in raw counts.

Parameters

in	*i*	The index of the temperature sensor sample to return. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD will be returned.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} temperature sensor value, in raw counts, or XMSG_SENS_BAD if the index `i` exceeds the number of pressure sensor samples in the aggregated data vector.

10.64.4.23 SampleTempAsFloat()

```
T util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature,
MAX_MSGS >::SampleTempAsFloat (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} temperature sensor value, in degC.

Parameters

in	*i*	The index of the sensor value. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_SALN will be returned.
in	*gain*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*offs*	The temperature sensor offset, in degC.

Note

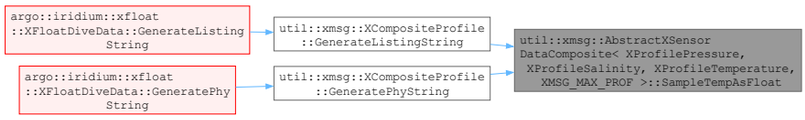
This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} temperature sensor value, in degC. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_TEMP will be returned.

Referenced by GenerateListingString(), and GeneratePhyString().

Here is the caller graph for this function:



10.64.4.24 set_aggregated_data_valid()

```
void util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature,
MAX_MSGS >::set_aggregated_data_valid (
            bool valid)  [inline], [protected], [inherited]
```

Set the value of the aggregated_data_valid_ field.

Parameters

in	*valid*	TRUE if the aggregated data is valid, or FALSE otherwise.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

10.64.4.25 UnlockObject()

```
void util::thread::RecursiveLockable::UnlockObject ()  [inline], [inherited]
```

Unlock the object.

Exceptions

util::log::MessageException	if an error occurs.

References CATCH_BLOCK, and util::thread::RecursiveLockable::mutex_.

10.64.5 Member Data Documentation

10.64.5.1 aggregated_data_valid_

```
bool util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature,
MAX_MSGS >::aggregated_data_valid_  [private], [inherited]
```

The aggregated data is valid flag.

This flag indicates the status of the aggregated sensor data. It is used to ensure the composite sensor data is aggregated only once following each assignment of sensor data to the composite data message.

This field is set to FALSE during initialization, and is set to FALSE each time a sensor data message is assigned to the composite data message. Each time AggregateSensorData() is called, the data will be aggregated, and this field will be set to TRUE.

10.64.5.2 aggregated_pres_data_

vector<int32_t> util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, MAX_MSGS >::aggregated_pres_data_ [private], [inherited]

A vector of the aggregated pressure data samples, in raw counts.

Each time the data is aggregated, the sensor data samples from the sensor data messages assigned to this composite objects are stored in this vector.

10.64.5.3 aggregated_saln_data_

vector<int32_t> util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, MAX_MSGS >::aggregated_saln_data_ [private], [inherited]

A vector of the aggregated salinity data samples, in raw counts.

Each time the data is aggregated, the sensor data samples from the sensor data messages assigned to this composite objects are stored in this vector.

10.64.5.4 aggregated_temp_data_

vector<int32_t> util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, MAX_MSGS >::aggregated_temp_data_ [private], [inherited]

A vector of the aggregated temperature data samples, in raw counts.

Each time the data is aggregated, the sensor data samples from the sensor data messages assigned to this composite object are stored in this vector.

10.64.5.5 mutex_

recursive_mutex util::thread::RecursiveLockable::mutex_ [mutable], [protected], [inherited]

Recursive mutual exclusion lock for synchronizing operations.

Referenced by util::xmsg::AbstractXSensorDataComposite< PRES_CLASS, SALN_CLASS, TEMP_CLASS, MAX_MSGS >::AggregateS

10.64.5.6 pres_messages_

PresMsgVector_t util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, MAX_MSGS >::pres_messages_ [private], [inherited]

A static vector (of size MAX_MSGS) containing pointers the pressure sensor data messages assigned to this composite object.

Each time a pressure sensor data message is assigned to the this object, it will be emplaced in this vector in order of increasing message indices.

10.64.5.7 saln_messages_

SalnMsgVector_t util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, MAX_MSGS >::saln_messages_ [private], [inherited]

A static vector (of size MAX_MSGS) containing pointers the salinity sensor data messages assigned to this composite object.

Each time a salinity sensor data message is assigned to the this object, it will be emplaced in this vector in order of increasing message indices.

10.64.5.8 temp_messages_

TempMsgVector_t util::xmsg::AbstractXSensorDataComposite< XProfilePressure, XProfileSalinity, XProfileTemperature, MAX_MSGS >::temp_messages_ [private], [inherited]

A static vector (of size MAX_MSGS) containing pointers the temperature sensor data messages assigned to this composite object.

Each time a temperature sensor data message is assigned to the this object, it will be emplaced in this vector in order of increasing message indices.

The documentation for this class was generated from the following file:

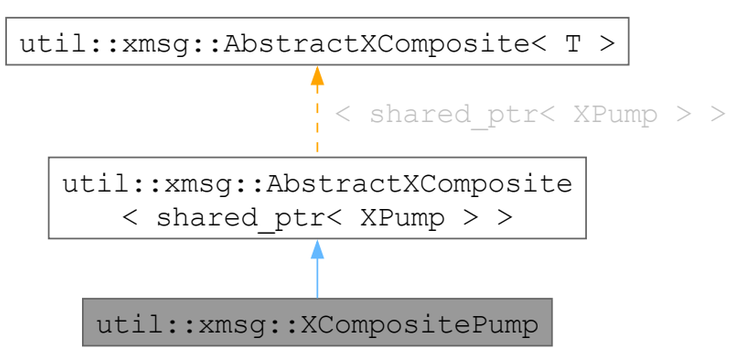
- data/xmsg/XCompositeProfile.h

10.65 util::xmsg::XCompositePump Class Reference

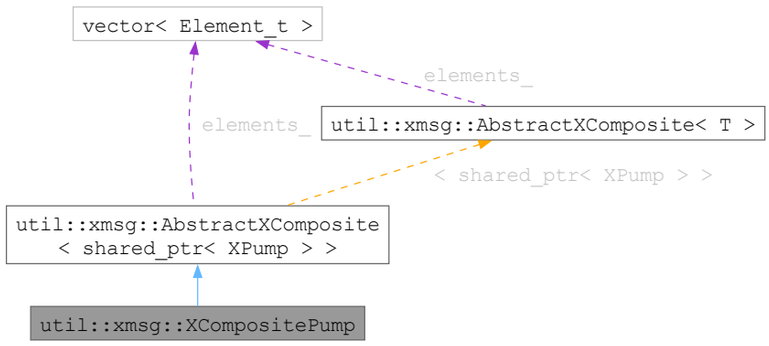
Class representing the aggregate pump time-series data for a single dive, composed from one or more pump time-series messages.

`#include <XCompositePump.h>`

Inheritance diagram for util::xmsg::XCompositePump:



Collaboration diagram for util::xmsg::XCompositePump:



Public Member Functions

- XCompositePump ()

  The default constructor.
- ~XCompositePump ()

  The destructor.
- void AppendAllElements (const static_vector< Element_t, I > &elements)

  Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.
- virtual void AssignElement (const Element_t &element)

  Assign an element to this composite object.
- const vector< Element_t > & elements () const

  Get the vector of individual X-Messages elements that compose this composite object.
- const string GenerateListingString (uint16_t pg, uint16_t po, float pc) const

  Generate a listing entry string from this composite pump data object.
- virtual bool **IsEmpty** () const
- virtual size_t num_elements () const

  Get the number of individual elements that compose this composite object.

Protected Member Functions

- void AppendAllElements (const vector< Element_t > &elements)

  Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.
- void AppendElement (const Element_t &element)

  Append one element to the vector of individual X-Messages elements that compose this composite object.

Private Types

- typedef shared_ptr< XPump > Element_t

  Type definition for the element aggregated by this object.
- typedef ElementVec_t::const_iterator **ElementConstIter_t**
- typedef ElementVec_t::iterator **ElementIter_t**
- typedef vector< Element_t > **ElementVec_t**

Private Attributes

- ElementVec_t elements_

  The vector of individual X-Messages elements that compose this composite object.

10.65.1 Detailed Description

Class representing the aggregate pump time-series data for a single dive, composed from one or more pump time-series messages.

10.65.2 Member Typedef Documentation

10.65.2.1 Element_t

```
typedef shared_ptr< XPump > util::xmsg::AbstractXComposite< shared_ptr< XPump > >::Element_↩
t  [private], [inherited]
```

Type definition for the element aggregated by this object.

10.65.3 Constructor & Destructor Documentation

10.65.3.1 XCompositePump()

```
util::xmsg::XCompositePump::XCompositePump ()  [inline]
```

The default constructor.

10.65.3.2 ~XCompositePump()

```
util::xmsg::XCompositePump::~XCompositePump ()  [inline]
```

The destructor.

10.65.4 Member Function Documentation

10.65.4.1 AppendAllElements() [1/2]

```
void util::xmsg::AbstractXComposite< shared_ptr< XPump > >::AppendAllElements (
            const static_vector< Element_t, I > & elements)  [inline], [inherited]
```

Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*elements*	The vector of elements to append.

10.65.4.2 AppendAllElements() [2/2]

```
void util::xmsg::AbstractXComposite< shared_ptr< XPump > >::AppendAllElements (
            const vector< Element_t > & elements)  [inline], [protected], [inherited]
```

Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*elements*	The vector of elements to append.

10.65.4.3 AppendElement()

```
void util::xmsg::AbstractXComposite< shared_ptr< XPump > >::AppendElement (
            const Element_t & element)  [inline], [protected], [inherited]
```

Append one element to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*element*	The element to append.

10.65.4.4 AssignElement()

```
virtual void util::xmsg::AbstractXComposite< shared_ptr< XPump > >::AssignElement (
            const Element_t & element)  [inline], [virtual], [inherited]
```

Assign an element to this composite object.

The default implementation appends the element; derived classes may override it to insert elements in order or reject duplicates.

Parameters

in	*element*	The element to assign.

10.65.4.5 elements()

```
const vector< Element_t > & util::xmsg::AbstractXComposite< shared_ptr< XPump > >::elements ()
const  [inline], [inherited]
```

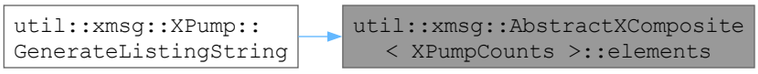
Get the vector of individual X-Messages elements that compose this composite object.

Returns

The vector of individual X-Messages elements that compose this composite object.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.65.4.6 GenerateListingString()

```
const string util::xmsg::XCompositePump::GenerateListingString (
            uint16_t pg,
            uint16_t po,
            float pc) const  [inline]
```

Generate a listing entry string from this composite pump data object.

Parameters

in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Exceptions

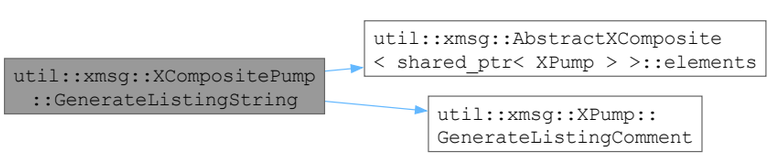
log::MessageException	if an error occurs while generating the listing string.

Returns

A listing entry string representation of this composite pump data object.

References CATCH_BLOCK, util::xmsg::AbstractXComposite< shared_ptr< XPump > >::elements(), util::xmsg::XPump::GenerateListin
and XMSG_SECTION_BREAK.

Here is the call graph for this function:



10.65.4.7 num_elements()

```
virtual size_t util::xmsg::AbstractXComposite< shared_ptr< XPump > >::num_elements () const
[inline], [virtual], [inherited]
```

Get the number of individual elements that compose this composite object.

Returns

The number of individual elements that compose this composite object.

10.65.5 Member Data Documentation

10.65.5.1 elements_

```
ElementVec_t util::xmsg::AbstractXComposite< shared_ptr< XPump > >::elements_  [private], [inherited]
```

The vector of individual X-Messages elements that compose this composite object.

The documentation for this class was generated from the following file:

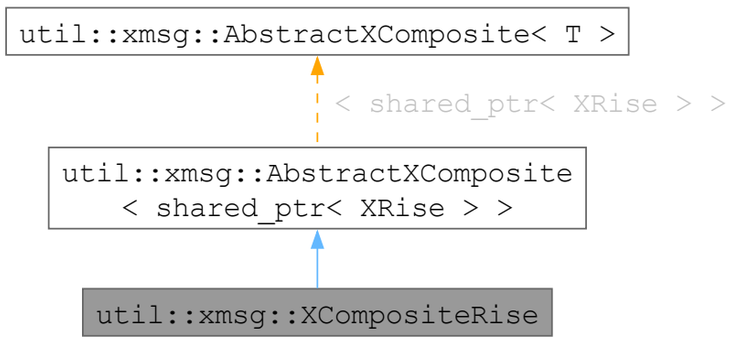
- data/xmsg/XCompositePump.h

10.66 util::xmsg::XCompositeRise Class Reference

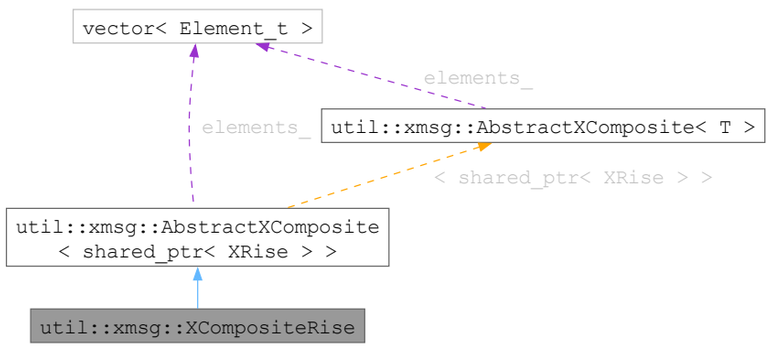
Class representing the aggregate pump data for a single dive, composed from one or more pump data messages.

```
#include <XCompositeRise.h>
```

Inheritance diagram for util::xmsg::XCompositeRise:



Collaboration diagram for util::xmsg::XCompositeRise:



Public Member Functions

- XCompositeRise ()

  The default constructor.
- ~XCompositeRise ()

  The destructor.
- void AppendAllElements (const static_vector< Element_t, I > &elements)

  Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.
- virtual void AssignElement (const Element_t &element)

  Assign an element to this composite object.
- const vector< Element_t > & elements () const

  Get the vector of individual X-Messages elements that compose this composite object.
- const string GenerateListingString (uint16_t pg, uint16_t po, uint16_t sg, uint16_t so, uint16_t tg, uint16_t to, float pc) const

  Generate a listing entry string from this composite rise time-series data object.
- virtual bool **IsEmpty** () const
- virtual size_t num_elements () const

  Get the number of individual elements that compose this composite object.

Protected Member Functions

- void AppendAllElements (const vector< Element_t > &elements)

  Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.
- void AppendElement (const Element_t &element)

  Append one element to the vector of individual X-Messages elements that compose this composite object.

Private Types

- typedef shared_ptr< XRise > Element_t

  Type definition for the element aggregated by this object.
- typedef ElementVec_t::const_iterator **ElementConstIter_t**
- typedef ElementVec_t::iterator **ElementIter_t**
- typedef vector< Element_t > **ElementVec_t**

Private Attributes

- ElementVec_t elements_

  The vector of individual X-Messages elements that compose this composite object.

10.66.1 Detailed Description

Class representing the aggregate pump data for a single dive, composed from one or more pump data messages.

10.66.2 Member Typedef Documentation

10.66.2.1 Element_t

```
typedef shared_ptr< XRise > util::xmsg::AbstractXComposite< shared_ptr< XRise > >::Element_↩
t  [private], [inherited]
```

Type definition for the element aggregated by this object.

10.66.3 Constructor & Destructor Documentation

10.66.3.1 XCompositeRise()

```
util::xmsg::XCompositeRise::XCompositeRise ()  [inline]
```

The default constructor.

10.66.3.2 ~XCompositeRise()

```
util::xmsg::XCompositeRise::~XCompositeRise ()  [inline]
```

The destructor.

10.66.4 Member Function Documentation

10.66.4.1 AppendAllElements() [1/2]

```
void util::xmsg::AbstractXComposite< shared_ptr< XRise > >::AppendAllElements (
            const static_vector< Element_t, I > & elements)  [inline], [inherited]
```

Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*elements*	The vector of elements to append.

10.66.4.2 AppendAllElements() [2/2]

```
void util::xmsg::AbstractXComposite< shared_ptr< XRise > >::AppendAllElements (
            const vector< Element_t > & elements)  [inline], [protected], [inherited]
```

Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*elements*	The vector of elements to append.

10.66.4.3 AppendElement()

```
void util::xmsg::AbstractXComposite< shared_ptr< XRise > >::AppendElement (
            const Element_t & element)  [inline], [protected], [inherited]
```

Append one element to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*element*	The element to append.

10.66.4.4 AssignElement()

```
virtual void util::xmsg::AbstractXComposite< shared_ptr< XRise > >::AssignElement (
            const Element_t & element)  [inline], [virtual], [inherited]
```

Assign an element to this composite object.

The default implementation appends the element; derived classes may override it to insert elements in order or reject duplicates.

Parameters

in	*element*	The element to assign.

10.66.4.5 elements()

```
const vector< Element_t > & util::xmsg::AbstractXComposite< shared_ptr< XRise > >::elements ()
const  [inline], [inherited]
```

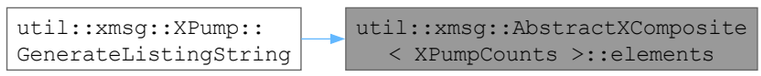
Get the vector of individual X-Messages elements that compose this composite object.

Returns

The vector of individual X-Messages elements that compose this composite object.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.66.4.6 GenerateListingString()

```
const string util::xmsg::XCompositeRise::GenerateListingString (
            uint16_t pg,
            uint16_t po,
            uint16_t sg,
            uint16_t so,
            uint16_t tg,
            uint16_t to,
            float pc) const  [inline]
```

Generate a listing entry string from this composite rise time-series data object.

Parameters

in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*sg*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*so*	The salinity sensor offset, in PSU.
in	*tg*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*to*	The temperature sensor offset, in degC.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Exceptions

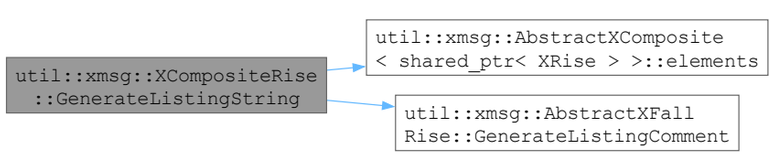
log::MessageException	if an error occurs while generating the listing string.

Returns

A listing entry string representation of this composite rise time-series data object.

References CATCH_BLOCK, util::xmsg::AbstractXComposite< shared_ptr< XRise > >::elements(), util::xmsg::AbstractXFallRise::Gene
and XMSG_SECTION_BREAK.

Here is the call graph for this function:



10.66.4.7 num_elements()

```
virtual size_t util::xmsg::AbstractXComposite< shared_ptr< XRise > >::num_elements () const
[inline], [virtual], [inherited]
```

Get the number of individual elements that compose this composite object.

Returns

The number of individual elements that compose this composite object.

10.66.5 Member Data Documentation

10.66.5.1 elements_

```
ElementVec_t util::xmsg::AbstractXComposite< shared_ptr< XRise > >::elements_  [private], [inherited]
```

The vector of individual X-Messages elements that compose this composite object.

The documentation for this class was generated from the following file:

10.67.1 Detailed Description

Class representing the aggregate surface pressure data for a single dive, composed from one or more surface pressure messages.

10.67.2 Constructor & Destructor Documentation

10.67.2.1 XCompositeSurfaceData()

```
util::xmsg::XCompositeSurfaceData::XCompositeSurfaceData () [inline]
```

Default constructor.

10.67.2.2 ~XCompositeSurfaceData()

```
util::xmsg::XCompositeSurfaceData::~XCompositeSurfaceData () [inline]
```

Destructor.

10.67.3 Member Function Documentation

10.67.3.1 AggregateSensorData()

```
void util::xmsg::XCompositeSurfaceData::AggregateSensorData ()  [inline], [virtual]
```

Aggregate the surface time series and compute outlier-filtered pressure statistics.

First aggregates the messages as in AbstractXTimeSeriesDataComposite::AggregateSensorData(), then refines the surface pressure statistics in three passes over the valid samples (after the static gain):

1. compute the pressure variance about the mean;
2. discard samples more than two standard deviations from the mean, and recompute the maximum, minimum and mean from the rest;
3. recompute the variance from the remaining samples.

These statistics drive the surface pressure offset correction (see `XFloatDiveData::UpdateDerived↩SurfaceDataFields()`).

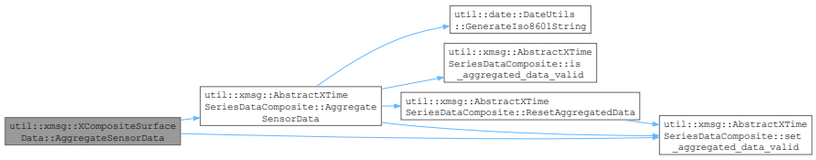
Exceptions

util::log::MessageException	if a pass finds no valid samples.

Reimplemented from util::xmsg::AbstractXTimeSeriesDataComposite< XSurfaceData >.

References util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), CATCH_BLOCK, EXC_THROW, ldbg, lwrn, util::xmsg::AbstractXTimeSeriesDataComposite< XSurfaceData >::set_aggregated_data_valid(), and XMSG_SENS_BAD.

Here is the call graph for this function:



10.67.3.2 AssignMessage()

```
virtual void util::xmsg::AbstractXTimeSeriesDataComposite< XSurfaceData >::AssignMessage (
            const MsgPtr_t & x)  [inline], [virtual], [inherited]
```

Assign a time-series message to this composite and re-aggregate the time series.

The message is inserted in order of message index, and `AggregateSensorData()` is called to rebuild the combined time series.

Parameters

in	*x*	The time-series message to assign.

Exceptions

util::log::MessageException	if `x` is NULL or a message with the same index has already been assigned.

10.67.3.3 GenerateListingString()

```
const string util::xmsg::XCompositeSurfaceData::GenerateListingString (
            uint16_t pg,
            uint16_t po,
            uint16_t sg,
            uint16_t so,
            uint16_t tg,
            uint16_t to,
            float pc) const  [inline]
```

Generate a listing entry string from this composite surface pressure time-series data object.

Parameters

in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*sg*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*so*	The salinity sensor offset, in PSU.
in	*tg*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*to*	The temperature sensor offset, in degC.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Exceptions

log::MessageException	if an error occurs while generating the listing string.

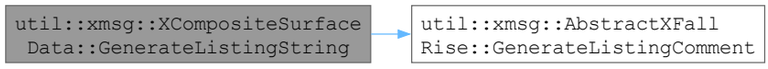
Returns

A listing entry string representation of this composite surface pressure time-series data object.

References CATCH_BLOCK, util::xmsg::AbstractXFallRise::GenerateListingComment(), and XMSG_SECTION.

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:

10.67.3.4 is_aggregated_data_valid()

```
bool util::xmsg::AbstractXTimeSeriesDataComposite< XSurfaceData >::is_aggregated_data_valid ()
const  [inline], [inherited]
```

Is the aggregated data valid?

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

TRUE if the aggregated sensor is valid, or FALSE otherwise.

10.67.3.5 IsEmpty()

```
bool util::xmsg::AbstractXTimeSeriesDataComposite< XSurfaceData >::IsEmpty () const  [inline],
[inherited]
```

Is this composite data object empty?

Returns

TRUE if empty, or FALSE otherwise.

10.67.3.6 Reset()

```
void util::xmsg::AbstractXTimeSeriesDataComposite< XSurfaceData >::Reset ()  [inline], [inherited]
```

Remove all assigned messages and clear the aggregated data.

Exceptions

util::log::MessageException	if an error occurs.

10.67.3.7 ResetAggregatedData()

```
void util::xmsg::AbstractXTimeSeriesDataComposite< XSurfaceData >::ResetAggregatedData ()  [inline],
[inherited]
```

Clear the aggregated time series and its derived pressure statistics.

The assigned messages are kept; the next call to `AggregateSensorData()` rebuilds the aggregated data from them.

Exceptions

util::log::MessageException	if an error occurs.

10.67.3.8 SamplePres()

```
int32_t util::xmsg::AbstractXTimeSeriesDataComposite< XSurfaceData >::SamplePres (
            size_t i) const  [inline], [inherited]
```

Get the i^{th} pressure sensor value, in raw counts.

Parameters

in	*i*	The index of the pressure sensor sample to return. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD will be returned.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} pressure sensor value, in raw counts, or XMSG_SENS_BAD if the index `i` exceeds the number of pressure sensor samples in the aggregated data vector.

10.67.3.9 SamplePresAsFloat()

```
T util::xmsg::AbstractXTimeSeriesDataComposite< XSurfaceData >::SamplePresAsFloat (
            size_t i,
            int16_t pg,
            int16_t po,
            float pc) const  [inline], [inherited]
```

Get the i^{th} pressure sensor value, in dBar.

Parameters

in	*i*	The index of the sensor value. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_PRES will be returned.
in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} pressure sensor value, in dBar. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_PRES will be returned.

10.67.3.10 SampleSaln()

```
int32_t util::xmsg::AbstractXTimeSeriesDataComposite< XSurfaceData >::SampleSaln (
            size_t i) const  [inline], [inherited]
```

Get the i^{th} salinity sensor value, in raw counts.

Parameters

in	*i*	The index of the salinity sensor sample to return. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD will be returned.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} salinity sensor value, in raw counts, or XMSG_SENS_BAD if the index `i` exceeds the number of pressure sensor samples in the aggregated data vector.

10.67.3.11 SampleSalnAsFloat()

```
T util::xmsg::AbstractXTimeSeriesDataComposite< XSurfaceData >::SampleSalnAsFloat (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} salinity sensor value, in PSU.

Parameters

in	*i*	The index of the sensor value. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_SALN will be returned.
in	*gain*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*offs*	The salinity sensor offset, in PSU.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} salinity sensor value, in PSU. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_SALN will be returned.

10.67.3.12 SampleTemp()

```
int32_t util::xmsg::AbstractXTimeSeriesDataComposite< XSurfaceData >::SampleTemp (
            size_t i) const  [inline], [inherited]
```

Get the i^{th} temperature sensor value, in raw counts.

Parameters

in	*i*	The index of the temperature sensor sample to return. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD will be returned.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} temperature sensor value, in raw counts, or XMSG_SENS_BAD if the index `i` exceeds the number of pressure sensor samples in the aggregated data vector.

10.67.3.13 SampleTempAsFloat()

```
T util::xmsg::AbstractXTimeSeriesDataComposite< XSurfaceData >::SampleTempAsFloat (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} temperature sensor value, in degC.

Parameters

in	*i*	The index of the sensor value. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_SALN will be returned.
in	*gain*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*offs*	The temperature sensor offset, in degC.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The i^{th} temperature sensor value, in degC. If the index exceeds the number of values in the aggregated data vector, then XMSG_SENS_BAD_TEMP will be returned.

10.67.3.14 set_aggregated_data_valid()

```
void util::xmsg::AbstractXTimeSeriesDataComposite< XSurfaceData >::set_aggregated_data_valid (
            bool valid)  [inline], [protected], [inherited]
```

Set the value of the aggregated_data_valid_ field.

Parameters

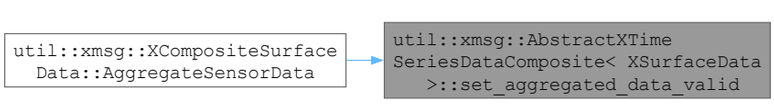
in	*valid*	TRUE if the aggregated data is valid, or FALSE otherwise.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Referenced by AggregateSensorData().

Here is the caller graph for this function:



10.67.4 Member Data Documentation

10.67.4.1 aggregated_data_valid_

bool util::xmsg::AbstractXTimeSeriesDataComposite< XSurfaceData >::aggregated_data_valid_ [private], [inherited]

The aggregated data is valid flag.

This flag indicates the status of the aggregated sensor data. It is used to ensure the composite sensor data is aggregated only once following each assignment of sensor data to the composite data message.

This field is set to FALSE during initialization, and is set to FALSE each time a sensor data message is assigned to the composite data message. Each time AggregateSensorData() is called, the data will be aggregated, and this field will be set to TRUE.

The documentation for this class was generated from the following file:

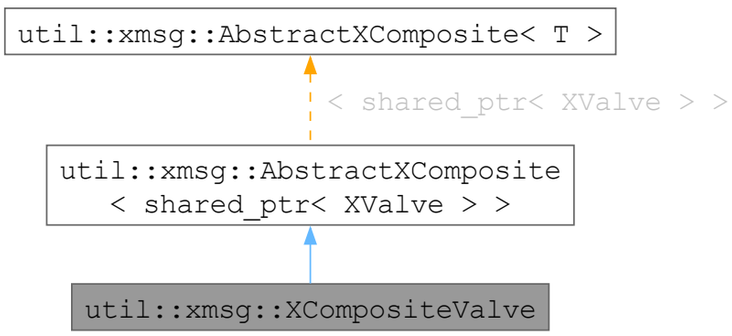
- data/xmsg/XCompositeSurfaceData.h

10.68 util::xmsg::XCompositeValve Class Reference

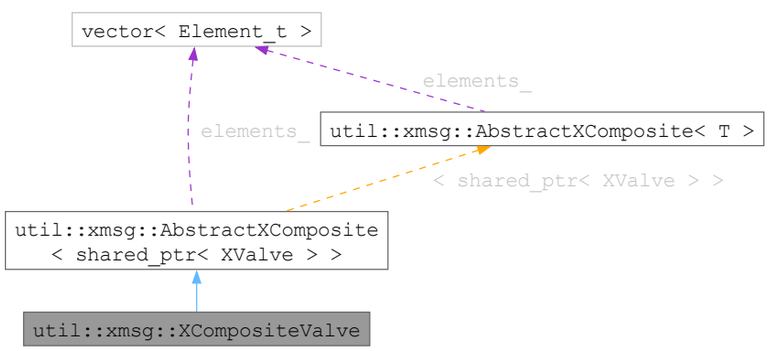
The composite valve data class.

#include <XCompositeValve.h>

Inheritance diagram for util::xmsg::XCompositeValve:



Collaboration diagram for util::xmsg::XCompositeValve:



Public Member Functions

- void AppendAllElements (const static_vector< Element_t, I > &elements)

  Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.
- virtual void AssignElement (const Element_t &element)

  Assign an element to this composite object.
- const vector< Element_t > & elements () const

  Get the vector of individual X-Messages elements that compose this composite object.
- const string **GenerateListingString** (uint16_t pGain, uint16_t pOff, float pres_correction) const
- virtual bool **IsEmpty** () const
- virtual size_t num_elements () const

  Get the number of individual elements that compose this composite object.

Protected Member Functions

- void AppendAllElements (const vector< Element_t > &elements)

  Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.
- void AppendElement (const Element_t &element)

  Append one element to the vector of individual X-Messages elements that compose this composite object.

Private Types

- typedef shared_ptr< XValve > Element_t

  Type definition for the element aggregated by this object.
- typedef ElementVec_t::const_iterator **ElementConstIter_t**
- typedef ElementVec_t::iterator **ElementIter_t**
- typedef vector< Element_t > **ElementVec_t**

Private Attributes

- ElementVec_t elements_

  The vector of individual X-Messages elements that compose this composite object.

10.68.1 Detailed Description

The composite valve data class.

An instance of this class aggregates the valve data messages (see XValve) received for a single dive.

10.68.2 Member Typedef Documentation

10.68.2.1 Element_t

```
typedef shared_ptr< XValve > util::xmsg::AbstractXComposite< shared_ptr< XValve > >::Element_t
[private], [inherited]
```

Type definition for the element aggregated by this object.

10.68.3 Member Function Documentation

10.68.3.1 AppendAllElements() [1/2]

```
void util::xmsg::AbstractXComposite< shared_ptr< XValve > >::AppendAllElements (
            const static_vector< Element_t, I > & elements)  [inline], [inherited]
```

Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*elements*	The vector of elements to append.

10.68.3.2 AppendAllElements() [2/2]

```
void util::xmsg::AbstractXComposite< shared_ptr< XValve > >::AppendAllElements (
            const vector< Element_t > & elements)  [inline], [protected], [inherited]
```

Append a vector of elements to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*elements*	The vector of elements to append.

10.68.3.3 AppendElement()

```
void util::xmsg::AbstractXComposite< shared_ptr< XValve > >::AppendElement (
            const Element_t & element)  [inline], [protected], [inherited]
```

Append one element to the vector of individual X-Messages elements that compose this composite object.

Parameters

in	*element*	The element to append.

10.68.3.4 AssignElement()

```
virtual void util::xmsg::AbstractXComposite< shared_ptr< XValve > >::AssignElement (
            const Element_t & element)  [inline], [virtual], [inherited]
```

Assign an element to this composite object.

The default implementation appends the element; derived classes may override it to insert elements in order or reject duplicates.

Parameters

in	*element*	The element to assign.

10.68.3.5 elements()

```
const vector< Element_t > & util::xmsg::AbstractXComposite< shared_ptr< XValve > >::elements ()
const  [inline], [inherited]
```

Get the vector of individual X-Messages elements that compose this composite object.

Returns

The vector of individual X-Messages elements that compose this composite object.

10.68.3.6 num_elements()

```
virtual size_t util::xmsg::AbstractXComposite< shared_ptr< XValve > >::num_elements () const
[inline], [virtual], [inherited]
```

Get the number of individual elements that compose this composite object.

Returns

The number of individual elements that compose this composite object.

10.68.4 Member Data Documentation

10.68.4.1 elements_

`ElementVec_t util::xmsg::AbstractXComposite< shared_ptr< XValve > >::elements_ [private], [inherited]`

The vector of individual X-Messages elements that compose this composite object.

The documentation for this class was generated from the following file:

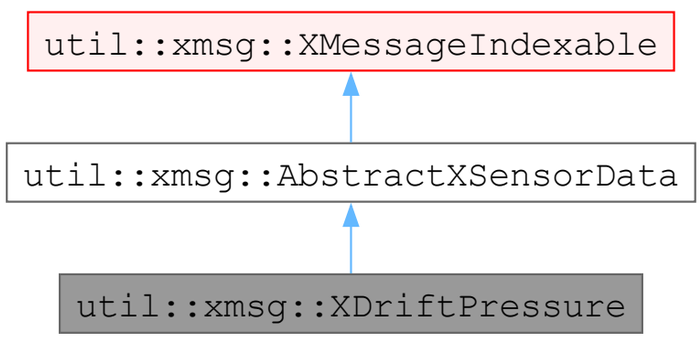
10.69 util::xmsg::XDriftPressure Class Reference

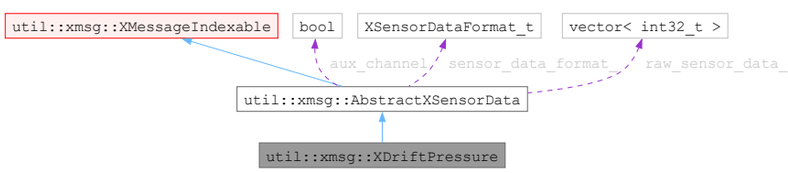
Class representing a drift pressure time-series X-Message.

`#include <XDriftPressure.h>`

Inheritance diagram for util::xmsg::XDriftPressure:



Collaboration diagram for util::xmsg::XDriftPressure:



Public Member Functions

- XDriftPressure (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)
  Parameterized constructor.
- ~XDriftPressure ()
  Destructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)
  Check the X-message for the correct ID, minimum size, and message terminator.
- void DecodeXMsgData (const vector< uint8_t > &data)
  Decode the drift pressure X-Message from binary data.
- int16_t id_dive () const
  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const
  Get the unique instrument identifier of this X-Message.

- XMsgTypeId_t id_xmsg_type () const
  Get the enumerated X-Message type identifier.
- bool **is_aux_channel** () const
- size_t num_samples () const
  Get the number of samples in this message.
- const vector< int32_t > & raw_sensor_data () const
  Get the raw sensor data vector.
- int32_t Sample (size_t i) const
  Get the raw integer value of the i^{th} sample.
- template<typename T = double>
  T SampleValue (size_t i, int16_t gain, int16_t offs) const
  Get the i^{th} sensor value in scientific units.
- template<typename T = double>
  T SampleValueAsPressure (size_t i, int16_t gain, int16_t offs) const
  Get the i^{th} pressure sensor value, in dBar.
- template<typename T = double>
  T SampleValueAsSalinity (size_t i, int16_t gain, int16_t offs) const
  Get the i^{th} salinity sensor value, in PSU.
- template<typename T = double>
  T SampleValueAsTemperature (size_t i, int16_t gain, int16_t offs) const
  Get the i^{th} temperature sensor value, in degC.
- XSensorDataFormat_t sensor_data_format () const
  Get the enumerated sensor data format value.
- uint8_t xmsg_index () const
  Get the index of this X-Message.
- uint16_t xmsg_size_bytes () const
  Get the size of the X-Message, in bytes.

Protected Member Functions

- void set_id_dive (int16_t id_dive)
  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)
  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)
  Set the X-Message type identifier.
- void set_raw_sensor_data (const vector< int32_t > &raw_sensor_data)
  Set raw integer counts of the measured sensor data.
- void set_sensor_data_format (XSensorDataFormat_t sensor_data_format)
  Set the sensor data format.
- void set_xmsg_index (uint8_t xmsg_index)
  Set the index of this X-Message.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)
  Set the size of the X-Message, in bytes.
- virtual vector< int32_t > UnpackSensorData (const vector< uint8_t > &data)
  Unpack the sensor data from the binary message.

Protected Attributes

- bool **aux_channel**
- vector< int32_t > raw_sensor_data_
  The raw integer counts of the measured sensor data.
- XSensorDataFormat_t sensor_data_format_
  The enumerated sensor data packing format.

Private Attributes

- int16_t id_dive_
  The dive or cycle number of this message.
- uint16_t id_instrument_
  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_
  The X-message type identifier.
- uint8_t xmsg_index_
  The index of this X-Message.
- uint16_t xmsg_size_bytes_
  The size of the X message, in bytes.

10.69.1 Detailed Description

Class representing a drift pressure time-series X-Message.

10.69.2 Constructor & Destructor Documentation

10.69.2.1 XDriftPressure()

```
util::xmsg::XDriftPressure::XDriftPressure (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

Parameterized constructor.

Parameters

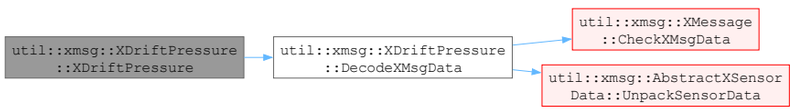
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.69.2.2 ~XDriftPressure()

```
util::xmsg::XDriftPressure::~XDriftPressure ()  [inline]
```

Destructor.

10.69.3 Member Function Documentation

10.69.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

```
void util::xmsg::XDriftPressure::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode the drift pressure X-Message from binary data.

Parameters

in	*data*	The binary data to decode.

Implements util::xmsg::AbstractXSensorData.

References CATCH_BLOCK, util::xmsg::XMessage::CheckXMsgData(), EXC_THROW, util::xmsg::AbstractXSensorData::UnpackSensorD

Here is the caller graph for this function:

10.69.3.6 num_samples()

```
size_t util::xmsg::AbstractXSensorData::num_samples () const  [inline], [inherited]
```

Get the number of samples in this message.

Returns

The number of samples in this message.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

10.69.3.7 raw_sensor_data()

```
const vector< int32_t > & util::xmsg::AbstractXSensorData::raw_sensor_data () const  [inline],
[inherited]
```

Get the raw sensor data vector.

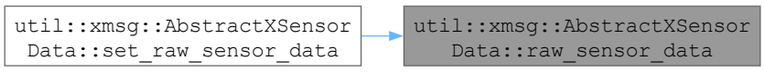
Returns

The raw sensor data vector.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

Referenced by util::xmsg::AbstractXSensorData::set_raw_sensor_data().

Here is the caller graph for this function:



10.69.3.8 Sample()

```
int32_t util::xmsg::AbstractXSensorData::Sample (
            size_t i) const  [inline], [inherited]
```

Get the raw integer value of the i^{th} sample.

Parameters

in	*i*	The index of the sensor value.

Returns

The raw integer value of the i^{th} ith sample.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

10.69.3.9 SampleValue()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValue (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} sensor value in scientific units.

Parameters

in	*i*	The index of the sensor value.
in	*gain*	The sensor sensitivity scale factor.
in	*offs*	The sensor offset.

Returns

The i^{th} sensor value in scientific units.

References CATCH_BLOCK, and util::xmsg::AbstractXSensorData::raw_sensor_data_.

Referenced by util::xmsg::AbstractXSensorData::SampleValueAsPressure(), util::xmsg::AbstractXSensorData::SampleValueAsSalinity(), and util::xmsg::AbstractXSensorData::SampleValueAsTemperature().

10.69.3.10 SampleValueAsPressure()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValueAsPressure (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} pressure sensor value, in dBar.

Parameters

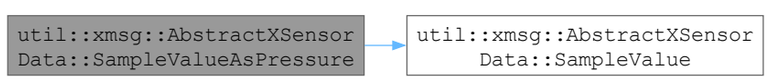
in	*i*	The index of the sensor value.
in	*gain*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*offs*	The pressure sensor offset, in dBar.

Returns

The i^{th} pressure sensor value, in dBar.

References util::xmsg::AbstractXSensorData::SampleValue(), XMSG_SENS_BAD_PRES, and XMSG_SENS_MAX_PRES.

Here is the call graph for this function:



10.69.3.11 SampleValueAsSalinity()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValueAsSalinity (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} salinity sensor value, in PSU.

Parameters

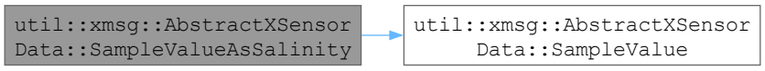
in	*i*	The index of the sensor value.
in	*gain*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*offs*	The salinity sensor offset, in PSU.

Returns

The i^{th} salinity sensor value, in PSU.

References util::xmsg::AbstractXSensorData::SampleValue(), XMSG_SENS_BAD_SALN, and XMSG_SENS_MAX_SALN.

Here is the call graph for this function:



10.69.3.12 SampleValueAsTemperature()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValueAsTemperature (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} temperature sensor value, in degC.

Parameters

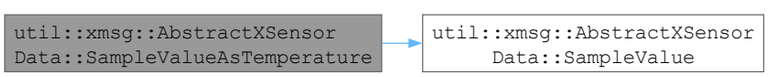
in	*i*	The index of the sensor value.
in	*gain*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*offs*	The temperature sensor offset, in degC.

Returns

The i^{th} temperature sensor value, in degC.

References util::xmsg::AbstractXSensorData::SampleValue(), XMSG_SENS_BAD_TEMP, and XMSG_SENS_MAX_TEMP.

Here is the call graph for this function:



10.69.3.13 sensor_data_format()

```
XSensorDataFormat_t util::xmsg::AbstractXSensorData::sensor_data_format () const  [inline], [inherited]
```

Get the enumerated sensor data format value.

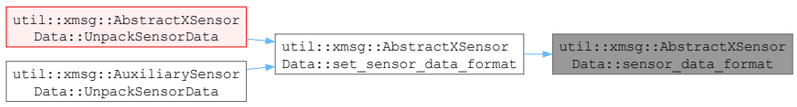
Returns

The enumerated sensor data format value.

References util::xmsg::AbstractXSensorData::sensor_data_format_.

Referenced by util::xmsg::AbstractXSensorData::set_sensor_data_format().

Here is the caller graph for this function:



10.69.3.14 set_id_dive()

```
void util::xmsg::XMessage::set_id_dive (
            int16_t id_dive)  [inline], [protected], [inherited]
```

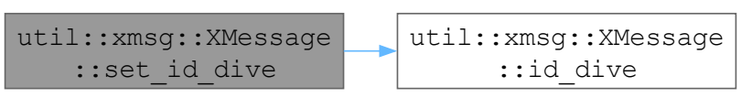
Set the dive or cycle number of this message.

Parameters

in	*id_dive*	The dive or cycle number of this message to set.

References util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::id_dive_.

Here is the call graph for this function:



10.69.3.15 set_id_instrument()

```
void util::xmsg::XMessage::set_id_instrument (
            uint16_t id_instrument)  [inline], [protected], [inherited]
```

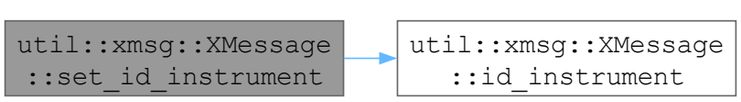
Set the unique instrument identifier.

Parameters

in	*id_instrument*	The unique instrument identifier to set.

References util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::id_instrument_.

Here is the call graph for this function:



10.69.3.16 set_id_xmsg_type()

```
void util::xmsg::XMessage::set_id_xmsg_type (
            XMsgTypeId_t id_xmsg_type)  [inline], [protected], [inherited]
```

Set the X-Message type identifier.

Parameters

in	*id_xmsg_type*	The X-Message type identifier to set.

References util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::id_xmsg_type_.

10.69.3.21 UnpackSensorData()

```
virtual vector< int32_t > util::xmsg::AbstractXSensorData::UnpackSensorData (
            const vector< uint8_t > & data)  [inline], [protected], [virtual], [inherited]
```

Unpack the sensor data from the binary message.

This field unpacks the encoded sensor data from the message and stores the decoded sensor values in raw_sensor_data_. First the function checks the size of the message, and the data packing format. The message data is decoded according to the packing format type. Both first-difference and curvature encoding are supported. The encoding method is determined from the value of the high nibble of byte `data`[1].

Once this function completes successfully, then the data may be recovered in scientific units from the raw sensor values by applying the appropriate sensor gain and offset values.

Parameters

in	*data*	The binary message to unpack, in a vector of unsigned bytes.

Warning

The function assumes the message data is valid. Message validity should be ensured before this function is called.

Exceptions

util::log::MessageException	if • an error occurs while decoding the message, • the message is of insufficient length, or • an invalid packing format is encountered.

Returns

The sensor data raw counts, in a vector of signed integers.

Reimplemented in util::xmsg::AuxiliarySensorData.

References CATCH_BLOCK, CATCH_NOTHROW, EXC_THROW, i24, util::xmsg::XMessage::id_xmsg_type(), ldbg, lwrn, util::xmsg::AbstractXSensorData::raw_sensor_data_, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::AbstractXSensorData::s util::xmsg::XMessageIndexable::set_xmsg_index(), u16, u24, XMSG_SENS_MAX_SUB, util::xmsg::XMSG_TYPE_ID_PRES0, util::xmsg::XMSG_TYPE_ID_PRES_DRIFT8, util::xmsg::XMSG_TYPE_ID_PRES_HI_RES0, util::xmsg::XMSG_TYPE_ID_SALN0, util::xmsg::XMSG_TYPE_ID_SALN_DRIFT8, util::xmsg::XMSG_TYPE_ID_SALN_HI_RES0, util::xmsg::XMSG_TYPE_ID_TEMP0, util::xmsg::XMSG_TYPE_ID_TEMP_DRIFT8, util::xmsg::XMSG_TYPE_ID_TEMP_HI_RES0, util::xmsg::XSENS_FMT_CURVATURE, and util::xmsg::XSENS_FMT_DIFFERENCE.

10.69.4 Member Data Documentation

10.69.4.1 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.69.4.2 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.69.4.3 id_xmsg_type_

XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_ [private], [inherited]

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.69.4.4 raw_sensor_data_

vector<int32_t> util::xmsg::AbstractXSensorData::raw_sensor_data_ [protected], [inherited]

The raw integer counts of the measured sensor data.

This vector of integers represents the "raw" sample values of the message. That is, by applying the appropriate gain and offset corrections, the sensor values may be recovered in scientific units. This data may represent pressure, temperature, salinity, or any other data that is recorded during the drift or profile phases of the dive cycle.

Referenced by util::xmsg::AbstractXSensorData::num_samples(), util::xmsg::AbstractXSensorData::raw_sensor_data(), util::xmsg::AbstractXSensorData::Sample(), util::xmsg::AbstractXSensorData::SampleValue(), util::xmsg::AbstractXSensorData::set_raw_ util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

10.69.4.5 sensor_data_format_

XSensorDataFormat_t util::xmsg::AbstractXSensorData::sensor_data_format_ [protected], [inherited]

The enumerated sensor data packing format.

This field indicates the format of encoded sensor data. The manner in which the sensor data is decoded is determined by the format of this field.

Referenced by util::xmsg::AbstractXSensorData::sensor_data_format(), and util::xmsg::AbstractXSensorData::set_sensor_data_format().

10.69.4.6 xmsg_index_

uint8_t util::xmsg::XMessageIndexable::xmsg_index_ [private], [inherited]

The index of this X-Message.

Referenced by util::xmsg::XMessageIndexable::set_xmsg_index(), and util::xmsg::XMessageIndexable::xmsg_index().

10.69.4.7 xmsg_size_bytes_

uint16_t util::xmsg::XMessage::xmsg_size_bytes_ [private], [inherited]

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

- data/xmsg/XDriftPressure.h

10.70 util::xmsg::XDriftSalinity Class Reference

Class representing a drift salinity time-series X-Message.

`#include <XDriftSalinity.h>`

Get the i^{th} pressure sensor value, in dBar.

- template<typename T = double>
  T SampleValueAsSalinity (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} salinity sensor value, in PSU.
- template<typename T = double>
  T SampleValueAsTemperature (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} temperature sensor value, in degC.
- XSensorDataFormat_t sensor_data_format () const

  Get the enumerated sensor data format value.
- uint8_t xmsg_index () const

  Get the index of this X-Message.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Protected Member Functions

- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_raw_sensor_data (const vector< int32_t > &raw_sensor_data)

  Set raw integer counts of the measured sensor data.
- void set_sensor_data_format (XSensorDataFormat_t sensor_data_format)

  Set the sensor data format.
- void set_xmsg_index (uint8_t xmsg_index)

  Set the index of this X-Message.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.
- virtual vector< int32_t > UnpackSensorData (const vector< uint8_t > &data)

  Unpack the sensor data from the binary message.

Protected Attributes

- bool **aux_channel**
- vector< int32_t > raw_sensor_data_

  The raw integer counts of the measured sensor data.
- XSensorDataFormat_t sensor_data_format_

  The enumerated sensor data packing format.

Private Attributes

- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint8_t xmsg_index_

  The index of this X-Message.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.70.1 Detailed Description

Class representing a drift salinity time-series X-Message.

10.70.2 Constructor & Destructor Documentation

10.70.2.1 XDriftSalinity()

```
util::xmsg::XDriftSalinity::XDriftSalinity (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

The parameterized constructor.

Parameters

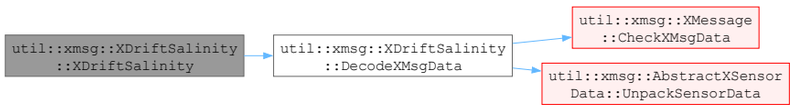
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.70.2.2 ~XDriftSalinity()

```
util::xmsg::XDriftSalinity::~XDriftSalinity ()  [inline]
```

Destructor.

10.70.3 Member Function Documentation

10.70.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

10.70.3.2 DecodeXMsgData()

```
void util::xmsg::XDriftSalinity::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode the drift salinity X-Message from binary data.

Parameters

in	*data*	The binary data to decode.

Implements util::xmsg::AbstractXSensorData.

References CATCH_BLOCK, util::xmsg::XMessage::CheckXMsgData(), EXC_THROW, util::xmsg::AbstractXSensorData::UnpackSensorD

Here is the caller graph for this function:

10.70.3.6 num_samples()

```
size_t util::xmsg::AbstractXSensorData::num_samples () const  [inline], [inherited]
```

Get the number of samples in this message.

Returns

The number of samples in this message.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

10.70.3.7 raw_sensor_data()

```
const vector< int32_t > & util::xmsg::AbstractXSensorData::raw_sensor_data () const  [inline],
[inherited]
```

Get the raw sensor data vector.

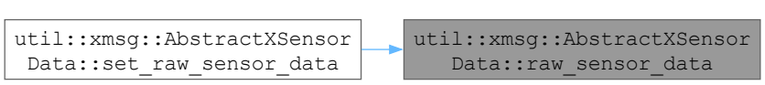
Returns

The raw sensor data vector.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

Referenced by util::xmsg::AbstractXSensorData::set_raw_sensor_data().

Here is the caller graph for this function:



10.70.3.8 Sample()

```
int32_t util::xmsg::AbstractXSensorData::Sample (
            size_t i) const  [inline], [inherited]
```

Get the raw integer value of the i^{th} sample.

Parameters

in	*i*	The index of the sensor value.

Returns

The raw integer value of the i^{th} ith sample.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

10.70.3.9 SampleValue()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValue (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} sensor value in scientific units.

Parameters

in	*i*	The index of the sensor value.
in	*gain*	The sensor sensitivity scale factor.
in	*offs*	The sensor offset.

Returns

The i^{th} sensor value in scientific units.

References CATCH_BLOCK, and util::xmsg::AbstractXSensorData::raw_sensor_data_.

Referenced by util::xmsg::AbstractXSensorData::SampleValueAsPressure(), util::xmsg::AbstractXSensorData::SampleValueAsSalinity(), and util::xmsg::AbstractXSensorData::SampleValueAsTemperature().

10.70.3.10 SampleValueAsPressure()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValueAsPressure (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} pressure sensor value, in dBar.

Parameters

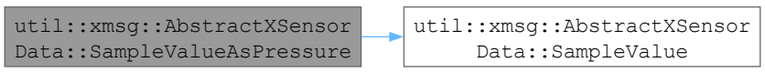
in	*i*	The index of the sensor value.
in	*gain*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*offs*	The pressure sensor offset, in dBar.

Returns

The i^{th} pressure sensor value, in dBar.

References util::xmsg::AbstractXSensorData::SampleValue(), XMSG_SENS_BAD_PRES, and XMSG_SENS_MAX_PRES.

Here is the call graph for this function:



10.70.3.11 SampleValueAsSalinity()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValueAsSalinity (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} salinity sensor value, in PSU.

Parameters

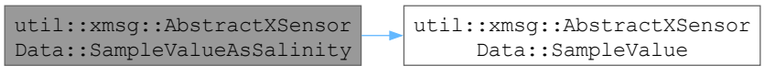
in	*i*	The index of the sensor value.
in	*gain*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*offs*	The salinity sensor offset, in PSU.

Returns

The i^{th} salinity sensor value, in PSU.

References util::xmsg::AbstractXSensorData::SampleValue(), XMSG_SENS_BAD_SALN, and XMSG_SENS_MAX_SALN.

Here is the call graph for this function:



10.70.3.12 SampleValueAsTemperature()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValueAsTemperature (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} temperature sensor value, in degC.

Parameters

in	*i*	The index of the sensor value.
in	*gain*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*offs*	The temperature sensor offset, in degC.

Returns

The i^{th} temperature sensor value, in degC.

References util::xmsg::AbstractXSensorData::SampleValue(), XMSG_SENS_BAD_TEMP, and XMSG_SENS_MAX_TEMP.

Here is the call graph for this function:

10.70.3.13 sensor_data_format()

```
XSensorDataFormat_t util::xmsg::AbstractXSensorData::sensor_data_format () const  [inline], [inherited]
```

Get the enumerated sensor data format value.

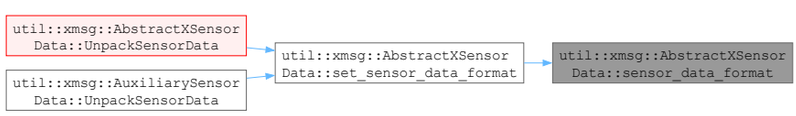
Returns

The enumerated sensor data format value.

References util::xmsg::AbstractXSensorData::sensor_data_format_.

Referenced by util::xmsg::AbstractXSensorData::set_sensor_data_format().

Here is the caller graph for this function:



10.70.3.14 set_id_dive()

```
void util::xmsg::XMessage::set_id_dive (
            int16_t id_dive)  [inline], [protected], [inherited]
```

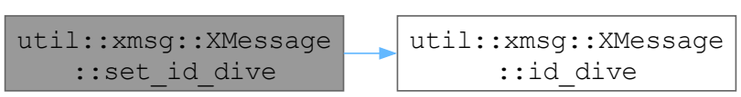
Set the dive or cycle number of this message.

Parameters

in	*id_dive*	The dive or cycle number of this message to set.

References util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::id_dive_.

Here is the call graph for this function:



10.70.3.15 set_id_instrument()

```
void util::xmsg::XMessage::set_id_instrument (
            uint16_t id_instrument)  [inline], [protected], [inherited]
```

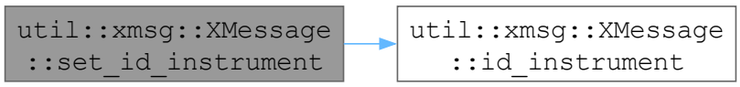
Set the unique instrument identifier.

Parameters

in	*id_instrument*	The unique instrument identifier to set.

References util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::id_instrument_.

Here is the call graph for this function:



10.70.3.16 set_id_xmsg_type()

```
void util::xmsg::XMessage::set_id_xmsg_type (
            XMsgTypeId_t id_xmsg_type)  [inline], [protected], [inherited]
```

Set the X-Message type identifier.

Parameters

in	*id_xmsg_type*	The X-Message type identifier to set.

References util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::id_xmsg_type_.

Here is the caller graph for this function:

10.70.3.21 UnpackSensorData()

```
virtual vector< int32_t > util::xmsg::AbstractXSensorData::UnpackSensorData (
            const vector< uint8_t > & data)  [inline], [protected], [virtual], [inherited]
```

Unpack the sensor data from the binary message.

This field unpacks the encoded sensor data from the message and stores the decoded sensor values in raw_sensor_data_. First the function checks the size of the message, and the data packing format. The message data is decoded according to the packing format type. Both first-difference and curvature encoding are supported. The encoding method is determined from the value of the high nibble of byte `data`[1].

Once this function completes successfully, then the data may be recovered in scientific units from the raw sensor values by applying the appropriate sensor gain and offset values.

Parameters

in	*data*	The binary message to unpack, in a vector of unsigned bytes.

Warning

The function assumes the message data is valid. Message validity should be ensured before this function is called.

Exceptions

util::log::MessageException	if • an error occurs while decoding the message, • the message is of insufficient length, or • an invalid packing format is encountered.

Returns

The sensor data raw counts, in a vector of signed integers.

Reimplemented in util::xmsg::AuxiliarySensorData.

References CATCH_BLOCK, CATCH_NOTHROW, EXC_THROW, i24, util::xmsg::XMessage::id_xmsg_type(), ldbg, lwrn, util::xmsg::AbstractXSensorData::raw_sensor_data_, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::AbstractXSensorData::s util::xmsg::XMessageIndexable::set_xmsg_index(), u16, u24, XMSG_SENS_MAX_SUB, util::xmsg::XMSG_TYPE_ID_PRES0, util::xmsg::XMSG_TYPE_ID_PRES_DRIFT8, util::xmsg::XMSG_TYPE_ID_PRES_HI_RES0, util::xmsg::XMSG_TYPE_ID_SALN0, util::xmsg::XMSG_TYPE_ID_SALN_DRIFT8, util::xmsg::XMSG_TYPE_ID_SALN_HI_RES0, util::xmsg::XMSG_TYPE_ID_TEMP0, util::xmsg::XMSG_TYPE_ID_TEMP_DRIFT8, util::xmsg::XMSG_TYPE_ID_TEMP_HI_RES0, util::xmsg::XSENS_FMT_CURVATURE, and util::xmsg::XSENS_FMT_DIFFERENCE.

10.70.4 Member Data Documentation

10.70.4.1 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.70.4.2 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.70.4.3 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.70.4.4 raw_sensor_data_

```
vector<int32_t> util::xmsg::AbstractXSensorData::raw_sensor_data_  [protected], [inherited]
```

The raw integer counts of the measured sensor data.

This vector of integers represents the "raw" sample values of the message. That is, by applying the appropriate gain and offset corrections, the sensor values may be recovered in scientific units. This data may represent pressure, temperature, salinity, or any other data that is recorded during the drift or profile phases of the dive cycle.

Referenced by util::xmsg::AbstractXSensorData::num_samples(), util::xmsg::AbstractXSensorData::raw_sensor_data(), util::xmsg::AbstractXSensorData::Sample(), util::xmsg::AbstractXSensorData::SampleValue(), util::xmsg::AbstractXSensorData::set_raw_ util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

10.70.4.5 sensor_data_format_

```
XSensorDataFormat_t util::xmsg::AbstractXSensorData::sensor_data_format_  [protected], [inherited]
```

The enumerated sensor data packing format.

This field indicates the format of encoded sensor data. The manner in which the sensor data is decoded is determined by the format of this field.

Referenced by util::xmsg::AbstractXSensorData::sensor_data_format(), and util::xmsg::AbstractXSensorData::set_sensor_data_format().

10.70.4.6 xmsg_index_

```
uint8_t util::xmsg::XMessageIndexable::xmsg_index_  [private], [inherited]
```

The index of this X-Message.

Referenced by util::xmsg::XMessageIndexable::set_xmsg_index(), and util::xmsg::XMessageIndexable::xmsg_index().

10.70.4.7 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

- data/xmsg/XDriftSalinity.h

10.71 util::xmsg::XDriftTemperature Class Reference

Class reprenting a drift temperature X-Message.

`#include <XDriftTemperature.h>`

  T SampleValue (size_t i, int16_t gain, int16_t offs) const
  Get the i^{th} sensor value in scientific units.
- template<typename T = double>
  T SampleValueAsPressure (size_t i, int16_t gain, int16_t offs) const

Get the i^{th} pressure sensor value, in dBar.

- template<typename T = double>
  T SampleValueAsSalinity (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} salinity sensor value, in PSU.
- template<typename T = double>
  T SampleValueAsTemperature (size_t i, int16_t gain, int16_t offs) const

  Get the i^{th} temperature sensor value, in degC.
- XSensorDataFormat_t sensor_data_format () const

  Get the enumerated sensor data format value.
- uint8_t xmsg_index () const

  Get the index of this X-Message.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Protected Member Functions

- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_raw_sensor_data (const vector< int32_t > &raw_sensor_data)

  Set raw integer counts of the measured sensor data.
- void set_sensor_data_format (XSensorDataFormat_t sensor_data_format)

  Set the sensor data format.
- void set_xmsg_index (uint8_t xmsg_index)

  Set the index of this X-Message.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.
- virtual vector< int32_t > UnpackSensorData (const vector< uint8_t > &data)

  Unpack the sensor data from the binary message.

Protected Attributes

- bool **aux_channel**
- vector< int32_t > raw_sensor_data_

  The raw integer counts of the measured sensor data.
- XSensorDataFormat_t sensor_data_format_

  The enumerated sensor data packing format.

Private Attributes

- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint8_t xmsg_index_

  The index of this X-Message.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.71.1 Detailed Description

Class reprenting a drift temperature X-Message.

10.71.2 Constructor & Destructor Documentation

10.71.2.1 XDriftTemperature()

```
util::xmsg::XDriftTemperature::XDriftTemperature (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

The parameterized constructor.

Parameters

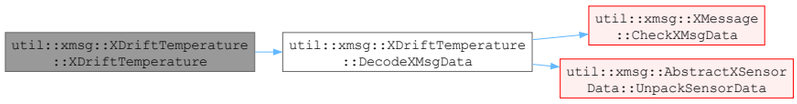
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.71.2.2 ~XDriftTemperature()

```
util::xmsg::XDriftTemperature::~XDriftTemperature ()  [inline]
```

The destructor.

10.71.3 Member Function Documentation

10.71.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

10.71.3.2 DecodeXMsgData()

```
void util::xmsg::XDriftTemperature::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode the drift temperature X-Message from binary data.

Parameters

in	*data*	The binary data to decode.

Implements util::xmsg::AbstractXSensorData.

References CATCH_BLOCK, util::xmsg::XMessage::CheckXMsgData(), EXC_THROW, util::xmsg::AbstractXSensorData::UnpackSensorD

Here is the caller graph for this function:

10.71.3.6 num_samples()

```
size_t util::xmsg::AbstractXSensorData::num_samples () const  [inline], [inherited]
```

Get the number of samples in this message.

Returns

The number of samples in this message.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

10.71.3.7 raw_sensor_data()

```
const vector< int32_t > & util::xmsg::AbstractXSensorData::raw_sensor_data () const  [inline],
[inherited]
```

Get the raw sensor data vector.

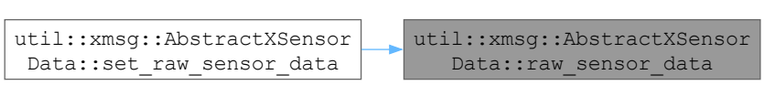
Returns

The raw sensor data vector.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

Referenced by util::xmsg::AbstractXSensorData::set_raw_sensor_data().

Here is the caller graph for this function:



10.71.3.8 Sample()

```
int32_t util::xmsg::AbstractXSensorData::Sample (
            size_t i) const  [inline], [inherited]
```

Get the raw integer value of the i^{th} sample.

Parameters

in	*i*	The index of the sensor value.

Returns

The raw integer value of the i^{th} ith sample.

References util::xmsg::AbstractXSensorData::raw_sensor_data_.

10.71.3.9 SampleValue()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValue (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} sensor value in scientific units.

Parameters

in	*i*	The index of the sensor value.
in	*gain*	The sensor sensitivity scale factor.
in	*offs*	The sensor offset.

Returns

The i^{th} sensor value in scientific units.

References CATCH_BLOCK, and util::xmsg::AbstractXSensorData::raw_sensor_data_.

10.71.3.10 SampleValueAsPressure()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValueAsPressure (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} pressure sensor value, in dBar.

Parameters

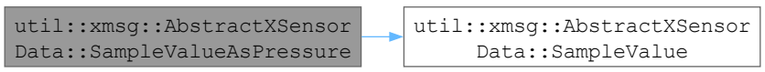
in	*i*	The index of the sensor value.
in	*gain*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*offs*	The pressure sensor offset, in dBar.

Returns

The i^{th} pressure sensor value, in dBar.

References util::xmsg::AbstractXSensorData::SampleValue(), XMSG_SENS_BAD_PRES, and XMSG_SENS_MAX_PRES.

Here is the call graph for this function:



10.71.3.11 SampleValueAsSalinity()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValueAsSalinity (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} salinity sensor value, in PSU.

Parameters

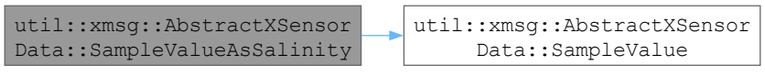
in	*i*	The index of the sensor value.
in	*gain*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*offs*	The salinity sensor offset, in PSU.

Returns

The i^{th} salinity sensor value, in PSU.

References util::xmsg::AbstractXSensorData::SampleValue(), XMSG_SENS_BAD_SALN, and XMSG_SENS_MAX_SALN.

Here is the call graph for this function:



10.71.3.12 SampleValueAsTemperature()

```
template<typename T = double>
T util::xmsg::AbstractXSensorData::SampleValueAsTemperature (
            size_t i,
            int16_t gain,
            int16_t offs) const  [inline], [inherited]
```

Get the i^{th} temperature sensor value, in degC.

Parameters

in	*i*	The index of the sensor value.
in	*gain*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*offs*	The temperature sensor offset, in degC.

Returns

The i^{th} temperature sensor value, in degC.

References util::xmsg::AbstractXSensorData::SampleValue(), XMSG_SENS_BAD_TEMP, and XMSG_SENS_MAX_TEMP.

10.71.3.13 sensor_data_format()

```
XSensorDataFormat_t util::xmsg::AbstractXSensorData::sensor_data_format () const  [inline], [inherited]
```

Get the enumerated sensor data format value.

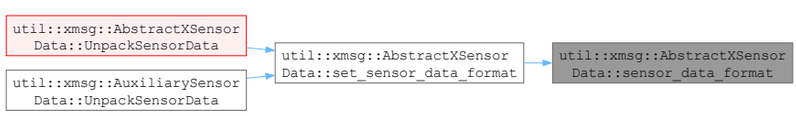
Returns

The enumerated sensor data format value.

References util::xmsg::AbstractXSensorData::sensor_data_format_.

Referenced by util::xmsg::AbstractXSensorData::set_sensor_data_format().

Here is the caller graph for this function:



10.71.3.14 set_id_dive()

```
void util::xmsg::XMessage::set_id_dive (
            int16_t id_dive)  [inline], [protected], [inherited]
```

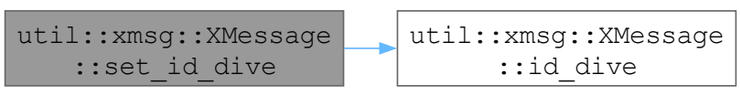
Set the dive or cycle number of this message.

Parameters

in	*id_dive*	The dive or cycle number of this message to set.

References util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::id_dive_.

Here is the call graph for this function:



10.71.3.15 set_id_instrument()

```
void util::xmsg::XMessage::set_id_instrument (
            uint16_t id_instrument)  [inline], [protected], [inherited]
```

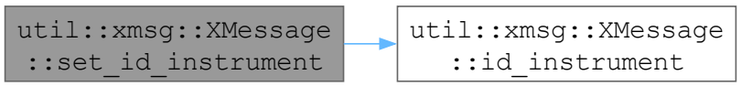
Set the unique instrument identifier.

Parameters

in	*id_instrument*	The unique instrument identifier to set.

References util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::id_instrument_.

Here is the call graph for this function:



10.71.3.16 set_id_xmsg_type()

```
void util::xmsg::XMessage::set_id_xmsg_type (
            XMsgTypeId_t id_xmsg_type)  [inline], [protected], [inherited]
```

Set the X-Message type identifier.

Parameters

in	*id_xmsg_type*	The X-Message type identifier to set.

References util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::id_xmsg_type_.

Here is the caller graph for this function:

10.71.3.21 UnpackSensorData()

```
virtual vector< int32_t > util::xmsg::AbstractXSensorData::UnpackSensorData (
            const vector< uint8_t > & data)  [inline], [protected], [virtual], [inherited]
```

Unpack the sensor data from the binary message.

This field unpacks the encoded sensor data from the message and stores the decoded sensor values in raw_sensor_data_. First the function checks the size of the message, and the data packing format. The message data is decoded according to the packing format type. Both first-difference and curvature encoding are supported. The encoding method is determined from the value of the high nibble of byte `data`[1].

Once this function completes successfully, then the data may be recovered in scientific units from the raw sensor values by applying the appropriate sensor gain and offset values.

Parameters

`in`	*data*	The binary message to unpack, in a vector of unsigned bytes.

Warning

The function assumes the message data is valid. Message validity should be ensured before this function is called.

Exceptions

util::log::MessageException	if • an error occurs while decoding the message, • the message is of insufficient length, or • an invalid packing format is encountered.

Returns

The sensor data raw counts, in a vector of signed integers.

Reimplemented in util::xmsg::AuxiliarySensorData.

References CATCH_BLOCK, CATCH_NOTHROW, EXC_THROW, i24, util::xmsg::XMessage::id_xmsg_type(), ldbg, lwrn, util::xmsg::AbstractXSensorData::raw_sensor_data_, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::AbstractXSensorData::s util::xmsg::XMessageIndexable::set_xmsg_index(), u16, u24, XMSG_SENS_MAX_SUB, util::xmsg::XMSG_TYPE_ID_PRES0, util::xmsg::XMSG_TYPE_ID_PRES_DRIFT8, util::xmsg::XMSG_TYPE_ID_PRES_HI_RES0, util::xmsg::XMSG_TYPE_ID_SALN0, util::xmsg::XMSG_TYPE_ID_SALN_DRIFT8, util::xmsg::XMSG_TYPE_ID_SALN_HI_RES0, util::xmsg::XMSG_TYPE_ID_TEMP0, util::xmsg::XMSG_TYPE_ID_TEMP_DRIFT8, util::xmsg::XMSG_TYPE_ID_TEMP_HI_RES0, util::xmsg::XSENS_FMT_CURVATURE, and util::xmsg::XSENS_FMT_DIFFERENCE.

10.71.4 Member Data Documentation

10.71.4.1 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.71.4.2 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.71.4.3 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.71.4.4 raw_sensor_data_

```
vector<int32_t> util::xmsg::AbstractXSensorData::raw_sensor_data_  [protected], [inherited]
```

The raw integer counts of the measured sensor data.

This vector of integers represents the "raw" sample values of the message. That is, by applying the appropriate gain and offset corrections, the sensor values may be recovered in scientific units. This data may represent pressure, temperature, salinity, or any other data that is recorded during the drift or profile phases of the dive cycle.

Referenced by util::xmsg::AbstractXSensorData::num_samples(), util::xmsg::AbstractXSensorData::raw_sensor_data(), util::xmsg::AbstractXSensorData::Sample(), util::xmsg::AbstractXSensorData::SampleValue(), util::xmsg::AbstractXSensorData::set_raw_ util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

10.71.4.5 sensor_data_format_

```
XSensorDataFormat_t util::xmsg::AbstractXSensorData::sensor_data_format_  [protected], [inherited]
```

The enumerated sensor data packing format.

This field indicates the format of encoded sensor data. The manner in which the sensor data is decoded is determined by the format of this field.

Referenced by util::xmsg::AbstractXSensorData::sensor_data_format(), and util::xmsg::AbstractXSensorData::set_sensor_data_format().

10.71.4.6 xmsg_index_

```
uint8_t util::xmsg::XMessageIndexable::xmsg_index_  [private], [inherited]
```

The index of this X-Message.

Referenced by util::xmsg::XMessageIndexable::set_xmsg_index(), and util::xmsg::XMessageIndexable::xmsg_index().

10.71.4.7 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

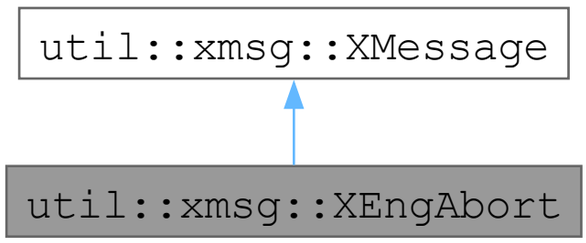
- data/xmsg/XDriftTemperature.h

10.72 util::xmsg::XEngAbort Class Reference

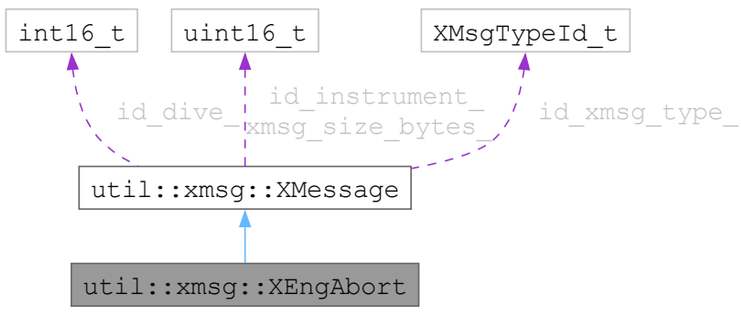
Class representing an abort/beacon mode engineering X-Message.

`#include <XEngAbort.h>`

Inheritance diagram for util::xmsg::XEngAbort:



Collaboration diagram for util::xmsg::XEngAbort:



Public Member Functions

- XEngAbort (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)

  Parameterized constructor.
- ~XEngAbort ()

  Destructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)

  Check the X-message for the correct ID, minimum size, and message terminator.
- void DecodeXMsgData (const vector< uint8_t > &data)

  Decode the abort/beacon mode engineering X-Message from the binary data.
- const string GenerateListingString () const

  Generate a listing string representation of the abort/beacon mode engineering data message.
- int16_t id_dive () const

  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const

  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const

  Get the enumerated X-Message type identifier.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Protected Member Functions

- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.

Private Attributes

- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.72.1 Detailed Description

Class representing an abort/beacon mode engineering X-Message.

10.72.2 Constructor & Destructor Documentation

10.72.2.1 XEngAbort()

```
util::xmsg::XEngAbort::XEngAbort (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

Parameterized constructor.

Parameters

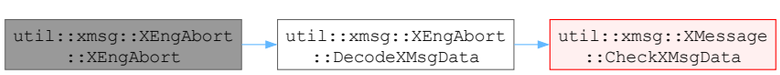
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.72.2.2 ~XEngAbort()

```
util::xmsg::XEngAbort::~XEngAbort ()  [inline]
```

Destructor.

10.72.3 Member Function Documentation

10.72.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::XMessage::set_xmsg_size_byte
u16, and util::xmsg::XMessage::xmsg_size_bytes().

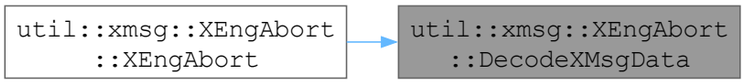
Here is the caller graph for this function:



10.72.3.3 GenerateListingString()

```
const string util::xmsg::XEngAbort::GenerateListingString () const  [inline]
```

Generate a listing string representation of the abort/beacon mode engineering data message.

Returns

A listing string representation of the abort/beacon mode engineering data message.

Todo Implement the functionality for generating a listing string for the Solo-II abort/beacon mode engineering data message.

References CATCH_BLOCK.

10.72.3.4 id_dive()

```
int16_t util::xmsg::XMessage::id_dive () const  [inline], [inherited]
```

Get the dive or cycle number of this X-Message.

Returns

The dive or cycle number of this X-Message.

References util::xmsg::XMessage::id_dive_.

Referenced by util::xmsg::XGPS::DeleteFromDatabase(), util::xmsg::XArgo::GenerateListingString(), util::xmsg::XEngAscent::GenerateLis

10.72.4 Member Data Documentation

10.72.4.1 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.72.4.2 id_instrument_

`uint16_t util::xmsg::XMessage::id_instrument_ [private], [inherited]`

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.72.4.3 id_xmsg_type_

`XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_ [private], [inherited]`

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.72.4.4 xmsg_size_bytes_

`uint16_t util::xmsg::XMessage::xmsg_size_bytes_ [private], [inherited]`

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

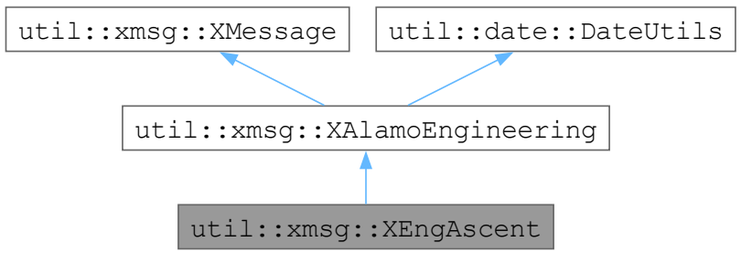
- data/xmsg/XEngAbort.h

10.73 util::xmsg::XEngAscent Class Reference

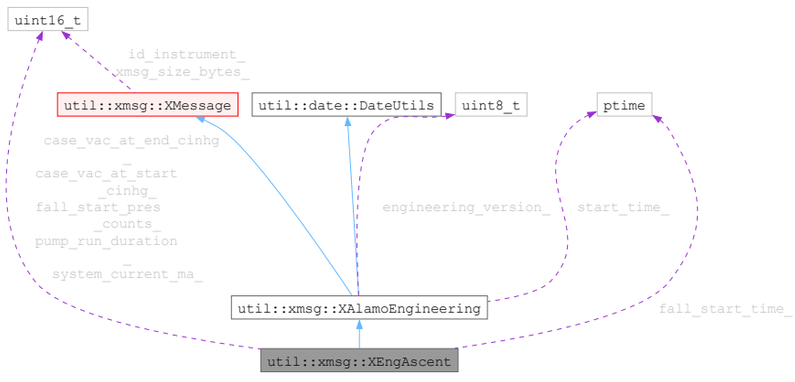
Class representing an ascend state engineering X-Message.

`#include <XEngAscent.h>`

Inheritance diagram for util::xmsg::XEngAscent:



Collaboration diagram for util::xmsg::XEngAscent:



Public Member Functions

- XEngAscent (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)

  Parameterized constructor.
- ~XEngAscent ()

  Destructor.
- uint16_t **case_vac_at_end_cinhg** () const
- template<typename T = float>
  T **case_vac_at_end_inhg** () const
- uint16_t **case_vac_at_start_cinhg** () const
- template<typename T = float>
  T **case_vac_at_start_inhg** () const
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)

  Check the X-message for the correct ID, minimum size, and message terminator.
- void DecodeXMsgData (const vector< uint8_t > &data)

  Decode the ascent state engineering X-Message from the binary data.
- uint8_t engineering_version () const

  Get the engineering message version identifier.
- float engineering_version_as_float () const

  Get the engineering message verion identifier as a floating point number.
- uint16_t **fall_start_pres_counts** () const
- template<typename T = float>
  T **fall_start_pres_dbar** (int16_t gain, int16_t offs) const
- const ptime & **fall_start_time** () const
- const string GenerateListingString (uint16_t pg, uint16_t po, uint16_t sg, uint16_t so, uint16_t tg, uint16_t to) const

  Get the listing entry string for this ascent engineering data X-Message.
- int16_t id_dive () const

  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const

  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const

  Get the enumerated X-Message type identifier.
- uint16_t **pump_run_duration** () const
- const ptime & start_time () const

  Get the engineering message state start time.
- template<typename T = float>
  T system_current_a () const

  Get the system current, in amps.
- uint16_t **system_current_ma** () const
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Static Public Member Functions

- static string GenerateCurrentUtcTimeIso8601String ()

  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- static string GenerateIso8601String (const ptime &p, bool extended=true)

  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)

  Convert a date/time to fractional days since a reference date/time.
- static ptime GetCurrentUtcTime ()

  Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Protected Member Functions

- void **set_case_vac_at_end_cinhg** (uint16_t case_vac_at_end_cinhg)
- void **set_case_vac_at_start_cinhg** (uint16_t case_vac_at_start_cinhg)
- void set_engineering_version (uint8_t engineering_version)

  Set the engineering message version identifier.
- void **set_fall_start_pres_counts** (uint16_t fall_start_pres)
- void **set_fall_start_time** (const ptime &fall_start_time)
- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void **set_pump_run_duration** (uint16_t pump_run_duration)
- void set_start_time (const ptime &start_time)

  Set the engineering message state start time.
- void **set_system_current_ma** (uint16_t system_current_ma)
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.

Private Attributes

- uint16_t case_vac_at_end_cinhg_

  The measured internal pres case vacuum, in 0.01 inHg, at the end of the ascent/profile phase of the dive cycle.
- uint16_t case_vac_at_start_cinhg_

  The measured internal pres case vacuum, in 0.01 inHg, at the start of the ascent/profile phase of the dive cycle.
- uint8_t engineering_version_

  The engineering message version identifier.
- uint16_t **fall_start_pres_counts_**
- ptime **fall_start_time_**
- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint16_t pump_run_duration_

  The cumulative pump run time during the ascent phase of the dive cycle, in seconds.
- ptime start_time_

  The engineering message state start time.
- uint16_t system_current_ma_

  The measured system current, in mA.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.73.1 Detailed Description

Class representing an ascend state engineering X-Message.

Note

This X-Message is only used by ALAMO-type instruments.

This message type was added in X-Message version 2.1.

10.73.2 Constructor & Destructor Documentation

10.73.2.1 XEngAscent()

```
util::xmsg::XEngAscent::XEngAscent (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

Parameterized constructor.

Parameters

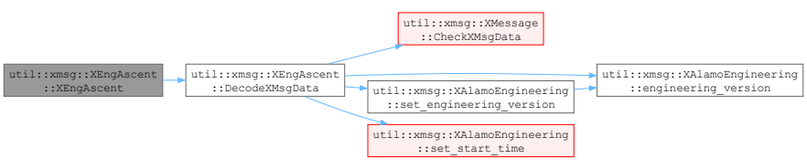
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.73.2.2 ~XEngAscent()

```
util::xmsg::XEngAscent::~XEngAscent ()  [inline]
```

Destructor.

10.73.3 Member Function Documentation

10.73.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

10.73.3.4 engineering_version_as_float()

```
float util::xmsg::XAlamoEngineering::engineering_version_as_float () const  [inline], [inherited]
```

Get the engineering message verion identifier as a floating point number.

Returns

The engineering message verion identifier as a floating point number.

References util::xmsg::XAlamoEngineering::engineering_version_.

10.73.3.5 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

Returns

An ISO8601 format date/time string representation of the current time.

References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the caller graph for this function:

10.73.3.6 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

10.73.3.7 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref↩ _dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.73.3.8 GenerateListingString()

```
const string util::xmsg::XEngAscent::GenerateListingString (
            uint16_t pg,
            uint16_t po,
            uint16_t sg,
            uint16_t so,
            uint16_t tg,
            uint16_t to) const  [inline]
```

Get the listing entry string for this ascent engineering data X-Message.

Parameters

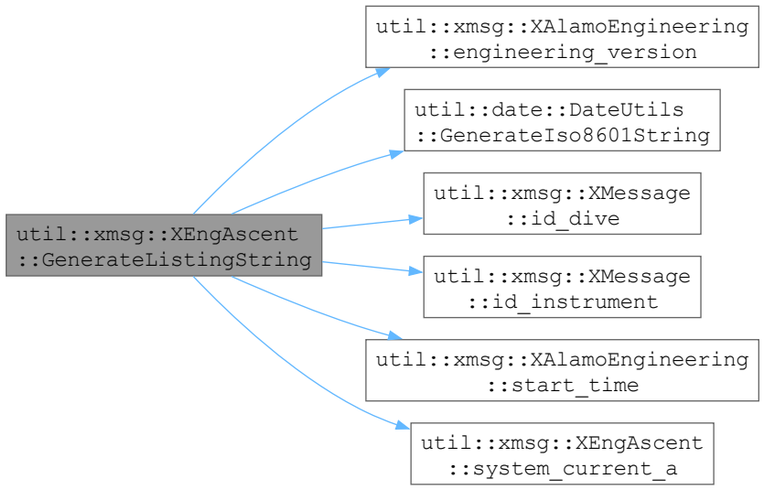
in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*sg*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*so*	The salinity sensor offset, in PSU.
in	*tg*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*to*	The temperature sensor offset, in degC.

Returns

The listing entry string for this ascent engineering data X-Message

References util::xmsg::XAlamoEngineering::engineering_version(), EXC_THROW, util::date::DateUtils::GenerateIso8601String(), util::xmsg::XMessage::id_dive(), util::xmsg::XMessage::id_instrument(), util::xmsg::XAlamoEngineering::start_time(), and system_current_a().

Here is the call graph for this function:



10.73.3.9 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

10.73.4 Member Data Documentation

10.73.4.1 case_vac_at_end_cinhg_

```
uint16_t util::xmsg::XEngAscent::case_vac_at_end_cinhg_  [private]
```

The measured internal pres case vacuum, in 0.01 inHg, at the end of the ascent/profile phase of the dive cycle.

Note

This field was added in version 0x11.

10.73.4.2 case_vac_at_start_cinhg_

```
uint16_t util::xmsg::XEngAscent::case_vac_at_start_cinhg_  [private]
```

The measured internal pres case vacuum, in 0.01 inHg, at the start of the ascent/profile phase of the dive cycle.

Note

This field was added in version 0x11.

10.73.4.3 engineering_version_

```
uint8_t util::xmsg::XAlamoEngineering::engineering_version_  [private], [inherited]
```

The engineering message version identifier.

Referenced by util::xmsg::XAlamoEngineering::engineering_version(), util::xmsg::XAlamoEngineering::engineering_version_as_float(), and util::xmsg::XAlamoEngineering::set_engineering_version().

10.73.4.4 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.73.4.5 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.73.4.6 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.73.4.7 pump_run_duration_

```
uint16_t util::xmsg::XEngAscent::pump_run_duration_  [private]
```

The cumulative pump run time during the ascent phase of the dive cycle, in seconds.

Note

This field is only used for message version 0x10. It was removed in version 0x11.

10.73.4.8 start_time_

```
ptime util::xmsg::XAlamoEngineering::start_time_  [private], [inherited]
```

The engineering message state start time.

Referenced by util::xmsg::XAlamoEngineering::set_start_time(), and util::xmsg::XAlamoEngineering::start_time().

10.73.4.9 system_current_ma_

```
uint16_t util::xmsg::XEngAscent::system_current_ma_  [private]
```

The measured system current, in mA.

Note

This field is only used for message version 0x10. It was removed in version 0x11.

Referenced by system_current_a().

10.73.4.10 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

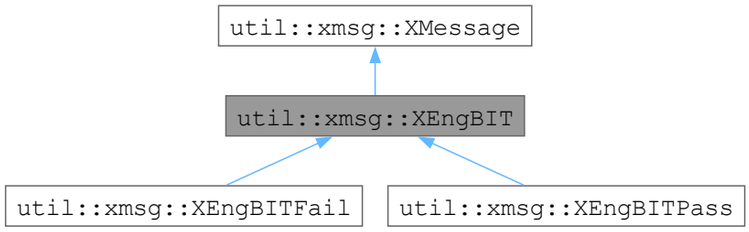
- data/xmsg/XEngAscent.h

10.74 util::xmsg::XEngBIT Class Reference

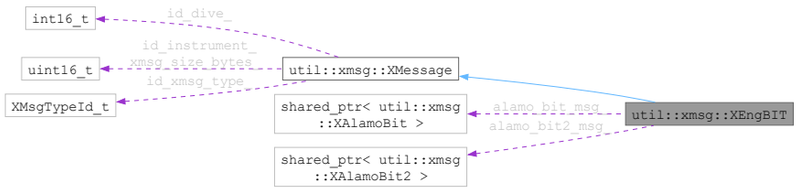
The ALAMO Built-in-Test (BIT) engineering message.

```
#include <XEngBIT.h>
```

Inheritance diagram for util::xmsg::XEngBIT:



Collaboration diagram for util::xmsg::XEngBIT:



Public Member Functions

- XEngBIT (int16_t dive, uint16_t whoi, const vector< uint8_t > data)

  Parameterized constructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)

  Check the X-message for the correct ID, minimum size, and message terminator.
- void DecodeXMsgData (const vector< uint8_t > &data)

  Decode the BIT engineering X-Message from the binary data.
- const string GenerateListingString (uint16_t pg, uint16_t po, uint16_t sg, uint16_t so, uint16_t tg, uint16_t to) const

  Return a listing entry string representation of the BIT engineering X-Message.
- int16_t id_dive () const

  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const

  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const

  Get the enumerated X-Message type identifier.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Protected Member Functions

- void set_alamo_bit2_msg (const shared_ptr< XAlamoBit2 > &alamo_bit2_msg)
  Set the ALAMO Built-in-Test (BIT) v2 message.
- void set_alamo_bit_msg (const shared_ptr< XAlamoBit > &alamo_bit_msg)
  Set the ALALMO Built-in-Test (BIT) v1 message.
- void set_id_dive (int16_t id_dive)
  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)
  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)
  Set the X-Message type identifier.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)
  Set the size of the X-Message, in bytes.

Private Attributes

- shared_ptr< XAlamoBit2 > alamo_bit2_msg_
  A shared pointer to the ALALMO Built-in-Test (BIT) message.
- shared_ptr< XAlamoBit > alamo_bit_msg_
  A shared pointer to the ALALMO Built-in-Test (BIT) message.
- int16_t id_dive_
  The dive or cycle number of this message.
- uint16_t id_instrument_
  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_
  The X-message type identifier.
- uint16_t xmsg_size_bytes_
  The size of the X message, in bytes.

10.74.1 Detailed Description

The ALAMO Built-in-Test (BIT) engineering message.

An instance of this class represents a BIT engineering X-message. Depending on the BIT format in byte 3, the message is decoded as an XAlamoBit (formats 6-8, firmware before 10.x) or an XAlamoBit2 (formats 9-11, firmware 10.x and later).

10.74.2 Constructor & Destructor Documentation

10.74.2.1 XEngBIT()

```
util::xmsg::XEngBIT::XEngBIT (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > data)  [inline]
```

Parameterized constructor.

Parameters

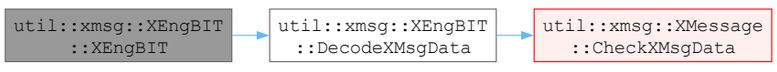
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.74.3 Member Function Documentation

10.74.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

10.74.3.2 DecodeXMsgData()

```
void util::xmsg::XEngBIT::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode the BIT engineering X-Message from the binary data.

Parameters

in	*data*	The binary message to decode.

Exceptions

util::log::MessageException	if an error occurs while decoding.

Implements util::xmsg::XMessage.

References alamo_bit2_msg_, alamo_bit_msg_, CATCH_BLOCK, util::xmsg::XMessage::CheckXMsgData(), and EXC_THROW.

Referenced by XEngBIT().

10.74.3.3 GenerateListingString()

```
const string util::xmsg::XEngBIT::GenerateListingString (
            uint16_t pg,
            uint16_t po,
            uint16_t sg,
            uint16_t so,
            uint16_t tg,
            uint16_t to) const  [inline]
```

Return a listing entry string representation of the BIT engineering X-Message.

Parameters

in	*pg*	The pressure sensor sensitivity (gain) scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*sg*	The salinity sensor sensitivity (gain) scale factor, in LSB/PSU.
in	*so*	The salinity sensor offset, in PSU.
in	*tg*	The temperature sensor sensitivity (gain) scale factor, in LSB/degC.
in	*to*	The temperature sensor offset, in degC.

Exceptions

util::log::MessageException	if an error occurs while generating the listing entry string representation.

Returns

A listing entry string representation of the BIT engineering X-Message.

References alamo_bit2_msg_, alamo_bit_msg_, CATCH_BLOCK, util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::id_instrume

```

Set the X-Message type identifier.

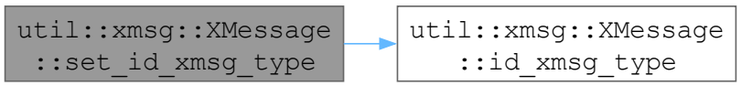
Parameters

in	*id_xmsg_type*	The X-Message type identifier to set.

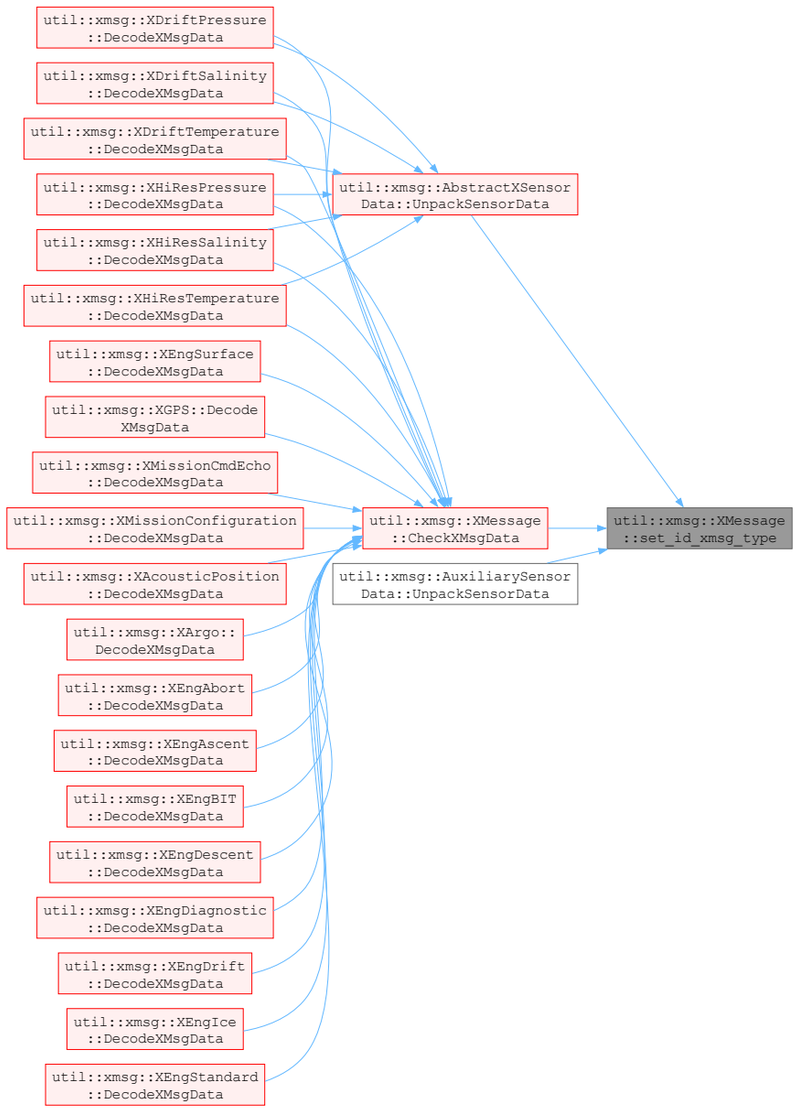
References util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::id_xmsg_type_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

Here is the call graph for this function:



Here is the caller graph for this function:



10.74.3.12 set_xmsg_size_bytes()

```
void util::xmsg::XMessage::set_xmsg_size_bytes (
            uint16_t xmsg_size_bytes)  [inline], [protected], [inherited]
```

Set the size of the X-Message, in bytes.

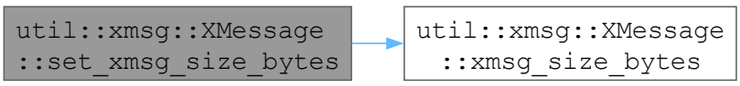
Parameters

in	*xmsg_size_bytes*	The size of the X-Message to set, in bytes.

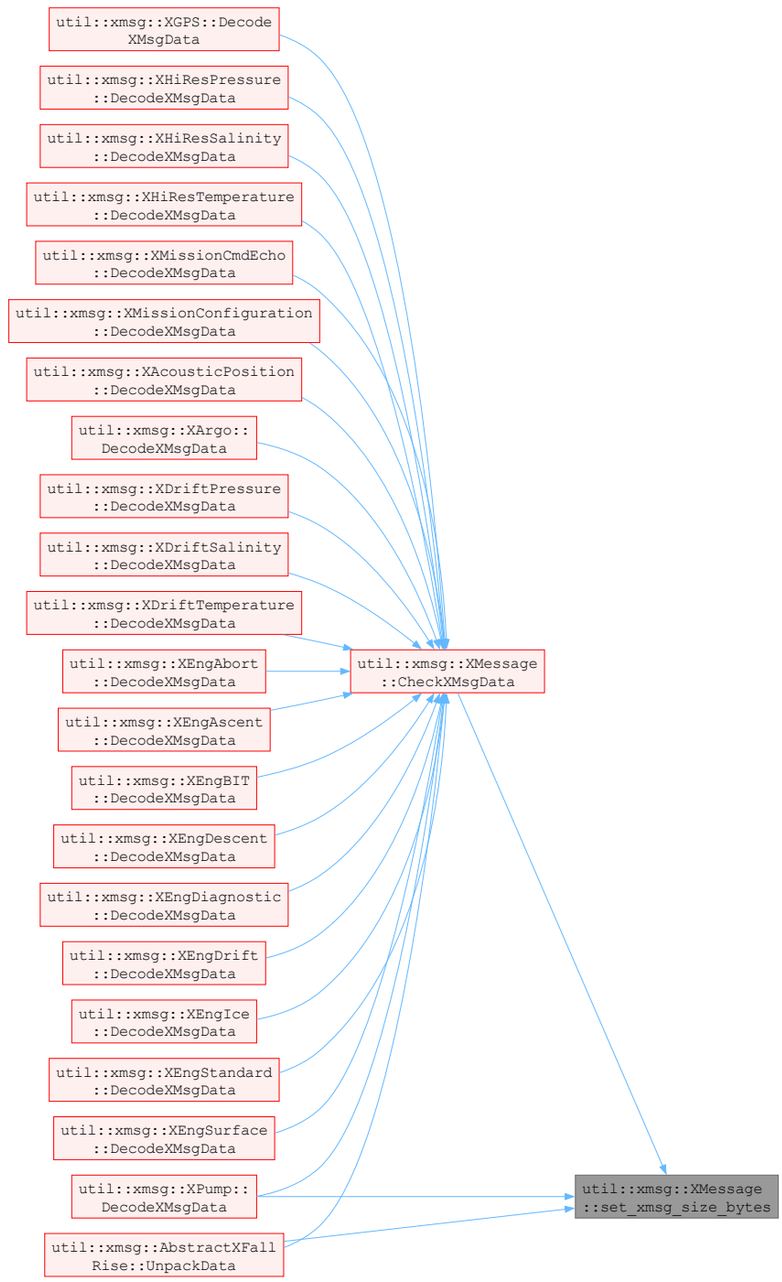
References util::xmsg::XMessage::xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), util::xmsg::XPump::DecodeXMsgData(), and util::xmsg::AbstractXFallRise::Unpa

Here is the call graph for this function:



Here is the caller graph for this function:



10.74.3.13 xmsg_size_bytes()

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes () const  [inline], [inherited]
```

Get the size of the X-Message, in bytes.

Returns

The size of the X-Message, in bytes.

References util::xmsg::XMessage::xmsg_size_bytes_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), util::xmsg::XArgo::DecodeXMsgData(), util::xmsg::XEngDescent::DecodeXMsgI

10.74.4 Member Data Documentation

10.74.4.1 alamo_bit2_msg_

```
shared_ptr<XAlamoBit2> util::xmsg::XEngBIT::alamo_bit2_msg_  [private]
```

A shared pointer to the ALALMO Built-in-Test (BIT) message.

Note

This member is only used for ALAMO-type instruments starting with firmware version 10.x.

Referenced by DecodeXMsgData(), GenerateListingString(), and set_alamo_bit2_msg().

10.74.4.2 alamo_bit_msg_

```
shared_ptr<XAlamoBit> util::xmsg::XEngBIT::alamo_bit_msg_  [private]
```

A shared pointer to the ALALMO Built-in-Test (BIT) message.

Note

This member is only used for ALAMO-type instruments prior to firmware version 10.x.

Referenced by DecodeXMsgData(), GenerateListingString(), and set_alamo_bit_msg().

10.74.4.3 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.74.4.4 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.74.4.5 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.74.4.6 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

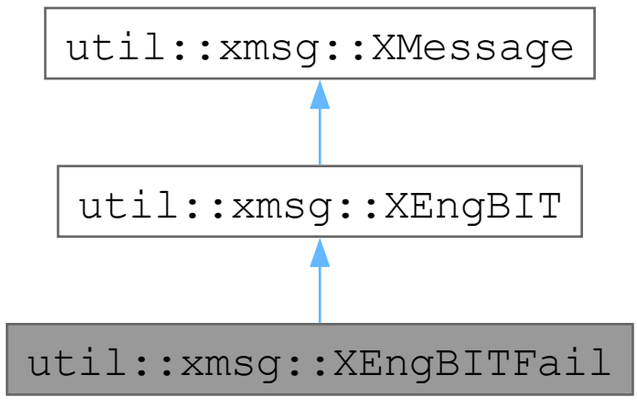
- data/xmsg/XEngBIT.h

10.75 util::xmsg::XEngBITFail Class Reference

Class representing an engineering startup message for BIT failed.

`#include <XEngBITFail.h>`

Inheritance diagram for util::xmsg::XEngBITFail:



Collaboration diagram for util::xmsg::XEngBITFail:

Public Member Functions

- XEngBITFail (int16_t dive, uint16_t whoi, const vector< uint8_t > data)

  Parameterized constructor.
- ~XEngBITFail ()

  The destructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)

  Check the X-message for the correct ID, minimum size, and message terminator.
- void DecodeXMsgData (const vector< uint8_t > &data)

  Decode the BIT engineering X-Message from the binary data.
- const string GenerateListingString (uint16_t pg, uint16_t po, uint16_t sg, uint16_t so, uint16_t tg, uint16_t to) const

  Return a listing entry string representation of the BIT engineering X-Message.
- int16_t id_dive () const

  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const

  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const

  Get the enumerated X-Message type identifier.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Protected Member Functions

- void set_alamo_bit2_msg (const shared_ptr< XAlamoBit2 > &alamo_bit2_msg)
  Set the ALAMO Built-in-Test (BIT) v2 message.
- void set_alamo_bit_msg (const shared_ptr< XAlamoBit > &alamo_bit_msg)
  Set the ALALMO Built-in-Test (BIT) v1 message.
- void set_id_dive (int16_t id_dive)
  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)
  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)
  Set the X-Message type identifier.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)
  Set the size of the X-Message, in bytes.

Private Attributes

- shared_ptr< XAlamoBit2 > alamo_bit2_msg_
  A shared pointer to the ALALMO Built-in-Test (BIT) message.
- shared_ptr< XAlamoBit > alamo_bit_msg_
  A shared pointer to the ALALMO Built-in-Test (BIT) message.
- int16_t id_dive_
  The dive or cycle number of this message.
- uint16_t id_instrument_
  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_
  The X-message type identifier.
- uint16_t xmsg_size_bytes_
  The size of the X message, in bytes.

10.75.1 Detailed Description

Class representing an engineering startup message for BIT failed.

10.75.2 Constructor & Destructor Documentation

10.75.2.1 XEngBITFail()

```
util::xmsg::XEngBITFail::XEngBITFail (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > data)  [inline]
```

Parameterized constructor.

Parameters

in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

10.75.2.2 ~XEngBITFail()

```
util::xmsg::XEngBITFail::~XEngBITFail ()  [inline]
```

The destructor.

10.75.3 Member Function Documentation

10.75.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::XMessage::set_xmsg_size_byte
u16, and util::xmsg::XMessage::xmsg_size_bytes().

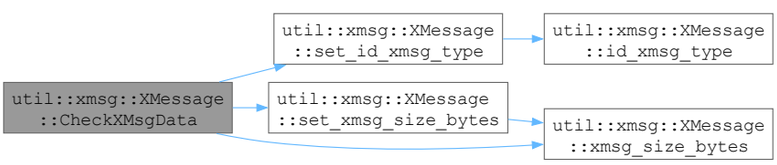
Here is the call graph for this function:



10.75.3.2 DecodeXMsgData()

```
void util::xmsg::XEngBIT::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual], [inherited]
```

Decode the BIT engineering X-Message from the binary data.

Parameters

in	*data*	The binary message to decode.

Exceptions

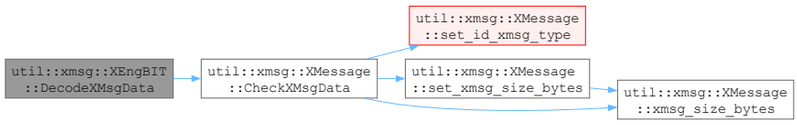
util::log::MessageException	if an error occurs while decoding.

Implements util::xmsg::XMessage.

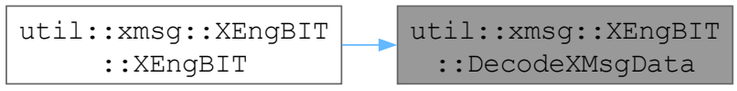
References util::xmsg::XEngBIT::alamo_bit2_msg_, util::xmsg::XEngBIT::alamo_bit_msg_, CATCH_BLOCK, util::xmsg::XMessage::Chec and EXC_THROW.

Referenced by util::xmsg::XEngBIT::XEngBIT().

Here is the call graph for this function:



Here is the caller graph for this function:



10.75.3.3 GenerateListingString()

```
const string util::xmsg::XEngBIT::GenerateListingString (
            uint16_t pg,
            uint16_t po,
            uint16_t sg,
            uint16_t so,
            uint16_t tg,
            uint16_t to) const  [inline], [inherited]
```

Return a listing entry string representation of the BIT engineering X-Message.

Parameters

in	*pg*	The pressure sensor sensitivity (gain) scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*sg*	The salinity sensor sensitivity (gain) scale factor, in LSB/PSU.
in	*so*	The salinity sensor offset, in PSU.
in	*tg*	The temperature sensor sensitivity (gain) scale factor, in LSB/degC.
in	*to*	The temperature sensor offset, in degC.

Exceptions

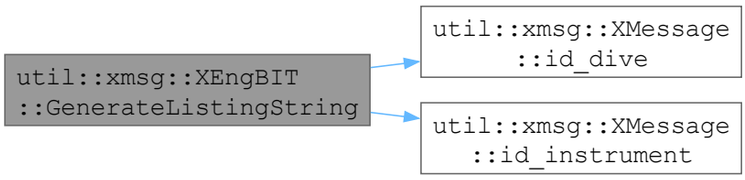
util::log::MessageException	if an error occurs while generating the listing entry string representation.

Returns

A listing entry string representation of the BIT engineering X-Message.

References util::xmsg::XEngBIT::alamo_bit2_msg_, util::xmsg::XEngBIT::alamo_bit_msg_, CATCH_BLOCK, util::xmsg::XMessage::id_div
and util::xmsg::XMessage::id_instrument().

Here is the call graph for this function:



10.75.3.4 id_dive()

```
int16_t util::xmsg::XMessage::id_dive () const  [inline], [inherited]
```

Get the dive or cycle number of this X-Message.

Returns

The dive or cycle number of this X-Message.

References util::xmsg::XMessage::id_dive_.

Referenced by util::xmsg::XGPS::DeleteFromDatabase(), util::xmsg::XArgo::GenerateListingString(), util::xmsg::XEngAscent::GenerateLis

Here is the caller graph for this function:

10.75.3.7 set_alamo_bit2_msg()

```
void util::xmsg::XEngBIT::set_alamo_bit2_msg (
            const shared_ptr< XAlamoBit2 > & alamo_bit2_msg)  [inline], [protected], [inherited]
```

Set the ALAMO Built-in-Test (BIT) v2 message.

Parameters

in	*alamo_bit2_msg*	A shared pointer to the ALAMO Built-in-Test (BIT) v2 message to set.

References util::xmsg::XEngBIT::alamo_bit2_msg_.

10.75.3.8 set_alamo_bit_msg()

```
void util::xmsg::XEngBIT::set_alamo_bit_msg (
            const shared_ptr< XAlamoBit > & alamo_bit_msg)  [inline], [protected], [inherited]
```

Set the ALALMO Built-in-Test (BIT) v1 message.

Parameters

in	*alamo_bit_msg*	A shared pointer to the ALALMO Built-in-Test (BIT) message to set.

References util::xmsg::XEngBIT::alamo_bit_msg_.

10.75.3.9 set_id_dive()

```
void util::xmsg::XMessage::set_id_dive (
            int16_t id_dive)  [inline], [protected], [inherited]
```

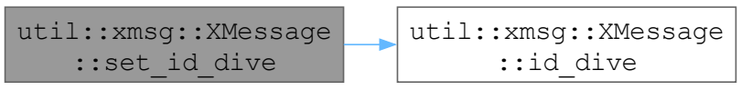
Set the dive or cycle number of this message.

Parameters

in	*id_dive*	The dive or cycle number of this message to set.

References util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::id_dive_.

Here is the call graph for this function:



10.75.3.10 set_id_instrument()

```
void util::xmsg::XMessage::set_id_instrument (
            uint16_t id_instrument)  [inline], [protected], [inherited]
```

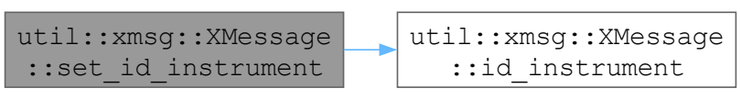
Set the unique instrument identifier.

Parameters

in	*id_instrument*	The unique instrument identifier to set.

References util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::id_instrument_.

Here is the call graph for this function:



10.75.3.11 set_id_xmsg_type()

```
void util::xmsg::XMessage::set_id_xmsg_type (
            XMsgTypeId_t id_xmsg_type)  [inline], [protected], [inherited]
```

Set the X-Message type identifier.

Parameters

in	*id_xmsg_type*	The X-Message type identifier to set.

References util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::id_xmsg_type_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

10.75.4 Member Data Documentation

10.75.4.1 alamo_bit2_msg_

```
shared_ptr<XAlamoBit2> util::xmsg::XEngBIT::alamo_bit2_msg_  [private], [inherited]
```

A shared pointer to the ALALMO Built-in-Test (BIT) message.

Note

This member is only used for ALAMO-type instruments starting with firmware version 10.x.

Referenced by util::xmsg::XEngBIT::DecodeXMsgData(), util::xmsg::XEngBIT::GenerateListingString(), and util::xmsg::XEngBIT::set_alam

10.75.4.2 alamo_bit_msg_

```
shared_ptr<XAlamoBit> util::xmsg::XEngBIT::alamo_bit_msg_  [private], [inherited]
```

A shared pointer to the ALALMO Built-in-Test (BIT) message.

Note

This member is only used for ALAMO-type instruments prior to firmware version 10.x.

Referenced by util::xmsg::XEngBIT::DecodeXMsgData(), util::xmsg::XEngBIT::GenerateListingString(), and util::xmsg::XEngBIT::set_alam

10.75.4.3 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.75.4.4 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.75.4.5 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.75.4.6 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

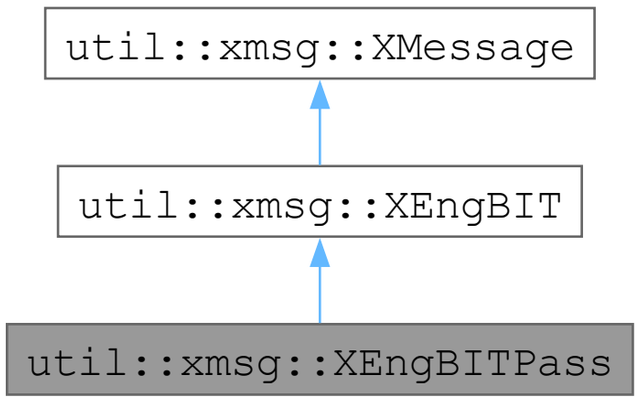
- data/xmsg/XEngBITFail.h

10.76 util::xmsg::XEngBITPass Class Reference

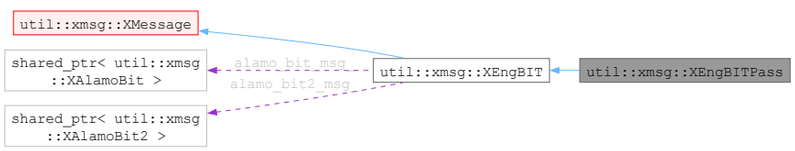
Class representing an engineering startup message for BIT passed.

`#include <XEngBITPass.h>`

Inheritance diagram for util::xmsg::XEngBITPass:



Collaboration diagram for util::xmsg::XEngBITPass:



Public Member Functions

- XEngBITPass (int16_t dive, uint16_t whoi, const vector< uint8_t > data)

  Parameterized constructor.
- ~XEngBITPass ()

  Destructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)

  Check the X-message for the correct ID, minimum size, and message terminator.
- void DecodeXMsgData (const vector< uint8_t > &data)

  Decode the BIT engineering X-Message from the binary data.
- const string GenerateListingString (uint16_t pg, uint16_t po, uint16_t sg, uint16_t so, uint16_t tg, uint16_t to) const

  Return a listing entry string representation of the BIT engineering X-Message.
- int16_t id_dive () const

  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const

  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const

  Get the enumerated X-Message type identifier.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Protected Member Functions

- void set_alamo_bit2_msg (const shared_ptr< XAlamoBit2 > &alamo_bit2_msg)

  Set the ALAMO Built-in-Test (BIT) v2 message.
- void set_alamo_bit_msg (const shared_ptr< XAlamoBit > &alamo_bit_msg)

  Set the ALALMO Built-in-Test (BIT) v1 message.
- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.

Private Attributes

- shared_ptr< XAlamoBit2 > alamo_bit2_msg_

  A shared pointer to the ALALMO Built-in-Test (BIT) message.
- shared_ptr< XAlamoBit > alamo_bit_msg_

  A shared pointer to the ALALMO Built-in-Test (BIT) message.
- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.76.1 Detailed Description

Class representing an engineering startup message for BIT passed.

Todo Add support for Solo-II type bit passed engineering data message.

10.76.2 Constructor & Destructor Documentation

10.76.2.1 XEngBITPass()

```
util::xmsg::XEngBITPass::XEngBITPass (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > data)  [inline]
```

Parameterized constructor.

Parameters

in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

10.76.2.2 ~XEngBITPass()

```
util::xmsg::XEngBITPass::~XEngBITPass ()  [inline]
```

Destructor.

10.76.3 Member Function Documentation

10.76.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

10.76.3.2 DecodeXMsgData()

```
void util::xmsg::XEngBIT::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual], [inherited]
```

Decode the BIT engineering X-Message from the binary data.

Parameters

in	*data*	The binary message to decode.

Exceptions

util::log::MessageException	if an error occurs while decoding.

Implements util::xmsg::XMessage.

References util::xmsg::XEngBIT::alamo_bit2_msg_, util::xmsg::XEngBIT::alamo_bit_msg_, CATCH_BLOCK, util::xmsg::XMessage::Chec and EXC_THROW.

Referenced by util::xmsg::XEngBIT::XEngBIT().

10.76.3.3 GenerateListingString()

```
const string util::xmsg::XEngBIT::GenerateListingString (
            uint16_t pg,
            uint16_t po,
            uint16_t sg,
            uint16_t so,
            uint16_t tg,
            uint16_t to) const  [inline], [inherited]
```

Return a listing entry string representation of the BIT engineering X-Message.

Parameters

in	*pg*	The pressure sensor sensitivity (gain) scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*sg*	The salinity sensor sensitivity (gain) scale factor, in LSB/PSU.
in	*so*	The salinity sensor offset, in PSU.
in	*tg*	The temperature sensor sensitivity (gain) scale factor, in LSB/degC.
in	*to*	The temperature sensor offset, in degC.

Exceptions

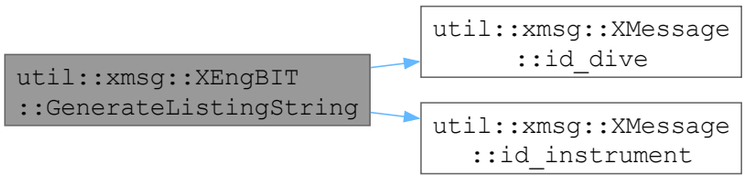
util::log::MessageException	if an error occurs while generating the listing entry string representation.

Returns

A listing entry string representation of the BIT engineering X-Message.

References util::xmsg::XEngBIT::alamo_bit2_msg_, util::xmsg::XEngBIT::alamo_bit_msg_, CATCH_BLOCK, util::xmsg::XMessage::id_div
and util::xmsg::XMessage::id_instrument().

Here is the call graph for this function:



10.76.3.4 id_dive()

```
int16_t util::xmsg::XMessage::id_dive () const  [inline], [inherited]
```

Get the dive or cycle number of this X-Message.

Returns

The dive or cycle number of this X-Message.

References util::xmsg::XMessage::id_dive_.

Referenced by util::xmsg::XGPS::DeleteFromDatabase(), util::xmsg::XArgo::GenerateListingString(), util::xmsg::XEngAscent::GenerateLis

10.76.3.7 set_alamo_bit2_msg()

```
void util::xmsg::XEngBIT::set_alamo_bit2_msg (
            const shared_ptr< XAlamoBit2 > & alamo_bit2_msg)  [inline], [protected], [inherited]
```

Set the ALAMO Built-in-Test (BIT) v2 message.

Parameters

in	*alamo_bit2_msg*	A shared pointer to the ALAMO Built-in-Test (BIT) v2 message to set.

References util::xmsg::XEngBIT::alamo_bit2_msg_.

10.76.3.8 set_alamo_bit_msg()

```
void util::xmsg::XEngBIT::set_alamo_bit_msg (
            const shared_ptr< XAlamoBit > & alamo_bit_msg)  [inline], [protected], [inherited]
```

Set the ALALMO Built-in-Test (BIT) v1 message.

Parameters

in	*alamo_bit_msg*	A shared pointer to the ALALMO Built-in-Test (BIT) message to set.

References util::xmsg::XEngBIT::alamo_bit_msg_.

10.76.3.9 set_id_dive()

```
void util::xmsg::XMessage::set_id_dive (
            int16_t id_dive)  [inline], [protected], [inherited]
```

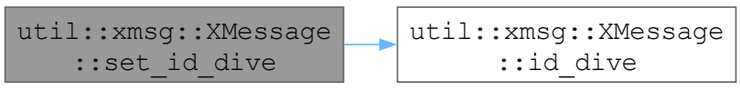
Set the dive or cycle number of this message.

Parameters

in	*id_dive*	The dive or cycle number of this message to set.

References util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::id_dive_.

Here is the call graph for this function:



10.76.3.10 set_id_instrument()

```
void util::xmsg::XMessage::set_id_instrument (
            uint16_t id_instrument)  [inline], [protected], [inherited]
```

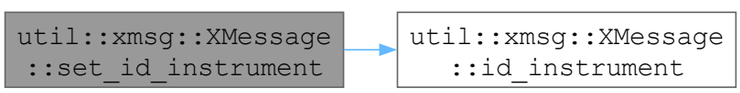
Set the unique instrument identifier.

Parameters

in	*id_instrument*	The unique instrument identifier to set.

References util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::id_instrument_.

Here is the call graph for this function:



10.76.3.11 set_id_xmsg_type()

```

10.76.4 Member Data Documentation

10.76.4.1 alamo_bit2_msg_

```
shared_ptr<XAlamoBit2> util::xmsg::XEngBIT::alamo_bit2_msg_  [private], [inherited]
```

A shared pointer to the ALALMO Built-in-Test (BIT) message.

Note

This member is only used for ALAMO-type instruments starting with firmware version 10.x.

Referenced by util::xmsg::XEngBIT::DecodeXMsgData(), util::xmsg::XEngBIT::GenerateListingString(), and util::xmsg::XEngBIT::set_alam

10.76.4.2 alamo_bit_msg_

```
shared_ptr<XAlamoBit> util::xmsg::XEngBIT::alamo_bit_msg_  [private], [inherited]
```

A shared pointer to the ALALMO Built-in-Test (BIT) message.

Note

This member is only used for ALAMO-type instruments prior to firmware version 10.x.

Referenced by util::xmsg::XEngBIT::DecodeXMsgData(), util::xmsg::XEngBIT::GenerateListingString(), and util::xmsg::XEngBIT::set_alam

10.76.4.3 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.76.4.4 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.76.4.5 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.76.4.6 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

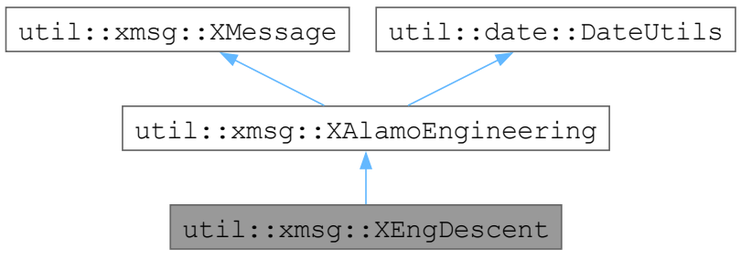
- data/xmsg/XEngBITPass.h

10.77 util::xmsg::XEngDescent Class Reference

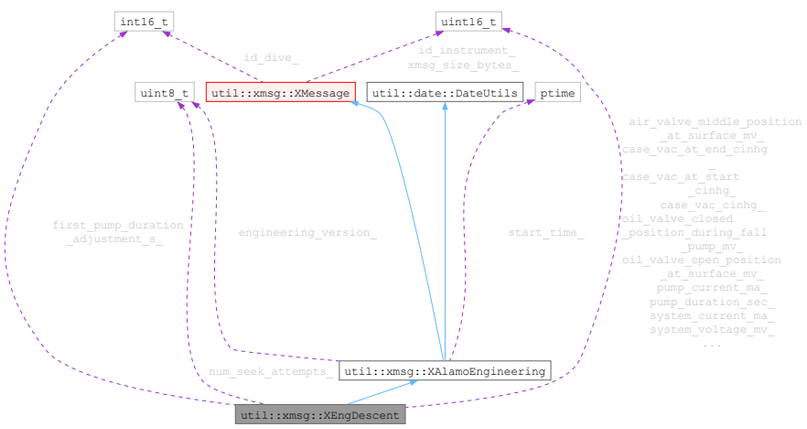
Class representing an descend state engineering X-Message.

`#include <XEngDescent.h>`

Inheritance diagram for util::xmsg::XEngDescent:



Collaboration diagram for util::xmsg::XEngDescent:



Public Member Functions

- XEngDescent (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)

  The parameterized constructor.
- ~XEngDescent ()

  The destructor.
- uint16_t **air_valve_middle_position_at_surface_mv** () const
- template<typename T = float>
  T **air_valve_middle_position_at_surface_v** () const
- uint16_t **case_vac_at_end_cinhg** () const
- template<typename T = float>

- template<typename T = float>
  T **oil_valve_open_position_at_surface_v** () const
- template<typename T = float>
  T pump_current_a () const

  Get the measured pump current, in amperes.
- uint16_t **pump_current_ma** () const
- uint16_t **pump_duration_sec** () const
- const ptime & start_time () const

  Get the engineering message state start time.
- template<typename T = float>
  T system_current_a () const

  Get the measured system current, in amperes.
- uint16_t **system_current_ma** () const
- uint16_t **system_voltage_mv** () const
- template<typename T = float>
  T system_voltage_v () const

  Get the measured system voltage, in volts.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Static Public Member Functions

- static string GenerateCurrentUtcTimeIso8601String ()

  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- static string GenerateIso8601String (const ptime &p, bool extended=true)

  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)

  Convert a date/time to fractional days since a reference date/time.
- static ptime GetCurrentUtcTime ()

  Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Protected Member Functions

- void **set_air_valve_middle_position_at_surface_mv** (uint16_t air_valve_middle_position_at_surface_mv)

- void **set_case_vac_cinhg** (uint16_t case_vac_cinhg)
- void set_engineering_version (uint8_t engineering_version)

  Set the engineering message version identifier.
- void **set_first_pump_duration_adjustment_s** (int16_t first_pump_duration_adjustment_s)
- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void **set_num_seek_attempts** (uint8_t num_seek_attempts)

- void **set_oil_valve_closed_position_during_fall_pump_mv** (uint16_t oil_valve_closed_position_during_fall↩ _pump_mv)
- void **set_oil_valve_open_position_at_surface_mv** (uint16_t oil_valve_open_position_at_surface_mv)
- void **set_pump_current_ma** (uint16_t pump_current_ma)
- void **set_pump_duration_sec** (uint16_t pump_duration_sec)
- void set_start_time (const ptime &start_time)

  Set the engineering message state start time.
- void **set_system_current_ma** (uint16_t system_current_ma)
- void **set_system_voltage_mv** (uint16_t system_voltage_mv)
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.

Private Attributes

- uint16_t air_valve_middle_position_at_surface_mv_

  The air valve middle position at surface, in .001 V.
- uint16_t case_vac_at_end_cinhg_

  The measured internal pressure case vacuum, in 0.01 inHg, at the end of the descent-to-drift/park-pressure phase of the dive cycle.
- uint16_t case_vac_at_start_cinhg_

  The measured internal pressure case vacuum, in 0.01 inHg, at the start of the descent-to-drift/park-pressure phase of the dive cycle.
- uint16_t case_vac_cinhg_

  The measured internal pressure case vacuum, in 0.01 inHg.
- uint8_t engineering_version_

  The engineering message version identifier.
- int16_t first_pump_duration_adjustment_s_

  The the first-pump run time adjustment, in seconds.
- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint8_t num_seek_attempts_

  The number of seek attempts.
- uint16_t oil_valve_closed_position_during_fall_pump_mv_

  The oil valve closed position during fall pump, in .001 V.
- uint16_t oil_valve_open_position_at_surface_mv_

  The oil valve open position at surface, in .001 V.
- uint16_t pump_current_ma_

  The measured pump current, in milliamps.
- uint16_t pump_duration_sec_

  The cumulative pump run time for the descent state of the dive cycle, in seconds.
- ptime start_time_

  The engineering message state start time.
- uint16_t system_current_ma_

  The measured system current, in milliamps.
- uint16_t system_voltage_mv_

  The measured system current, in millivolts.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.77.1 Detailed Description

Class representing an descend state engineering X-Message.

Note

This X-Message is only used by ALAMO-type instruments.

This message type was added in X-Message version 2.1.

10.77.2 Constructor & Destructor Documentation

10.77.2.1 XEngDescent()

```
util::xmsg::XEngDescent::XEngDescent (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

The parameterized constructor.

Parameters

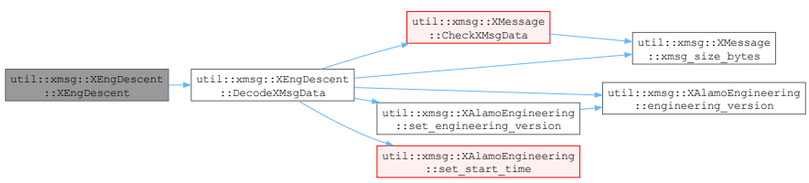
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.77.2.2 ~XEngDescent()

```
util::xmsg::XEngDescent::~XEngDescent ()  [inline]
```

The destructor.

10.77.3 Member Function Documentation

10.77.3.1 case_vac_inhg()

```
template<typename T = float>
T util::xmsg::XEngDescent::case_vac_inhg () const  [inline]
```

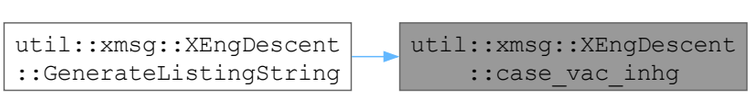
Get the measured pressure case vacuum, in inches of mercury.

Returns

The measured pressure case vacuum, in inches of mercury.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.77.3.2 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::XMessage::set_xmsg_size_byte
u16, and util::xmsg::XMessage::xmsg_size_bytes().

10.77.3.3 DecodeXMsgData()

```
void util::xmsg::XEngDescent::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode the descent state engineering X-Message from the binary data.

Parameters

in	*data*	The binary message to decode.

Implements util::xmsg::XMessage.

References CATCH_BLOCK, util::xmsg::XMessage::CheckXMsgData(), util::xmsg::XAlamoEngineering::engineering_version(), EXC_THROW, i16, s2000, util::xmsg::XAlamoEngineering::set_engineering_version(), util::xmsg::XAlamoEngineering::set_start_time(), u08, u16, and util::xmsg::XMessage::xmsg_size_bytes().

Referenced by XEngDescent().

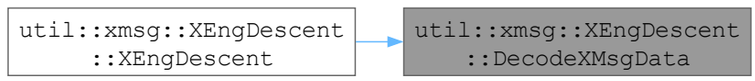
Here is the caller graph for this function:



10.77.3.4 engineering_version()

```
uint8_t util::xmsg::XAlamoEngineering::engineering_version () const  [inline], [inherited]
```

Get the engineering message version identifier.

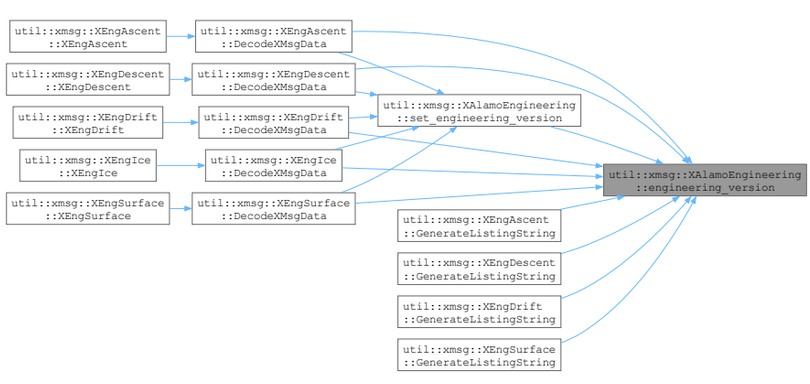
Returns

The engineering message version identifier.

References util::xmsg::XAlamoEngineering::engineering_version_.

Referenced by util::xmsg::XEngAscent::DecodeXMsgData(), DecodeXMsgData(), util::xmsg::XEngDrift::DecodeXMsgData(), util::xmsg::XEngIce::DecodeXMsgData(), util::xmsg::XEngSurface::DecodeXMsgData(), util::xmsg::XEngAscent::GenerateListingString(), GenerateListingString(), util::xmsg::XEngDrift::GenerateListingString(), util::xmsg::XEngSurface::GenerateListingString(), and util::xmsg::XAlamoEngineering::set_engineering_version().

Here is the caller graph for this function:



10.77.3.5 engineering_version_as_float()

```
float util::xmsg::XAlamoEngineering::engineering_version_as_float () const  [inline], [inherited]
```

Get the engineering message verion identifier as a floating point number.

Returns

The engineering message verion identifier as a floating point number.

References util::xmsg::XAlamoEngineering::engineering_version_.

10.77.3.6 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

Returns

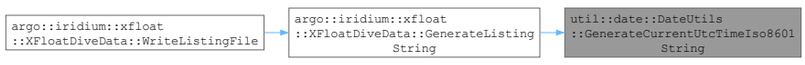
An ISO8601 format date/time string representation of the current time.

References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:

Here is the caller graph for this function:



10.77.3.7 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

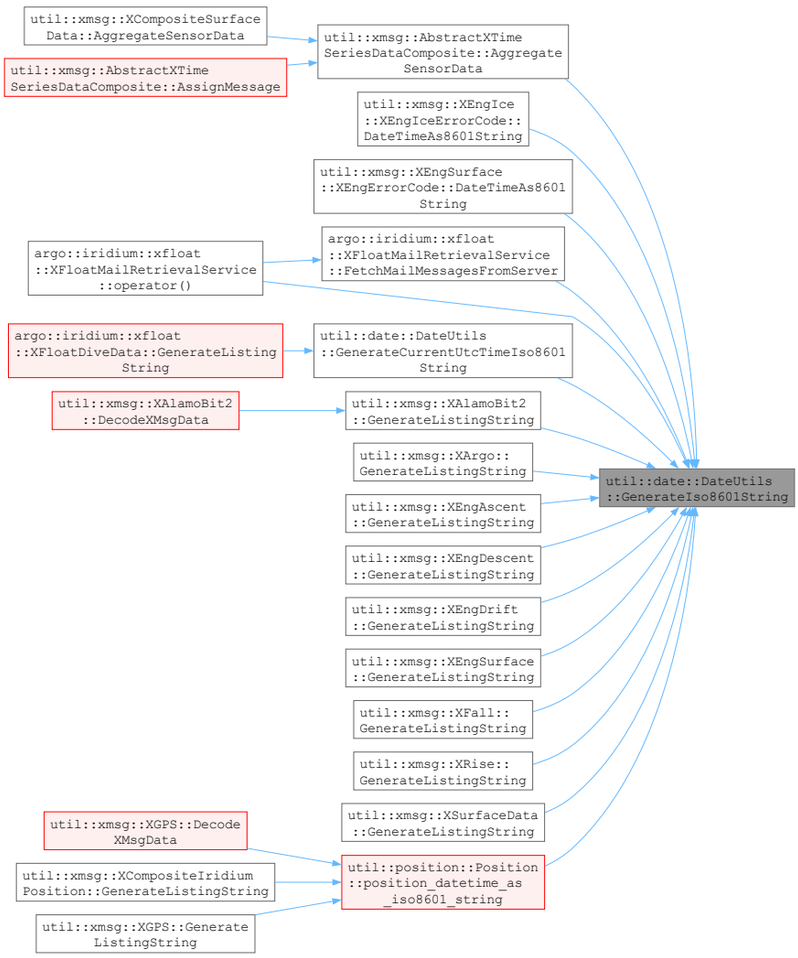
in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), util::xmsg::XEngIce::XEngIce util::xmsg::XEngSurface::XEngErrorCode::DateTimeAs8601String(), argo::iridium::xfloat::XFloatMailRetrievalService::FetchMailMessages util::date::DateUtils::GenerateCurrentUtcTimeIso8601String(), util::xmsg::XAlamoBit2::GenerateListingString(), util::xmsg::XArgo::Genera util::xmsg::XEngAscent::GenerateListingString(), GenerateListingString(), util::xmsg::XEngDrift::GenerateListingString(), util::xmsg::XEngSurface::GenerateListingString(), util::xmsg::XFall::GenerateListingString(), util::xmsg::XRise::GenerateListingString(), util::xmsg::XSurfaceData::GenerateListingString(), argo::iridium::xfloat::XFloatMailRetrievalService::operator()(), and util::position::Position::position_datetime_as_iso8601_string().

Here is the caller graph for this function:



10.77.3.8 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref↩ _dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.77.3.9 GenerateListingString()

```
const string util::xmsg::XEngDescent::GenerateListingString () const  [inline]
```

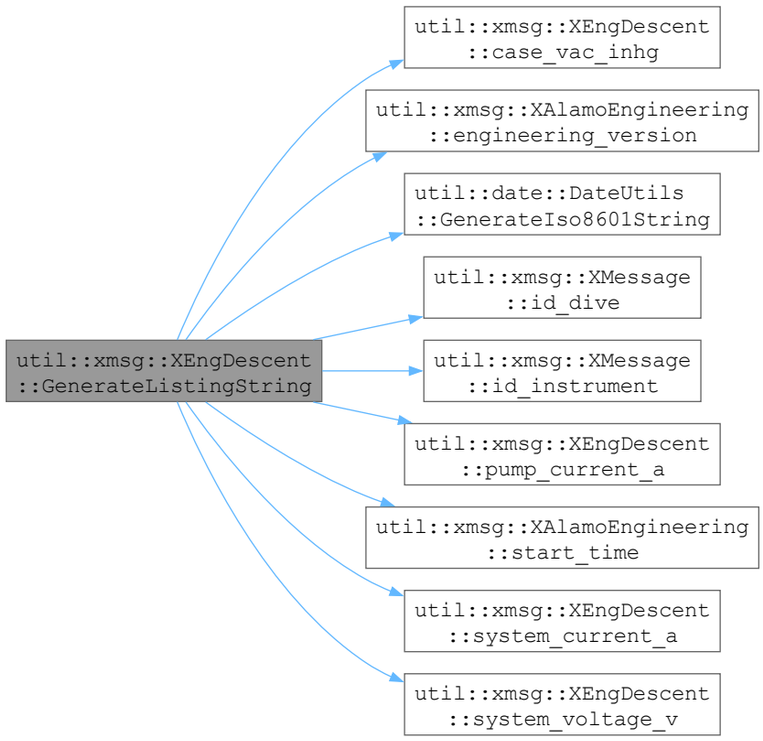
Get the listing entry string for this descent engineering data X-Message.

Returns

The listing entry string for this descent engineering data X-Message

References case_vac_inhg(), CATCH_BLOCK, util::xmsg::XAlamoEngineering::engineering_version(), EXC_THROW, util::date::DateUtils::GenerateIso8601String(), util::xmsg::XMessage::id_dive(), util::xmsg::XMessage::id_instrument(), pump_current_a(), util::xmsg::XAlamoEngineering::start_time(), system_current_a(), and system_voltage_v().

Here is the call graph for this function:



10.77.3.10 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

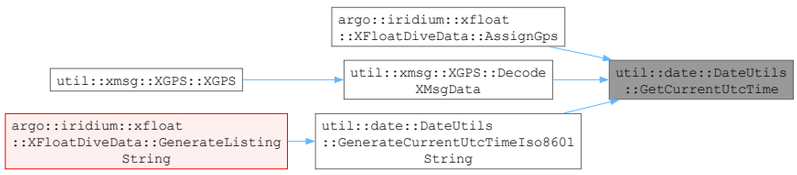
Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

Here is the caller graph for this function:



10.77.3.11 id_dive()

```
int16_t util::xmsg::XMessage::id_dive () const  [inline], [inherited]
```

Get the dive or cycle number of this X-Message.

Returns

The dive or cycle number of this X-Message.

References util::xmsg::XMessage::id_dive_.

Referenced by util::xmsg::XGPS::DeleteFromDatabase(), util::xmsg::XArgo::GenerateListingString(), util::xmsg::XEngAscent::GenerateLis

10.77.4 Member Data Documentation

10.77.4.1 air_valve_middle_position_at_surface_mv_

```
uint16_t util::xmsg::XEngDescent::air_valve_middle_position_at_surface_mv_  [private]
```

The air valve middle position at surface, in .001 V.

Note

This field was added in version 0x11.

10.77.4.2 case_vac_at_end_cinhg_

```
uint16_t util::xmsg::XEngDescent::case_vac_at_end_cinhg_  [private]
```

The measured internal pressure case vacuum, in 0.01 inHg, at the end of the descent-to-drift/park-pressure phase of the dive cycle.

Note

This field was added in version 0x11.

10.77.4.3 case_vac_at_start_cinhg_

```
uint16_t util::xmsg::XEngDescent::case_vac_at_start_cinhg_  [private]
```

The measured internal pressure case vacuum, in 0.01 inHg, at the start of the descent-to-drift/park-pressure phase of the dive cycle.

Note

This field was added in version 0x11.

10.77.4.4 case_vac_cinhg_

```
uint16_t util::xmsg::XEngDescent::case_vac_cinhg_  [private]
```

The measured internal pressure case vacuum, in 0.01 inHg.

Note

This field is only used for message version 0x10. It was removed in version 0x11.

10.77.4.5 engineering_version_

```
uint8_t util::xmsg::XAlamoEngineering::engineering_version_  [private], [inherited]
```

The engineering message version identifier.

Referenced by util::xmsg::XAlamoEngineering::engineering_version(), util::xmsg::XAlamoEngineering::engineering_version_as_float(), and util::xmsg::XAlamoEngineering::set_engineering_version().

10.77.4.6 first_pump_duration_adjustment_s_

```
int16_t util::xmsg::XEngDescent::first_pump_duration_adjustment_s_  [private]
```

The the first-pump run time adjustment, in seconds.

10.77.4.7 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.77.4.8 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.77.4.9 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.77.4.10 num_seek_attempts_

```
uint8_t util::xmsg::XEngDescent::num_seek_attempts_  [private]
```

The number of seek attempts.

10.77.4.11 oil_valve_closed_position_during_fall_pump_mv_

```
uint16_t util::xmsg::XEngDescent::oil_valve_closed_position_during_fall_pump_mv_  [private]
```

The oil valve closed position during fall pump, in .001 V.

Todo Clarify the description of the "oil valve position during fall pump" field.

Note

This field was added in version 0x11.

10.77.4.12 oil_valve_open_position_at_surface_mv_

```
uint16_t util::xmsg::XEngDescent::oil_valve_open_position_at_surface_mv_  [private]
```

The oil valve open position at surface, in .001 V.

Note

This field was added in version 0x11.

10.77.4.13 pump_current_ma_

```
uint16_t util::xmsg::XEngDescent::pump_current_ma_  [private]
```

The measured pump current, in milliamps.

Note

This field is only used for message version 0x10. It was removed in version 0x11.

Referenced by pump_current_a().

10.77.4.14 pump_duration_sec_

```
uint16_t util::xmsg::XEngDescent::pump_duration_sec_  [private]
```

The cumulative pump run time for the descent state of the dive cycle, in seconds.

Note

This field is only used for message version 0x10. It was removed in version 0x11.

10.77.4.15 start_time_

```
ptime util::xmsg::XAlamoEngineering::start_time_  [private], [inherited]
```

The engineering message state start time.

Referenced by util::xmsg::XAlamoEngineering::set_start_time(), and util::xmsg::XAlamoEngineering::start_time().

10.77.4.16 system_current_ma_

```
uint16_t util::xmsg::XEngDescent::system_current_ma_  [private]
```

The measured system current, in milliamps.

Note

This field is only used for message version 0x10. It was removed in version 0x11.

Referenced by system_current_a().

10.77.4.17 system_voltage_mv_

```
uint16_t util::xmsg::XEngDescent::system_voltage_mv_  [private]
```

The measured system current, in millivolts.

Note

This field is only used for message version 0x10. It was removed in version 0x11.

Referenced by system_voltage_v().

10.77.4.18 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

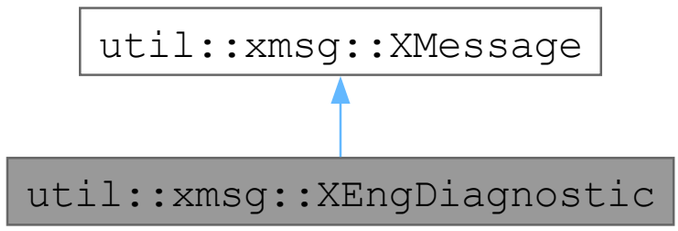
- data/xmsg/XEngDescent.h

10.78 util::xmsg::XEngDiagnostic Class Reference

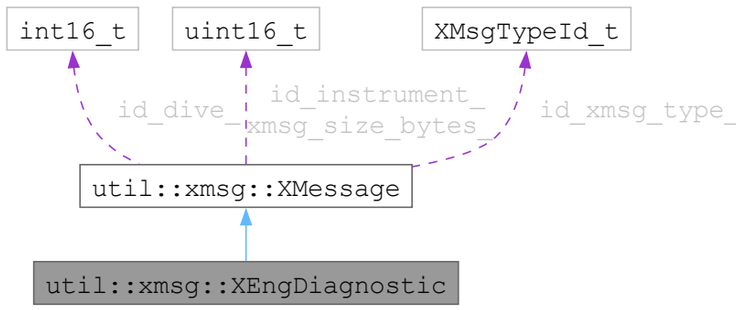
Class representing a diagnostic dive engineering message.

`#include <XEngDiagnostic.h>`

Inheritance diagram for util::xmsg::XEngDiagnostic:



Collaboration diagram for util::xmsg::XEngDiagnostic:



Public Member Functions

- XEngDiagnostic (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)
  Parameterized constructor.
- ~XEngDiagnostic ()
  Destructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)
  Check the X-message for the correct ID, minimum size, and message terminator.
- void DecodeXMsgData (const vector< uint8_t > &data)
  Decode the diagnostic dive engineering X-Message from the binary data.
- const string GenerateListingString () const
  Generate a listing string representation of the diagnostic dive engineering data message.
- int16_t id_dive () const
  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const
  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const
  Get the enumerated X-Message type identifier.
- uint16_t xmsg_size_bytes () const
  Get the size of the X-Message, in bytes.

Protected Member Functions

- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.

Private Attributes

- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.78.1 Detailed Description

Class representing a diagnostic dive engineering message.

10.78.2 Constructor & Destructor Documentation

10.78.2.1 XEngDiagnostic()

```
util::xmsg::XEngDiagnostic::XEngDiagnostic (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

Parameterized constructor.

Parameters

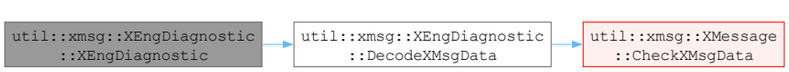
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.78.2.2 ~XEngDiagnostic()

```
util::xmsg::XEngDiagnostic::~XEngDiagnostic ()  [inline]
```

Destructor.

10.78.3 Member Function Documentation

10.78.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

10.78.3.2 DecodeXMsgData()

```
void util::xmsg::XEngDiagnostic::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode the diagnostic dive engineering X-Message from the binary data.

Parameters

in	*data*	The binary message to decode.

Todo Implement the functionality for decoding the Solo-II diagnostic engineering data message.

Implements util::xmsg::XMessage.

References CATCH_BLOCK, util::xmsg::XMessage::CheckXMsgData(), and util::xmsg::XMSG_TYPE_ID_ENG_DIAGNOSTIC.

10.78.3.3 GenerateListingString()

```
const string util::xmsg::XEngDiagnostic::GenerateListingString () const  [inline]
```

Generate a listing string representation of the diagnostic dive engineering data message.

Returns

A listing string representation of the diagnostic dive engineering data message.

Todo Implement the functionality for generating a listing string for the Solo-II diagnostic engineering data message.

References CATCH_BLOCK.

10.78.3.4 id_dive()

```
int16_t util::xmsg::XMessage::id_dive () const  [inline], [inherited]
```

Get the dive or cycle number of this X-Message.

Returns

The dive or cycle number of this X-Message.

References util::xmsg::XMessage::id_dive_.

10.78.4 Member Data Documentation

10.78.4.1 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.78.4.2 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.78.4.3 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.78.4.4 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

- data/xmsg/XEngDiagnostic.h

10.79 util::xmsg::XEngDrift Class Reference

Class representing an drift/park state engineering X-Message.

```
#include <XEngDrift.h>
```

- void **set_case_vac_at_start_cinhg** (uint16_t case_vac_at_start_cinhg)
- void set_engineering_version (uint8_t engineering_version)

  Set the engineering message version identifier.
- void **set_first_pump_duration_adjustment_s** (int16_t first_pump_duration_adjustment_s)
- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void **set_num_seek_attempts** (uint8_t num_seek_attempts)
- void **set_start_of_fall_to_profile_pressure_counts** (uint16_t start_of_fall_to_profile_pressure_counts)
- void **set_start_of_fall_to_profile_pressure_time** (const ptime &start_of_fall_to_profile_pressure_time)
- void set_start_time (const ptime &start_time)

  Set the engineering message state start time.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.

Private Attributes

- uint16_t average_drift_pressure_counts_

  The average pressure during the drift/park phase of the dive cycle, in raw pressure counts.
- uint16_t **average_drift_salinity_counts_**
- uint16_t average_drift_temperature_counts_

  The average temperature during the drift/park phase of the dive cycle, in raw temperature counts.
- uint16_t case_vac_at_end_cinhg_

  The measured internal pressure case vacuum, in 0.01 inHg, at the end of the drift/park phase of the dive cycle.
- uint16_t case_vac_at_start_cinhg_

  The measured internal pressure case vacuum, in 0.01 inHg, at the start of the drift/park phase of the dive cycle.
- uint8_t engineering_version_

  The engineering message version identifier.
- int16_t **first_pump_duration_adjustment_s_**
- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint8_t **num_seek_attempts_**
- uint16_t start_of_fall_to_profile_pressure_counts_

  The measured pressure at the start of the fall-to-profile phase of the dive cycle, in raw pressure counts.
- ptime start_of_fall_to_profile_pressure_time_

  The start time of the fall-to-profile phase of the dive cycle.
- ptime start_time_

  The engineering message state start time.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.79.1 Detailed Description

Class representing an drift/park state engineering X-Message.

Note

This X-Message is only used by ALAMO-type instruments.

This message type was introduced in the X-Message format specification version 2.1.

10.79.2 Constructor & Destructor Documentation

10.79.2.1 XEngDrift()

```
util::xmsg::XEngDrift::XEngDrift (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

Parameterized constructor.

Parameters

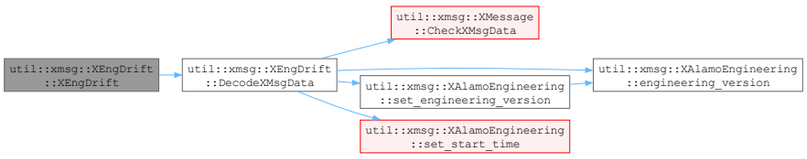
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.79.2.2 ~XEngDrift()

```
util::xmsg::XEngDrift::~XEngDrift ()  [inline]
```

Destructor.

10.79.3 Member Function Documentation

10.79.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::XMessage::set_xmsg_size_byte u16, and util::xmsg::XMessage::xmsg_size_bytes().

10.79.3.2 DecodeXMsgData()

```
void util::xmsg::XEngDrift::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode the drift/park state engineering X-Message from the binary data.

Parameters

in	*data*	The binary message to decode.

Implements util::xmsg::XMessage.

References CATCH_BLOCK, util::xmsg::XMessage::CheckXMsgData(), util::xmsg::XAlamoEngineering::engineering_version(), EXC_THROW, s2000, util::xmsg::XAlamoEngineering::set_engineering_version(), util::xmsg::XAlamoEngineering::set_start_time(), u08, and u16.

Referenced by XEngDrift().

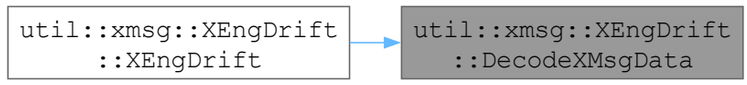
Here is the caller graph for this function:



10.79.3.3 engineering_version()

```
uint8_t util::xmsg::XAlamoEngineering::engineering_version () const  [inline], [inherited]
```

Get the engineering message version identifier.

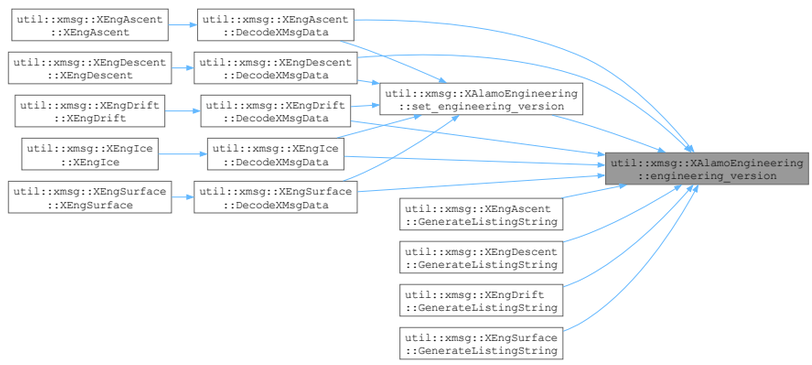
Returns

The engineering message version identifier.

References util::xmsg::XAlamoEngineering::engineering_version_.

Referenced by util::xmsg::XEngAscent::DecodeXMsgData(), util::xmsg::XEngDescent::DecodeXMsgData(), DecodeXMsgData(), util::xmsg::XEngIce::DecodeXMsgData(), util::xmsg::XEngSurface::DecodeXMsgData(), util::xmsg::XEngAscent::GenerateListingString(), util::xmsg::XEngDescent::GenerateListingString(), GenerateListingString(), util::xmsg::XEngSurface::GenerateListingString(), and util::xmsg::XAlamoEngineering::set_engineering_version().

Here is the caller graph for this function:



10.79.3.4 engineering_version_as_float()

```
float util::xmsg::XAlamoEngineering::engineering_version_as_float () const  [inline], [inherited]
```

Get the engineering message verion identifier as a floating point number.

Returns

The engineering message verion identifier as a floating point number.

References util::xmsg::XAlamoEngineering::engineering_version_.

10.79.3.5 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

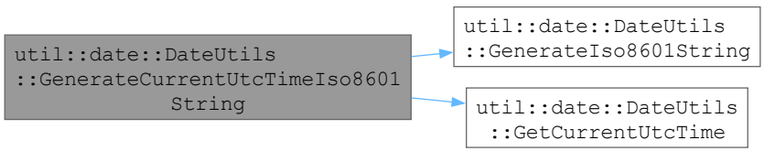
Returns

An ISO8601 format date/time string representation of the current time.

References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:

10.79.3.6 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), util::xmsg::XEngIce::XEngIce

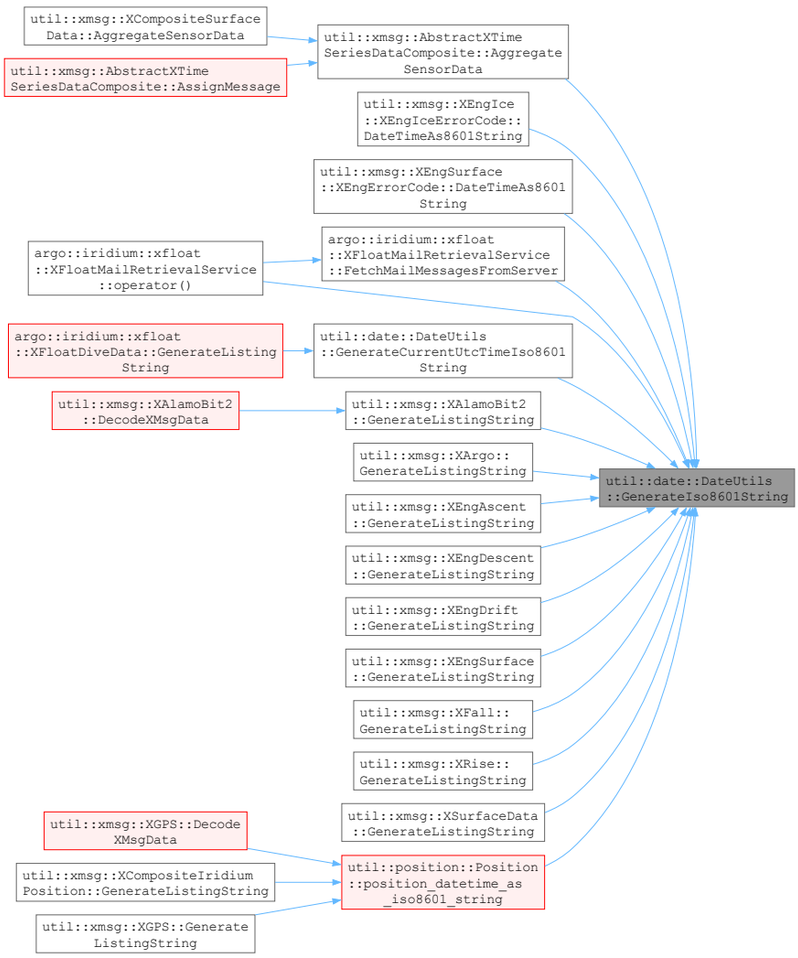
Here is the caller graph for this function:



10.79.3.7 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref*↩ *_dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.79.3.8 GenerateListingString()

```
const string util::xmsg::XEngDrift::GenerateListingString (
            uint16_t pg,
            uint16_t po,
            uint16_t sg,
            uint16_t so,
            uint16_t tg,
            uint16_t to) const  [inline]
```

Get the listing entry string for this drift/park engineering data X-Message.

Parameters

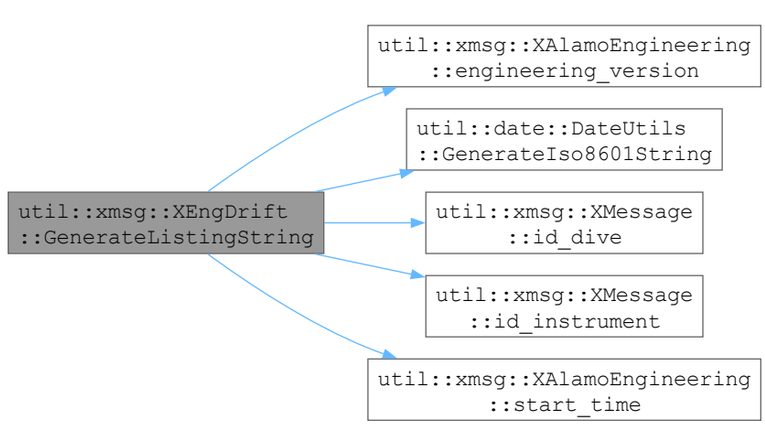
in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*sg*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*so*	The salinity sensor offset, in PSU.
in	*tg*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*to*	The temperatyre sensor offset, in degC.

Returns

The listing entry string for this drift/park engineering data X-Message.

References CATCH_BLOCK, util::xmsg::XAlamoEngineering::engineering_version(), EXC_THROW, util::date::DateUtils::GenerateIso860 util::xmsg::XMessage::id_dive(), util::xmsg::XMessage::id_instrument(), start_of_fall_to_profile_pressure_time_, and util::xmsg::XAlamoEngineering::start_time().

Here is the call graph for this function:



10.79.3.9 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

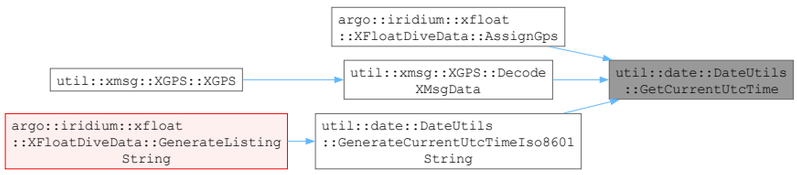
Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

Here is the caller graph for this function:



10.79.3.10 id_dive()

```
int16_t util::xmsg::XMessage::id_dive () const  [inline], [inherited]
```

Get the dive or cycle number of this X-Message.

Returns

The dive or cycle number of this X-Message.

10.79.4 Member Data Documentation

10.79.4.1 average_drift_pressure_counts_

```
uint16_t util::xmsg::XEngDrift::average_drift_pressure_counts_  [private]
```

The average pressure during the drift/park phase of the dive cycle, in raw pressure counts.

10.79.4.2 average_drift_temperature_counts_

```
uint16_t util::xmsg::XEngDrift::average_drift_temperature_counts_  [private]
```

The average temperature during the drift/park phase of the dive cycle, in raw temperature counts.

10.79.4.3 case_vac_at_end_cinhg_

```
uint16_t util::xmsg::XEngDrift::case_vac_at_end_cinhg_  [private]
```

The measured internal pressure case vacuum, in 0.01 inHg, at the end of the drift/park phase of the dive cycle.

Note

This field was added in version 0x11.

10.79.4.4 case_vac_at_start_cinhg_

```
uint16_t util::xmsg::XEngDrift::case_vac_at_start_cinhg_  [private]
```

The measured internal pressure case vacuum, in 0.01 inHg, at the start of the drift/park phase of the dive cycle.

Note

This field was added in version 0x11.

10.79.4.5 engineering_version_

```
uint8_t util::xmsg::XAlamoEngineering::engineering_version_  [private], [inherited]
```

The engineering message version identifier.

Referenced by util::xmsg::XAlamoEngineering::engineering_version(), util::xmsg::XAlamoEngineering::engineering_version_as_float(), and util::xmsg::XAlamoEngineering::set_engineering_version().

10.79.4.6 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]

  Set the error code.

Private Attributes

- ptime date_time_
  The timestamp for the error code.
- uint32_t error_code_
  The error code.

10.80.1 Detailed Description

The engineering surface data error code class.

An instance of this object represents a single error code reported in the ALAMO engineering (surface) data message. Each error consists of a timestamp and a

10.80.2 Constructor & Destructor Documentation

10.80.2.1 XEngErrorCode()

```
util::xmsg::XEngSurface::XEngErrorCode::XEngErrorCode (
            ptime date_time,
            uint32_t error_code)  [inline]
```

The parameterized constructor.

Parameters

in	*date_time*	The timestamp of the error code.
in	*error_code*	The error code.

10.80.2.2 ~XEngErrorCode()

```
util::xmsg::XEngSurface::XEngErrorCode::~XEngErrorCode ()  [inline]
```

The destructor.

10.80.3 Member Function Documentation

10.80.3.1 date_time()

```
const ptime & util::xmsg::XEngSurface::XEngErrorCode::date_time () const  [inline]
```

Get the timestamp for the error code.

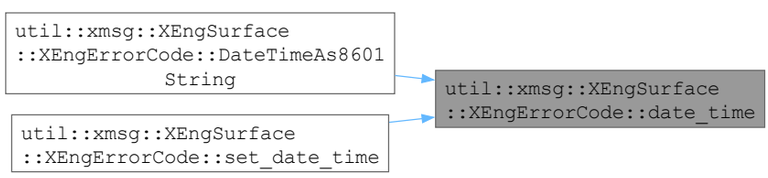
Returns

The timestamp for the error code.

References date_time_.

Referenced by DateTimeAs8601String(), and set_date_time().

Here is the caller graph for this function:



10.80.3.2 DateTimeAs8601String()

```
string util::xmsg::XEngSurface::XEngErrorCode::DateTimeAs8601String () const  [inline]
```

Generate an ISO8601 format date/time string representation of the error date/time.

Note

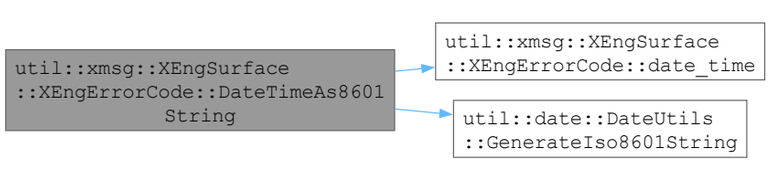
All date/time objects use the UTC time-zone.

Returns

An ISO8601 format date/time string representation of the error date/time. If date_time() returns boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" will be returned.

References date_time(), and util::date::DateUtils::GenerateIso8601String().

Here is the call graph for this function:



10.80.3.3 error_code()

```
uint32_t util::xmsg::XEngSurface::XEngErrorCode::error_code () const  [inline]
```

Get the error code.

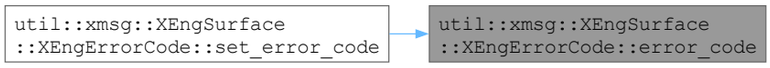
Returns

The error code.

References error_code_.

Referenced by set_error_code().

Here is the caller graph for this function:



10.80.3.4 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

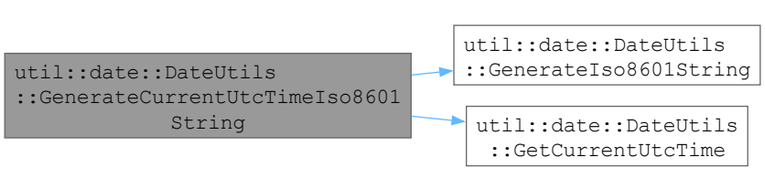
Returns

An ISO8601 format date/time string representation of the current time.

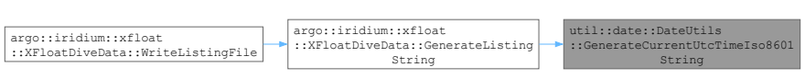
References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:



10.80.3.5 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

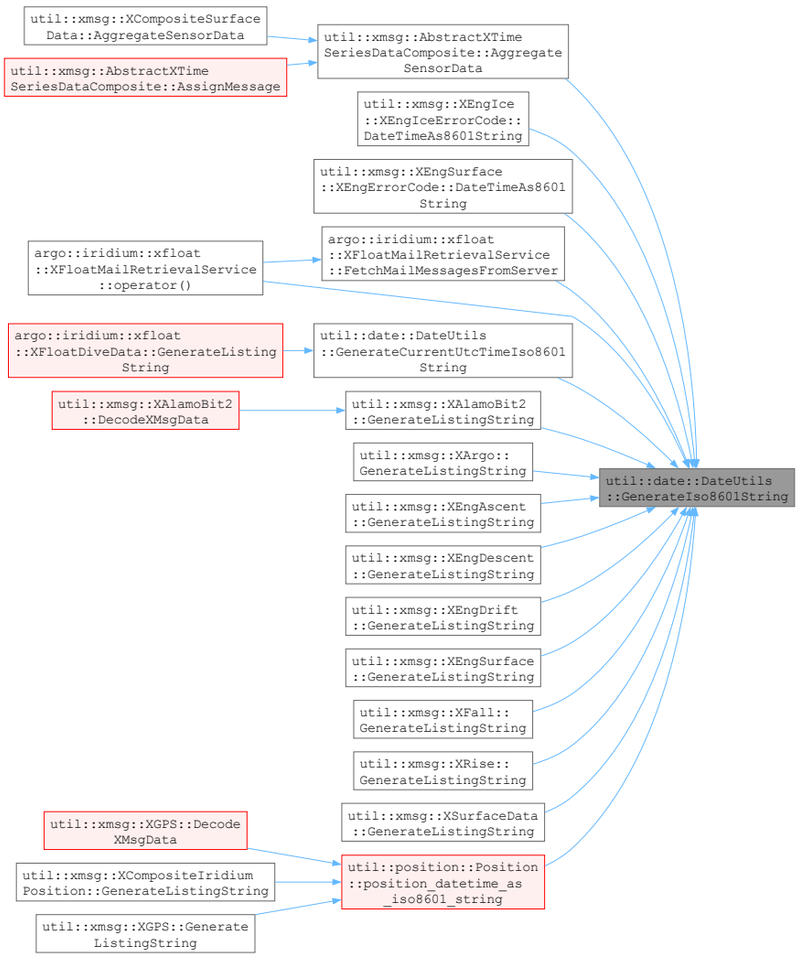
in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), util::xmsg::XEngIce::XEngIce DateTimeAs8601String(), argo::iridium::xfloat::XFloatMailRetrievalService::FetchMailMessagesFromServer(), util::date::DateUtils::Genera util::xmsg::XAlamoBit2::GenerateListingString(), util::xmsg::XArgo::GenerateListingString(), util::xmsg::XEngAscent::GenerateListingStrin util::xmsg::XEngDescent::GenerateListingString(), util::xmsg::XEngDrift::GenerateListingString(), util::xmsg::XEngSurface::GenerateListin util::xmsg::XFall::GenerateListingString(), util::xmsg::XRise::GenerateListingString(), util::xmsg::XSurfaceData::GenerateListingString(), argo::iridium::xfloat::XFloatMailRetrievalService::operator()(), and util::position::Position::position_datetime_as_iso8601_string().

Here is the caller graph for this function:



10.80.3.6 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref_dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.80.3.7 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

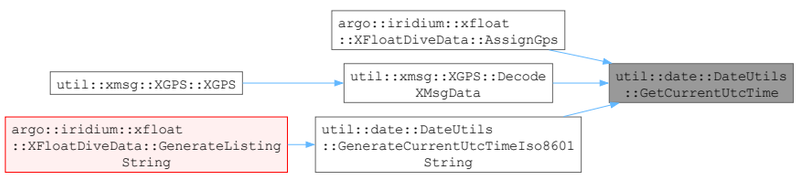
Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

Here is the caller graph for this function:



10.80.3.8 set_date_time()

```
void util::xmsg::XEngSurface::XEngErrorCode::set_date_time (
             const ptime & date_time)  [inline], [protected]
```

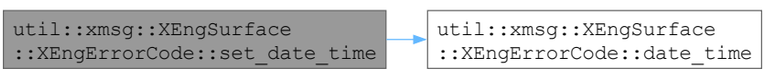
Set the timestamp for the error code.

Parameters

in	*date_time*	The timestamp for the error code.

References date_time(), and date_time_.

Here is the call graph for this function:



10.80.3.9 set_error_code()

```
void util::xmsg::XEngSurface::XEngErrorCode::set_error_code (
             uint32_t error_code)  [inline], [protected]
```

Set the error code.

Parameters

in	*error_code*	The error code.

References error_code(), and error_code_.

Here is the call graph for this function:

- uint8_t **status_urgency_**
- uint16_t **temp_threshold_test_**
- uint32_t **time_since_last_transmission_secs_**
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.81.1 Detailed Description

The ALAMO engineering (ice) message class.

An instance of this class represents a decoded ALAMO engineering (ice detection) X-message, which reports the ice detection status, surfacing attempts, threshold test values and any error codes recorded by the instrument.

10.81.2 Constructor & Destructor Documentation

10.81.2.1 XEngIce()

```
util::xmsg::XEngIce::XEngIce (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

The parameterized constructor.

Parameters

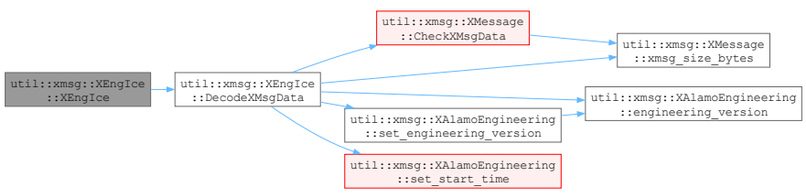
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.81.2.2 ~XEngIce()

```
util::xmsg::XEngIce::~XEngIce ()  [inline]
```

The destructor.

10.81.3 Member Function Documentation

10.81.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

References CATCH_BLOCK, EXC_THROW, lwrn, util::xmsg::XMessage::set_id_xmsg_type(), util::xmsg::XMessage::set_xmsg_size_byte
u16, and util::xmsg::XMessage::xmsg_size_bytes().

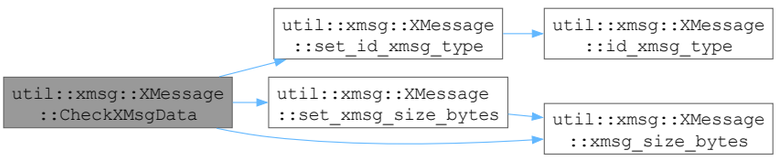
util::xmsg::XValve::DecodeXMsgData(), util::xmsg::XWave::DecodeXMsgData(), and util::xmsg::AbstractXFallRise::UnpackData().

Here is the call graph for this function:



10.81.3.2 DecodeXMsgData()

```
void util::xmsg::XEngIce::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode an engineering (ice) X-message.

Byte 3 holds the message version. Versions 0x10 and 0x11 share the fields in bytes 4-19: operation mode, ice detection status, urgency, number of surfacing attempts, number of stored SBD messages, time since the last transmission, minimum pressure, temperature threshold test and surface salinity test. Version 0x11 adds error codes; its layout is described in the 0x11 case below.

Parameters

in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if the message type, size or terminator is invalid, the version is unsupported, or (version 0x11) the error count does not match the number of error code entries.

Implements util::xmsg::XMessage.

References CATCH_BLOCK, util::xmsg::XMessage::CheckXMsgData(), util::xmsg::XAlamoEngineering::engineering_version(), error_codes_, EXC_THROW, lwrn, s2000, util::xmsg::XAlamoEngineering::set_engineering_version(), util::xmsg::XAlamoEngineering::se u08, u16, u32, and util::xmsg::XMessage::xmsg_size_bytes().

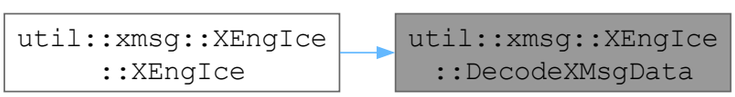
Here is the caller graph for this function:



10.81.3.3 engineering_version()

```
uint8_t util::xmsg::XAlamoEngineering::engineering_version () const  [inline], [inherited]
```

Get the engineering message version identifier.

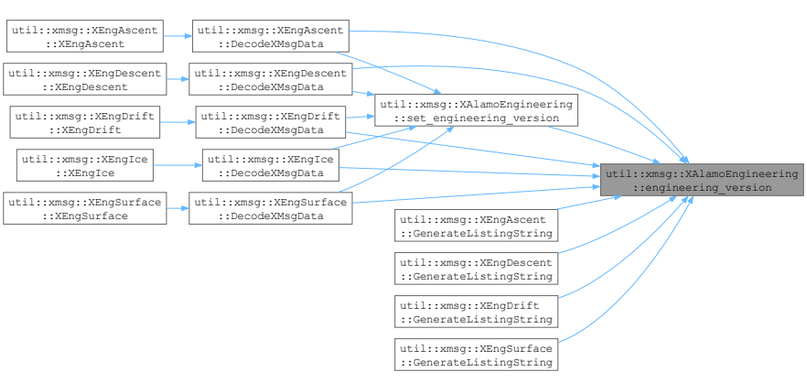
Returns

The engineering message version identifier.

References util::xmsg::XAlamoEngineering::engineering_version_.

Referenced by util::xmsg::XEngAscent::DecodeXMsgData(), util::xmsg::XEngDescent::DecodeXMsgData(), util::xmsg::XEngDrift::Decode DecodeXMsgData(), util::xmsg::XEngSurface::DecodeXMsgData(), util::xmsg::XEngAscent::GenerateListingString(), util::xmsg::XEngDescent::GenerateListingString(), util::xmsg::XEngDrift::GenerateListingString(), util::xmsg::XEngSurface::GenerateListin and util::xmsg::XAlamoEngineering::set_engineering_version().

Here is the caller graph for this function:



10.81.3.4 engineering_version_as_float()

```
float util::xmsg::XAlamoEngineering::engineering_version_as_float () const  [inline], [inherited]
```

Get the engineering message verion identifier as a floating point number.

Returns

The engineering message verion identifier as a floating point number.

References util::xmsg::XAlamoEngineering::engineering_version_.

10.81.3.5 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

Returns

An ISO8601 format date/time string representation of the current time.

References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:

Here is the caller graph for this function:

10.81.3.6 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

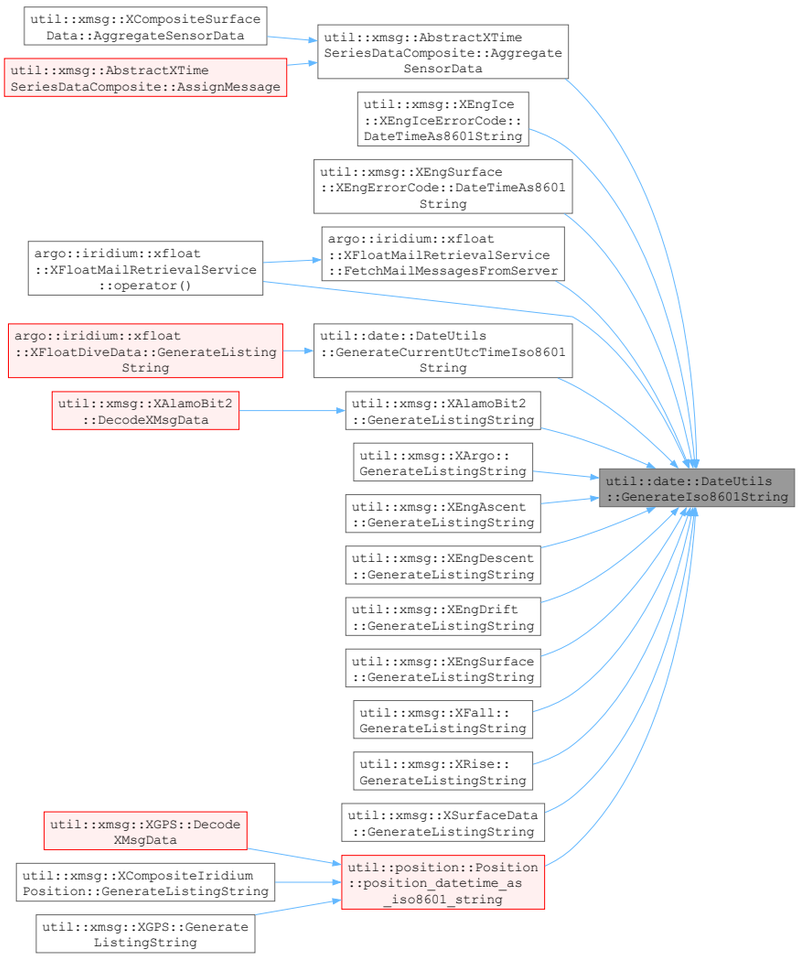
in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), util::xmsg::XEngIce::XEngIce util::xmsg::XEngSurface::XEngErrorCode::DateTimeAs8601String(), argo::iridium::xfloat::XFloatMailRetrievalService::FetchMailMessages util::date::DateUtils::GenerateCurrentUtcTimeIso8601String(), util::xmsg::XAlamoBit2::GenerateListingString(), util::xmsg::XArgo::Genera util::xmsg::XEngAscent::GenerateListingString(), util::xmsg::XEngDescent::GenerateListingString(), util::xmsg::XEngDrift::GenerateListing util::xmsg::XEngSurface::GenerateListingString(), util::xmsg::XFall::GenerateListingString(), util::xmsg::XRise::GenerateListingString(), util::xmsg::XSurfaceData::GenerateListingString(), argo::iridium::xfloat::XFloatMailRetrievalService::operator()(), and util::position::Position::position_datetime_as_iso8601_string().

Here is the caller graph for this function:



10.81.3.7 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref_dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.81.3.8 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

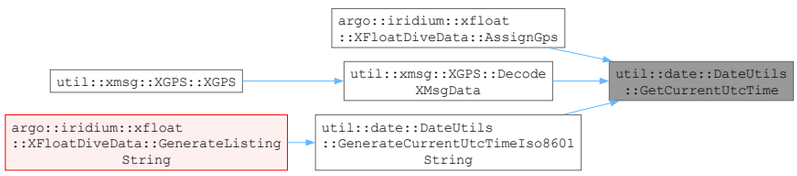
Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

Here is the caller graph for this function:



10.81.3.9 id_dive()

```
int16_t util::xmsg::XMessage::id_dive () const  [inline], [inherited]
```

Get the dive or cycle number of this X-Message.

Returns

The dive or cycle number of this X-Message.

References util::xmsg::XMessage::id_dive_.

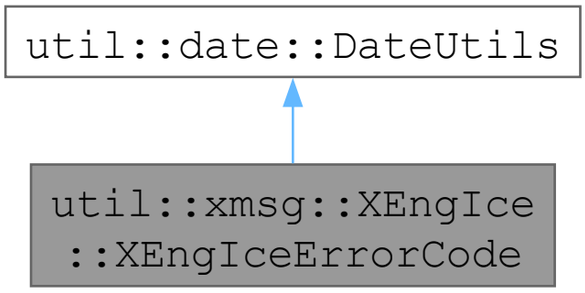
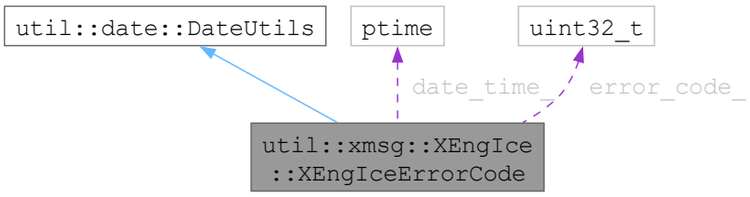
10.82 util::xmsg::XEngIce::XEngIceErrorCode Class Reference

The engineering (ice) error code class.

Inheritance diagram for util::xmsg::XEngIce::XEngIceErrorCode:



Collaboration diagram for util::xmsg::XEngIce::XEngIceErrorCode:



Public Member Functions

- XEngIceErrorCode (ptime date_time, uint32_t error_code)
  The parameterized constructor.
- ~XEngIceErrorCode ()
  The destructor.
- const ptime & date_time () const
  Get the timestamp for the error code.
- string DateTimeAs8601String () const
  Generate an ISO8601 format date/time string representation of the error date/time.
- uint32_t error_code () const
  Get the error code.

Static Public Member Functions

- static string GenerateCurrentUtcTimeIso8601String ()
  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- static string GenerateIso8601String (const ptime &p, bool extended=true)
  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)
  Convert a date/time to fractional days since a reference date/time.
- static ptime GetCurrentUtcTime ()
  Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Protected Member Functions

- void set_date_time (const ptime &date_time)
  Set the timestamp for the error code.
- void set_error_code (uint32_t error_code)
  Set the error code.

Private Attributes

- ptime date_time_
  The timestamp for the error code.
- uint32_t error_code_
  The error code.

10.82.1 Detailed Description

The engineering (ice) error code class.

An instance of this object represents a single error code reported in the ALAMO engineering (ice) data message. Each error consists of a timestamp and a 16-bit error code.

10.82.2 Constructor & Destructor Documentation

10.82.2.1 XEngIceErrorCode()

```
util::xmsg::XEngIce::XEngIceErrorCode::XEngIceErrorCode (
            ptime date_time,
            uint32_t error_code)  [inline]
```

The parameterized constructor.

Parameters

in	*date_time*	The timestamp of the error code.
in	*error_code*	The error code.

10.82.2.2 ~XEngIceErrorCode()

```
util::xmsg::XEngIce::XEngIceErrorCode::~XEngIceErrorCode ()  [inline]
```

The destructor.

10.82.3 Member Function Documentation

10.82.3.1 date_time()

```
const ptime & util::xmsg::XEngIce::XEngIceErrorCode::date_time () const  [inline]
```

Get the timestamp for the error code.

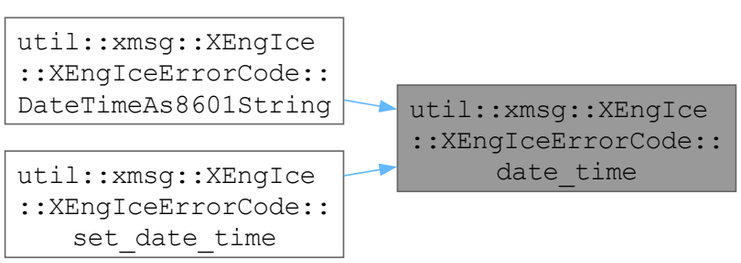
Returns

The timestamp for the error code.

References date_time_.

Referenced by DateTimeAs8601String(), and set_date_time().

Here is the caller graph for this function:



10.82.3.2 DateTimeAs8601String()

```
string util::xmsg::XEngIce::XEngIceErrorCode::DateTimeAs8601String () const  [inline]
```

Generate an ISO8601 format date/time string representation of the error date/time.

Note

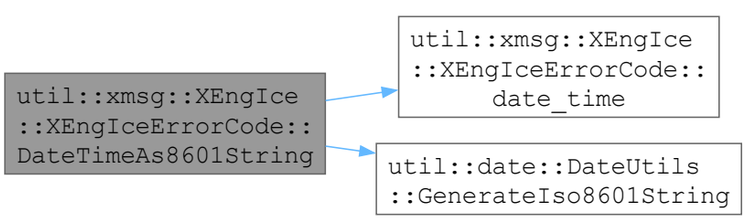
All date/time objects use the UTC time-zone.

Returns

An ISO8601 format date/time string representation of the error date/time. If date_time() returns boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" will be returned.

References date_time(), and util::date::DateUtils::GenerateIso8601String().

Here is the call graph for this function:



10.82.3.3 error_code()

```
uint32_t util::xmsg::XEngIce::XEngIceErrorCode::error_code () const  [inline]
```

Get the error code.

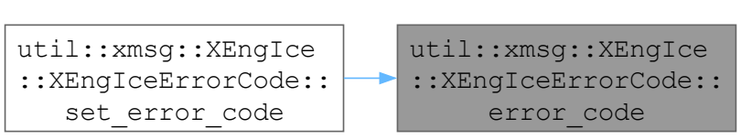
Returns

The error code.

References error_code_.

Referenced by set_error_code().

Here is the caller graph for this function:



10.82.3.4 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

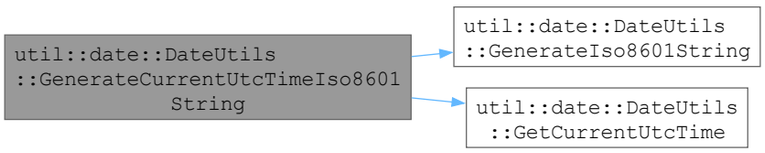
Returns

An ISO8601 format date/time string representation of the current time.

References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:

10.82.3.5 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

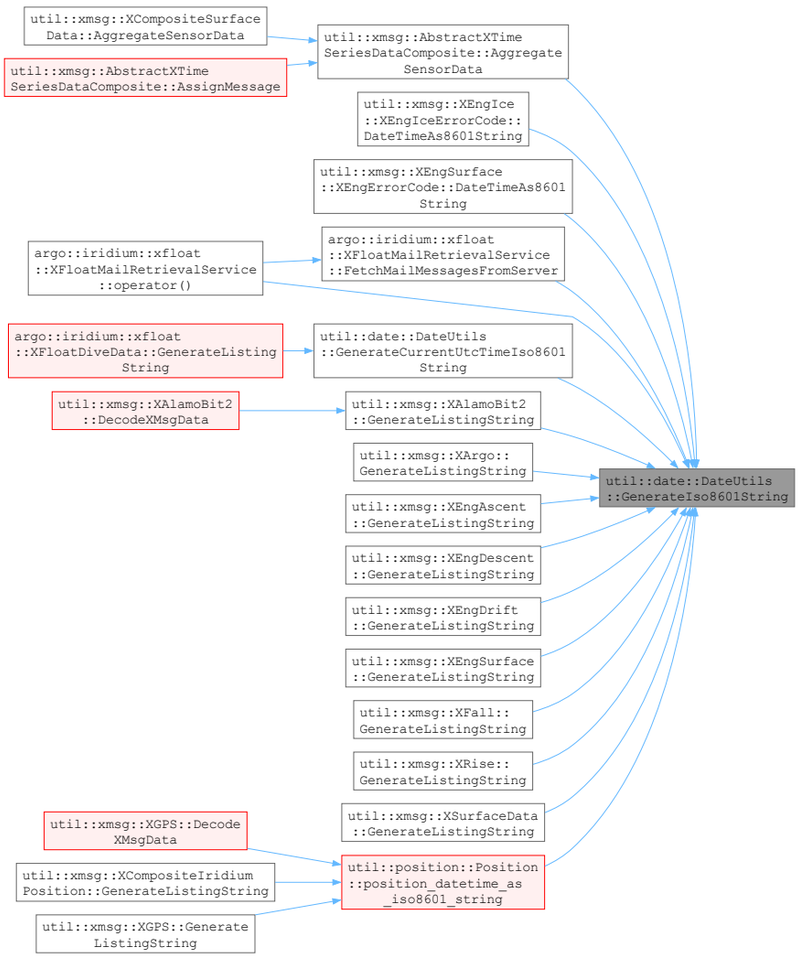
in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), DateTimeAs8601String(), util::xmsg::XEngSurface::XEngErrorCode::DateTimeAs8601String(), argo::iridium::xfloat::XFloatMailRetrievalService::FetchMailMessages util::date::DateUtils::GenerateCurrentUtcTimeIso8601String(), util::xmsg::XAlamoBit2::GenerateListingString(), util::xmsg::XArgo::Genera util::xmsg::XEngAscent::GenerateListingString(), util::xmsg::XEngDescent::GenerateListingString(), util::xmsg::XEngDrift::GenerateListing util::xmsg::XEngSurface::GenerateListingString(), util::xmsg::XFall::GenerateListingString(), util::xmsg::XRise::GenerateListingString(), util::xmsg::XSurfaceData::GenerateListingString(), argo::iridium::xfloat::XFloatMailRetrievalService::operator()(), and util::position::Position::position_datetime_as_iso8601_string().

Here is the caller graph for this function:



10.82.3.6 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref↩ _dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.82.3.7 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

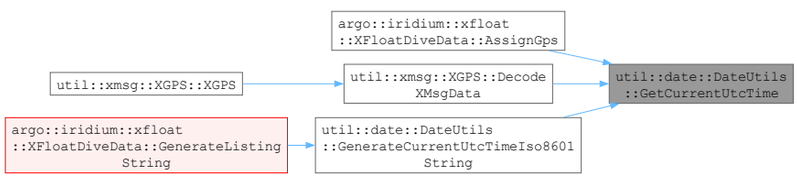
Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

Here is the caller graph for this function:



10.82.3.8 set_date_time()

```
void util::xmsg::XEngIce::XEngIceErrorCode::set_date_time (
            const ptime & date_time)  [inline], [protected]
```

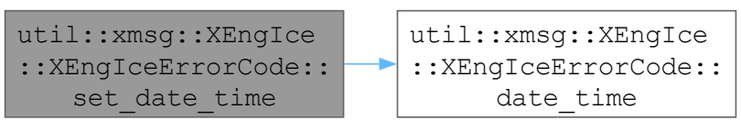
Set the timestamp for the error code.

Parameters

in	*date_time*	The timestamp for the error code.

References date_time(), and date_time_.

Here is the call graph for this function:



10.82.3.9 set_error_code()

```
void util::xmsg::XEngIce::XEngIceErrorCode::set_error_code (
            uint32_t error_code)  [inline], [protected]
```

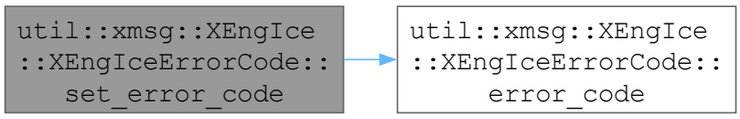
Set the error code.

Parameters

in	*error_code*	The error code.

References error_code(), and error_code_.

Here is the call graph for this function:



10.82.4 Member Data Documentation

10.82.4.1 date_time_

```
ptime util::xmsg::XEngIce::XEngIceErrorCode::date_time_  [private]
```

The timestamp for the error code.

Referenced by date_time(), and set_date_time().

```
uint32_t util::xmsg::XEngIce::XEngIceErrorCode::error_code_  [private]
```

The error code.

Referenced by error_code(), and set_error_code().

The documentation for this class was generated from the following file:

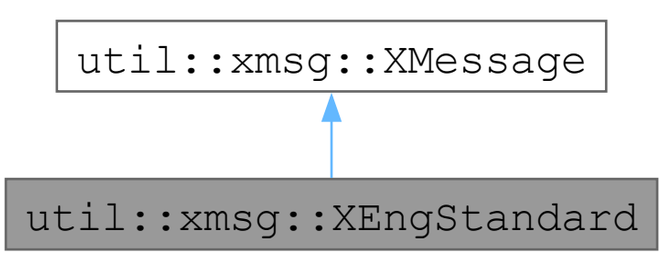
- data/xmsg/XEngIce.h

10.83 util::xmsg::XEngStandard Class Reference

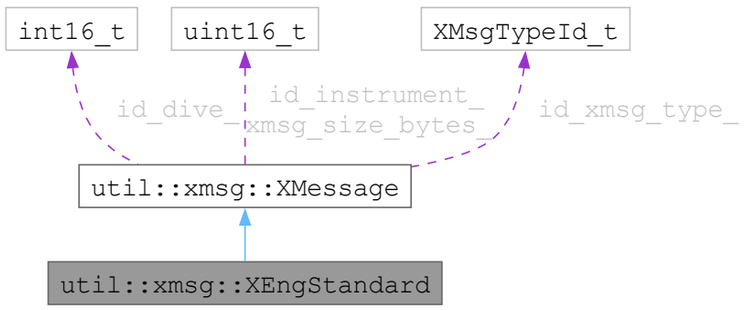
Class representing an engineering message for a standard dive cycle.

```
#include <XEngStandard.h>
```

Inheritance diagram for util::xmsg::XEngStandard:



Collaboration diagram for util::xmsg::XEngStandard:



Public Member Functions

- XEngStandard (uint16_t dive, uint16_t whoi, const std::vector< uint8_t > &data)

  Parameterized constructor.
- ~XEngStandard ()

  Destructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)

  Check the X-message for the correct ID, minimum size, and message terminator.
- void DecodeXMsgData (const std::vector< uint8_t > &data)

  Decode the standard dive engineering X-Message from the binary data.
- virtual void DecodeXMsgData (const vector< uint8_t > &data)=0

  Decode the X-Message data.
- const string GenerateListingString () const

  Generate a listing string representation of the standard dive engineering data message.
- int16_t id_dive () const

  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const

  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const

  Get the enumerated X-Message type identifier.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Protected Member Functions

- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.

Private Attributes

- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.83.1 Detailed Description

Class representing an engineering message for a standard dive cycle.

10.83.2 Constructor & Destructor Documentation

10.83.2.1 XEngStandard()

```
util::xmsg::XEngStandard::XEngStandard (
            uint16_t dive,
            uint16_t whoi,
            const std::vector< uint8_t > & data)  [inline]
```

Parameterized constructor.

Parameters

in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:

10.83.2.2 ~XEngStandard()

```
util::xmsg::XEngStandard::~XEngStandard ()  [inline]
```

Destructor.

10.83.3 Member Function Documentation

10.83.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

10.83.3.2 DecodeXMsgData() [1/2]

```
void util::xmsg::XEngStandard::DecodeXMsgData (
            const std::vector< uint8_t > & data)  [inline]
```

Decode the standard dive engineering X-Message from the binary data.

Parameters

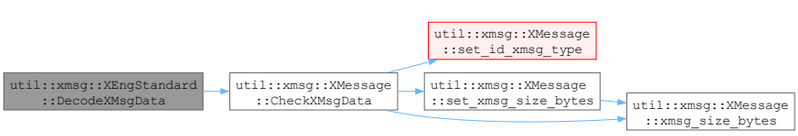
in	*data*	The binary message to decode.

Todo Implement the functionality for decoding the Solo-II standard dive/cycle engineering data message.

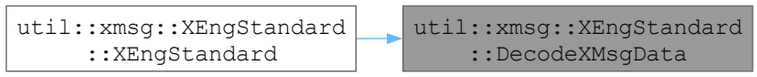
References CATCH_BLOCK, util::xmsg::XMessage::CheckXMsgData(), and util::xmsg::XMSG_TYPE_ID_ENG_DIVE.

Referenced by XEngStandard().

Here is the call graph for this function:



Here is the caller graph for this function:



10.83.3.3 DecodeXMsgData() [2/2]

```
virtual void util::xmsg::XMessage::DecodeXMsgData (
            const vector< uint8_t > & data)  [pure virtual], [inherited]
```

Decode the X-Message data.

Parameters

in	*data*	The encoded X message to decode.

Implemented in util::xmsg::AbstractXFallRise, util::xmsg::AbstractXSensorData, util::xmsg::XAcousticPosition, util::xmsg::XArgo, util::xmsg::XDriftPressure, util::xmsg::XDriftSalinity, util::xmsg::XDriftTemperature, util::xmsg::XEngAbort, util::xmsg::XEngAscent, util::xmsg::XEngBIT, util::xmsg::XEngDescent, util::xmsg::XEngDiagnostic, util::xmsg::XEngDrift, util::xmsg::XEngIce, util::xmsg::XEngSurface, util::xmsg::XFall, util::xmsg::XGPS, util::xmsg::XHiResPressure, util::xmsg::XHiResSalinity, util::xmsg::XHiResTemperature, util::xmsg::XMessageIndexable, util::xmsg::XMissionCmdEcho, util::xmsg::XMissionConfiguration, util::xmsg::XProfilePressure, util::xmsg::XProfileSalinity, util::xmsg::XProfileTemperature, util::xmsg::XPump, util::xmsg::XRise, util::xmsg::XSurfaceData, util::xmsg::XValve, and util::xmsg::XWave.

10.83.3.4 GenerateListingString()

```
const string util::xmsg::XEngStandard::GenerateListingString () const  [inline]
```

Generate a listing string representation of the standard dive engineering data message.

Returns

A listing string representation of the standard dive engineering data message.

Todo Implement the functionality for generating a listing string for the Solo-II standard dive engineering data message.

References CATCH_BLOCK.

10.83.3.5 id_dive()

```
int16_t util::xmsg::XMessage::id_dive () const  [inline], [inherited]
```

Get the dive or cycle number of this X-Message.

Returns

The dive or cycle number of this X-Message.

References util::xmsg::XMessage::id_dive_.

Referenced by util::xmsg::XGPS::DeleteFromDatabase(), util::xmsg::XArgo::GenerateListingString(), util::xmsg::XEngAscent::GenerateLis

10.83.3.8 set_id_dive()

```
void util::xmsg::XMessage::set_id_dive (
            int16_t id_dive)  [inline], [protected], [inherited]
```

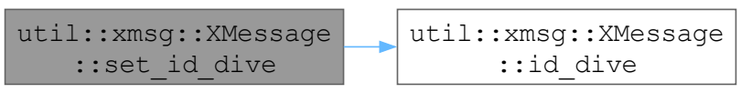
Set the dive or cycle number of this message.

Parameters

in	*id_dive*	The dive or cycle number of this message to set.

References util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::id_dive_.

Here is the call graph for this function:



10.83.3.9 set_id_instrument()

```
void util::xmsg::XMessage::set_id_instrument (
            uint16_t id_instrument)  [inline], [protected], [inherited]
```

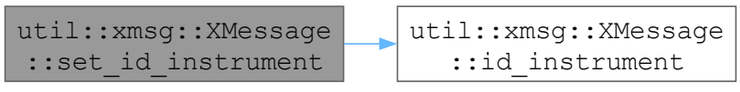
Set the unique instrument identifier.

Parameters

in	*id_instrument*	The unique instrument identifier to set.

References util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::id_instrument_.

Here is the call graph for this function:



10.83.3.10 set_id_xmsg_type()

```
void util::xmsg::XMessage::set_id_xmsg_type (
            XMsgTypeId_t id_xmsg_type)  [inline], [protected], [inherited]
```

Set the X-Message type identifier.

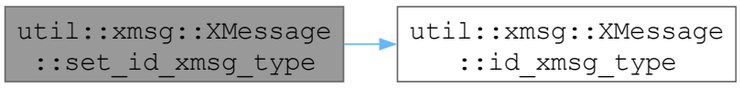
Parameters

in	*id_xmsg_type*	The X-Message type identifier to set.

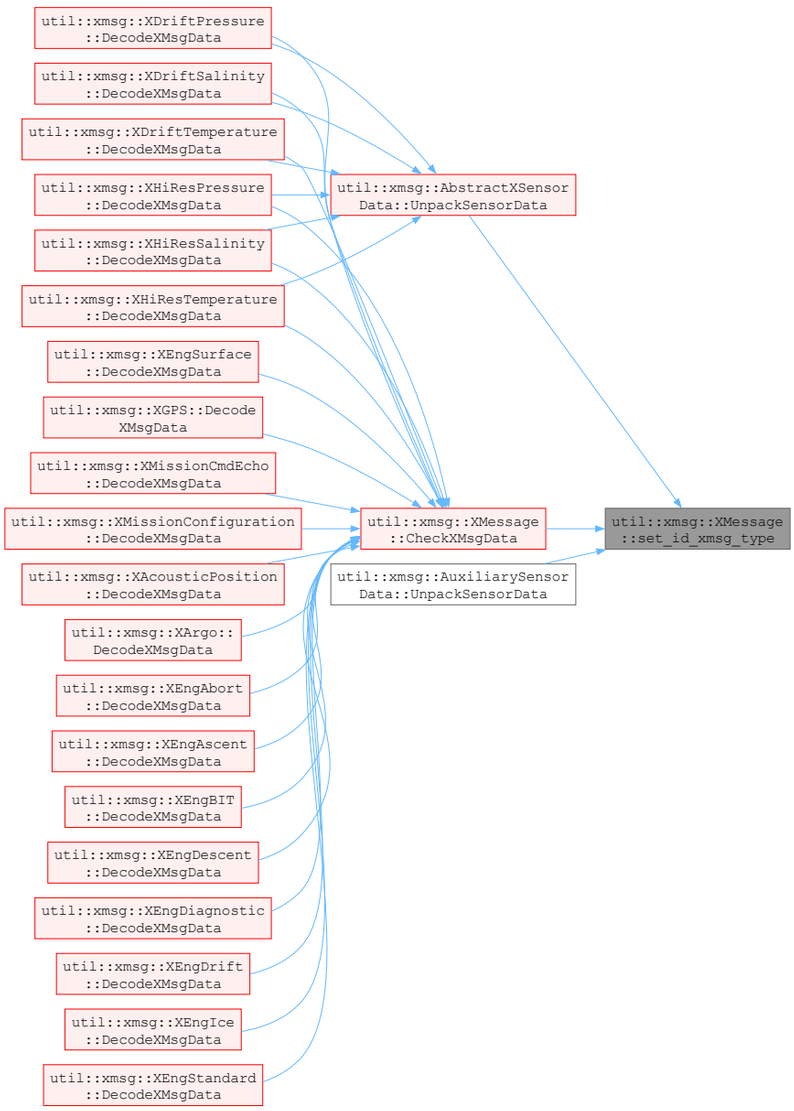
References util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::id_xmsg_type_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), util::xmsg::AbstractXSensorData::UnpackSensorData(), and util::xmsg::AuxiliarySensorData::UnpackSensorData().

Here is the call graph for this function:



Here is the caller graph for this function:



10.83.3.11 set_xmsg_size_bytes()

```
void util::xmsg::XMessage::set_xmsg_size_bytes (
            uint16_t xmsg_size_bytes)  [inline], [protected], [inherited]
```

Set the size of the X-Message, in bytes.

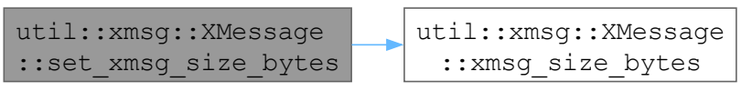
Parameters

in	*xmsg_size_bytes*	The size of the X-Message to set, in bytes.

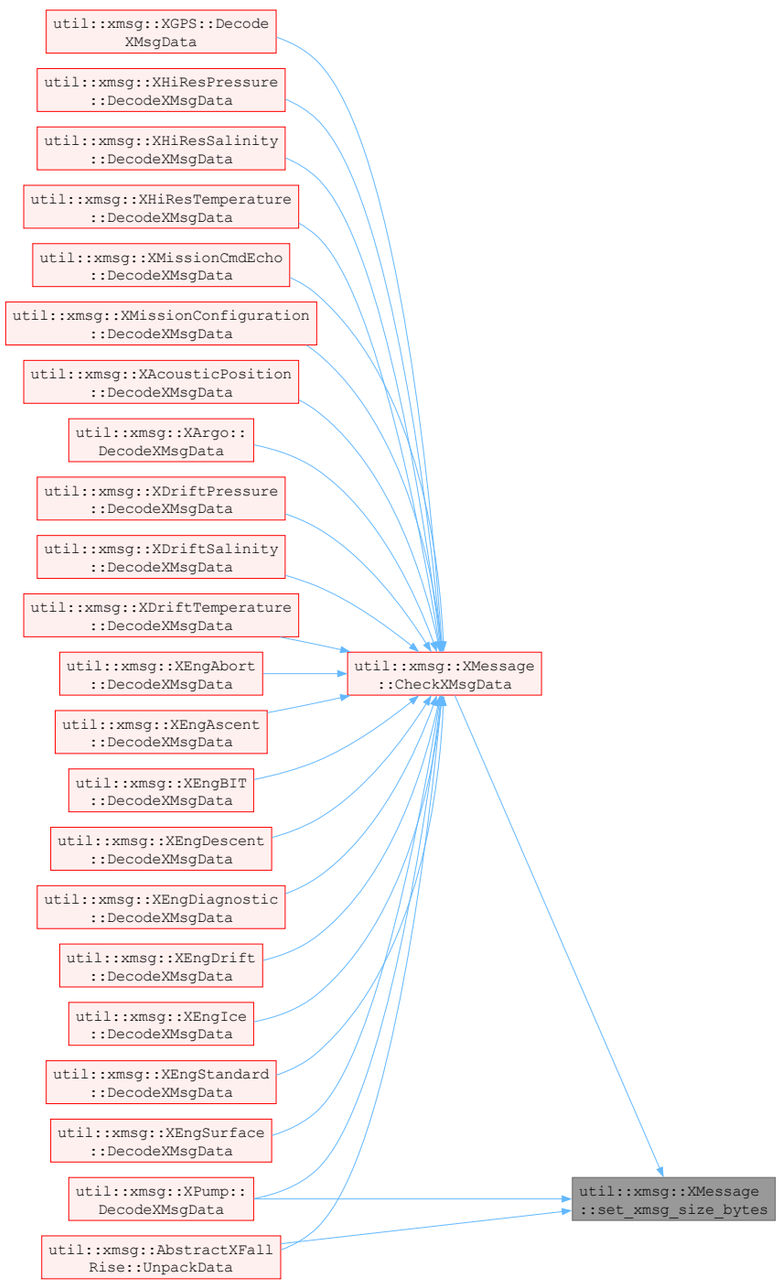
References util::xmsg::XMessage::xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), util::xmsg::XPump::DecodeXMsgData(), and util::xmsg::AbstractXFallRise::Unpa

Here is the call graph for this function:



Here is the caller graph for this function:



10.83.3.12 xmsg_size_bytes()

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes () const  [inline], [inherited]
```

Get the size of the X-Message, in bytes.

Returns

The size of the X-Message, in bytes.

References util::xmsg::XMessage::xmsg_size_bytes_.

Referenced by util::xmsg::XMessage::CheckXMsgData(), util::xmsg::XArgo::DecodeXMsgData(), util::xmsg::XEngDescent::DecodeXMsgI

10.83.4 Member Data Documentation

10.83.4.1 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.83.4.2 id_instrument_

`uint16_t util::xmsg::XMessage::id_instrument_ [private], [inherited]`

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.83.4.3 id_xmsg_type_

`XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_ [private], [inherited]`

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.83.4.4 xmsg_size_bytes_

`uint16_t util::xmsg::XMessage::xmsg_size_bytes_ [private], [inherited]`

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

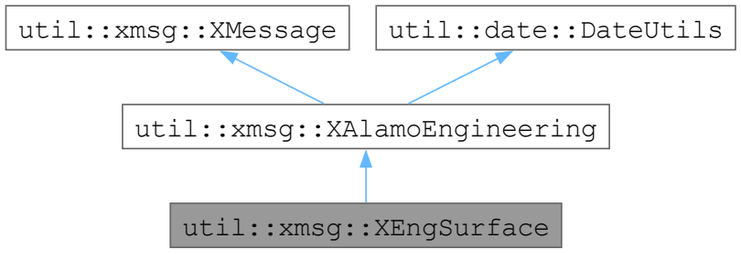
- data/xmsg/XEngStandard.h

10.84 util::xmsg::XEngSurface Class Reference

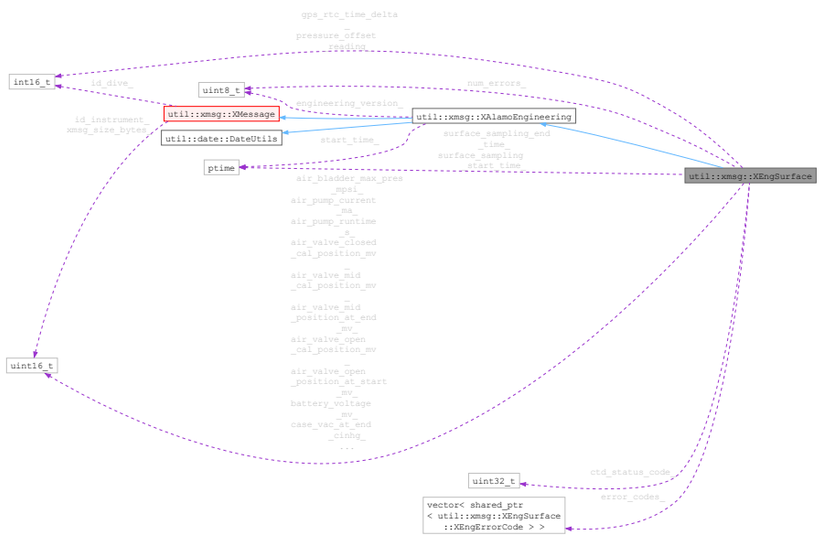
Class representing an surface state engineering X-Message.

`#include <XEngSurface.h>`

Inheritance diagram for util::xmsg::XEngSurface:



Collaboration diagram for util::xmsg::XEngSurface:



Classes

- class XEngErrorCode

  The engineering surface data error code class.

Public Member Functions

- XEngSurface (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)

  The parameterized constructor.
- ~XEngSurface ()

  The destructor.

  T system_current_a () const

  Get the measured system current, in amperes.
- uint16_t **system_current_ma** () const
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Static Public Member Functions

- static string GenerateCurrentUtcTimeIso8601String ()

  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- static string GenerateIso8601String (const ptime &p, bool extended=true)

  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)

  Convert a date/time to fractional days since a reference date/time.
- static ptime GetCurrentUtcTime ()

  Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Protected Member Functions

- void **set_prof_raw_sample_last_temp** (uint16_t prof_raw_sample_last_temp)
- void set_start_time (const ptime &start_time)

  Set the engineering message state start time.
- void **set_surface_sampling_end_time** (const ptime &surface_sampling_end_time)
- void **set_surface_sampling_start_time** (const ptime &surface_sampling_start_time)
- void **set_system_current_ma** (uint16_t system_current_ma)
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.

Private Attributes

- uint16_t air_bladder_max_pres_mpsi_

  The maximum measured air bladder pressure during the air pump, in .001 PSI.
- uint16_t air_pump_current_ma_

  The measured air pump current, in mA.
- uint16_t air_pump_runtime_s_

  The measured air pump run time, in seconds.
- uint16_t air_valve_closed_cal_position_mv_

  The air valve closed calibration position, in mV.
- uint16_t air_valve_mid_cal_position_mv_

  The air valve mid calibration position, in mV.
- uint16_t air_valve_mid_position_at_end_mv_

  The air valve mid position at the end of the surface phase of the dive cycle, in mV.

- uint16_t air_valve_open_cal_position_mv_

  The air valve open calibration position, in mV.
- uint16_t air_valve_open_position_at_start_mv_

  The air valve open position at the start of the surface phase of the dive cycle, in mV.
- uint16_t battery_voltage_mv_

  The measured system battery voltage, in mV.
- uint16_t case_vac_at_end_cinhg_

  The measured internal pressure case vacuum, in 0.01 inHg, at the end of the surface phase of the dive cycle.
- uint16_t case_vac_at_start_cinhg_

  The measured internal pressure case vacuum, in 0.01 inHg, at the start of the surface phase of the dive cycle.
- uint16_t case_vac_cingh_

  The measured internal pressure case vacuum, in 0.01 inHg.
- uint32_t ctd_status_code_

  The CTD status code.
- uint8_t engineering_version_

  The engineering message version identifier.
- vector< shared_ptr< XEngErrorCode > > error_codes_

  The error code values for this dive, if any.
- int16_t **gps_rtc_time_delta_**
- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- uint8_t num_errors_

  The number of error codes reported for this dive cycle.
- uint16_t num_sbd_packets_for_dive_

  The number of packets to be transmitted for the current dive.
- uint16_t num_transmit_attempts_for_previous_dive_

  The number of attempts to transmit in the previous Iridium session.
- uint16_t oil_valve_closed_cal_position_mv_

  The oil valve closed calibration position, in mV.
- uint16_t oil_valve_closed_position_at_end_mv_

  The oil valve closed position at the end of the surface phase of the dive cycle, in mV.
- uint16_t oil_valve_open_cal_position_mv_

  The oil valve open calibration position at the end of the surface phase of the dive cycle, in mV.
- uint16_t oil_valve_open_position_during_air_assist_mv_

  The oil valve open position during air pump, in mV.
- int16_t pressure_offset_reading_

  The measured pressure sensor offset at the surface, in 1/1000 dBar.
- uint16_t **prof_num_bins_**
- uint16_t **prof_num_bins_empty_**
- uint16_t **prof_num_raw_samples_**
- uint16_t **prof_raw_sample_first_pres_**
- uint16_t **prof_raw_sample_first_saln_**
- uint16_t **prof_raw_sample_first_temp_**
- uint16_t **prof_raw_sample_last_pres_**
- uint16_t **prof_raw_sample_last_saln_**
- uint16_t **prof_raw_sample_last_temp_**
- ptime start_time_

  The engineering message state start time.
- ptime **surface_sampling_end_time_**
- ptime **surface_sampling_start_time_**
- uint16_t system_current_ma_

  The measured system current, in mA.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.84.1 Detailed Description

Class representing an surface state engineering X-Message.

Note

This X-Message is only used by ALAMO-type instruments.

This message type was added in X-Message version 2.1.

10.84.2 Constructor & Destructor Documentation

10.84.2.1 XEngSurface()

```
util::xmsg::XEngSurface::XEngSurface (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

The parameterized constructor.

Parameters

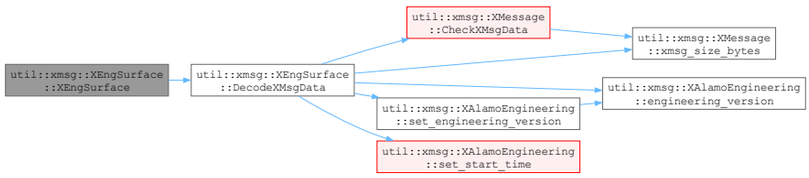
in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary X-message data to decode.

Exceptions

util::log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:



10.84.2.2 ~XEngSurface()

```
util::xmsg::XEngSurface::~XEngSurface ()  [inline]
```

The destructor.

10.84.3 Member Function Documentation

10.84.3.1 battery_voltage_v()

```
template<typename T = float>
T util::xmsg::XEngSurface::battery_voltage_v () const  [inline]
```

Get the measured system battery voltage, in volts.

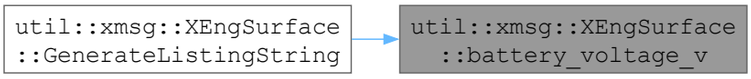
Returns

The measured system battery voltage, in volts.

References battery_voltage_mv_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.84.3.2 case_vacuum_inhg()

```
template<typename T = float>
T util::xmsg::XEngSurface::case_vacuum_inhg () const  [inline]
```

Get the measured internal pressure case vacuum, in inches of Mercury.

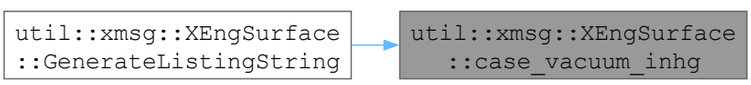
Returns

The measured internal pressure case vacuum, in inches of Mercury.

References case_vac_cingh_.

Referenced by GenerateListingString().

Here is the caller graph for this function:



10.84.3.3 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

10.84.3.4 DecodeXMsgData()

```
void util::xmsg::XEngSurface::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode the surface state engineering X-Message from the binary data.

Parameters

in	*data*	The binary message to decode.

Implements util::xmsg::XMessage.

References CATCH_BLOCK, util::xmsg::XMessage::CheckXMsgData(), util::xmsg::XAlamoEngineering::engineering_version(),
error_codes_, EXC_THROW, i16, lwrn, s2000, util::xmsg::XAlamoEngineering::set_engineering_version(), util::xmsg::XAlamoEngineering

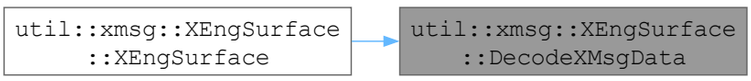
Here is the caller graph for this function:



10.84.3.5 engineering_version()

```
uint8_t util::xmsg::XAlamoEngineering::engineering_version () const  [inline], [inherited]
```

Get the engineering message version identifier.

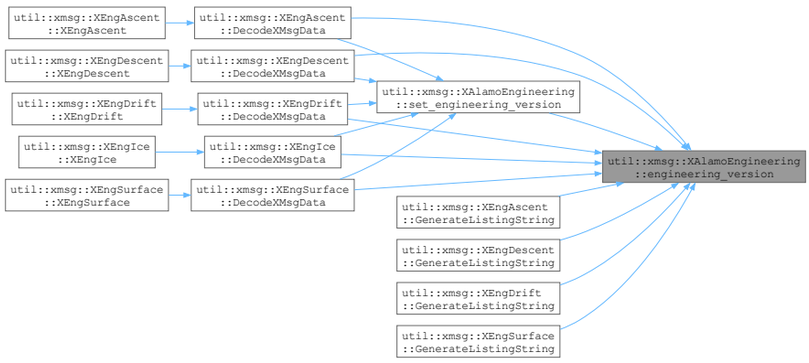
Returns

The engineering message version identifier.

References util::xmsg::XAlamoEngineering::engineering_version_.

Referenced by util::xmsg::XEngAscent::DecodeXMsgData(), util::xmsg::XEngDescent::DecodeXMsgData(), util::xmsg::XEngDrift::Decode util::xmsg::XEngIce::DecodeXMsgData(), DecodeXMsgData(), util::xmsg::XEngAscent::GenerateListingString(), util::xmsg::XEngDescent::GenerateListingString(), util::xmsg::XEngDrift::GenerateListingString(), GenerateListingString(), and util::xmsg::XAlamoEngineering::set_engineering_version().

Here is the caller graph for this function:



10.84.3.6 engineering_version_as_float()

```
float util::xmsg::XAlamoEngineering::engineering_version_as_float () const  [inline], [inherited]
```

Get the engineering message verion identifier as a floating point number.

Returns

The engineering message verion identifier as a floating point number.

References util::xmsg::XAlamoEngineering::engineering_version_.

10.84.3.7 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

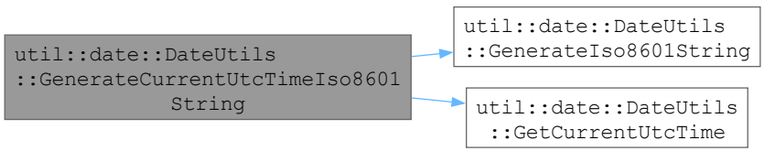
Returns

An ISO8601 format date/time string representation of the current time.

References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:

10.84.3.8 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), util::xmsg::XEngIce::XEngIce

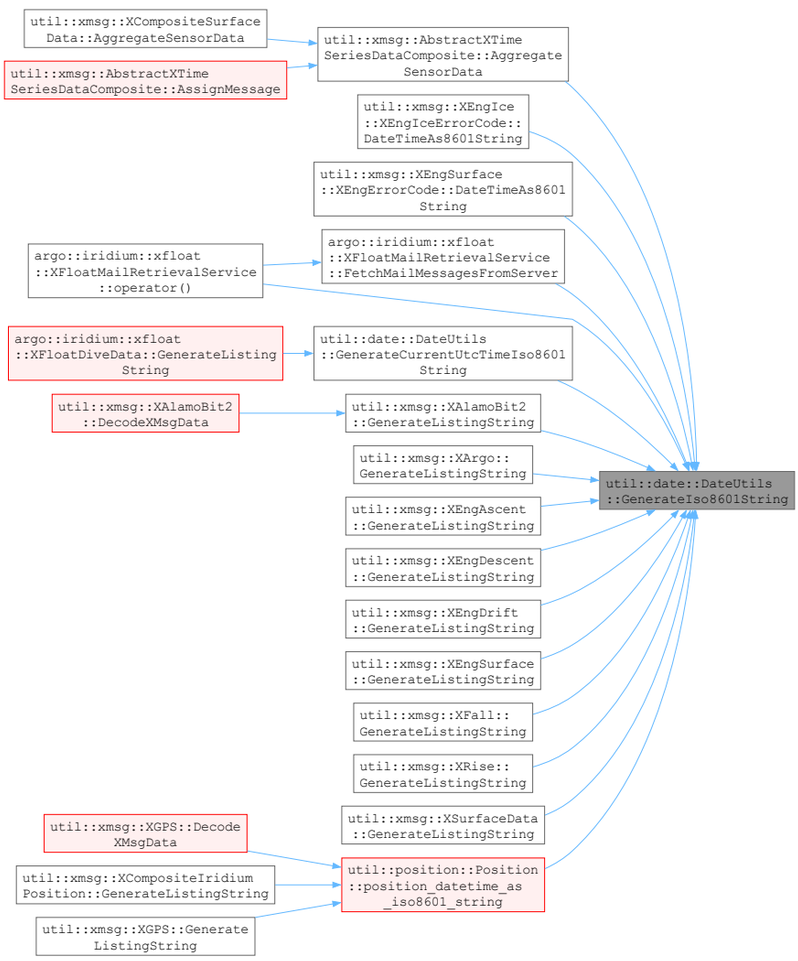
Here is the caller graph for this function:



10.84.3.9 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref*↩ *_dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.84.3.10 GenerateListingString()

```
const string util::xmsg::XEngSurface::GenerateListingString (
            uint16_t pg,
            uint16_t po,
            uint16_t sg,
            uint16_t so,
            uint16_t tg,
            uint16_t to) const  [inline]
```

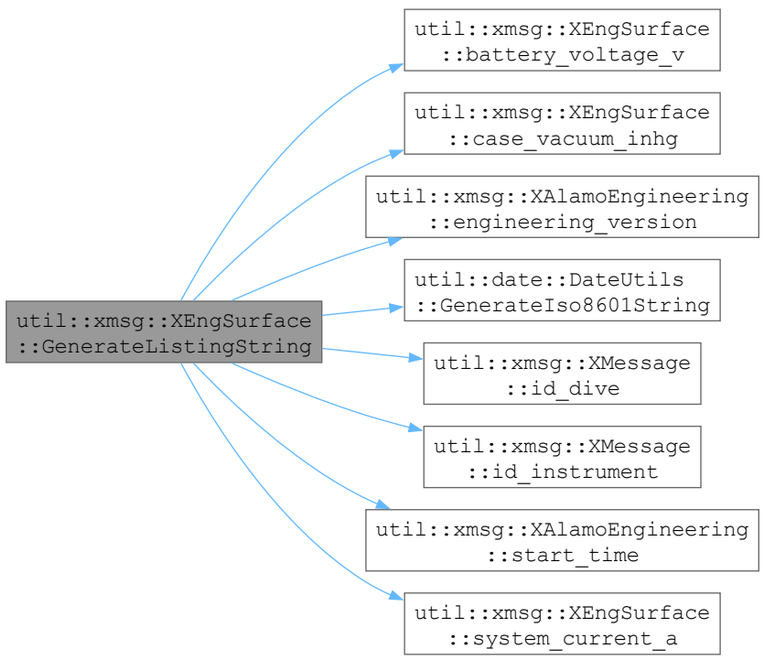
Generate the listing entry string for this surface engineering data X-Message.

Returns

The listing entry string for this surface engineering data X-Message.

References battery_voltage_v(), case_vacuum_inhg(), CATCH_BLOCK, util::xmsg::XAlamoEngineering::engineering_version(), error_codes_, EXC_THROW, util::date::DateUtils::GenerateIso8601String(), util::xmsg::XMessage::id_dive(), util::xmsg::XMessage::id_instrument(), util::xmsg::XAlamoEngineering::start_time(), and system_current_a().

Here is the call graph for this function:



10.84.3.11 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

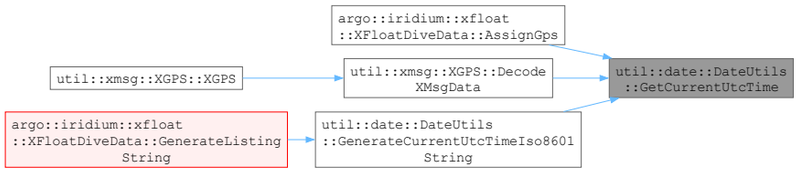
Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

Here is the caller graph for this function:



10.84.3.12 id_dive()

```
int16_t util::xmsg::XMessage::id_dive () const  [inline], [inherited]
```

Get the dive or cycle number of this X-Message.

Returns

The dive or cycle number of this X-Message.

References util::xmsg::XMessage::id_dive_.

Referenced by util::xmsg::XGPS::DeleteFromDatabase(), util::xmsg::XArgo::GenerateListingString(), util::xmsg::XEngAscent::GenerateLis

10.84.4 Member Data Documentation

10.84.4.1 air_bladder_max_pres_mpsi_

```
uint16_t util::xmsg::XEngSurface::air_bladder_max_pres_mpsi_  [private]
```

The maximum measured air bladder pressure during the air pump, in .001 PSI.

Note

This field was added in version 0x11.

10.84.4.2 air_pump_current_ma_

```
uint16_t util::xmsg::XEngSurface::air_pump_current_ma_  [private]
```

The measured air pump current, in mA.

Note

This field was added in version 0x11.

10.84.4.3 air_pump_runtime_s_

```
uint16_t util::xmsg::XEngSurface::air_pump_runtime_s_  [private]
```

The measured air pump run time, in seconds.

Note

This field was added in version 0x11.

10.84.4.4 air_valve_closed_cal_position_mv_

```
uint16_t util::xmsg::XEngSurface::air_valve_closed_cal_position_mv_  [private]
```

The air valve closed calibration position, in mV.

Note

This field was added in version 0x11.

10.84.4.5 air_valve_mid_cal_position_mv_

```
uint16_t util::xmsg::XEngSurface::air_valve_mid_cal_position_mv_  [private]
```

The air valve mid calibration position, in mV.

Note

This field was added in version 0x11.

10.84.4.6 air_valve_mid_position_at_end_mv_

```
uint16_t util::xmsg::XEngSurface::air_valve_mid_position_at_end_mv_  [private]
```

The air valve mid position at the end of the surface phase of the dive cycle, in mV.

Note

This field was added in version 0x11.

10.84.4.7 air_valve_open_cal_position_mv_

```
uint16_t util::xmsg::XEngSurface::air_valve_open_cal_position_mv_  [private]
```

The air valve open calibration position, in mV.

Note

This field was added in version 0x11.

10.84.4.8 air_valve_open_position_at_start_mv_

```
uint16_t util::xmsg::XEngSurface::air_valve_open_position_at_start_mv_  [private]
```

The air valve open position at the start of the surface phase of the dive cycle, in mV.

Note

This field was added in version 0x11.

10.84.4.9 battery_voltage_mv_

```
uint16_t util::xmsg::XEngSurface::battery_voltage_mv_  [private]
```

The measured system battery voltage, in mV.

Note

This field is only used for message version 0x10. It was removed in version 0x11.

Referenced by battery_voltage_v().

10.84.4.10 case_vac_at_end_cinhg_

```
uint16_t util::xmsg::XEngSurface::case_vac_at_end_cinhg_  [private]
```

The measured internal pressure case vacuum, in 0.01 inHg, at the end of the surface phase of the dive cycle.

Note

This field was added in version 0x11.

10.84.4.11 case_vac_at_start_cinhg_

```
uint16_t util::xmsg::XEngSurface::case_vac_at_start_cinhg_  [private]
```

The measured internal pressure case vacuum, in 0.01 inHg, at the start of the surface phase of the dive cycle.

Note

This field was added in version 0x11.

10.84.4.12 case_vac_cingh_

```
uint16_t util::xmsg::XEngSurface::case_vac_cingh_  [private]
```

The measured internal pressure case vacuum, in 0.01 inHg.

Note

This field is only used for message version 0x10. It was removed in version 0x11.

Referenced by case_vacuum_inhg().

10.84.4.13 ctd_status_code_

```
uint32_t util::xmsg::XEngSurface::ctd_status_code_  [private]
```

The CTD status code.

Todo Define status code values for the ALAMO surface engineering data message.

10.84.4.14 engineering_version_

```
uint8_t util::xmsg::XAlamoEngineering::engineering_version_  [private], [inherited]
```

The engineering message version identifier.

Referenced by util::xmsg::XAlamoEngineering::engineering_version(), util::xmsg::XAlamoEngineering::engineering_version_as_float(), and util::xmsg::XAlamoEngineering::set_engineering_version().

10.84.4.15 error_codes_

```
vector<shared_ptr<XEngErrorCode> > util::xmsg::XEngSurface::error_codes_  [private]
```

The error code values for this dive, if any.

Referenced by DecodeXMsgData(), and GenerateListingString().

10.84.4.16 id_dive_

```
int16_t util::xmsg::XMessage::id_dive_  [private], [inherited]
```

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.84.4.17 id_instrument_

```
uint16_t util::xmsg::XMessage::id_instrument_  [private], [inherited]
```

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.84.4.18 id_xmsg_type_

```
XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_  [private], [inherited]
```

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.84.4.19 num_errors_

```
uint8_t util::xmsg::XEngSurface::num_errors_  [private]
```

The number of error codes reported for this dive cycle.

10.84.4.20 num_sbd_packets_for_dive_

```
uint16_t util::xmsg::XEngSurface::num_sbd_packets_for_dive_  [private]
```

The number of packets to be transmitted for the current dive.

10.84.4.21 num_transmit_attempts_for_previous_dive_

```
uint16_t util::xmsg::XEngSurface::num_transmit_attempts_for_previous_dive_  [private]
```

The number of attempts to transmit in the previous Iridium session.

10.84.4.22 oil_valve_closed_cal_position_mv_

```
uint16_t util::xmsg::XEngSurface::oil_valve_closed_cal_position_mv_  [private]
```

The oil valve closed calibration position, in mV.

10.84.4.23 oil_valve_closed_position_at_end_mv_

```
uint16_t util::xmsg::XEngSurface::oil_valve_closed_position_at_end_mv_  [private]
```

The oil valve closed position at the end of the surface phase of the dive cycle, in mV.

10.84.4.24 oil_valve_open_cal_position_mv_

```
uint16_t util::xmsg::XEngSurface::oil_valve_open_cal_position_mv_  [private]
```

The oil valve open calibration position at the end of the surface phase of the dive cycle, in mV.

10.84.4.25 oil_valve_open_position_during_air_assist_mv_

```
uint16_t util::xmsg::XEngSurface::oil_valve_open_position_during_air_assist_mv_  [private]
```

The oil valve open position during air pump, in mV.

10.84.4.26 pressure_offset_reading_

```
int16_t util::xmsg::XEngSurface::pressure_offset_reading_  [private]
```

The measured pressure sensor offset at the surface, in 1/1000 dBar.

10.84.4.27 start_time_

```
ptime util::xmsg::XAlamoEngineering::start_time_  [private], [inherited]
```

The engineering message state start time.

Referenced by util::xmsg::XAlamoEngineering::set_start_time(), and util::xmsg::XAlamoEngineering::start_time().

10.84.4.28 system_current_ma_

```
uint16_t util::xmsg::XEngSurface::system_current_ma_  [private]
```

The measured system current, in mA.

Note

This field is only used for message version 0x10. It was removed in version 0x11.

Referenced by system_current_a().

10.84.4.29 xmsg_size_bytes_

```
uint16_t util::xmsg::XMessage::xmsg_size_bytes_  [private], [inherited]
```

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

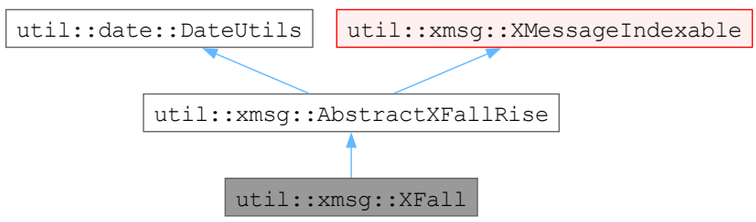
- data/xmsg/XEngSurface.h

10.85 util::xmsg::XFall Class Reference

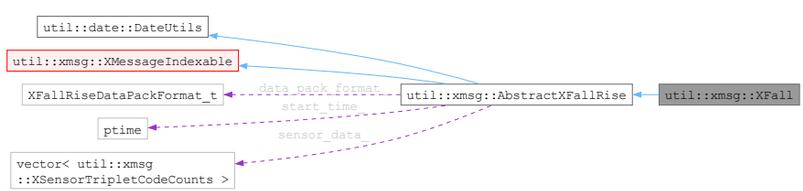
Class representing a fall time-series data X-Message.

`#include <XFall.h>`

Inheritance diagram for util::xmsg::XFall:



Collaboration diagram for util::xmsg::XFall:



Public Member Functions

- XFall (int16_t dive, uint16_t whoi, const vector< uint8_t > &data)

  Parameterized constructor.
- ~XFall ()

  Destructor.
- const uint8_t * CheckXMsgData (const vector< uint8_t > &data, int id, int minBytes, bool parseSize=true)

  Check the X-message for the correct ID, minimum size, and message terminator.
- XFallRiseDataPackFormat_t data_pack_format () const

  Get the enumerated data packing format type.
- void DecodeXMsgData (const vector< uint8_t > &data)

  Decode the fall data X-Message from the binary message data.
- const string GenerateListingString (uint16_t pg, uint16_t po, uint16_t sg, uint16_t so, uint16_t tg, uint16_t to, float pc) const

  Get the listing entry string for this fall data X-Message.
- int16_t id_dive () const

  Get the dive or cycle number of this X-Message.
- uint16_t id_instrument () const

  Get the unique instrument identifier of this X-Message.
- XMsgTypeId_t id_xmsg_type () const

  Get the enumerated X-Message type identifier.
- size_t num_samples () const

  Get the number of samples in this message.
- const vector< XSensorTripletCodeCounts > & sensor_data () const

  Get the vector of sensor data triplets.
- const ptime & start_time () const

  Get the start time of this message.
- uint8_t xmsg_index () const

  Get the index of this X-Message.
- uint16_t xmsg_size_bytes () const

  Get the size of the X-Message, in bytes.

Static Public Member Functions

- static string GenerateCurrentUtcTimeIso8601String ()

  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- static string GenerateIso8601String (const ptime &p, bool extended=true)

  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)

  Convert a date/time to fractional days since a reference date/time.
- static const string GenerateListingComment ()

  Get the listing entry comment string.
- static ptime GetCurrentUtcTime ()

  Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Protected Member Functions

- void set_data_pack_format (XFallRiseDataPackFormat_t data_pack_format)

  Set the enumerated data packing format value for this message.
- void set_id_dive (int16_t id_dive)

  Set the dive or cycle number of this message.
- void set_id_instrument (uint16_t id_instrument)

  Set the unique instrument identifier.
- void set_id_xmsg_type (XMsgTypeId_t id_xmsg_type)

  Set the X-Message type identifier.
- void set_start_time (const ptime &start_time)

  Set the start time of this message.
- void set_xmsg_index (uint8_t xmsg_index)

  Set the index of this X-Message.
- void set_xmsg_size_bytes (uint16_t xmsg_size_bytes)

  Set the size of the X-Message, in bytes.
- vector< XSensorTripletCodeCounts > UnpackData (const vector< uint8_t > &data)

  Unpack the fall/rise data from the binary message.

Private Attributes

- XFallRiseDataPackFormat_t data_pack_format_

  The packing format type identifier.
- int16_t id_dive_

  The dive or cycle number of this message.
- uint16_t id_instrument_

  The unique WHOI identifier of this instrument.
- XMsgTypeId_t id_xmsg_type_

  The X-message type identifier.
- vector< XSensorTripletCodeCounts > sensor_data_

  The raw counts of measured fall, rise, or surface time-series data.
- ptime start_time_

  The start time reference.
- uint8_t xmsg_index_

  The index of this X-Message.
- uint16_t xmsg_size_bytes_

  The size of the X message, in bytes.

10.85.1 Detailed Description

Class representing a fall time-series data X-Message.

10.85.2 Constructor & Destructor Documentation

10.85.2.1 XFall()

```
util::xmsg::XFall::XFall (
            int16_t dive,
            uint16_t whoi,
            const vector< uint8_t > & data)  [inline]
```

Parameterized constructor.

Parameters

in	*dive*	The dive or cycle number of this message.
in	*whoi*	The unique WHOI identifier.
in	*data*	The binary fall rate X-message data to decode.

Exceptions

log::MessageException	if an decode error occurs.

References DecodeXMsgData().

Here is the call graph for this function:

10.85.2.2 ~XFall()

```
util::xmsg::XFall::~XFall ()  [inline]
```

Destructor.

10.85.3 Member Function Documentation

10.85.3.1 CheckXMsgData()

```
const uint8_t * util::xmsg::XMessage::CheckXMsgData (
            const vector< uint8_t > & data,
            int id,
            int minBytes,
            bool parseSize = true)  [inline], [inherited]
```

Check the X-message for the correct ID, minimum size, and message terminator.

Parameters

in	*data*	The X-message binary data to check.
in	*id*	The expected ID of the X-message. If this field is less that 0, then the ID check will be skipped.
in	*minBytes*	The minimum number of bytes expected in a valid message.
in	*parseSize*	If TRUE, then the message size field will be parsed from the X-Message. Otherwise, the size field will not be parsed.

Exceptions

util::log::MessageException	if • the message does not contain the expected ID, • the message does not contain the minimum number of expected bytes, • the message does not contain a terminator (';') in the correct location, or, • any other error occurs.

Returns

A pointer to the underlying data buffer of data.

10.85.3.2 data_pack_format()

```
XFallRiseDataPackFormat_t util::xmsg::AbstractXFallRise::data_pack_format () const  [inline],
[inherited]
```

Get the enumerated data packing format type.

Returns

The enumerated data packing format type.

References util::xmsg::AbstractXFallRise::data_pack_format_.

Referenced by util::xmsg::AbstractXFallRise::set_data_pack_format(), and util::xmsg::AbstractXFallRise::UnpackData().

10.85.3.3 DecodeXMsgData()

```
void util::xmsg::XFall::DecodeXMsgData (
            const vector< uint8_t > & data)  [inline], [virtual]
```

Decode the fall data X-Message from the binary message data.

Parameters

in	*data*	The binary message data to decode.

Exceptions

log::MessageException	if the message is invalid or an error occurs during decoding.

Implements util::xmsg::AbstractXFallRise.

References CATCH_BLOCK, EXC_THROW, util::xmsg::AbstractXFallRise::UnpackData(), and util::xmsg::XMSG_TYPE_ID_FALL0.

Referenced by XFall().

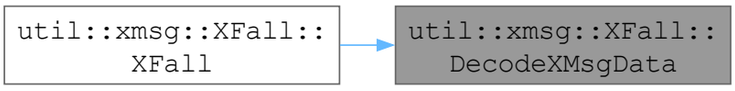
Here is the caller graph for this function:



10.85.3.4 GenerateCurrentUtcTimeIso8601String()

`static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String () [inline], [static], [inherited]`

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

Returns

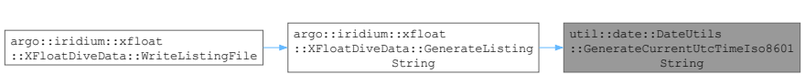
An ISO8601 format date/time string representation of the current time.

References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:

Here is the caller graph for this function:



10.85.3.5 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

Referenced by util::xmsg::AbstractXTimeSeriesDataComposite< MSG_CLASS >::AggregateSensorData(), util::xmsg::XEngIce::XEngIce

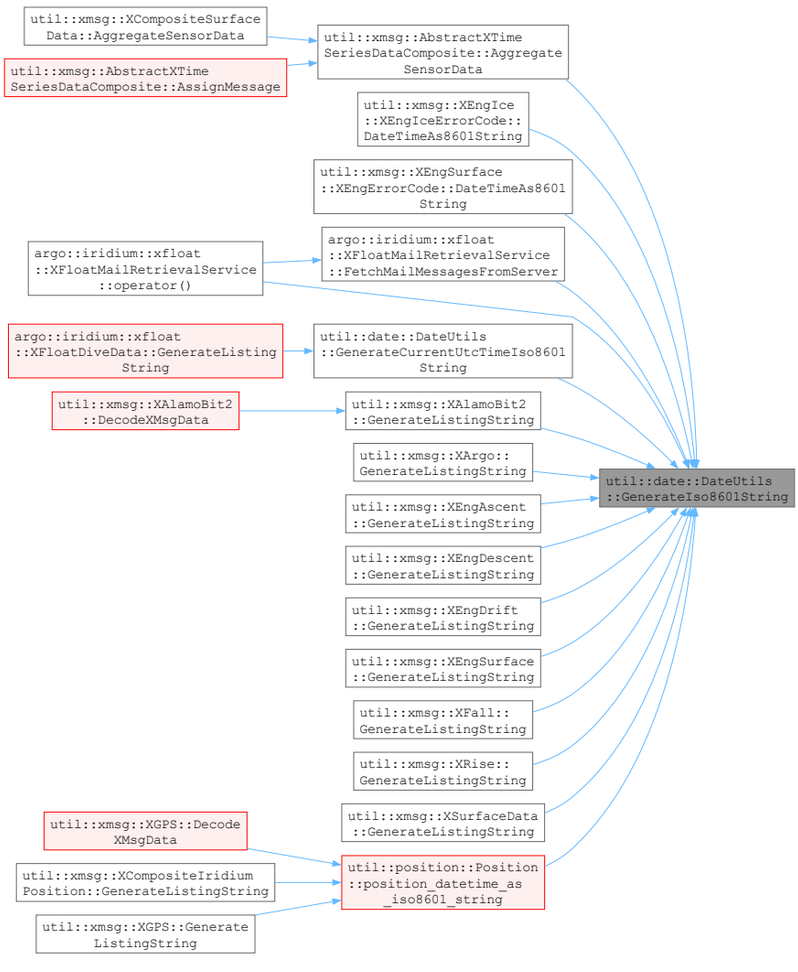
Here is the caller graph for this function:



10.85.3.6 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref↩ _dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.85.3.7 GenerateListingComment()

```
static const string util::xmsg::AbstractXFallRise::GenerateListingComment ()  [inline], [static],
[inherited]
```

Get the listing entry comment string.

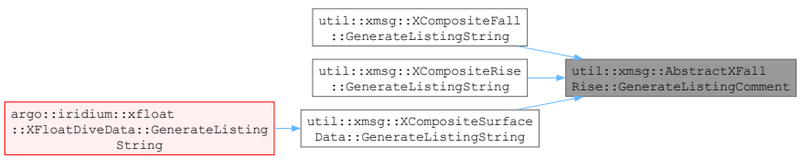
Returns

The listing entry comment string.

References CATCH_BLOCK.

Referenced by util::xmsg::XCompositeFall::GenerateListingString(), util::xmsg::XCompositeRise::GenerateListingString(), and util::xmsg::XCompositeSurfaceData::GenerateListingString().

Here is the caller graph for this function:



10.85.3.8 GenerateListingString()

```
const string util::xmsg::XFall::GenerateListingString (
            uint16_t pg,
            uint16_t po,
            uint16_t sg,
            uint16_t so,
            uint16_t tg,
            uint16_t to,
            float pc) const  [inline]
```

Get the listing entry string for this fall data X-Message.

Parameters

in	*pg*	The pressure sensor sensitivity scale factor, in LSB/dBar.
in	*po*	The pressure sensor offset, in dBar.
in	*sg*	The salinity sensor sensitivity scale factor, in LSB/PSU.
in	*so*	The salinity sensor offset, in PSU.
in	*tg*	The temperature sensor sensitivity scale factor, in LSB/degC.
in	*to*	The temperature sensor offset, in degC.
in	*pc*	The pressure correction, in dBar, to be subtracted computed pressure value.

Exceptions

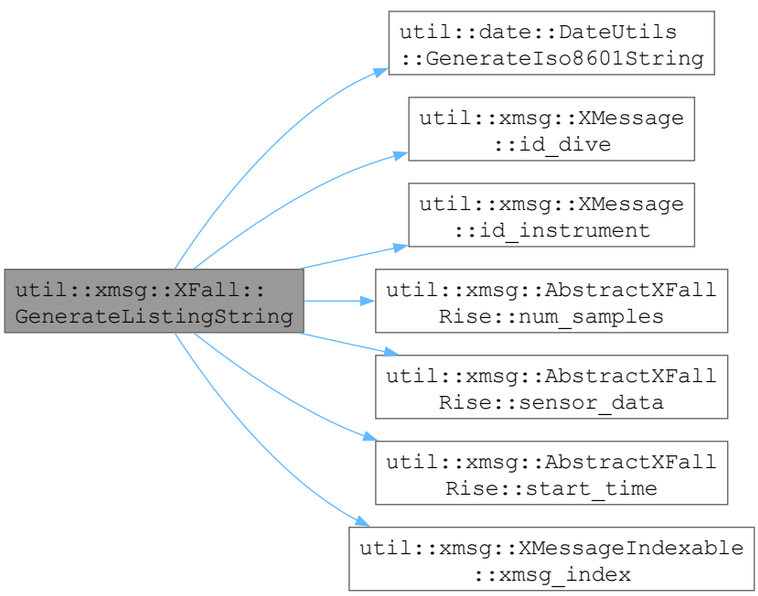
log::MessageException	if an error occurs while generating the listing string.

Returns

The listing entry string for this fall data X-Message

References CATCH_BLOCK, util::date::DateUtils::GenerateIso8601String(), util::xmsg::XMessage::id_dive(), util::xmsg::XMessage::id_ins
util::xmsg::AbstractXFallRise::num_samples(), util::xmsg::AbstractXFallRise::sensor_data(), util::xmsg::AbstractXFallRise::start_time(),
and util::xmsg::XMessageIndexable::xmsg_index().

Here is the call graph for this function:



10.85.3.9 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

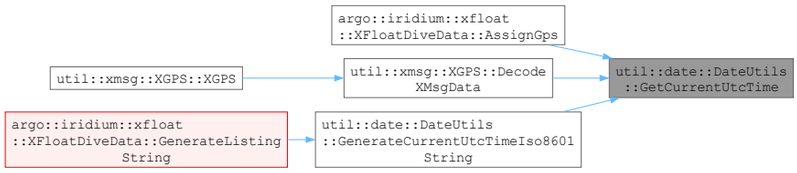
Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

Here is the caller graph for this function:



10.85.3.10 id_dive()

```
int16_t util::xmsg::XMessage::id_dive () const  [inline], [inherited]
```

Get the dive or cycle number of this X-Message.

Returns

The dive or cycle number of this X-Message.

References util::xmsg::XMessage::id_dive_.

Referenced by util::xmsg::XGPS::DeleteFromDatabase(), util::xmsg::XArgo::GenerateListingString(), util::xmsg::XEngAscent::GenerateLis

Here is the caller graph for this function:

10.85.3.22 start_time()

```
const ptime & util::xmsg::AbstractXFallRise::start_time () const  [inline], [inherited]
```

Get the start time of this message.

Returns

The start time of this message.

References util::xmsg::AbstractXFallRise::start_time_.

Referenced by GenerateListingString(), util::xmsg::XRise::GenerateListingString(), util::xmsg::XSurfaceData::GenerateListingString(), and util::xmsg::AbstractXFallRise::set_start_time().

10.85.3.23 UnpackData()

```
vector< XSensorTripletCodeCounts > util::xmsg::AbstractXFallRise::UnpackData (
            const vector< uint8_t > & data)  [inline], [protected], [inherited]
```

Unpack the fall/rise data from the binary message.

Parameters

in	*data*	The binary message to unpack.

Exceptions

util::log::MessageException	if • the message is of insufficient length, • an invalid packing format is encountered, or • the message terminator is in an invalid location.

Returns

The raw counts of measured fall or rise time-series data.

References CATCH_BLOCK, util::xmsg::XMessage::CheckXMsgData(), util::xmsg::AbstractXFallRise::data_pack_format(), EXC_THROW, lwrn, s2000, util::xmsg::AbstractXFallRise::sensor_data_, util::xmsg::AbstractXFallRise::set_data_pack_format(), util::xmsg::AbstractXFallRise::set_start_time(), util::xmsg::XMessageIndexable::set_xmsg_index(), util::xmsg::XMessage::set_xmsg_size_ XMSG_SENS_BAD, util::xmsg::XMessage::xmsg_size_bytes(), util::xmsg::XPHASE_CODE_UNKNOWN, util::xmsg::XRISEFALL_FMT_ util::xmsg::XRISEFALL_FMT_STNDRD, util::xmsg::XRISEFALL_FMT_STNDRD_WITH_TEMP_AND_SALN, and util::xmsg::XRISEFALL_FMT_UNKNOWN.

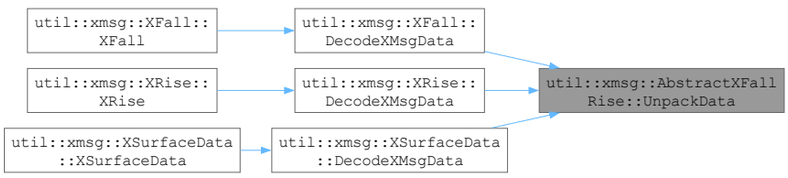
Here is the caller graph for this function:



10.85.3.24 xmsg_index()

```
uint8_t util::xmsg::XMessageIndexable::xmsg_index () const  [inline], [inherited]
```

Get the index of this X-Message.

Returns

The index of this X-Message.

References util::xmsg::XMessageIndexable::xmsg_index_.

Referenced by util::xmsg::XMissionConfiguration::DecodeXMsgData(), GenerateListingString(), util::xmsg::XMissionConfiguration::Genera

10.85.4 Member Data Documentation

10.85.4.1 data_pack_format_

```
XFallRiseDataPackFormat_t util::xmsg::AbstractXFallRise::data_pack_format_  [private], [inherited]
```

The packing format type identifier.

Referenced by util::xmsg::AbstractXFallRise::data_pack_format(), and util::xmsg::AbstractXFallRise::set_data_pack_format().

10.85.4.2 id_dive_

int16_t util::xmsg::XMessage::id_dive_ [private], [inherited]

The dive or cycle number of this message.

Referenced by util::xmsg::XMessage::id_dive(), and util::xmsg::XMessage::set_id_dive().

10.85.4.3 id_instrument_

uint16_t util::xmsg::XMessage::id_instrument_ [private], [inherited]

The unique WHOI identifier of this instrument.

Referenced by util::xmsg::XMessage::id_instrument(), and util::xmsg::XMessage::set_id_instrument().

10.85.4.4 id_xmsg_type_

XMsgTypeId_t util::xmsg::XMessage::id_xmsg_type_ [private], [inherited]

The X-message type identifier.

Referenced by util::xmsg::XMessage::id_xmsg_type(), and util::xmsg::XMessage::set_id_xmsg_type().

10.85.4.5 sensor_data_

vector<XSensorTripletCodeCounts> util::xmsg::AbstractXFallRise::sensor_data_ [private], [inherited]

The raw counts of measured fall, rise, or surface time-series data.

Referenced by util::xmsg::AbstractXFallRise::num_samples(), util::xmsg::AbstractXFallRise::sensor_data(), and util::xmsg::AbstractXFallRise::UnpackData().

10.85.4.6 start_time_

ptime util::xmsg::AbstractXFallRise::start_time_ [private], [inherited]

The start time reference.

Referenced by util::xmsg::AbstractXFallRise::set_start_time(), and util::xmsg::AbstractXFallRise::start_time().

10.85.4.7 xmsg_index_

uint8_t util::xmsg::XMessageIndexable::xmsg_index_ [private], [inherited]

The index of this X-Message.

Referenced by util::xmsg::XMessageIndexable::set_xmsg_index(), and util::xmsg::XMessageIndexable::xmsg_index().

10.85.4.8 xmsg_size_bytes_

uint16_t util::xmsg::XMessage::xmsg_size_bytes_ [private], [inherited]

The size of the X message, in bytes.

Referenced by util::xmsg::XMessage::set_xmsg_size_bytes(), and util::xmsg::XMessage::xmsg_size_bytes().

The documentation for this class was generated from the following file:

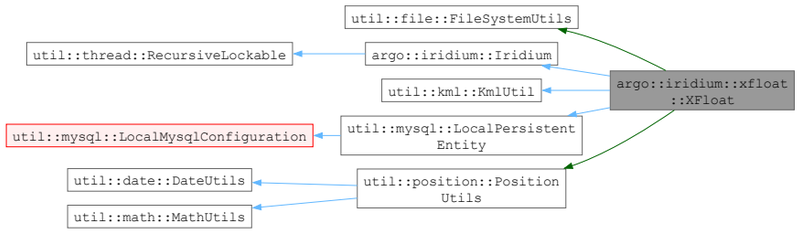
- data/xmsg/XFall.h

10.86 argo::iridium::xfloat::XFloat Class Reference

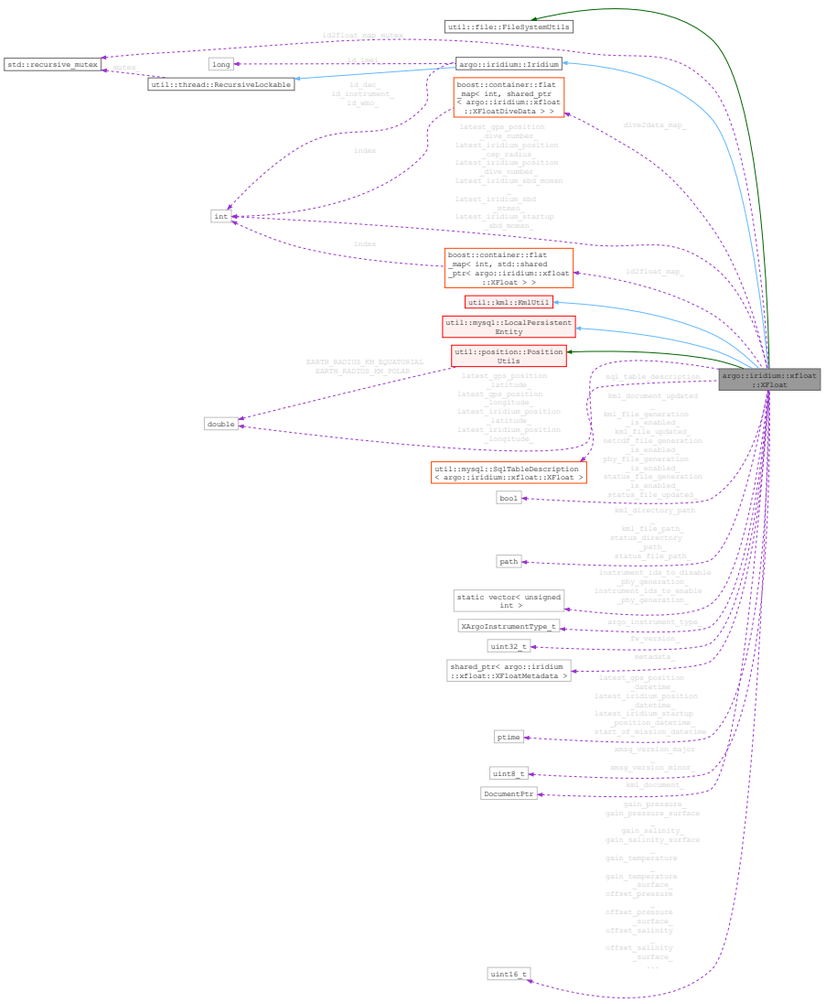
The instrument or float class.

`#include <XFloat.h>`

Inheritance diagram for argo::iridium::xfloat::XFloat:



Collaboration diagram for argo::iridium::xfloat::XFloat:



Public Member Functions

- XFloat ()

  The default constructor.
- XFloat (int whoi, long long imei=XFLT_ID_UNKNOWN, int wmo=XFLT_ID_UNKNOWN, int dac=XFLT_ID_UNKNOWN)

  The parameterized constructor.
- ~XFloat ()

  The destructor.
- uint8_t argo_instrument_type () const

Get the enumerated Argo instrument type identifier.

- uint32_t fw_version () const

  Get the firmware version.

- uint16_t gain_pressure () const ATTR_DEPRECATED

  Get the pressure gain value, in dBar/LSB.

- uint16_t gain_pressure_surface () const ATTR_DEPRECATED

  Get the pressure gain value for surface data, in dBar/LSB.

- uint16_t gain_salinity () const ATTR_DEPRECATED

  Get the salinity gain value, in PSU/LSB.

- uint16_t gain_salinity_surface () const ATTR_DEPRECATED

  Get the salinity gain value for surface data, in PSU/LSB.

- uint16_t gain_temperature () const ATTR_DEPRECATED

  Get the temperature gain value, in degC/LSB.

- uint16_t gain_temperature_surface () const ATTR_DEPRECATED

  Get the temperature gain value for surface data, in degC/LSB.

- vector< shared_ptr< XFloatDiveData > > GetAllDiveData ()

  Get all dive data objects for this float.

- shared_ptr< XFloatDiveData > GetDiveData (int dive, bool load_from_local_cache_only=false)

  Get the dive data object from the dive or cycle number.

- vector< shared_ptr< x::XGPS > > **GetGpsPositions** () const
- path GetListingDirectoryPath () const

  Get the listing directory path for this float.

- int id_dac () const

  Get the unique Data Assembly Center (DAC) identifier.

- long id_imei () const

  Get the unique International Mobile Equipment Identifier (IMEI).

- int id_instrument () const

  Get the unique instrument identifier or instrument serial number.

- int id_wmo () const

  Get the unique World Meteorological Organization (WMO) identifier.

- bool **is_kml_document_updated** () const
- bool **is_kml_file_updated** () const
- bool **is_status_file_updated** () const
- const kmldom::DocumentPtr & **kml_document** () const
- const path & **kml_file_path** () const
- string **latest_gps_position_as_iso6709_string** () const
- ptime **latest_gps_position_datetime** () const
- int **latest_gps_position_dive_number** () const
- double **latest_gps_position_latitude** () const
- double **latest_gps_position_longitude** () const
- string **latest_iridium_position_as_iso6709_string** () const
- int **latest_iridium_position_cep_radius** () const
- ptime **latest_iridium_position_datetime** () const
- int **latest_iridium_position_dive_number** () const
- double **latest_iridium_position_latitude** () const
- double **latest_iridium_position_longitude** () const
- const ptime & **latest_iridium_startup_position_datetime** () const
- int **latest_iridium_startup_sbd_momsn** () const
- int **latest_sbd_momsn** () const
- int **latest_sbd_mtmsn** () const
- bool LockObject (bool block)

  Lock the object.

- const shared_ptr< XFloatMetadata > & metadata () const

  Get the metadata object for this instrument.

- bool **netcdf_file_generation_is_enabled** () const
- uint16_t offset_pressure () const ATTR_DEPRECATED

  Get the pressure offset value for this instrument, in dBar.

- uint16_t offset_pressure_surface () const ATTR_DEPRECATED

  Get the pressure offset value for surface data, in dBar.

- uint16_t offset_salinity () const ATTR_DEPRECATED

  Get the salinity offset value for this instrument, in PSU.

- uint16_t offset_salinity_surface () const ATTR_DEPRECATED

  Get the salinity offset value for surface data, in PSU.

- uint16_t offset_temperature () const ATTR_DEPRECATED

Get the temperature offset value for this instrument, in degC.

- uint16_t offset_temperature_surface () const ATTR_DEPRECATED

  Get the temperature offset value for surface data, in degC.

- bool phy_file_generation_is_enabled () const

  Is PHY file generation enabled?

- void ResetCachedDiveData (int dive) ATTR_NO_EXCEPTIONS

  Reset the dive data object for the given dive or cycle number.

- void ResetDiveData ()

  Reset the dive data objects for this float.

- ptime start_of_mission_datetime () const

  Get the date/time of the start-of-mission for this instrument.

- const path & **status_file_path** () const
- void UnlockObject ()

  Unlock the object.

- uint8_t xmsg_version_major () const

  Get the X-Message major version identifier for this instrument.

- uint8_t xmsg_version_minor () const

  Get the X-Message minor version identifier for this instrument.

Static Public Member Functions

- static void CloseKmlFactory ()

  Release this thread's KML factory pointer.

- static void CloseSqlConnection ()

  Close the thread-specific MySQL connection if it is currently open.

- static shared_ptr< sql::ResultSet > **executeDeleteQuery** (const string &from, const string &where="")
- static shared_ptr< ResultSet > ExecuteQuery (Connection *con, const string &query)

  Execute an SQL query and return a shared pointer to the ResultSet object.

- static shared_ptr< sql::ResultSet > executeQuery (const string &query)

  Execute an SQL query and return a shared pointer to the ResultSet object.

- static shared_ptr< sql::ResultSet > executeSelectQuery (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)

  Execute an SQL select query and return a shared pointer to the ResultSet object.

- static int ExecuteUpdate (Connection *con, const string &update)

  Execute an SQL update and return the status code.

- static int executeUpdate (const string &update)

  Execute an SQL update and return the status code.

- static shared_ptr< PreparedStatement > GeneratePreparedStatement (Connection *con, const string &statement)

  Generate a prepared SQL statement object for the given SQL statement.

- static shared_ptr< sql::PreparedStatement > generatePreparedStatement (const string &statement)

  Generate a prepared SQL statement object for the given SQL statement.

- static string GenerateSqlDeleteStr (const string &from, const string &where="")

  Generate an SQL DELETE statement.

- static string GenerateSqlSelectStr (const string &what, const string &from, const string &where="", const string &groupBy="", const string &orderBy="", unsigned int limit=0, unsigned int offset=0)

  Generate an SQL select statement.

- static vector< shared_ptr< XFloat > > GetAllCachedFloats ()

  Get all float objects currently stored in the cache.

- static const Color32 & GetDefaltKmlPathColor (int id)

  Get the palette colour for an index (an instrument ID, for example), modulo the palette size.

- static const string & GetDefaltKmlPathStyleId (int id)

  Get the path (line) style ID for an index, modulo the palette size.

- static const string & GetDefaltKmlPlacemarkStyleId (int id)

  Get the large placemark style ID for an index, modulo the palette size.

- static shared_ptr< XFloat > GetFloat (int instrument_id)

  Get a float object from the instrument identifier.

- static thread_specific_ptr< KmlFactory > & GetKmlFactory ()

  Get the libkml factory, initializing it for this thread if necessary.

- static const string & GetSmallKmlPlacemarkStyleId (int id)

  Get the small placemark style ID for an index, modulo the palette size.

- static thread_specific_ptr< Connection > & GetSqlConnection (string url, string user, string password, string schema)

Get a thread-specific instance of a MySQL connection object.

- static thread_specific_ptr< MySQL_Driver > & GetSqlDriver ()

  Get a thread-specific instance of a MySQL driver object.
- static const string & GetTriangleKmlPlacemarkStyleId (int id)

  Get the triangle placemark style ID for an index, modulo the palette size.
- static const vector< unsigned int > & instrument_ids_to_disable_phy_generation ()

  Get the floats that the user has specified to disable PHY file generation.
- static const vector< unsigned int > & instrument_ids_to_enable_phy_generation ()

  Get the floats that the user has specified to enable PHY file generation.
- static void LoadLocalCacheFromDatabase ()

  Load all persistent instrument data from the database and use this data to populate the local cache.
- static void LoadMetadataFromFiles ()

  Load the instrument metadata.
- static void SaveLocalCacheToDatabase ()

  Save the local cache of X-Float objects to the database.
- static vector< shared_ptr< XFloat > > SelectAllObjectsFromDatabase (const string &groupBy="", const string &orderBy="", const unsigned int &limit=0, const unsigned int &offset=0)

  Select all XFloat objects from this SQL database table.
- static shared_ptr< XFloat > SelectObjectFromDatabase (const string &where="", const string &groupBy="", const string &orderBy="", const unsigned int &offset=0)

  Get a single XFloat object from the database.
- static vector< shared_ptr< XFloat > > SelectObjectsFromDatabase (const string &where="", const string &groupBy="", const string &orderBy="", const unsigned int &limit=0, const unsigned int &offset=0)

  Query float objects from the SQL database.
- template<typename TT >
  static TT SelectValueFromDatabase (const string &what, const string &where="", const string &groupBy="", const string &orderBy="", const unsigned int &offset=0)

  Select a value from the SQL database table that contains the persisted float objects.
- static void SetAllDefaultKmlSyles (const DocumentPtr &document)

  Add the default styles for every palette colour to a KML document.
- static void SetDefaultKmlStyle (const DocumentPtr &document, unsigned int style_idx)

  Add the four default styles for one palette colour to a KML document.
- static void StartupTasks ()

  Perform XFloat startup tasks.

Protected Member Functions

- void set_id_dac (int id_dac)

  Set the unique Data Assembly Center (DAC) identifier.
- void set_id_imei (long id_imei)

  Set the unique International Mobile Equipment Identifier (IMEI).
- void set_id_instrument (int id_instrument)

  Set the unique instrument identifier or instrument serial number.
- void set_id_wmo (int id_wmo)

  Set the unique World Meteorological Organization (WMO) identifier.

Static Protected Member Functions

- static float **bitcastUint32ToFloat** (uint32_t u)
- template<typename T >
  static double CalculateEllipsoidHeight (T lat)

  Get the approximate surface altitude or height of earth for a given latitude, in kilometers.
- template<typename T >
  static double CalculateGeographicDistance (T lat1, T lon1, T lat0, T lon0)

  Get the geographical distance between two position, in kilometers, from the positions' locations, in decimal degrees.
- template<typename T >
  static double degToRad (T deg)

  Convert angular units from from degrees to decimal radians.
- static string GenerateCurrentUtcTimeIso8601String ()

  Generate an ISO8601 format date/time string representation of the current time, in UTC.
- template<typename T >
  static std::string GenerateIso6709String (T lat, T lon)

  Generate an IS06709 string representation of the position given by (`lat`, `lon`).

- static string GenerateIso8601String (const ptime &p, bool extended=true)

  Generate an ISO8601 format date/time string representation of a POSIX time object.
- static double GenerateJulianDay (const ptime &dt, const ptime &ref_dt)

  Convert a date/time to fractional days since a reference date/time.
- static ptime GetCurrentUtcTime ()

  Generate a POSIX time object representing the current date and time (rounded to the nearest second).
- static const path & GetDirectoryPath (const path &dir, bool create=false)

  Get a directory path.
- static path GetDirectoryPathFromString (const string &dir, bool create=false)

  Generate a boost::filesystem::path object from the directory path string.
- static sql::Connection * getSqlConnection ()

  Generate a thread-specific instance of a MySQL connection object.
- template<typename T >
  static bool IsPositionValid (T lat, T lon)

  Check position validity.
- static vector< path > ListDirectories (const path &dir)

  List all directories contained in the given directory.
- static vector< path > ListFiles (path dir, size_t n=0)

  List all regular files contained in the given directory.
- static path MoveFileToDirectory (const path &file, const path &dir_dst, bool create_dir=false)

  Copy a file into a directory.

Protected Attributes

- recursive_mutex mutex_

  Recursive mutual exclusion lock for synchronizing operations.

Private Member Functions

- kmldom::DocumentPtr **GenerateKmlDocument** (bool set_default_kml_style=true, bool visibility=true) const
- string GenerateKmlString ()

  Generate the Google Earth KML string for this float.
- string **GenerateStatusString** () const
- void SaveObjectToDatabase () const

  Save this float object to the database.
- void set_argo_instrument_type (uint8_t argo_instrument_type)

  Set the enumerated Argo instrument type identifier.
- void set_fw_version (uint32_t fw_version)

  Set the instrument firmware version.
- void set_gain_pressure (uint16_t gain)

  Set the instrument pressure gain value, in dBar/LSB.
- void set_gain_pressure_surface (uint16_t gain)

  Set the instrument pressure gain value for surface data, in dBar/LSB.
- void set_gain_salinity (uint16_t gain)

  Set the instrument salinity gain value, in PSU/LSB.
- void set_gain_salinity_surface (uint16_t gain)

  Set the instrument salinity gain value for surface data, in PSU/LSB.
- void set_gain_temperature (uint16_t gain)

  Set the instrument temperature gain value, in degC/LSB.
- void set_gain_temperature_surface (uint16_t gain)

  Set the instrument temperature gain value for surface data, in degC/LSB.
- void **set_kml_document** (const kmldom::DocumentPtr &kml_document)
- void **set_kml_document_updated** (bool kml_document_updated=true)
- void **set_kml_file_path** (const path &kml_file_path)
- void **set_kml_file_updated** (bool kml_file_updated=true)
- void **set_latest_gps_position_datetime** (const ptime &latest_gps_position_datetime)
- void **set_latest_gps_position_dive_number** (int latest_gps_position_dive_number)
- void **set_latest_gps_position_latitude** (double latest_gps_position_latitude)
- void **set_latest_gps_position_longitude** (double latest_gps_position_longitude)
- void **set_latest_iridium_position_cep_radius** (int latest_iridium_position_cep_radius)
- void **set_latest_iridium_position_datetime** (const ptime &latest_iridium_position_datetime)
- void **set_latest_iridium_position_dive_number** (int latest_iridium_position_dive_number)
- void **set_latest_iridium_position_latitude** (double latest_iridium_position_latitude)

- void **set_latest_iridium_position_longitude** (double latest_iridium_position_longitude)
- void **set_latest_iridium_startup_position_datetime** (const ptime &latest_iridium_startup_position_datetime)
- void **set_latest_iridium_startup_sbd_momsn** (int latest_iridium_startup_sbd_momsn)
- void **set_latest_sbd_momsn** (int latest_sbd_momsn)
- void **set_latest_sbd_mtmsn** (int latest_sbd_mtmsn)
- void set_metadata (const shared_ptr< XFloatMetadata > &metadata)

  Assign an instrument metadata object to this X-Float object.
- void **set_netcdf_file_generation_is_enabled** (bool netcdf_file_generation_is_enabled)
- void set_offset_pressure (uint16_t offs)

  Set the instrument pressure offset value, in dBar.
- void set_offset_pressure_surface (uint16_t offs)

  Set the instrument pressure offset value for surface data, in dBar.
- void set_offset_salinity (uint16_t offs)

  Set the instrument salinity offset value, in PSU.
- void set_offset_salinity_surface (uint16_t offs)

  Set the instrument salinity offset value for surface data, in PSU.
- void set_offset_temperature (uint16_t offs)

  Set the instrument temperature offset value, in degC.
- void set_offset_temperature_surface (uint16_t offs)

  Set the instrument temperature offset value for surface data, in degC.
- void set_phy_file_generation_is_enabled (bool is_enabled)

  Set the PHY-file-generation-is-enabled flag.
- void set_start_of_mission_datetime (const ptime &datetime)

  Set the date/time of the start-of-mission for this instrument.
- void **set_status_file_path** (const path &path)
- void **set_status_file_updated** (bool status_file_updated=true)
- void set_xmsg_version_major (uint8_t xmsg_version_major)

  Set the X-Message major version number.
- void set_xmsg_version_minor (uint8_t xmsg_version_minor)

  Set the X-Message minor version number.
- bool WriteKmlFile ()

  Write the Google Earth KML file for this float.
- void WriteStatusFile ()

  Write the status file for this float.

Static Private Member Functions

- static void CleanupSqlConnection (Connection *con)

  Cleanup an SQL connection.
- static void CleanupSqlDriver (MySQL_Driver *driver)

  Function for memory cleanup of MySQL driver on destruct.
- static kmldom::DocumentPtr GenerateKmlMasterDocument ()

  Generate the Google Earth KML master document.
- static string GenerateKmlMasterString ()

  Generate the Google Earth KML master string.
- static void WriteKmlMasterFile ()

  Write the KML master file.

Private Attributes

- XArgoInstrumentType_t argo_instrument_type_

  The enumerated Argo instrument type identifier.
- flat_map< int, shared_ptr< XFloatDiveData > > dive2data_map_

  The dive-number-to-dive-data-object map.
- uint32_t fw_version_

  The reported instrument firmware version.
- uint16_t gain_pressure_

  The pressure sensitivity gain factor, in dBar/LSB.
- uint16_t gain_pressure_surface_

  The pressure sensitivity gain factor for surface data, in dBar/LSB.
- uint16_t gain_salinity_

  The salinity sensitivity scale factor, in PSU/LSB.

- uint16_t gain_salinity_surface_

  The salinity sensitivity scale factor for surface data, in PSU/LSB.
- uint16_t gain_temperature_

  The temperature sensitivity gain factor, in degC/LSB.
- uint16_t gain_temperature_surface_

  The temperature sensitivity gain factor for surface data, in degC/LSB.
- int id_dac_

  The unique Data Assembly Center (DAC) identifier.
- long id_imei_

  The unique International Mobile Equipment Identifier (IMEI).
- int id_instrument_

  The unique instrument identifier or instrument serial number.
- int id_wmo_

  The unique World Meteorological Organization (WMO) identifier.
- kmldom::DocumentPtr kml_document_

  The GE KML document.
- bool kml_document_updated_

  The KML document is updated flag.
- path kml_file_path_

  The KMLfile path.
- bool kml_file_updated_

  The KML file is updated flag.
- ptime latest_gps_position_datetime_

  The latest GPS position date/time.
- int latest_gps_position_dive_number_

  The latest GPS position dive number.
- double latest_gps_position_latitude_

  The latest GPS position latitude.
- double latest_gps_position_longitude_

  The latest GPS position longitude.
- int latest_iridium_position_cep_radius_

  The latest iridium position circular error probable radius.
- ptime latest_iridium_position_datetime_

  The latest iridium position date/time.
- int latest_iridium_position_dive_number_

  The latest iridium position dive number.
- double latest_iridium_position_latitude_

  The latest iridium position latitude.
- double latest_iridium_position_longitude_

  The latest iridium position longitude.
- int latest_iridium_sbd_momsn_

  The latest iridium position Mobile-Originated Message Number (MOMSN).
- int latest_iridium_sbd_mtmsn_

  The latest iridium position Mobile-Terminated Message Number (MTMSN).
- ptime latest_iridium_startup_position_datetime_

  The latest startup iridium position date/time.
- int latest_iridium_startup_sbd_momsn_

  The latest startup iridium position Mobile-Originated Message Number (MOMSN).
- shared_ptr< XFloatMetadata > metadata_

  The instrument metadata.
- bool netcdf_file_generation_is_enabled_

  The NetCDF-file-generation-is-enabled flag.
- uint16_t offset_pressure_

  The pressure offset, in dBar.
- uint16_t offset_pressure_surface_

  The pressure offset for surface data, in dBar.
- uint16_t offset_salinity_

  The salinity offset, in PSU.
- uint16_t offset_salinity_surface_

  The salinity offset for surface data, in PSU.
- uint16_t offset_temperature_

  The temperature offset, in degC.
- uint16_t offset_temperature_surface_

The temperature offset for surface data, in degC.

- bool phy_file_generation_is_enabled_

  The PHY-file-generation-enabled flag.
- ptime start_of_mission_datetime_

  The date/time of startup of the instrument.
- path status_file_path_

  The status file path.
- bool status_file_updated_

  The status-file-is-updated flag.
- uint8_t xmsg_version_major_

  The X-Message format major version number.
- uint8_t xmsg_version_minor_

  The X-Message format minor version number.

Static Private Attributes

- static string address_

  The SQL server qualified name or IP address string.
- static const double EARTH_RADIUS_KM_EQUATORIAL = 6378.1

  The equatorial radius of the earth, in kilometers.
- static const double EARTH_RADIUS_KM_POLAR = 6356.1

  The polar radius of the earth, in kilometers.
- static flat_map< int, std::shared_ptr< XFloat > > id2float_map_

  The instrument-identifier-to-instrument-object map.
- static recursive_mutex id2float_map_mutex_

  The mutex lock for synchronizing access to the instrument-identifier-to-instrument-object map.
- static vector< unsigned int > instrument_ids_to_disable_phy_generation_

  A list of instrument identifiers for which to disable PHY file generation.
- static vector< unsigned int > instrument_ids_to_enable_phy_generation_

  A list of instrument identifiers for which to enable PHY file generation.
- static const Color32 kml_default_path_colors_ [KML_NUM_DFLT_PATH_COLORS]

  The colour palette for instrument paths and placemarks, indexed by style index.
- static const string kml_default_path_style_ids_ [KML_NUM_DFLT_PATH_COLORS]

  The KML style IDs of the path (line) styles, one per palette colour.
- static const string kml_default_placemark_style_ids_ [KML_NUM_DFLT_PATH_COLORS]

  The KML style IDs of the large placemark styles, one per palette colour.
- static path kml_directory_path_

  The KML file directory.
- static thread_specific_ptr< KmlFactory > kml_factory_

  The libkml factory used to create KML elements, held per thread.
- static bool kml_file_generation_is_enabled_

  The global KML-file-generation-is-enabled flag.
- static const string kml_small_placemark_style_ids_ [KML_NUM_DFLT_PATH_COLORS]

  The KML style IDs of the small placemark styles, one per palette colour.
- static const string kml_triangle_placemark_style_ids_ [KML_NUM_DFLT_PATH_COLORS]

  The KML style IDs of the triangle placemark styles, one per palette colour.
- static string password_

  The SQL server account password string.
- static unsigned int port_

  The SQL server port number.
- static string protocol_

  The protocol to use in the SQL server connection e.g.
- static string schema_

  The SQL server schema name.
- static thread_specific_ptr< Connection > sql_connection_

  Tthe thread-specific pointer to MySQL connection object.
- static thread_specific_ptr< MySQL_Driver > sql_driver_

  The thread-specific pointer to MySQL driver object.
- static const util::mysql::SqlTableDescription< XFloat > sql_table_description_

  The SQL table description object.
- static path status_directory_path_

  The global status file directory path.
- static bool status_file_generation_is_enabled_

  The global status-file-generation-is-enabled flag.
- static string user_

  The SQL server account username string.

Friends

- const util::config::LocalConfiguration & Initialize (int argc, char **argv)

  Initialize the application.
- options_description util::config::LocalConfiguration::GenerateCommandLineOptionsDescription ()

  Friend function for populating some of the static members of this class from the command-line options.
- options_description util::config::LocalConfiguration::GenerateConfigurationFileOptionsDescription ()

  Friend function for populating some of the static members of this class from the configuration file options.
- class **XFloatDiveData**
- class **XFloatMailProcessingService**
- class **XFloatPostProcessingService**
- class **XFloatTelemetryDecoderService**

10.86.1 Detailed Description

The instrument or float class.

This class represents a single instrument or float. Each instance of this contains information about an instrument including unique identifiers, sensor gains and offsets, metadata, and the instrument type. It also contains a dive-or-cycle-number-to-dive-data-object, dive2data_map_, map that contains all of the incomplete dive data objects that belong to the instrument, uniquely indexed by dive or cycle number. As the application receives the telemetry data from the instrument, the data is decoded and assigned to the corresponding dive data object. Once it is determined that the data is complete for a single dive, the intermediate and PHY listing files are written to the local filesystem, the dive data object is persisted to the SQL database, and then the shared reference to the dive data object is released, thereby purging the dive data from the program's memory.

At run-time, at most one float object will exist for each instrument. Each float object is accessed and/or manipulated by the worker threads through a shared reference. A shared reference to all float objects is contained in the instrument-identifier-to-instrument-object map, id2float_map_, which is indexed by the unique instrument identifier. During application initialization, the map is populated as a result of querying all the known instruments from the SQL database. Each time a float object is created, it is added to the map. During application termination, the daemon thread iterates over the contents of the map and persists each of the float objects to the SQL database.

Note

This object is lockable. It contains a recursive mutual exclusion (mutex) lock in order to synchronize access to and modification of objects of this type by various worker threads. Once the object is locked, any other thread that attempts to access or modify the object will block until the initial lock is released. Since the mutex is recursive, the object may be locked multiple times by the same thread without causing the thread to block indefinitely.

This class is mapped to an SQL database table by the sql_table_description_ object. This allows some or all of the field of this class to be persisted to the SQL database. Likewise, an object of this type may be constructed from the results of an SQL query to the corresponding table.

Todo Devise a method to actively check for (1) changes in the metadata files and (2) newly created metadata files. Load the metadata from the new or modified files and assign them to the corresponding float object. If necessary, retroactively process the mail messages for these instruments. Persist updates to the SQL database as necessary.

10.86.2 Constructor & Destructor Documentation

10.86.2.1 XFloat() [1/2]

```
argo::iridium::xfloat::XFloat::XFloat (
            int whoi,
            long long imei = XFLT_ID_UNKNOWN,
            int wmo = XFLT_ID_UNKNOWN,
            int dac = XFLT_ID_UNKNOWN)
```

The parameterized constructor.

Parameters

in	*imei*	The unique International Mobile Equipment Identifier (IMEI).
in	*whoi*	The unique WHOI identifier.
in	*wmo*	The unique World Meteorological Organization (WMO) identifier.
in	*dac*	The unique Data Assembly Center (DAC) identifier.

10.86.2.2 XFloat() [2/2]

```
argo::iridium::xfloat::XFloat::XFloat ()
```

The default constructor.

10.86.2.3 ~XFloat()

```
argo::iridium::xfloat::XFloat::~XFloat ()
```

The destructor.

10.86.3 Member Function Documentation

10.86.3.1 argo_instrument_type()

```
uint8_t argo::iridium::xfloat::XFloat::argo_instrument_type () const  [inline]
```

Get the enumerated Argo instrument type identifier.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The enumerated Argo instrument type identifier.

References argo_instrument_type_, and util::thread::RecursiveLockable::mutex_.

Referenced by set_argo_instrument_type().

Here is the caller graph for this function:

10.86.3.2 CalculateEllipsoidHeight()

```
template<typename T >
static double util::position::PositionUtils::CalculateEllipsoidHeight (
            T lat)  [inline], [static], [inherited]
```

Get the approximate surface altitude or height of earth for a given latitude, in kilometers.

Warning

This method provides approximate surface height estimates only! This approximation is calculated from a reference ellipsoid – a mathematically-defined surface that approximates the geoid, the truer figure of the Earth.

Parameters

in	*lat*	The geographic latitude of interest, in decimal degrees.

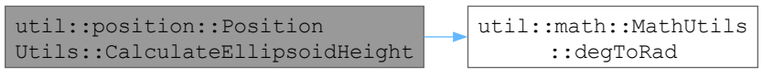
Returns

The approximate surface altitude or height of earth for the given latitude, in kilometers.

References util::math::MathUtils::degToRad(), util::position::PositionUtils::EARTH_RADIUS_KM_EQUATORIAL, and util::position::PositionUtils::EARTH_RADIUS_KM_POLAR.

Referenced by util::position::PositionUtils::CalculateGeographicDistance().

Here is the call graph for this function:



Here is the caller graph for this function:

10.86.3.3 CalculateGeographicDistance()

```
template<typename T >
static double util::position::PositionUtils::CalculateGeographicDistance (
            T lat1,
            T lon1,
            T lat0,
            T lon0)  [inline], [static], [inherited]
```

Get the geographical distance between two position, in kilometers, from the positions' locations, in decimal degrees.

Warning

This method provides approximate geographic estimates only! This approximation is calculated from a reference ellipsoid – a mathematically-defined surface that approximates the geoid, the truer figure of the Earth.

Note

This method uses the 'haversine' formula to calculate the great-circle distance between two points – that is, the shortest distance over the earth's surface – giving an 'as-the-crow-flies' distance between the points (ignoring any hills they fly over, of course!).

Parameters

in	*lat1*	The latitude of the geographic final position, in decimal degrees North.
in	*lon1*	The longitude of the geographic final position, in decimal degrees East.
in	*lat0*	The latitude of the geographic initial position, in decimal degrees North.
in	*lon0*	The longitude of the geographic initial position, in decimal degrees East.

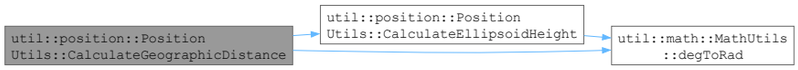
Returns

The geographical distance between the two given positions, in kilometers.

References util::position::PositionUtils::CalculateEllipsoidHeight(), and util::math::MathUtils::degToRad().

Referenced by util::xmsg::XCompositeIridiumPosition::ComputeAverageIrdiumPosition().

Here is the call graph for this function:



Here is the caller graph for this function:

10.86.3.4 CleanupSqlConnection()

```
static void util::mysql::MysqlUtils::CleanupSqlConnection (
            Connection * con)  [inline], [static], [private], [inherited]
```

Cleanup an SQL connection.

This function for memory cleanup of the SQL connection on destruction. The thread-specific SQL connection object will be deleted if it exists.

Parameters

in	*con*	The SQL connection to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL connection object.

References CATCH_BLOCK.

10.86.3.5 CleanupSqlDriver()

```
static void util::mysql::MysqlUtils::CleanupSqlDriver (
            MySQL_Driver * driver)  [inline], [static], [private], [inherited]
```

Function for memory cleanup of MySQL driver on destruct.

Signals the SQL driver to end operation, if it exists.

Parameters

in	*driver*	Driver to cleanup.

Exceptions

log::MessageException	if an error occurs while cleaning up the SQL driver object.

References CATCH_BLOCK.

10.86.3.6 CloseKmlFactory()

```
static void util::kml::KmlUtil::CloseKmlFactory ()  [inline], [static], [inherited]
```

Release this thread's KML factory pointer.

Warning

This deletes libkml's shared factory (see kml_factory_). It is not currently called.

Exceptions

util::log::MessageException	if an error occurs.

References CATCH_BLOCK, and util::kml::KmlUtil::kml_factory_.

10.86.3.7 CloseSqlConnection()

```
static void util::mysql::MysqlUtils::CloseSqlConnection ()  [inline], [static], [inherited]
```

Close the thread-specific MySQL connection if it is currently open.

If the thread local MySQL connection is not currently open, then this function will have no effect.

Note

The MySQL connection should be closed when idle to prevent the connection from timing out and throwing exceptions.

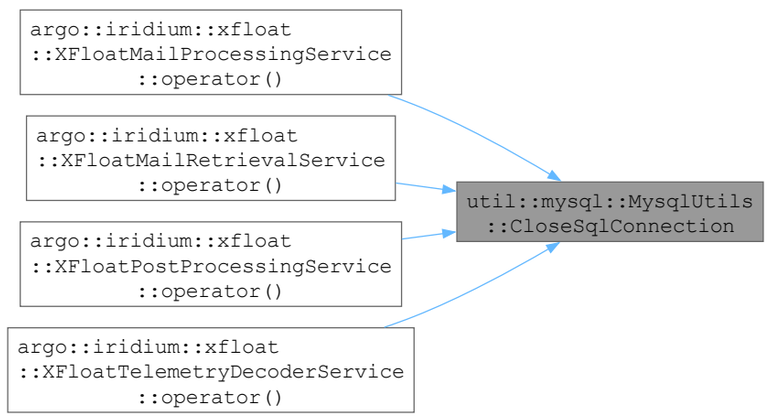
Exceptions

log::MessageException	if an error occurs while attempting to close the MySQL connection.

References CATCH_BLOCK, and util::mysql::MysqlUtils::sql_connection_.

Referenced by argo::iridium::xfloat::XFloatMailProcessingService::operator()(), argo::iridium::xfloat::XFloatMailRetrievalService::operator(argo::iridium::xfloat::XFloatPostProcessingService::operator()(), and argo::iridium::xfloat::XFloatTelemetryDecoderService::operator()().

Here is the caller graph for this function:



10.86.3.8 degToRad()

```
template<typename T >
static double util::math::MathUtils::degToRad (
             T deg)  [inline], [static], [inherited]
```

Convert angular units from from degrees to decimal radians.

Parameters

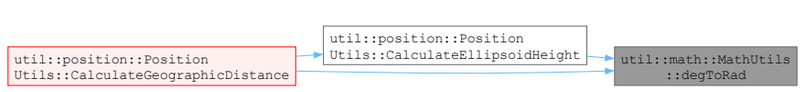
in	*deg*	Angle in integer or decimal degrees to convert to radians.

Returns

Angle in decimal radians.

Referenced by util::position::PositionUtils::CalculateEllipsoidHeight(), and util::position::PositionUtils::CalculateGeographicDistance().

Here is the caller graph for this function:



10.86.3.9 ExecuteQuery()

```
static shared_ptr< ResultSet > util::mysql::MysqlUtils::ExecuteQuery (
            Connection * con,
            const string & query)  [inline], [static], [inherited]
```

Execute an SQL query and return a shared pointer to the ResultSet object.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*query*	The SQL query to execute. This must be a well-formatted SQL query string.

Exceptions

log::MessageException	if 'con' is null, 'query' is a malfored SQL string, or any other error occurs.

Returns

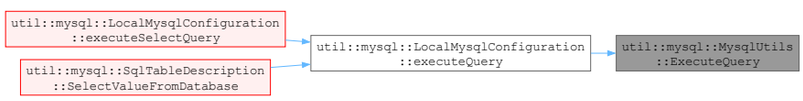
A shared pointer to the query ResultSet object.

References CATCH_BLOCK, and util::mysql::MysqlUtils::GeneratePreparedStatement().

Referenced by util::mysql::LocalMysqlConfiguration::executeQuery().

Here is the call graph for this function:

Here is the caller graph for this function:



10.86.3.10 executeQuery()

```
shared_ptr< sql::ResultSet > util::mysql::LocalMysqlConfiguration::executeQuery (
            const string & query)  [static], [inherited]
```

Execute an SQL query and return a shared pointer to the ResultSet object.

Parameters

in	*query*	The SQL query to execute. This must be a well-formatted SQL query string.

Exceptions

log::MessageException	'query' is a malfored SQL string or any other error occurs while executing the query.

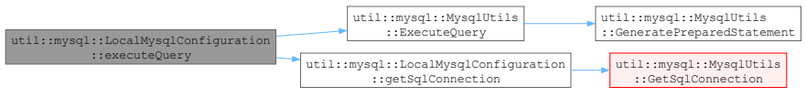
Returns

A shared pointer to the query ResultSet object.

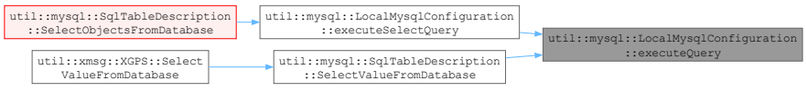
References util::mysql::MysqlUtils::ExecuteQuery(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

Referenced by util::mysql::LocalMysqlConfiguration::executeSelectQuery(), and util::mysql::SqlTableDescription< T >::SelectValueFromD

Here is the call graph for this function:



Here is the caller graph for this function:



10.86.3.11 executeSelectQuery()

```
shared_ptr< sql::ResultSet > util::mysql::LocalMysqlConfiguration::executeSelectQuery (
            const string & what,
            const string & from,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [static], [inherited]
```

Execute an SQL select query and return a shared pointer to the ResultSet object.

Parameters

in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table–references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Exceptions

log::MessageException	if an error occurs while executing the query.

Returns

A shared pointer to the ResultSet object.

References CATCH_BLOCK, util::mysql::LocalMysqlConfiguration::executeQuery(), and util::mysql::MysqlUtils::GenerateSqlSelectStr().

Referenced by util::mysql::SqlTableDescription< T >::SelectObjectsFromDatabase().

Here is the call graph for this function:

Here is the caller graph for this function:

10.86.3.12 ExecuteUpdate()

```
static int util::mysql::MysqlUtils::ExecuteUpdate (
            Connection * con,
            const string & update)  [inline], [static], [inherited]
```

Execute an SQL update and return the status code.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*update*	The SQL update to execute. This must be a well-formatted SQL update string.

Exceptions

log::MessageException	if 'con' is null, 'update' is a malformed SQL string, or any other error occurs.

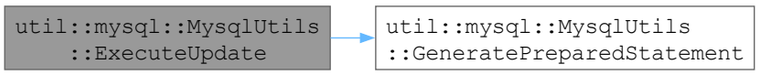
Returns

The update status code.

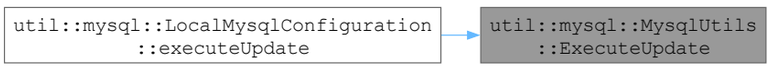
References CATCH_BLOCK, and util::mysql::MysqlUtils::GeneratePreparedStatement().

Referenced by util::mysql::LocalMysqlConfiguration::executeUpdate().

Here is the call graph for this function:



Here is the caller graph for this function:



10.86.3.13 executeUpdate()

```
int util::mysql::LocalMysqlConfiguration::executeUpdate (
            const string & update)  [static], [inherited]
```

Execute an SQL update and return the status code.

Parameters

in	*update*	The SQL update to execute. This must be a well-formatted SQL update string.

Exceptions

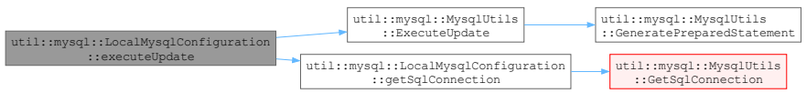
log::MessageException	if 'update' is a malformed SQL string, or any other error occurs while executing the update.

Returns

The update status code.

References util::mysql::MysqlUtils::ExecuteUpdate(), and util::mysql::LocalMysqlConfiguration::getSqlConnection().

Here is the call graph for this function:



10.86.3.14 fw_version()

```
uint32_t argo::iridium::xfloat::XFloat::fw_version () const  [inline]
```

Get the firmware version.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

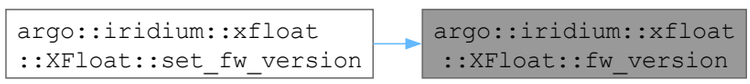
Returns

The firmware version.

References fw_version_, and util::thread::RecursiveLockable::mutex_.

Referenced by set_fw_version().

Here is the caller graph for this function:



10.86.3.15 gain_pressure()

```
uint16_t argo::iridium::xfloat::XFloat::gain_pressure () const  [inline]
```

Get the pressure gain value, in dBar/LSB.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The pressure gain value, in dBar/LSB.

References gain_pressure_, and util::thread::RecursiveLockable::mutex_.

10.86.3.16 gain_pressure_surface()

```
uint16_t argo::iridium::xfloat::XFloat::gain_pressure_surface () const  [inline]
```

Get the pressure gain value for surface data, in dBar/LSB.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The pressure gain value, in dBar/LSB.

References gain_pressure_surface_, and util::thread::RecursiveLockable::mutex_.

10.86.3.17 gain_salinity()

```
uint16_t argo::iridium::xfloat::XFloat::gain_salinity () const  [inline]
```

Get the salinity gain value, in PSU/LSB.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The salinity gain value, in PSU/LSB.

References gain_salinity_, and util::thread::RecursiveLockable::mutex_.

10.86.3.18 gain_salinity_surface()

```
uint16_t argo::iridium::xfloat::XFloat::gain_salinity_surface () const  [inline]
```

Get the salinity gain value for surface data, in PSU/LSB.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The salinity gain value, in PSU/LSB.

References gain_salinity_surface_, and util::thread::RecursiveLockable::mutex_.

10.86.3.19 gain_temperature()

```
uint16_t argo::iridium::xfloat::XFloat::gain_temperature () const  [inline]
```

Get the temperature gain value, in degC/LSB.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The temperature gain value, in degC/LSB.

References gain_temperature_, and util::thread::RecursiveLockable::mutex_.

10.86.3.20 gain_temperature_surface()

```
uint16_t argo::iridium::xfloat::XFloat::gain_temperature_surface () const  [inline]
```

Get the temperature gain value for surface data, in degC/LSB.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The temperature gain value, in degC/LSB.

References gain_temperature_surface_, and util::thread::RecursiveLockable::mutex_.

10.86.3.21 GenerateCurrentUtcTimeIso8601String()

```
static string util::date::DateUtils::GenerateCurrentUtcTimeIso8601String ()  [inline], [static],
[inherited]
```

Generate an ISO8601 format date/time string representation of the current time, in UTC.

Note

All date/time objects use the UTC time-zone.

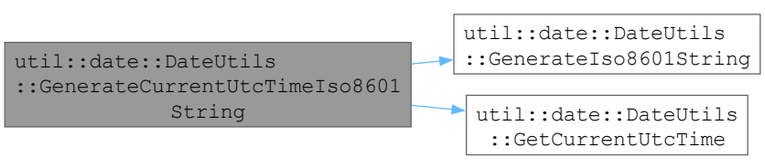
Returns

An ISO8601 format date/time string representation of the current time.

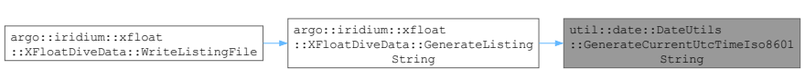
References util::date::DateUtils::GenerateIso8601String(), and util::date::DateUtils::GetCurrentUtcTime().

Referenced by argo::iridium::xfloat::XFloatDiveData::GenerateListingString().

Here is the call graph for this function:



Here is the caller graph for this function:



10.86.3.22 GenerateIso6709String()

```
template<typename T >
static std::string util::position::PositionUtils::GenerateIso6709String (
            T lat,
            T lon)  [inline], [static], [inherited]
```

Generate an IS06709 string representation of the position given by (`lat`, `lon`).

Parameters

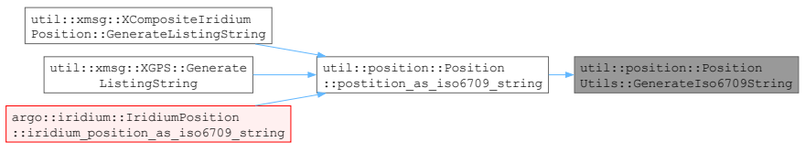
in	*lat*	The latitude of the position, in degrees North.
in	*lon*	The longitude of the position, in degrees East.

Returns

An IS06709 string representation of the position given by (`lat`, `lon`).

Referenced by util::position::Position::postition_as_iso6709_string().

Here is the caller graph for this function:



10.86.3.23 GenerateIso8601String()

```
static string util::date::DateUtils::GenerateIso8601String (
            const ptime & p,
            bool extended = true)  [inline], [static], [inherited]
```

Generate an ISO8601 format date/time string representation of a POSIX time object.

Note

All date/time objects use the UTC time-zone.

Parameters

in	*p*	POSIX time from which to generate string.
in	*extended*	If TRUE, use the ISO 8601 extended format (YYYY-MM-DDThh:mm:ssZ); otherwise, use the basic format (YYYYMMDDThhmmss).

Returns

An ISO8601 format date/time string representation of the POSIX time object. If p is equal to boost::posix_↩ time::not_a_date_time, then the string "0000-00-00T00:00:00Z" (extended) or "00000000000000" (basic) will be returned.

10.86.3.24 GenerateJulianDay()

```
static double util::date::DateUtils::GenerateJulianDay (
            const ptime & dt,
            const ptime & ref_dt)  [inline], [static], [inherited]
```

Convert a date/time to fractional days since a reference date/time.

Parameters

in	*dt*	The date/time to convert.
in	*ref↩ _dt*	The reference date/time (day 0).

Exceptions

util::log::MessageException	if either date/time is not valid.

Returns

The number of days (with millisecond resolution) from `ref_dt` to `dt`.

References CATCH_BLOCK, and EXC_THROW.

10.86.3.25 GenerateKmlMasterDocument()

```
kmldom::DocumentPtr argo::iridium::xfloat::XFloat::GenerateKmlMasterDocument ()  [static], [private]
```

Generate the Google Earth KML master document.

Returns

The Google Earth KML master document.

References CATCH_BLOCK, GetAllCachedFloats(), util::kml::KmlUtil::GetKmlFactory(), and util::kml::KmlUtil::SetAllDefaultKmlSyles().

Here is the caller graph for this function:

10.86.3.27 GenerateKmlString()

```
string argo::iridium::xfloat::XFloat::GenerateKmlString ()  [private]
```

Generate the Google Earth KML string for this float.

Returns

The Google Earth KML string for this float.

References CATCH_BLOCK.

10.86.3.28 GeneratePreparedStatement()

```
static shared_ptr< PreparedStatement > util::mysql::MysqlUtils::GeneratePreparedStatement (
            Connection * con,
            const string & statement)  [inline], [static], [inherited]
```

Generate a prepared SQL statement object for the given SQL statement.

Parameters

in	*con*	A pointer to the SQL connection object. This must not be NULL.
in	*statement*	The SQL statement to prepare. This must be a well-formed SQL string.

Exceptions

log::MessageException	if 'con' is NULL, 'statement' is not a valid SQL string, or if an error occurs.

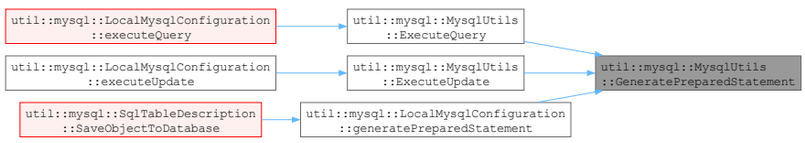
Returns

A prepared SQL statement object generated from the given SQL statement.

References CATCH_BLOCK, and EXC_THROW.

Referenced by util::mysql::MysqlUtils::ExecuteQuery(), util::mysql::MysqlUtils::ExecuteUpdate(), and util::mysql::LocalMysqlConfiguration:

Here is the caller graph for this function:



10.86.3.29 generatePreparedStatement()

```
std::shared_ptr< sql::PreparedStatement > util::mysql::LocalMysqlConfiguration::generatePrepared↩
Statement (
            const string & statement)  [static], [inherited]
```

Generate a prepared SQL statement object for the given SQL statement.

Parameters

in	*statement*	The SQL statement to prepare. This must be a well-formed SQL string.

Exceptions

log::MessageException	if 'statement' is not a valid SQL string or if an error occurs while generating the prepared statement object..

Returns

A prepared SQL statement object generated from the given SQL statement.

            const string & where = "")  [inline], [static], [inherited]
```

Generate an SQL DELETE statement.

Warning

Without a `where` clause, the statement deletes every row in the table.

Parameters

`in`	*from*	The name of the table to delete from.
`in`	*where*	The SQL "where-condition" clause (empty = all rows).

Returns

The SQL statement.

10.86.3.31 GenerateSqlSelectStr()

```
static string util::mysql::MysqlUtils::GenerateSqlSelectStr (
            const string & what,
            const string & from,
            const string & where = "",
            const string & groupBy = "",
            const string & orderBy = "",
            unsigned int limit = 0,
            unsigned int offset = 0)  [inline], [static], [inherited]
```

Generate an SQL select statement.

Parameters

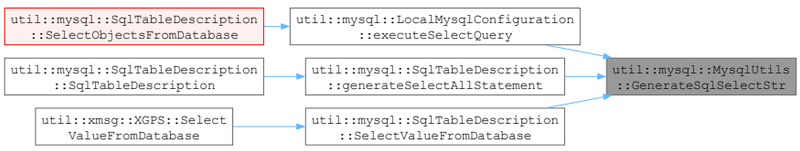
in	*what*	The SQL select statement select-expression clause.
in	*from*	The SQL select statement table-references clause.
in	*where*	The SQL select statement where-condition clause.
in	*groupBy*	The SQL select statement group-by clause.
in	*orderBy*	The SQL select statement order-by clause.
in	*limit*	The SQL select statement result set row limit value.
in	*offset*	The SQL select statement result set row offset.

Returns

The SQL select statement.

Referenced by util::mysql::LocalMysqlConfiguration::executeSelectQuery(), util::mysql::SqlTableDescription< T >::generateSelectAllState and util::mysql::SqlTableDescription< T >::SelectValueFromDatabase().

Here is the caller graph for this function:



10.86.3.32 GetAllCachedFloats()

```
vector< shared_ptr< XFloat > > argo::iridium::xfloat::XFloat::GetAllCachedFloats ()  [static]
```

Get all float objects currently stored in the cache.

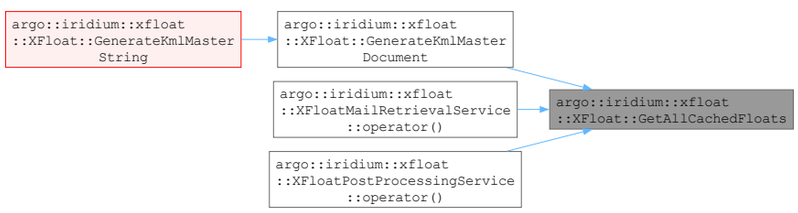
Returns

A vector of shared pointers to the cached float objects.

References CATCH_BLOCK, id2float_map_, and id2float_map_mutex_.

Referenced by GenerateKmlMasterDocument(), argo::iridium::xfloat::XFloatMailRetrievalService::operator()(), and argo::iridium::xfloat::XFloatPostProcessingService::operator()().

Here is the caller graph for this function:



10.86.3.33 GetAllDiveData()

```
vector< shared_ptr< XFloatDiveData > > argo::iridium::xfloat::XFloat::GetAllDiveData ()
```

Get all dive data objects for this float.

Returns

A vector of shared pointers to all dive data objects for this float.

References CATCH_BLOCK.

10.86.3.34 GetCurrentUtcTime()

```
static ptime util::date::DateUtils::GetCurrentUtcTime ()  [inline], [static], [inherited]
```

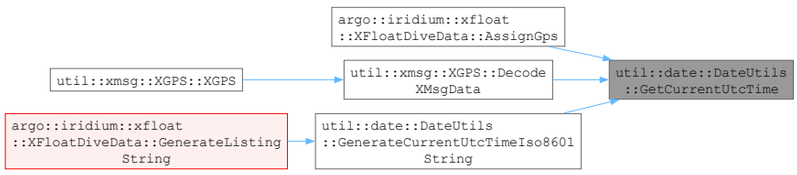
Generate a POSIX time object representing the current date and time (rounded to the nearest second).

Returns

A POSIX time object representing the current date and time (rounded to the nearest second).

Referenced by argo::iridium::xfloat::XFloatDiveData::AssignGps(), util::xmsg::XGPS::DecodeXMsgData(), and util::date::DateUtils::GenerateCurrentUtcTimeIso8601String().

Here is the caller graph for this function:



10.86.3.35 GetDefaltKmlPathColor()

```
static const Color32 & util::kml::KmlUtil::GetDefaltKmlPathColor (
            int id)  [inline], [static], [inherited]
```

Get the palette colour for an index (an instrument ID, for example), modulo the palette size.

Parameters

in	*id*	The index.

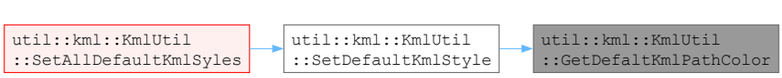
Returns

The colour.

References util::kml::KmlUtil::kml_default_path_colors_.

Referenced by util::kml::KmlUtil::SetDefaultKmlStyle().

Here is the caller graph for this function:



10.86.3.36 GetDefaltKmlPathStyleId()

```
static const string & util::kml::KmlUtil::GetDefaltKmlPathStyleId (
            int id)  [inline], [static], [inherited]
```

Get the path (line) style ID for an index, modulo the palette size.

Parameters

in	*id*	The index.

Returns

The KML style ID.

References util::kml::KmlUtil::kml_default_path_style_ids_.

Referenced by util::kml::KmlUtil::SetDefaultKmlStyle().

Here is the caller graph for this function:

10.86.3.37 GetDefaltKmlPlacemarkStyleId()

```
static const string & util::kml::KmlUtil::GetDefaltKmlPlacemarkStyleId (
            int id)  [inline], [static], [inherited]
```

Get the large placemark style ID for an index, modulo the palette size.

Parameters

in	*id*	The index.

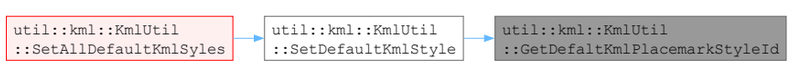
Returns

The KML style ID.

References util::kml::KmlUtil::kml_default_placemark_style_ids_.

Referenced by util::kml::KmlUtil::SetDefaultKmlStyle().

Here is the caller graph for this function:



10.86.3.38 GetDirectoryPath()

```
static const path & util::file::FileSystemUtils::GetDirectoryPath (
            const path & dir,
            bool create = false)  [inline], [static], [inherited]
```

Get a directory path.

Exceptions

MessageException	if create == FALSE and the directory specified by path does not exist.

Parameters

in	*dir*	Directory path.
in	*create*	If TRUE, the directory specified by path will be created if it does not already exists. If FALSE, an exception will be thrown if the directory does not exist.

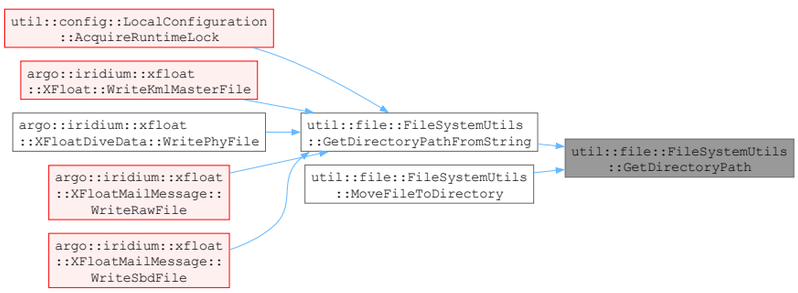
Returns

dir

References CATCH_BLOCK, EXC_THROW, and ldbg.

Referenced by util::file::FileSystemUtils::GetDirectoryPathFromString(), and util::file::FileSystemUtils::MoveFileToDirectory().

Here is the caller graph for this function:



10.86.3.39 GetDirectoryPathFromString()

```
static path util::file::FileSystemUtils::GetDirectoryPathFromString (
            const string & dir,
            bool create = false)  [inline], [static], [inherited]
```

Generate a boost::filesystem::path object from the directory path string.

Exceptions

MessageException	if create == FALSE and the directory specified by path does not exist.

Parameters

in	*dir*	Directory path string.
in	*create*	If TRUE, the directory specified by path will be created if it does not already exists. If FALSE, an exception will be thrown if the directory does not exist.

Returns

A boost::filesystem::path object from the directory path string.

References CATCH_BLOCK, and util::file::FileSystemUtils::GetDirectoryPath().

Referenced by util::config::LocalConfiguration::AcquireRuntimeLock(), WriteKmlMasterFile(), argo::iridium::xfloat::XFloatDiveData::WriteP argo::iridium::xfloat::XFloatMailMessage::WriteRawFile(), and argo::iridium::xfloat::XFloatMailMessage::WriteSbdFile().

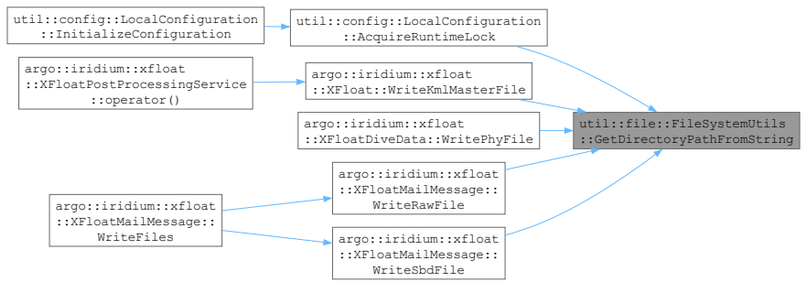
Here is the caller graph for this function:



10.86.3.40 GetDiveData()

```
shared_ptr< XFloatDiveData > argo::iridium::xfloat::XFloat::GetDiveData (
            int dive,
            bool local_only = false)
```

Get the dive data object from the dive or cycle number.

This function returns a shared reference to the dive data object for this instrument identified by the unique dive or cycle number. First, the function checks if the dive data object exists in the dive-or-cycle-number-to-dive-data-object map, dive2data_map_. If it does, then a shared reference to the object is returned.

Otherwise, if the dive data object does not exist in the map, the function attempts to query the SQL database, and populate a dive data object from the result of the SQL query. If successful, then the newly populated object is added to the map and a shared reference to the object is returned.

Finally, if the dive data object also does not exist in the SQL database, then a new dive data object will be constructed. The newly constructed dive data object is added to the dive-or-cycle-number-to-dive-data-object map, dive2data_map_, and then persisted to the SQL database. A shared reference to the new object is returned.

Exceptions

util::log::MessageException	if an error occurs while attempting to retrieve or construct the dive data object.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Parameters

in	*dive*	The cycle or dive number of interest.
in	*local_only*	If TRUE, then the dive data object will only be loaded from the local cache. Otherwise, the dive data object will be fetched from the SQL database if necessary.

Returns

The dive data object for a given dive.

References CATCH_BLOCK, dbg1, and ldbg.

10.86.3.41 GetFloat()

```
shared_ptr< XFloat > argo::iridium::xfloat::XFloat::GetFloat (
            int instrument_id)  [static]
```

Get a float object from the instrument identifier.

This function returns a shared reference to the float object identified by the unique instrument identifier. First, the function checks to see if the instrument-identifier-to-instrument-object map, id2float_map_, is empty. It the map is empty, then the query the known float object from the SQL database and used the result of the query to populate the map.

Next, the function checks to see if the map contains the float object with the given instrument identifier. If it does not, then a new float object is created and added to the map. Finally, the shared reference to float object is returned.

Exceptions

util::log::MessageException	if an error occurs while attempting to retrieve the float object with the give instrument identifier.

Note

This function places a lock guard on the instrument-identifier-to-instrument-object map mutual exclusion (mutex) lock, id2float_map_mutex_, thereby locking the instrument-identifier-to-instrument-object map, id2float_map_, and preventing access or modification of the map by any other thread. Any thread that does attempt to access or modify the map will block until the lock is released.

Parameters

in	*instrument↩ _id*	The unique instrument identifier.

Returns

A shared reference to the float object with the given instrument identifier, `instrument_id`.

References CATCH_BLOCK, id2float_map_, id2float_map_mutex_, and LoadLocalCacheFromDatabase().

            string user,
            string password,
            string schema)  [inline], [static], [inherited]
```

Get a thread-specific instance of a MySQL connection object.

A new connection will be created, if necessary.

Parameters

in	*url*	The MySQL host server qualified address.
in	*user*	The MySQL account username.
in	*password*	The MySQL account password.
in	*schema*	The MySQL account schema name.

Exceptions

log::MessageException	if an error occurs while creating a new thread-specific instance of the SQL connection object

Returns

A thread-specific instance of a MySQL connection object.

References CATCH_BLOCK, util::mysql::MysqlUtils::GetSqlDriver(), and util::mysql::MysqlUtils::sql_connection_.

Referenced by util::mysql::LocalMysqlConfiguration::getSqlConnection().

10.86.3.55 IsPositionValid()

```
template<typename T >
static bool util::position::PositionUtils::IsPositionValid (
            T lat,
            T lon)  [inline], [static], [inherited]
```

Check position validity.

Parameters

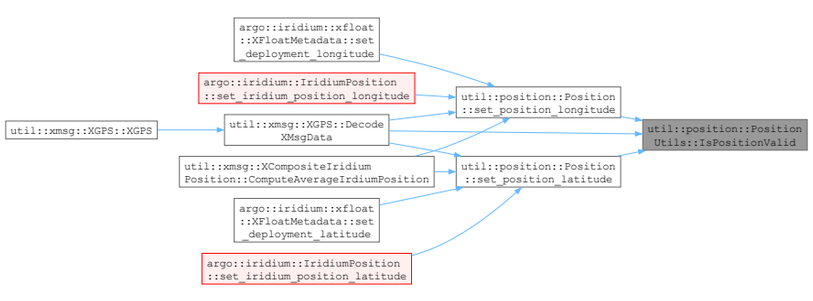
in	*lat*	Latitude of position.
in	*lon*	Longitude of position.

Returns

TRUE if (lat, lon) represents a valid geographical position, or FALSE otherwise.

Referenced by util::xmsg::XGPS::DecodeXMsgData(), util::position::Position::set_position_latitude(), and util::position::Position::set_positio

Here is the caller graph for this function:



10.86.3.56 ListDirectories()

```
static vector< path > util::file::FileSystemUtils::ListDirectories (
            const path & dir)  [inline], [static], [inherited]
```

List all directories contained in the given directory.

Parameters

in	*dir*	The path to the directory of interest.

Exceptions

log::MessageException	if the directory does not exist, is not a directory, or an error occurs.

Returns

A vector of paths to all the directories contained in the given directory.

References CATCH_BLOCK, and EXC_THROW.

10.86.3.57 ListFiles()

```
static vector< path > util::file::FileSystemUtils::ListFiles (
            path dir,
            size_t n = 0)  [inline], [static], [inherited]
```

List all regular files contained in the given directory.

Parameters

in	*dir*	The path to the directory of interest.
in	*n*	If n>0, the maximum number of paths to return, else no effect.

Exceptions

log::MessageException	if the directory does not exist, is not a directory, or an error occurs.

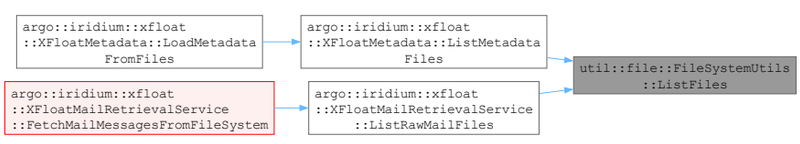
Returns

A vector of paths to all the regular files contained in the given directory.

References CATCH_BLOCK, and EXC_THROW.

Referenced by argo::iridium::xfloat::XFloatMetadata::ListMetadataFiles(), and argo::iridium::xfloat::XFloatMailRetrievalService::ListRawMa

Here is the caller graph for this function:



10.86.3.58 LoadLocalCacheFromDatabase()

```
void argo::iridium::xfloat::XFloat::LoadLocalCacheFromDatabase ()  [static]
```

Load all persistent instrument data from the database and use this data to populate the local cache.

Exceptions

util::log::MessageException	if an error occurs while querying the database or populating the local cache.

References id2float_map_mutex_, linf, lout, and SelectAllObjectsFromDatabase().

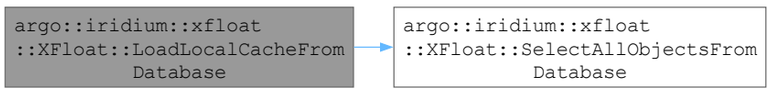
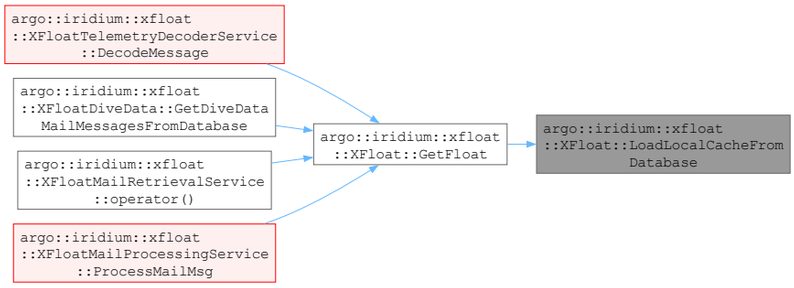
Here is the call graph for this function:



Here is the caller graph for this function:



10.86.3.59 LoadMetadataFromFiles()

```
void argo::iridium::xfloat::XFloat::LoadMetadataFromFiles ()  [static]
```

Load the instrument metadata.

This function loads the instruments' metadata from the metadata files on the local filesystem. It is called by the daemon thread during application initialization. A vector of metadata objects is created from the metadata files by calling XFloatMetadata::LoadMetadataFromFiles(). The function then iterates over the metadata files and assigns each to the corresponding float object before persisting the metadata object to the SQL database.

Exceptions

util::log::MessageException	if an error occurs while loading the instrument metadata from the files on the local file system.

Note

Metadata files that specify a DAC identifier of 9999 or -99 are used as place holders for instruments that have not yet been assigned a DAC identifier. Therefore, metadata files or objects specifying a DAC id less than 1, equal to 9999, or greater than 99998 will be discarded.

References linf, and lout.

10.86.3.60 LockObject()

```
bool util::thread::RecursiveLockable::LockObject (
            bool block)  [inline], [inherited]
```

Lock the object.

Parameters

in	*block*	If TRUE, then the calling thread will block until the lock becomes available.

Exceptions

util::log::MessageException	if an error occurs.

Returns

TRUE if the lock was successfully obtained, or FALSE if block is FALSE and another thread owns the lock on the mutex.

References CATCH_BLOCK, and util::thread::RecursiveLockable::mutex_.

10.86.3.61 metadata()

```
const shared_ptr< XFloatMetadata > & argo::iridium::xfloat::XFloat::metadata () const  [inline]
```

Get the metadata object for this instrument.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

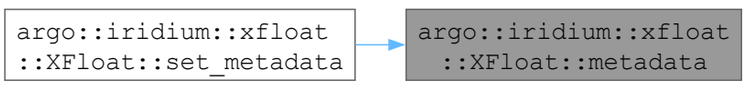
Returns

A shared pointer to the metadata object for this instrument.

References metadata_, and util::thread::RecursiveLockable::mutex_.

Referenced by set_metadata().

Here is the caller graph for this function:



10.86.3.62 MoveFileToDirectory()

```
static path util::file::FileSystemUtils::MoveFileToDirectory (
            const path & file,
            const path & dir_dst,
            bool create_dir = false)  [inline], [static], [inherited]
```

Copy a file into a directory.

Warning

Despite its name, this function copies the file and does not remove the source. If a file with the same name already exists in the destination directory, it is left unchanged. It is not currently called.

Parameters

in	*file*	The file to copy.
in	*dir_dst*	The destination directory.
in	*create_dir*	If TRUE, create the destination directory if it does not exist.

Exceptions

util::log::MessageException	if the file does not exist, is not a regular file, or cannot be copied.

Returns

The path of the file in the destination directory.

References CATCH_BLOCK, EXC_THROW, and util::file::FileSystemUtils::GetDirectoryPath().

10.86.3.63 offset_pressure()

```
uint16_t argo::iridium::xfloat::XFloat::offset_pressure () const  [inline]
```

Get the pressure offset value for this instrument, in dBar.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The pressure offset value for this instrument, in dBar.

References util::thread::RecursiveLockable::mutex_, and offset_pressure_.

10.86.3.64 offset_pressure_surface()

```
uint16_t argo::iridium::xfloat::XFloat::offset_pressure_surface () const  [inline]
```

Get the pressure offset value for surface data, in dBar.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The pressure offset value for this instrument, in dBar.

References util::thread::RecursiveLockable::mutex_, and offset_pressure_surface_.

10.86.3.65 offset_salinity()

```
uint16_t argo::iridium::xfloat::XFloat::offset_salinity () const  [inline]
```

Get the salinity offset value for this instrument, in PSU.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The salinity offset value for this instrument, in PSU.

References util::thread::RecursiveLockable::mutex_, and offset_salinity_.

10.86.3.66 offset_salinity_surface()

```
uint16_t argo::iridium::xfloat::XFloat::offset_salinity_surface () const  [inline]
```

Get the salinity offset value for surface data, in PSU.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The salinity offset value for this instrument, in PSU.

References util::thread::RecursiveLockable::mutex_, and offset_salinity_surface_.

10.86.3.67 offset_temperature()

```
uint16_t argo::iridium::xfloat::XFloat::offset_temperature () const  [inline]
```

Get the temperature offset value for this instrument, in degC.

Note

This object will be locked for the scope of the execution of this function. This function places a lock guard on the mutual exclusion (mutex) lock, thereby locking the float object and preventing access or modification of the object by any other thread. Any thread that does attempt to access or modify this object will block until the lock is released.

Returns

The temperature offset value for this instrument, in degC.

References util::thread::RecursiveLockable::mutex_, and offset_temperature_.
